KELWAY GARDENS.

Greenock,
26th August, 1908.

Messrs. Kelway and Son,
Langport, Somerset.

Dear Sirs,—You will be pleased to hear that the £10 or so which I have sent you in the last few years have made my garden (¼ acre) one beautiful mass of colour all the year round. . . .

This year especially the place has been a perfect picture—quite as fine as any of the pictures in Walter Wright's "Perfect Garden."

I am,
Yours faithfully.

FOR AUTUMN PLANTING.

PLANTERS of FRUIT TREES should write for our fully descriptive catalogue and supplement, 6d., post free; and gratis to customers.

Well-ripened trees of all kinds, and our large, developed specimens of Vines, Figs, Peaches, and Nectarines, are especially good.

An inspection solicited.

GEORGE BUNYARD and CO., Ltd.,
The Royal Nurseries, MAIDSTONE.

20,000 GOLD MEDAL DELPHINIUMS, splendid plants, finest sorts in cultivation; many with flowers 2 to 2½ inches across. Special lists ready. PERRY'S HARDY PLANT FARM, Enfield, Middlesex.

PERRY'S NEW BULB CATALOGUE is now ready. Unique collection. Low Prices. PERRY'S HARDY PLANT FARM, Enfield, Middx.

TO DAY! AND FOR YEARS AND YEARS PAST the XL ALL Specialities are and have been the best on the market. Where is the Gardener who does not pin his faith to one or the other of these celebrated Insecticides or Fertilisers? XL ALL FERTILISER has pleased all who have used it this season. The Sales of XL ALL FUMIGATOR prove that it is more popular than ever. XL ALL LIQUID NICOTINE INSECTICIDE is always spoken of by gardeners and growers as the most deadly to Mealy Bug, Thrips, etc. XL ALL WINTER WASH for dormant Trees acts like magic, clearing the Trees and Bushes of all Insects' Eggs, Moss and Fungoid Growths. XL ALL LAWN SAND, a weed eradicator and fertiliser for weedy and poor lawns. XL ALL WEED KILLER used once a year. "No weeds can live." Please ask your Nurseryman, Seedsman, or Florist for a copy of my small pink list, giving particulars of these and many other XL ALL Preparations, which can be obtained from the Horticultural Trade throughout the World. G. H. RICHARDS, Manufacturer and Patentee, 234, Borough High Street, London, S.E.

Holland in IRELAND.

Custom and tradition alike suggest your buying Bulbs in Holland. Why continue to do so? "Holland in Ireland" has amply proved the superiority of Irish grown Bulbs.

Tulips, Narcissi, Iris, Anemones, etc., from the Bulb Farms of Messrs. HOGG and ROBERTSON, equal and even surpass, the Dutch Bulbs in their exquisite form and beauty of colouring.

The Booklet "Holland in Ireland" fully illustrates and describes them; it is free on request.

DICKSON'S BULBS

THE PICK OF HOLLAND.

The pick of Holland's world renowned Bulbs are to be bought from Alex. Dickson & Sons, Ltd., and the awards our Irish grown bulbs have received in London and elsewhere clearly show that we also have the pick of Ireland's bulbs.

We grow a large number of bulbs on our farms in Ireland; but in addition, we buy from growers whose entire attention is devoted to raising a few kinds only, and thus it is that we are in the enviable position of selling only selected Bulbs of proved merit.

We shall be happy to send post free our new Illustrated List, showing all classes of bulbs at prices absolutely unobtainable elsewhere. Write to-day mentioning this paper

NOTES OF THE WEEK.

Flower Shows.

To those who take up a hobby of any kind there is nothing more discouraging in the long run than an absence of appreciative visitors who understand the merits of what is put before them, listen with comprehension to the history of the acquisitions, and from whose remarks a stimulus may often be derived to fresh efforts in the same or in new directions. This is particularly the case in natural hobbies such as are constituted by the many branches of culture of flowers, foliage plants, fruits, and vegetables, in all of which the amateur by dint of perseverance and concentration can vie with, and sometimes even excel, the professional nurseryman whose attention is naturally distributed over a wider field. It is here that the flower show proper affords the desired opportunity of comparison of results, and of meeting face to face with friendly competitors; and it is here that abundant opportunities exist for that exchange of experiences by which men learn what to avoid and what to adopt in the interests of their specialities. At the fortnightly meetings of the Royal Horticultural Society we see this principle embodied in its most practical form. To that [illegible] gravitate all the best and most advanced types which have been arrived at by selective culture on expert lines, or by importation from all parts of the world; and it is there that we find committees of experienced experts in all branches before whom these acquisitions are brought for judgment. Human nature is fallible, and the amateur and not rarely even the professional, is but too apt to mistake his "geese" for swans, but the anserine character is little likely to pass muster with a body of men who [illegible], by long years of experience, to discriminate between them. In the greater shows of the Temple and Holland Park we see, indeed, not merely the results of the cultivators skill and labour, but also that of the selective power of the judges aforesaid, which has undoubtedly contributed in a very large measure to the general high standard of the exhibits of all kinds. We appreciate this fact the more if we remember that a first-class exhibition of any speciality, orchids, roses, hippeastrums, begonias, etc., etc., involves a long period of previous preparation, during which the future exhibitor is always influenced in his choice by the knowledge that the eventual reward will not depend upon popular taste, which might be satisfied with a mere blaze of colour, but upon the sharp eyes of connoisseurs as quick to appreciate inferiority as superiority, and also that in all probability there will be keen competition on similar lines, and that the prize will go to the best. In these greater shows, both in London and the provinces, as in the fortnightly meetings at Westminster, it is gratifying to see how greatly the amateur figures as a successful competitor, as a result of that concentration to which we have alluded. Our floral wealth nowadays is so immense that the possibilities open to the selective cultivator and hybridiser are practically infinite. Nature is always busy devising new types, which, however, too often betray themselves at first in a degree only appreciable by skilled eyes, and hence often undoubtedly perish for lack of appreciation and encouragement; if, however, these be noted and followed up by judicious selection of their offspring, it is within the power of the smallest amateur to add something new and valuable to the wealth aforesaid. Every distinct "sport" is a direct gift from Nature, and often involves a suggestion of which the cultivator would otherwise never have dreamed. To follow these up and develop them successfully constitutes one of the greatest triumphs, and is yet within the reach of every true flower lover. All this, however, is of little use unless the cultivator familiarises himself with the work past and present of his fellows in his own particular line. Many of the "geese" that are put forward for awards by the R.H.S. Committees are obviously due to a want of knowledge of this kind, and such ignorance is best combated by study of the horticultural press whose province it is to dispel it, but far more by study of the exhibits at flower shows worthy of the name. We say worthy of the name because in our experience a number of local so-called flower shows are only so by courtesy, a tent or two being filled with second or third-rate plants, to which the judges must be hard put to it to award the first prizes, while the bulk of the attraction consists of a band, and sports of various kinds, other than floral ones. Such shows, in our opinion, contribute but little to the cult, and we should be pleased to see in these cases a strenuous effort to improve matters.

MR. E. J. HOLLAND, J.P.

Mr. Edward J. Holland, J.P., whose portrait it gives us very great pleasure to present this week, has arrived at that golden age when the enthusiasm of youth is undiminished, and the vigour of full manhood has brought with it an experience that tempers and directs the enthusiasm. One cannot be in Mr. Holland's company for five minutes without discovering that he has wide horticultural sympathies and an unbounded love for roses. At Silverdale, Sutton, Surrey, he grows about 2,800 roses that come under the "exhibition" class, besides garden and climbing roses in abundance, and about 200 pot roses. Mr. Holland is a business man, and moreover, he takes his full share of public work, being a member of the Surrey County Council and chairman of the Sutton District Council, and yet he finds, or makes, time to grow roses so well that in the present season his record of wins is as follows: First for 24 and 12 blooms at Richmond; first for 24, 12, and 8 trebles at Reigate; first for 24, 12, and 8 trebles at Sutton; first for 12, first for 6 new roses, and second for 12 trebles at the N.R.S. Show. At Croydon, Purley, and Eltham he was also successful, and he has had four silver medals for "best" blooms this year. Mr. Holland has quite a collection of "best bloom" medals, and no fewer than seven of them have been awarded for Mildred Grant. Mr. Holland is a member of the General Committee and also of the General Purposes Committee of the National Rose Society, and he ever seeks to advance the interests of the flower he so greatly loves.

Devon Daffodil Show.—Captain Parlby, of Crownhill, Devon, has sent us the schedule of the Devon Daffodil and Spring Flower Society's exhibition, to be held in the Plymouth Guildhall on April 20 and 21 next. No fewer than seventy-two classes are arranged, and liberal prizes are offered all through. We are especially glad to find that the new classification of daffodils, as arranged by the Royal Horticultural Society, is set out on one page of the schedule, and to see the special note that "the Royal Horticultural Society's classification of daffodils has been adopted as the standard, and varieties must be shown in the divisions to which they are there assigned. In case of any variety not being classified, the judges will be directed to allow the exhibitor to show it in that which it most nearly resembles, and in all cases to give him the benefit of any doubt."

Footpath Preservation. — Now that the prevalence of motors on the high roads is leading pedestrians to favour the country foopaths and bye-ways more than ever, it is interesting to learn that the preservation of such paths and rights-of-way is becoming a matter of great concern. The Commons and Footpaths Preservation Society is doing splendid work in this direction, but it ought to be more widely known that the duty of preserving such footpaths lies with the District Councils. It is the duty of the latter bodies to proceed in a case of obstruction reported to them by a Parish Council, and both Parish and District Councils may repair these public footpaths so as to prevent their disuse and the consequent lapse of rights.

Horticulture around Sheffield.—Most of our readers are aware that the cutlers and other steel workers in the neighbourhood of Sheffield include many very keen horticulturists. Some idea of the hold that gardening has upon the Sheffielders may be gathered from the fact that the "Sheffield Daily Telegraph," of September 14, contained reports of flower, fruit, and vegetable shows held by the Nether Hallam, Darnall, Norton, Bolehill,, Chapel-en-le-Frith, Buxton, North Wingfield, Stretton, Heanor Liberals', Monk Bretton, Elsecar, Darton, Stocksbridge, Turnditch, Shirland, Summercotes, Newfield Green, Crookes Allotment, and Oughtibridge Societies—nineteen horticultural exhibitions in one week!

Jubilee Bulb Show at Haarlem, 1910.—The Dutch Bulb Growers' Society is organising an important flower show in commemoration of its jubilee in 1910. Our readers are well aware that this society has organised large shows of bulbous plants every five years, and that the last exhibition of this kind was held at Haarlem in March, 1905, and fully reported and freely illustrated in our columns. All the visitors, and especially the foreign members of the jury were, however, unanimous in declaring that a show of flowering bulbs in the open ground would be even more desirable, hence the society has decided that the next quinquennial and jubilee show should be held in the natural flowering season of the bulbs, i.e., from the first days of April until the middle of May, 1910. The Haarlem City Council, recognising the high economical importance of bulb culture, has offered the most picturesque part of the City Park for the show site, and consequently it will be possible to prepare a floral exhibition of a quite distinct and new character, situated in landscape scenery of rare beauty. The flowering season of hyacinths and tulips always attracts large crowds of visitors, not only horticulturists, but also tourists. The Dutch Bulb Growers' Society may well celebrate its jubilee in a striking manner, considering its prosperity and importance. Founded in 1860 with about 150 Fellows, the society has now 2,800 members, divided into 37 local sections in the provinces of North Holland, South Holland, and Zeeland. The society publishes a journal, appearing twice weekly, and forming a yearly volume of 1,000 to 1,200 pages. The weekly mutual bulb market, the committee of arbiters, the floral committee for judging novelties, etc., have all been established by the Bulb Growers' Society.

The Public Parks and Gardens of the United Kingdom form a very interesting feature of our national horticultural life, and as the editor of the "Gardening Year Book" for 1909 is anxious to record the correct title and area of these parks and open spaces, he will be very greatly obliged if the superintendents will send him these particulars, as well as their own name and address. Secretaries of horticultural and gardening societies are also requested to furnish him with particulars of their societies, with dates of exhibitions, etc. The information should be sent as early as possible to the Editor, "Gardening Year Book," 148 and 149, Aldersgate Street, E.C.

Effect of Chloroform on Mimosas.—Dr. A. H. T. Montmorency, of Carrickmines, writes that, though most people are familiar with the sensitiveness of Mimosa pudica, the Sensitive Plant, few, perhaps, are aware that, when treated with chloroform or ether, this plant is like an animal, rendered insensible, and takes no notice of being touched.

M. Philippe de Vilmorin has been, we are pleased to learn, accorded the honour of Chevalier of the Legion of Honour.

Bulb Culture at Portmadoc.—Mrs. Lloyd George recently inaugurated an experiment that is to be conducted at Portmadoc in the culture of bulbs. The Town Improvements Committee has taken a small plot of ground for this purpose, and hopes to show that flower and bulb culture may be a profitable industry in the district.

The Bulb Trade of Holland.—Owing to the absence of the necessary data, it is impossible, says the "Journal" of the Board of Agriculture, to furnish an adequate idea of the importance of the fruit and vegetable industry in Holland, but Mr. Henry Turing, H.M. Consul at Rotterdam, states, as an example, that the value of the garden produce exported in 1905 was estimated at about £1,500,000, of which the bulb trade accounted for £600,000, the principal buyers being England, Germany, and the United States. Strawberries, cabbages, cucumbers, and apples are largely sent to Germany, while potatoes, onions, cucumbers, pears, cherries, gooseberries, and black, red, and white currants come to England.

Vegetable Imports were, on the whole, rather below the average last month, the most material decrease being in the quantities of onions received. The imports of potatoes amounted to 152,075 cwt., of the value of £30,228, these figures representing a decrease in quantity of 2,737 cwt., and in value of £2,967. Of the quantity mentioned, France sent 119,779 cwt., and "other countries" 31,279 cwt. Of onions the imports were 593,973 bushels, of the value of £65,820, or a decrease in quantity of 135,539 bushels, and in value of £21,623. Tomatoes, on the other hand, show an increase in quantity of 22,157 cwt., and in value of £9,870, the total having been 124,757 cwt., of the value of £120,625. The total value of unenumerated vegetables was £23,837, or an increase of £9,607.

Exhibit of English - grown Grapes.—It will be known to most of our readers that the Royal Horticultural Society have, at their Wisley Garden, the most complete collection of vines to be found in this or any other country, and they propose to exhibit at the fortnightly exhibition of flowers and fruits, to be held on September 29 at the Royal Horticultural Hall, Vincent Square, Westminster, about thirty varieties of dessert grapes grown upon these vines, thus affording a unique, and a perhaps hitherto unparalleled opportunity for the comparison of so large and representative a collection of fruits. Such an exhibit is intended to be chiefly educational, and especially to draw attention to some of the smaller-berried varieties which so vastly surpass in flavour their large and more showy brethren. The society has always paid special care to vine growing, which formed a prominent feature of their former gardens at Chiswick. In the early part of last century the society propagated wine-grapes for gratuitous distribution in the then young Colonies, and at the present time at the Wisley Garden, experiments are proceeding with an open-air vineyard to test the feasibility of such grape cultivation in suitable districts in England, and the best varieties for the purpose. Officers of the society will be in attendance with the exhibit on September 29 to give information to and to answer the enquiries of visitors.

A Notable Roof Garden.—The roof garden on the Lincoln Hotel, Seattle, the celebrated little city of the far-western state of Washington, renowned chiefly as the jumping-off ground for Yukon goldseekers, occupies, according to "The Sphere," a space of 12,000 sq. ft., and in addition to well laid out grass lawns, flower beds with beautiful blooms, shrubs, trees, and climbing vines, there is a charming teahouse and a pergola. The whole of the work in this aerial garden is done by Mrs. Blackwell and her two daughters. In addition to fruit trees there are a number of ash and birch trees, the latter reaching 12ft. in height. There are eight maple trees, six hollies, four hawthorns, a few evergreens, two laburnums, and one small apple tree which bears enormously large fruit. Then there are large shrubs like the lilac and quantities of roses, there being 300 or more bushes. There are 1,000 pansy plants in a bed 100ft. long, other plants including dahlias, a number of rhododendrons, 200 carnations, 1,500 Dutch bulbs, and numberless annuals that grow and bloom in profusion. The garden is, it is stated, regarded as one of the sights of the town.

DWARF POLYANTHA ROSES.

If you take a truss of Dorothy Perkins, Crimson Rambler, Baby Dorothy, or Mme. Norbert Levavasseur, and ask some growers what rose it is, the reply may be "A polyantha." This is correct. But what a difference when prefixed by the word dwarf or climbing!

These notes refer to the dwarf-growing forms, although it is admitted that many of the climbing or creeping forms will do well when pegged down. Those treated upon now are all dwarf or bushy growers, seldom exceeding eighteen to twenty-four inches in height, unless allowed to "run away." We have many forms of roses now, but for a lasting show of blossom, or as bedding roses, none can beat the dwarf polyanthas. From early June until the end of September they are one mass of bloom; full as they can possibly be for a fortnight or so; a slight rest, and then again a full crop of flowers that even rivals the begonias and zonal pelargoniums. They are also the simplest of roses to grow. Planted in fairly good soil the bed is a fixture, and only needs a little judicious pruning and feeding. Pruning consists chiefly in thinning out the centre and removing growths that have already flowered. In fact, this is almost all the wood there is to cut away; the rest is successive trusses of blossom.

The dwarf polyanthas are especially valuable in bedding form, because they carry their trusses bold and upright; you see the best flowers at first sight, and do not have to stoop to see their beauty, as is the case in many other dwarf growers, such as Viscountess Folkestone, Maman Cochet, as those you must lift up to see their centres. And yet these are grand roses for clusters and beds. The accompanying illustration represents a pot-grown plant of Madame Norbert Levavasseur, that was introduced in 1903. Unfortunately, there has been considerable confusion amongst some of these dwarf-growing forms. The one figured has been called Baby Rambler, also the Dwarf Crimson Rambler. Mme. Norbert Levavasseur would appear to be its correct name; the others only following when the rose and its characteristics became better known. While on this point, it may be as well to mention that Maman Levavasseur is a dwarf form of Dorothy Perkins, and this is often called the Baby Dorothy in the same connection that the one illustrated is called Baby Rambler. As a matter of fact, they are not Ramblers in the true sense of the word, and do not exhibit any of the Wichuraiana character in this respect. Phyllis is synonymous with Baby Dorothy and Maman Levavasseur, and was sent out in the same year, which was four years after Mme. N. Levavasseur or Baby Rambler.

So many flowers, as well as roses, produce sports at the same time in widely different parts of the country that one cannot entertain the idea of independent firms knowingly introducing the same under other names. We find the same thing occurs in sweet peas, chrysanthemums, and other flowers. I mention this because I do not for a moment believe any reputable firm would risk its credit by duplicating names.

Referring once more to the illustration, I do not think we could find more suitable plants for pot culture than the subjects of these notes; they flower as freely in pots as in the open, provided one takes even less care than is needed for other sections.

Among the polyanthas we have an immense range of colour: white, pink, yellow, red, cream, and almost purple; in short, any shades you can find among other sections. This class is increasing very rapidly and at the time of writing the twelve best may probably be found among those named below.

Madame N. Levavasseur (1903),should not be described as a dwarf Crimson Rrambler because it has a distinct shade of purple never found in that variety. We sometimes see the colour in Philadelphia Rambler, and very pronounced in Ne Plus Ultra. Otherwise, dwarf Crimson Rambler is a good description as regards colour, but the truss itself is more conical.

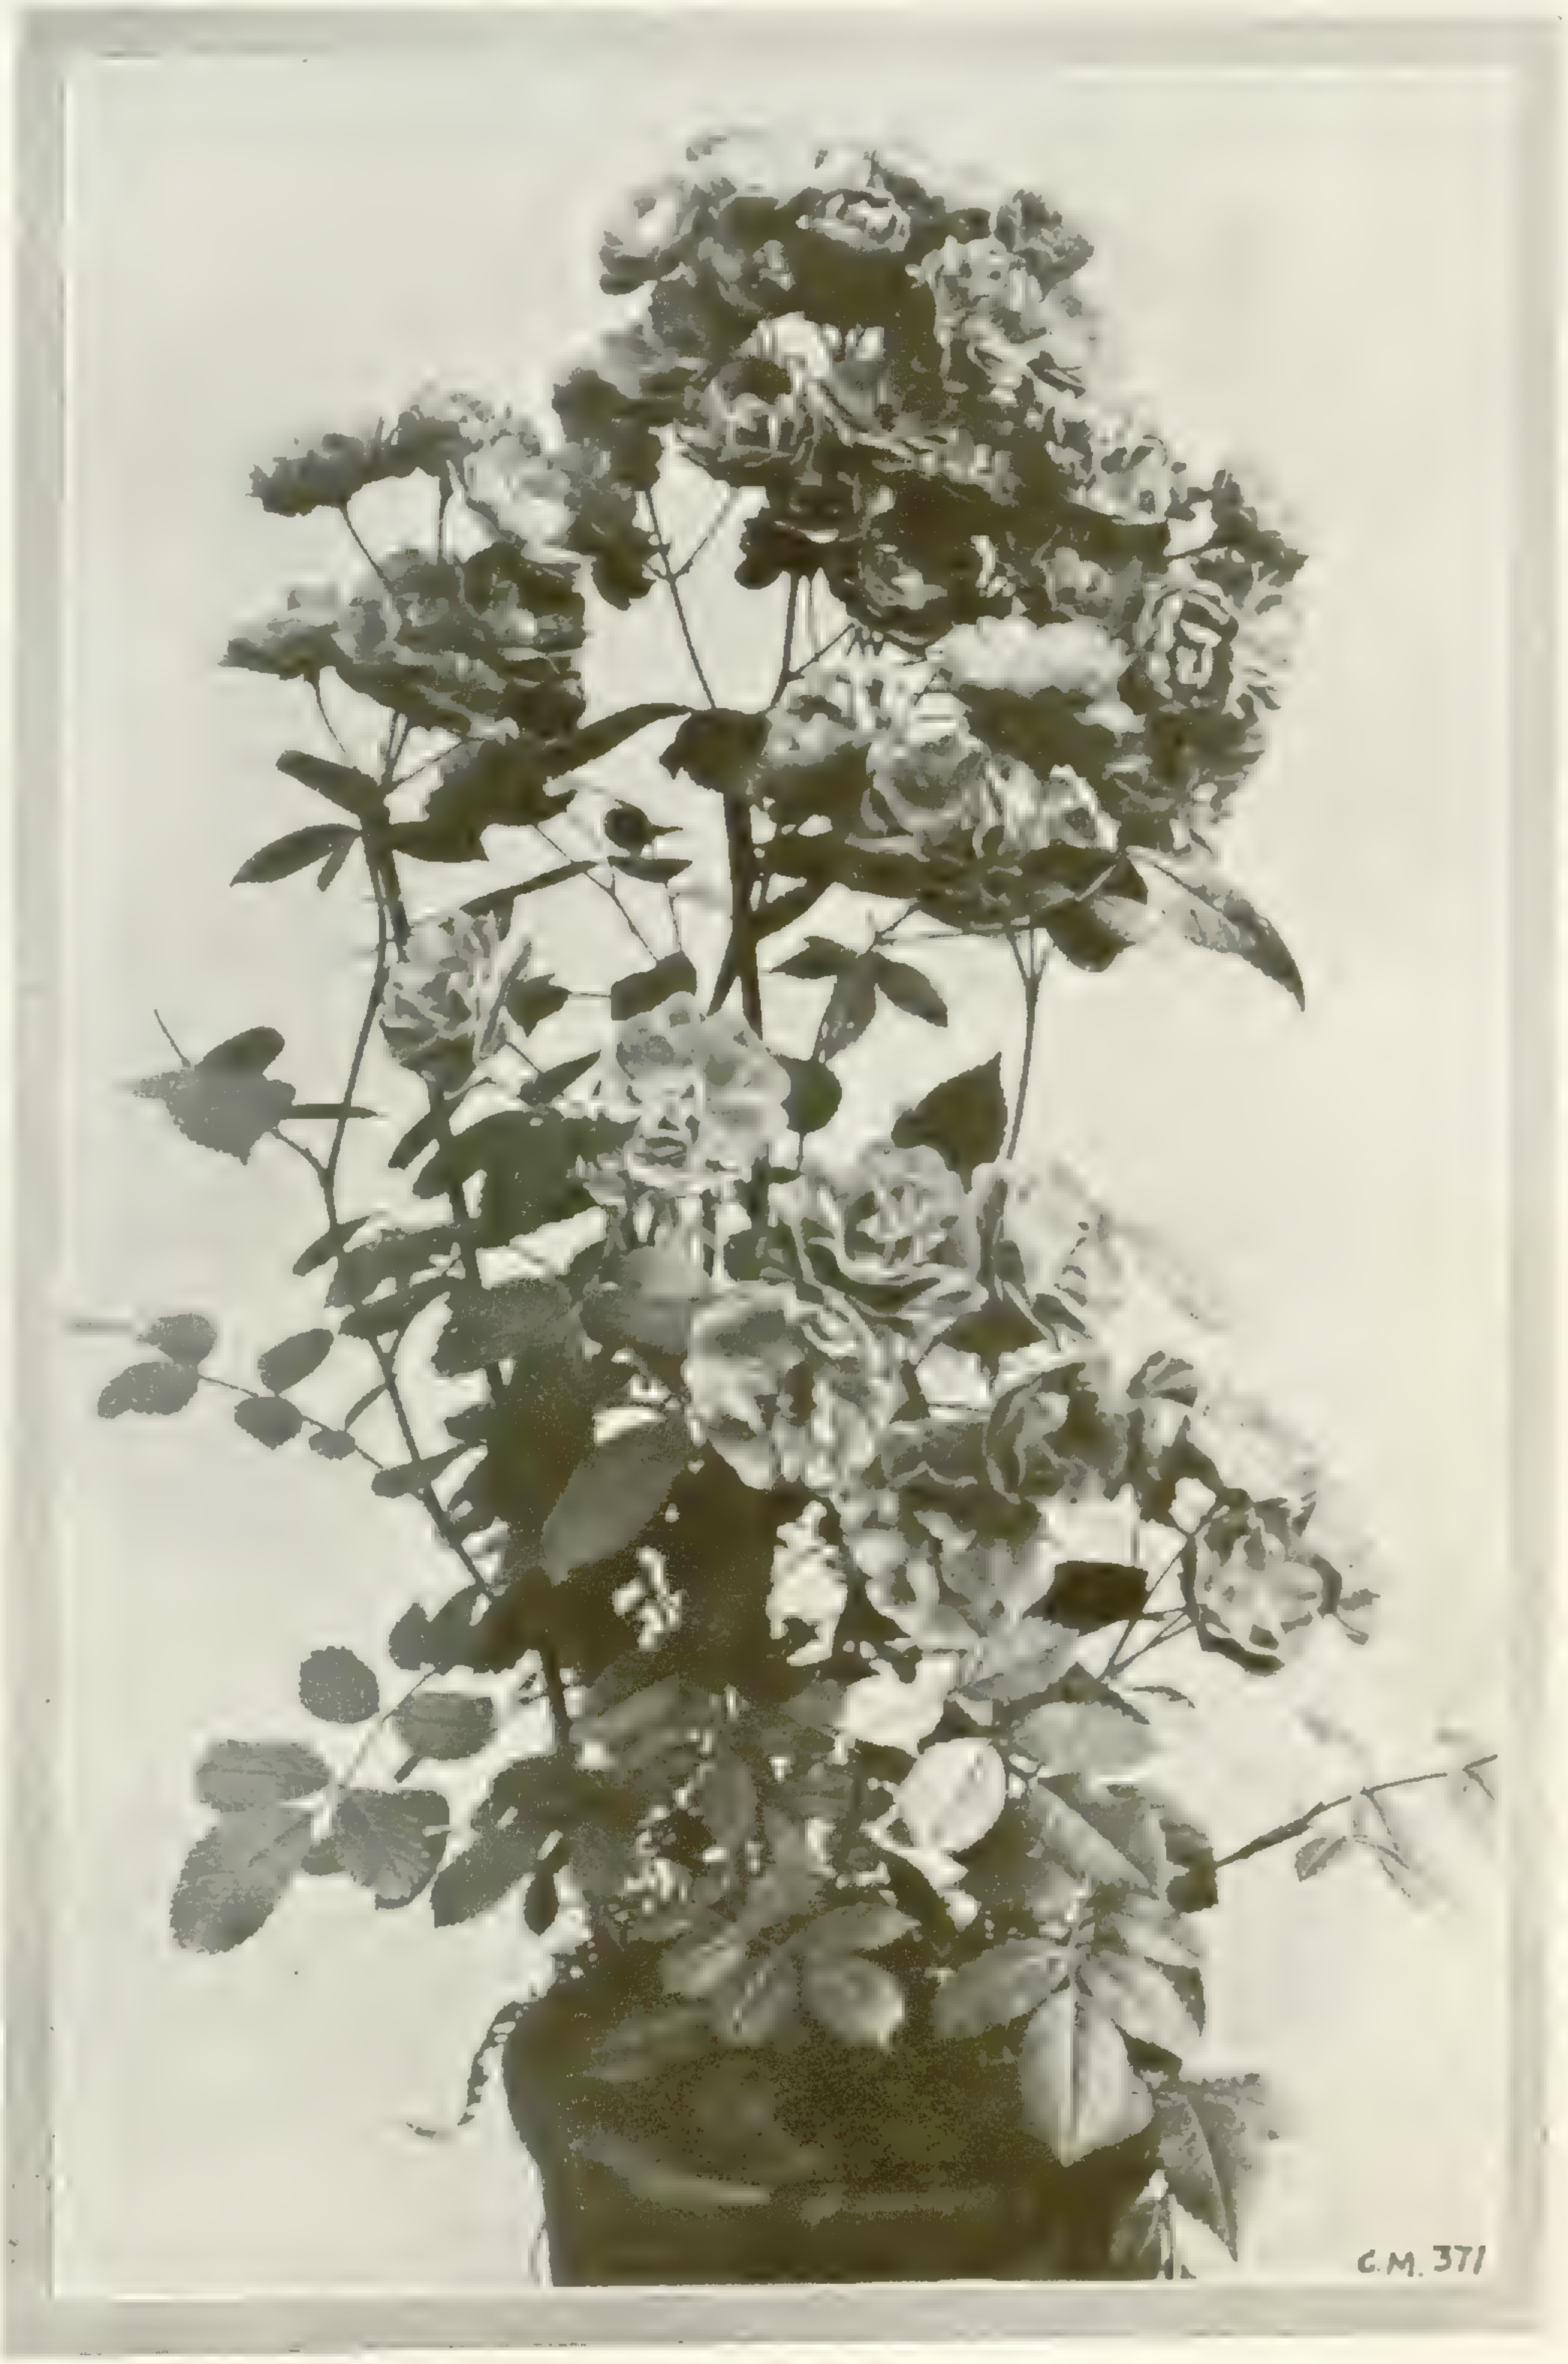
Maman Levavasseur (1907), is much lighter in colour than the centre of Dorothy Perkins, a rose it is reputed to have sported from. Here, again, the form of the trusses is distinct, although much of this may be from their upright instead of drooping habit.

Katherina Zeimet is sometimes called the White Baby Rambler. Why, I do not know, seeing it was introduced by M. P. Lambert, in 1901, two years before we named any of this section as "Babies." It is a beautiful little rose, almost snow-white, very free, and in its perfume resembles the hyacinths.

Schneewittchen was introduced by P. Lambert the same year (1901), and affords another white, yet quite distinct. This is semi-double, with very prominent golden stamens, which give the body of the flower an ivory, more than snowy-white, appearance. A good bloomer, and while roses are blooming this one is never flowerless.

Cécile Brunner is a blush-pink, lighter at the edges, with a distinct golden centre. There is a semi-climbing form of this now that is a great acquisition in that section, and so good as to call for a word here, although out of our subject.

White Pet is happily named. It is almost pure white when open, with a tinge of rose on the edges in its younger stages. I have counted three dozen blooms on a truss. A more perfectly rosette-shaped bloom it would be difficult to find.



DWARF POLYANTHA ROSE, MME NORBET LEVAVASSEUR.
Rich rose crimson, with a purple tinge as the flowers age.

Perle d'Or, a clear nankeen yellow with orange centre, does not keep so compact a habit as most, but is indispensable because of its unique colour and freedom.

Gloire des Polyantha produces very large trusses, somewhat heavy in appearance on account of its colour, a deep rose with lighter base, but it is exceptionally free.

Léonie Lamesch is called a nasturtium-red and yellow by the raiser, and it varies so much between these shades and deep orange that I cannot add to the description. A very peculiar colour this, flowers freely produced, set amongst quite distinct foliage, and the individual flowers lasting longer than any other in this class.

Floçon de Neige is another very aptly

named rose, for it resembles snowflakes when shattered. Pure white, particularly showy on the plant, free-flowering, but not a variety you can cut before it fully justifies its name.

Perle des Rouges gives the most reliable bright crimson, and I think it is better than Red Pet.

Mrs. W. J. Cutbush is a pale and yet clear pink, only semi-double, but a beautiful little rose borne in very large clusters. One of the best late in the season.

Uckfield. A. PIPER.

SINGLE ROSES.

During the last decade or so many purely single roses have come to the front. The growing taste for artistic decoration, rather than for the exhibitor's few blooms of exceptional merit, doubtless accounts for this. Personally I am a great admirer of roses in any form, from the perfectly symmetrical Horace Vernet or Catherine Mermet to the semi-doubles and singles; but few are more beautiful than those I wish more particularly to dwell upon in the present notes.

NEW SINGLE ROSE PARADISE.

A pink and white single Wichuraiana variety, recently well shown by Messrs. William Paul and Son, Waltham Cross.

We can have singles of any class of growth, from one to twenty feet or more in length; also blooms from three-quarters of an inch to five and a-half inches across; while every rose colour is represented. Not only are single roses exceedingly showy, but we get an immense number of varied coloured hips or seeds from them which are quite a feature in themselves.

The oldest known roses were, of course, singles, and it is not known how long the copper and yellow Austrian briars had existed before Gerard noted them. These two are still among the very best, and are, probably, with the help of our own British briars, the forerunners of many now so largely grown. Another great point with the singles is the length of their flowering season, for, although naturally rather evanescent in regard to each flower, blooms are produced so freely and continuously that a truss lasts a long time. Several sorts, too, such as the rugosas, will continue in flower from May until November.

Before going further let us look for a while at the grand show that can be had in the autumn from the rose hips alone; and it is only the single-flowered varieties that produce these. True we have hips upon such as General Jacqueminot, Mme. Abel Chatenay, Mme. Ravary, and a few more; but these are not very decorative. In Rosa pomifera we have bright red hips almost as large as a medlar; R. rugosa alba and R. r. rubra afford a large number of orange and purple-scarlet hips respectively, while R. rugosa atropurpurea has almost maroon-coloured fruits. Leuchtstern and Stella carry bunches of berries that are the same size and as showy as the thorns of our hedgerows. R. moschata alba has numerous bunches of small black berries. Rosa rugosa calocarpa is simply full of deep scarlet hips. Many of these rugosas are much used for covert planting, game birds being very fond of the berries. Even our own hedgerow briars are showy, but are quite surpassed by the grand trusses of sprays found upon the Penzance sweet briars. A stand of rose berries, ranging from black to white or pale lemon, deep orange and purple, with intense scarlet, makes a pretty feature for the table during autumn.

Maharajah is one of our largest singles. This is often five inches across, borne in trusses, the centre one opening first. It is a very strong grower, needs little pruning, has deep green foliage, and is one of the deepest velvety-crimson roses grown. Not the least attraction about single roses is their showy anthers, and here we have immense deep golden ones. Altogether, this is a grand variety for pillars or as a solitary bush on the lawn. It is good very early and again late in the season. Rosa sinica is a large pure white, with peculiar shiny foliage; R. sinica Anemone is beautiful silvery pink, shaded with rose. Both of these are rather tender, but unsurpassed where they will thrive. In Una we have another extra-sized flower, very hardy, and one that grows much like the Penzance briars. Few roses are more showy when growing upon a tall standard, its cascades of pale buff, changing to almost white, being very striking. It may be accepted that all of the single roses have showy anthers, so that I need not mention them individually.

Rosa macrantha, flesh, large, and very showy; and R. moschata alba, white, slightly tinged with pink on the edges, very early, are good. Morgenrot, rich crimson, with clear white eye, is very free flowering. Lady Curzon is classed as a Damask rose, but favours the briars very much; it is very large and pale pink. R. alpina is another very early rose, purple-crimson, and has hips—orange-red—that droop differently from any others. Bardou Job is one of the most dazzling brilliant roses; sometimes a pure scarlet, sometimes dark crimson shaded with blackish maroon, always opens well, and occasionally comes semi-double.

From Ireland we have a number of good singles, all named after the country of their origin, and, better still, in a short and sensible way. A few of the best are Irish Elegance, orange-bronze in the bud, which is long and pointed, opening into various shades of apricot, very perpetual, and a gold medal rose. Irish Beauty is pure white, large, and in clusters, very free in growth and flower. Irish Engineer is a most dazzling scarlet, very large; a sturdy and robust grower, with large deep-green foliage. Irish Brightness is not so good as Morgenrot already mentioned. Irish Pride is flesh, suffused with old rose and gold, and looks very much like a picotee. Irish Glory is silvery pink, back of petals crimson. Irish Modesty is coral pink, and Irish Harmony saffron-yellow, variable, and getting paler with age.

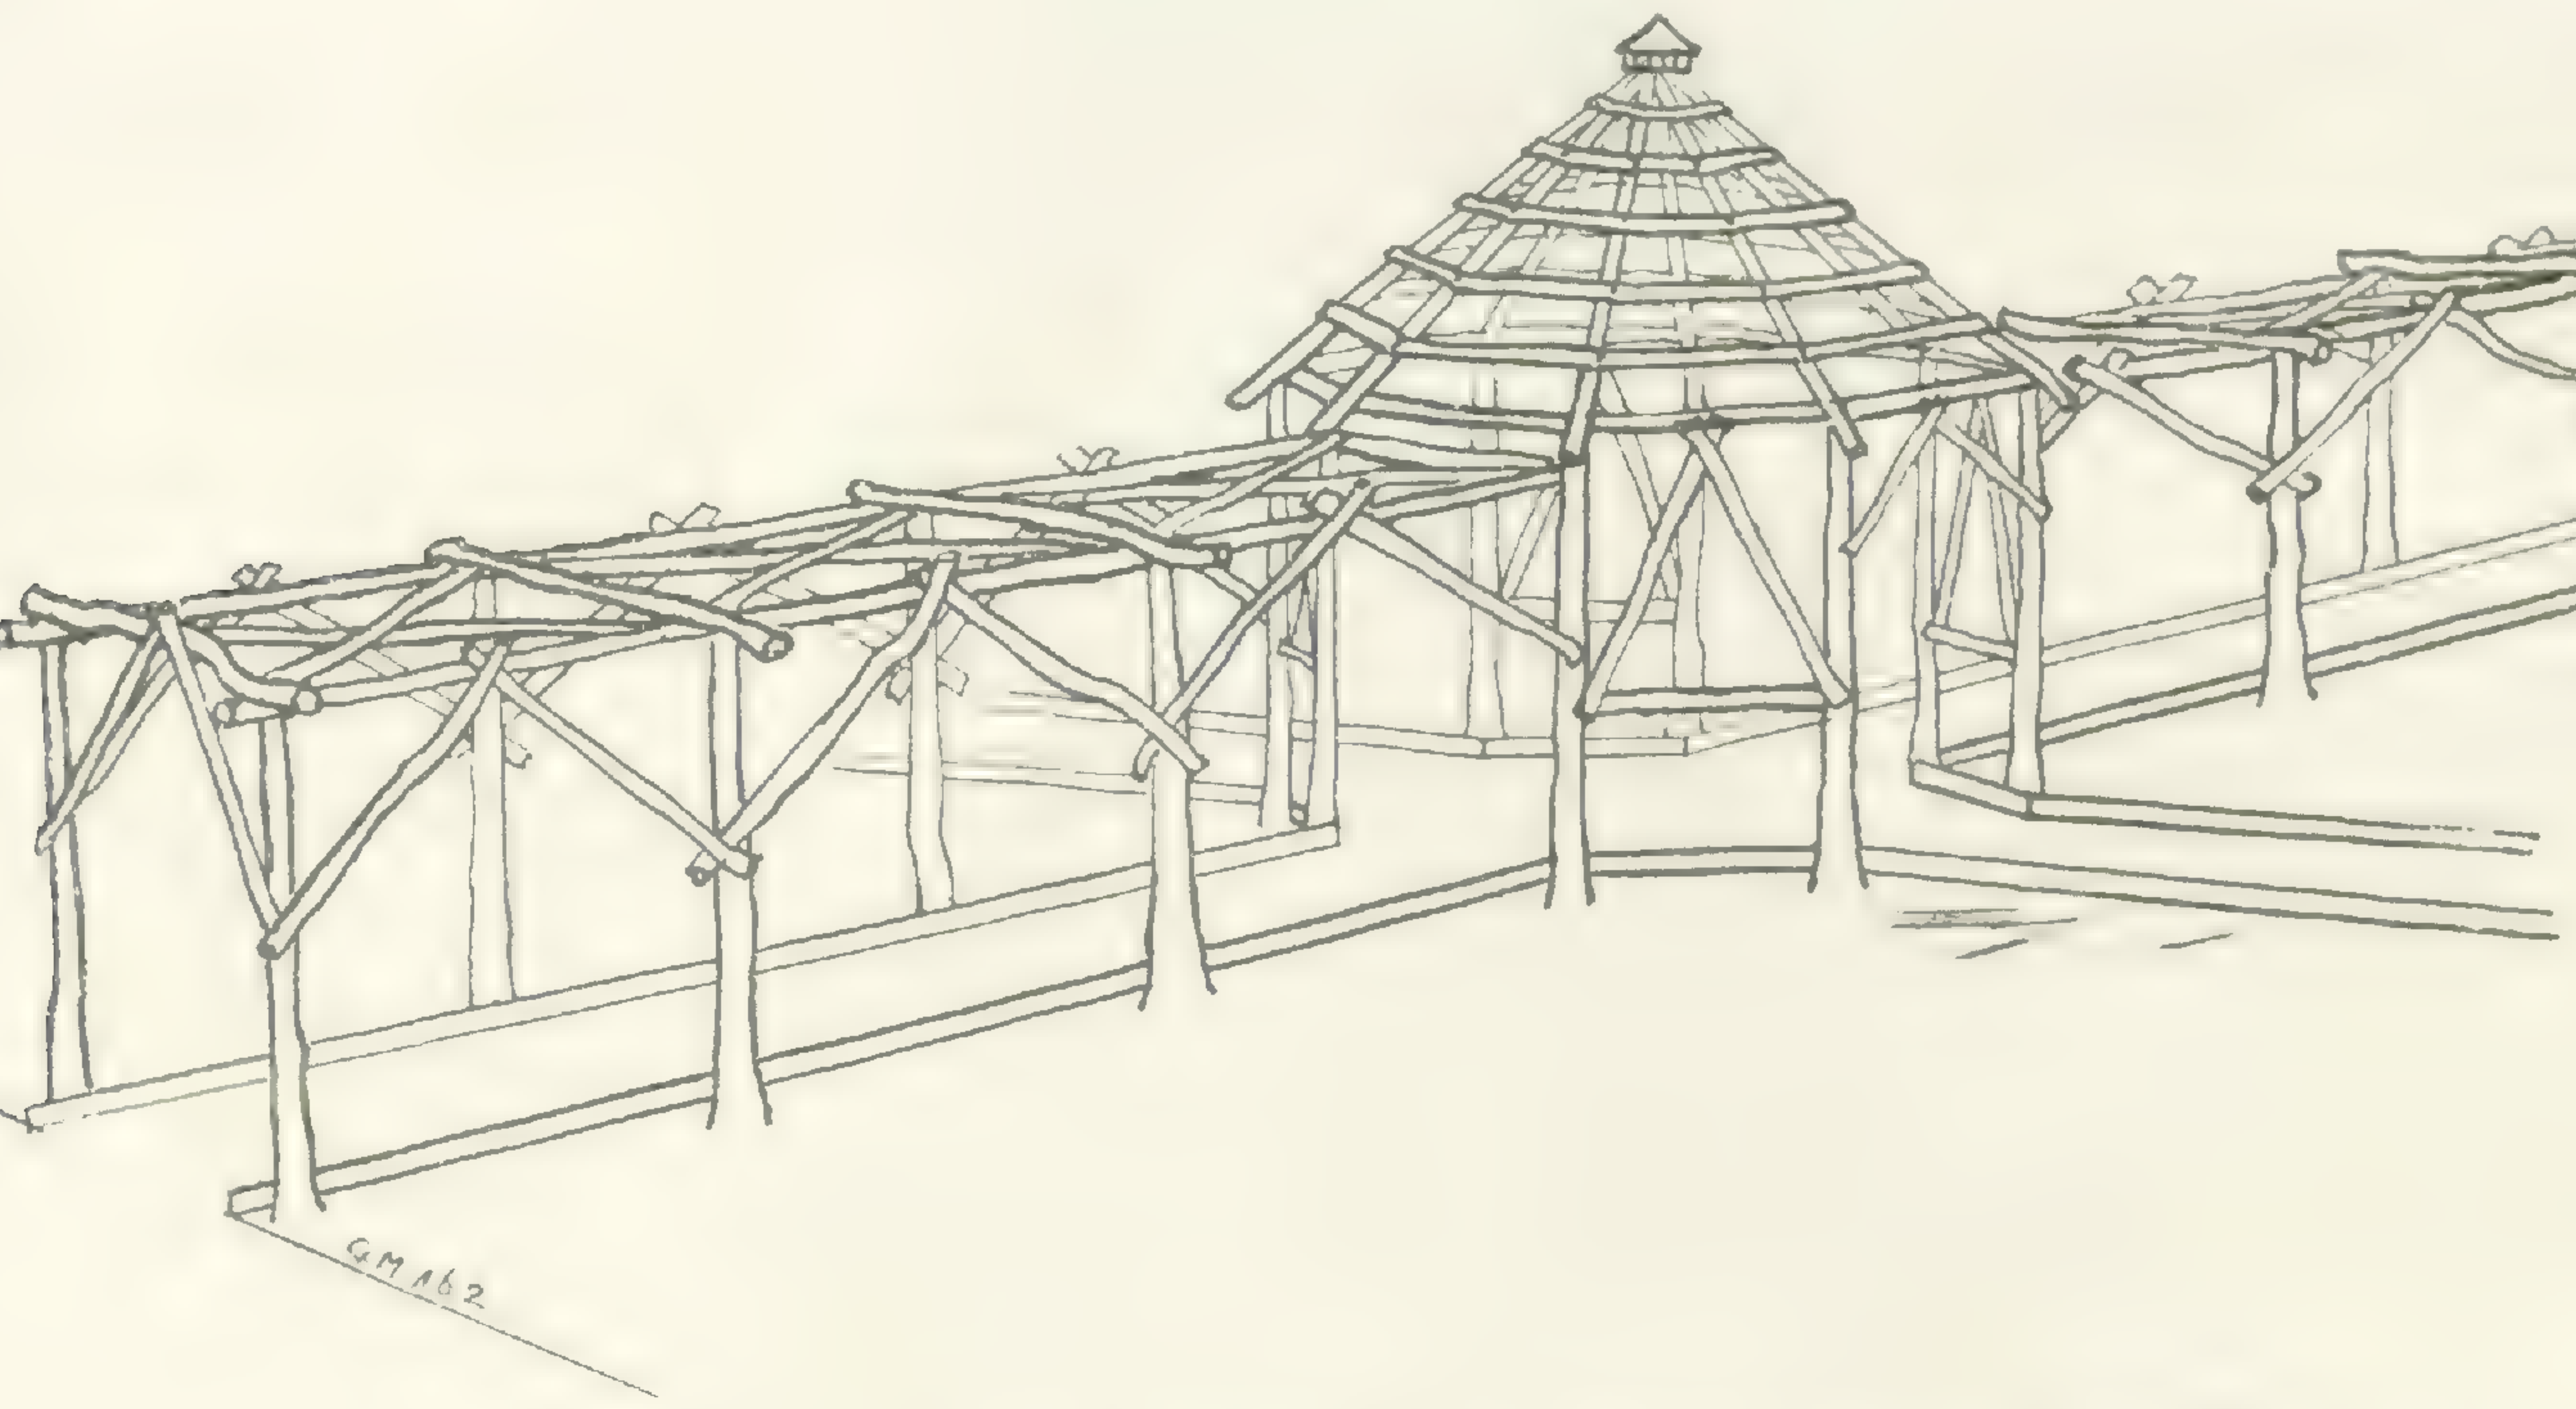
R. polyantha simplex flowers much the same as our common white-blossomed blackberry, but is very early and a mass of flowers for a long time. Mrs. O. G. Orpen, a newer variety, makes a good bush or pillar rose; this is bright rosy-pink, large, and flowers in trusses of from six to twenty blooms. R. himalaica is so erratic in flowering that I cannot recommend it. When one does get its snowy-white blossoms, with their yellow anthers, it is good. It has grown over 40ft. long in Kew Gardens, and would be a grand sight if one could procure blossoms the whole length of its shoots; but it is rather tender.

The Penzance sweet briars give quite a distinct group among roses, almost all are single, and all are covered with hips in the summer and autumn. All of them have the fragrance of the sweet briar foliage, and Lady Penzance more so than the original. I also like this one best of the lot. It is a beautiful soft tint of copper, with bright yellow at the base. Anne of Geierstein and Lucy Bertram (the last almost a perpetual bloomer) are the best deep crimsons. Amy Robsart, deep rose; Edith Bellenden, pale pink; Flora McIvor, pale rose; Catherine Seyton, rosy-pink; Julie Mannering, pearly pink; and Green Mantle, rich pink with a white centre, are among the best. The last three are perpetual flowering. These briars are wonderfully strong in growth, need little pruning, and form an impenetrable hedge quicker than any other rose.

Dawn is a very hardy rose, and so seldom semi-double that I must include it; rosy-pink, shot with silvery-rose; very large, borne in huge clusters, and it will grow in any position. Carmine Pillar is one of our very earliest to bloom; bright rosy-carmine, large and very free. Gottfried Keller is also slightly semi-double; deep apricot, golden yellow centre, darker on the outside of petals; very free flowering and perpetual; quite one of the best.

We cannot leave these single roses without noting a few of the Wichuraianas, a class that has come so much into evidence of late. Two of the very best are the oldest. The type has pure white flowers, borne in large trusses, and is in bloom throughout the season, and one of the prettiest features in our garden. Especially is this the case where growing upon tall standards, the drooping form is so graceful, and the foliage so clean and shiny. Rubra is not quite so free in any respect, but is red, tinted with orange-red, and white at the base of petals. Jersey Beauty, a clear pale lemon-yellow, is very large and showy; quite one of the best. Evangeline is a large single white, tipped with rosy-pink, very sweet-scented, perfectly distinct, very vigorous and grand upon arches or tall standards. Hiawatha is now so well known that I only include it to make my list more complete. There has been almost as much call for this rose as was the case for Crimson Rambler in 1893-4, and no praise is too high for it. For a single roses of its colour it has no faults; deep crimson, shading to almost white in the centre; immense trusses, lasting longer than most, and it is almost evergreen.

D. R.



SKETCH OF THE PERGOLA AT THE COTTAGE, BRENTWOOD.
Showing design and method of construction.

A SIMPLE PERGOLA.

When I entered into possession of my garden I had to deal with a rectangular piece of vacant ground about 30 yards in length by 20 yards in width. A good hedge of Myrobella plum bounds it on the north side, and grass paths form the other boundaries. The grass walks, although in bad condition, were too valuable to be disturbed, and I divided the ground into four equal parts by gravel paths. At the junction of the paths, as shown in the outline sketch, eight substantial larch poles were placed, one at each of the corners of the intersecting paths, and a light openwork roof of smaller poles erected, capped by a simple finial.

The pergola poles are of oak and birch, but I would recommend the former if easily procured. Stripped of their bark and dressed with carbolinium oak posts are long lasting. Smaller rods form the interlacing roof of the pergola and the sides. My gardener placed the uprights in position, and a rough sketch and a little personal supervision, sufficed to direct a very capable handyman who undertook the erection of the superstructure. There is nothing original in the pergola, and the rose bower is an adaptation of a garden ornament of which I think I saw an engraving in a Japanese book many years ago. The height of the poles in the pergola is 7ft. 6in., and they are set 6ft. 6in. apart; the poles of the bower are about a foot higher, and the cap of the openwork roof is 12ft. 6in. from the ground.

The upright poles in the bower are about 3in., the pergola poles rather less than 3in., and the cross rods from 1¾in. to 2in. in diameter.

It has been necessary to make several changes in the planting, for, though I was guided by the advice of a horticultural expert, the result was—well, not altogether a success. The bower is now well covered with roses, Carmine Pillar, Trier, Bennett's Seedling, Leuchtstern, Dorothy Perkins, Madame Berard, Aglaia, and Philadelphia Rambler; Aglaia this year has made too much wood and not enough blossom to be satisfactory. Hiawatha, Blush Rambler, Queen Alexandra, Lady Gay, Mrs. F. W. Flight, Clematis montana, Dutch honeysuckle, wistaria—these are in every way pleasing, but I have substituted rambling roses for clematis, vines, and blackberries.

If I were to make another pergola this autumn I should plant only rambling roses. What a glorious sight a pergola of Dorothy Perkins would be! One only needs sufficient pluck to refuse to listen to the voices of other charmers, charm they never so wisely!

And now as to the cost of this pergola and rose bower. The wood cost me about £6, and to my friend the handyman I paid £4 7s. 6d. To this must be added the value of my gardener's work, which may be fairly stated at £2. Thus the total is less than £13.

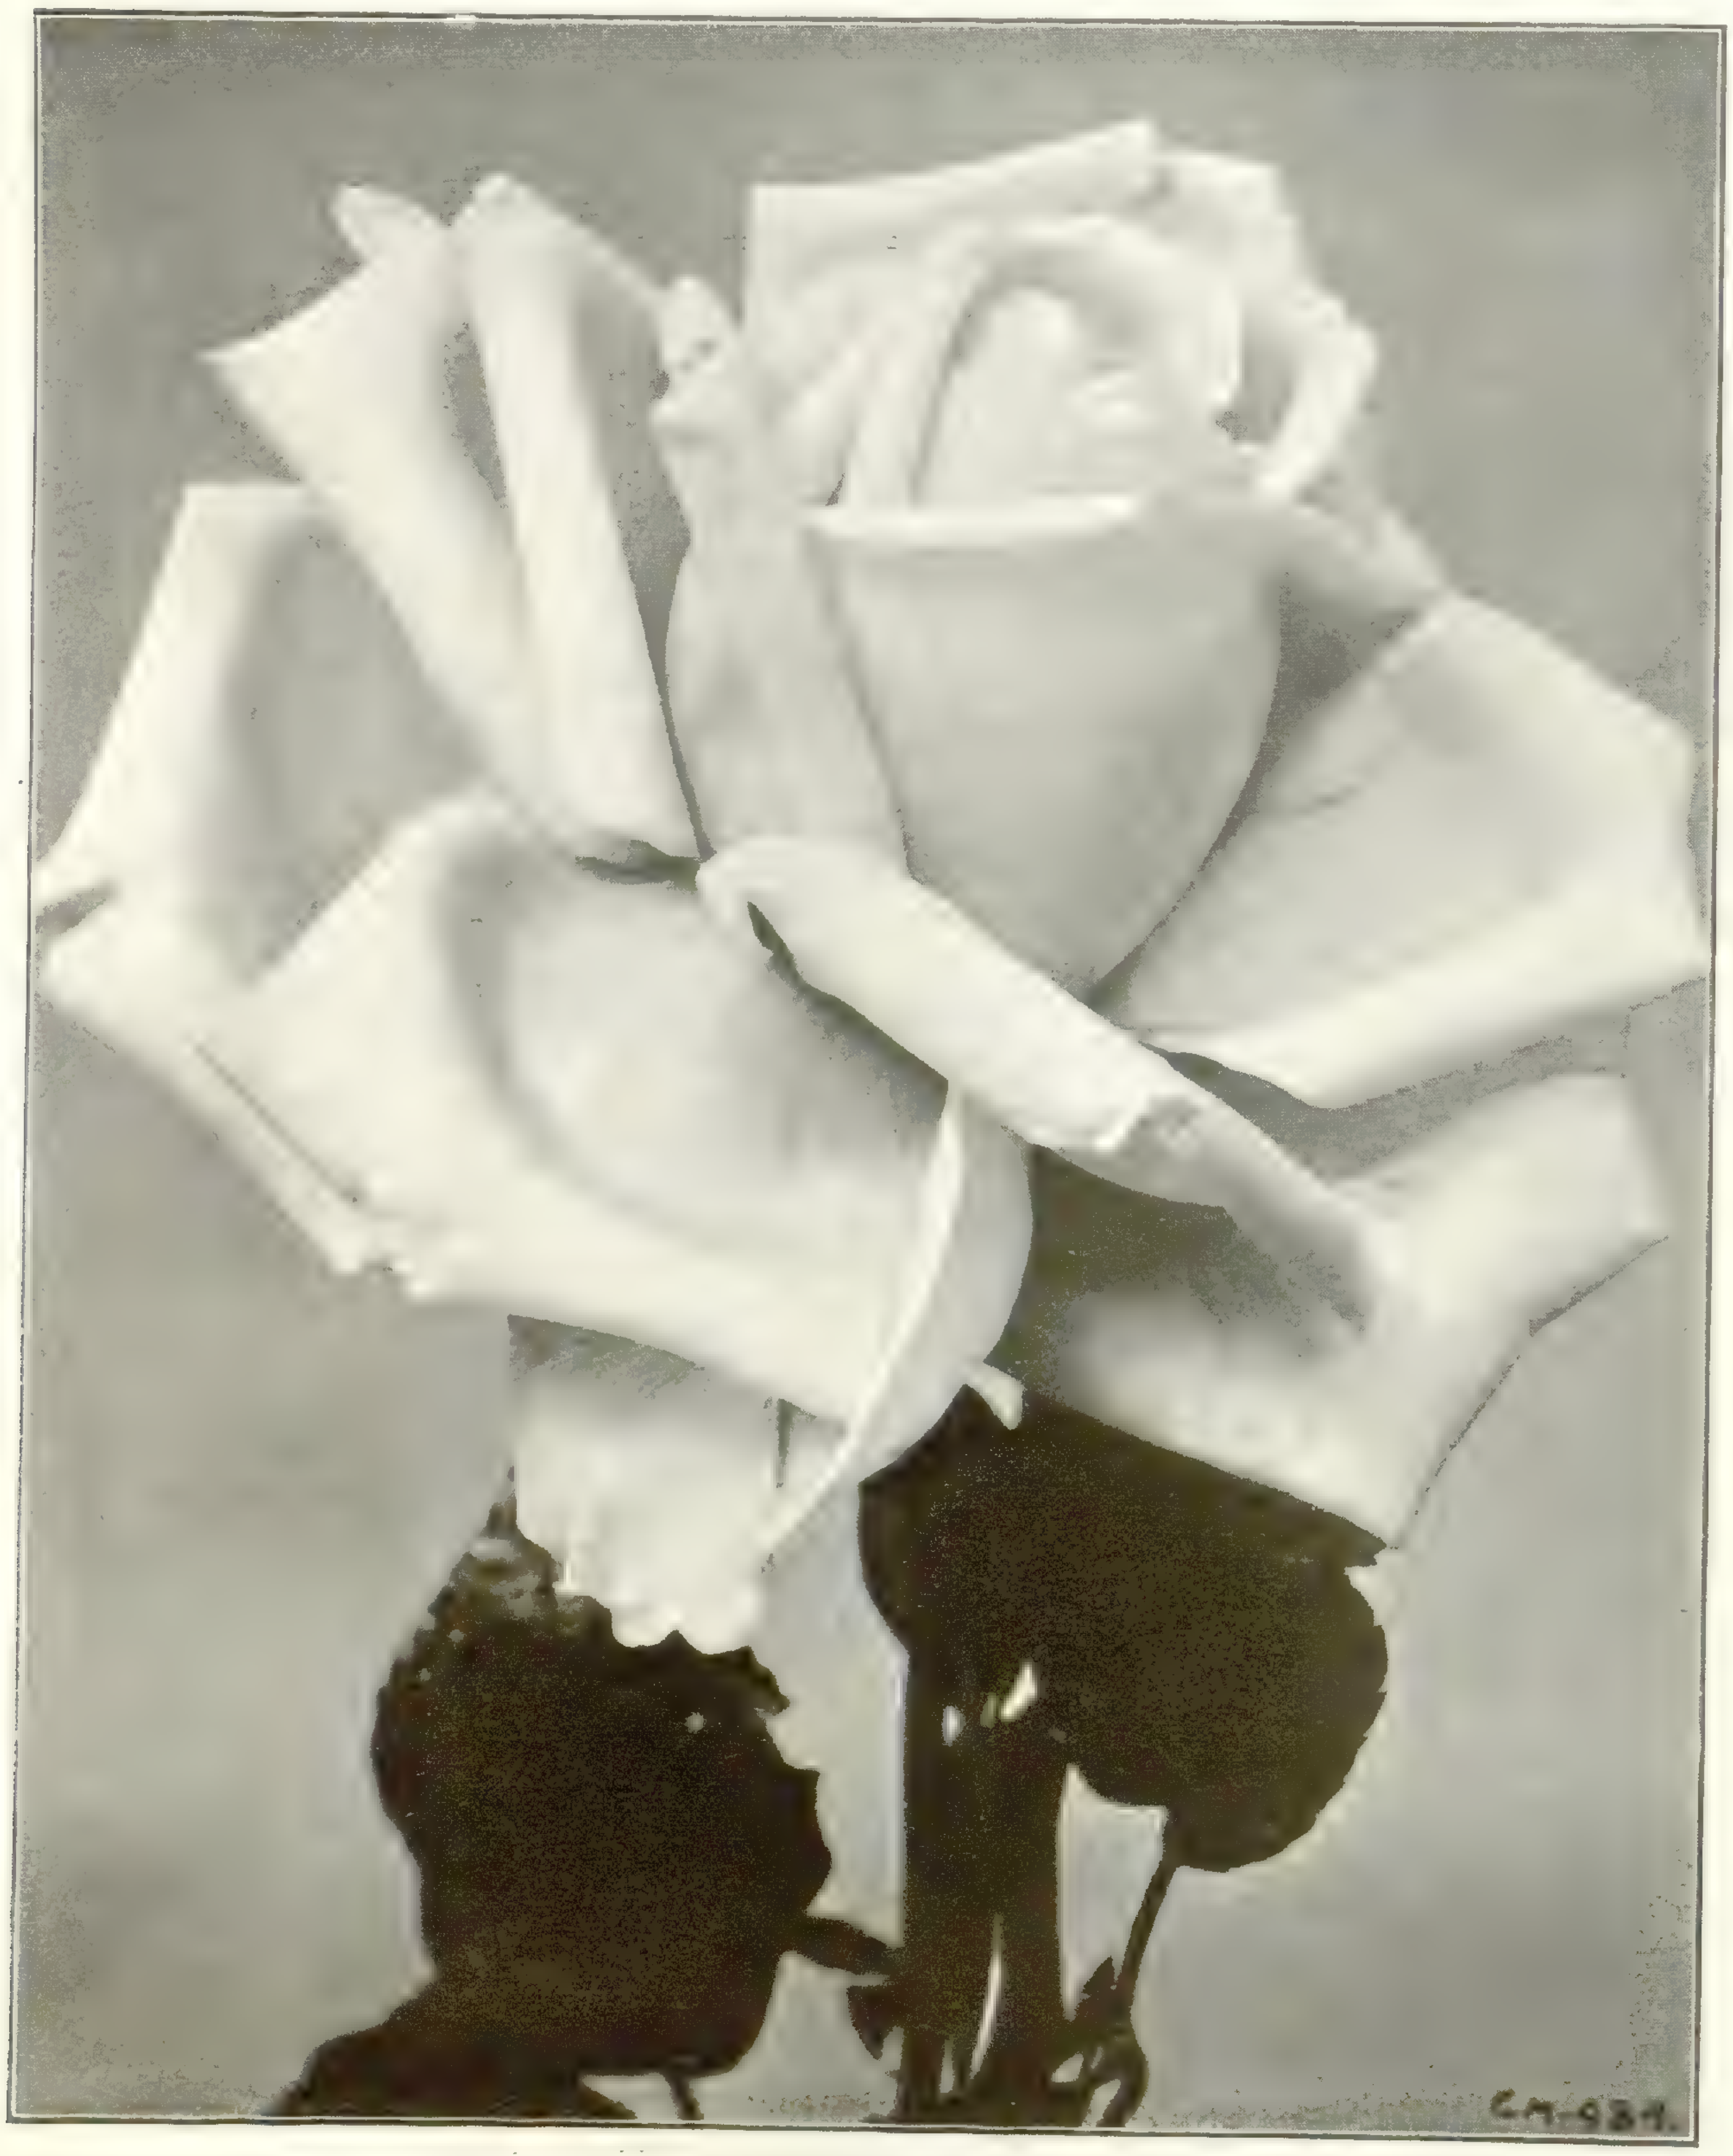
J. C.

Brentwood.

Flower Imports in August were about two-thirds the value of the flowers imported in the corresponding month of the two previous years. The total value was £1,081, and in August, 1907 and 1906 the value was £1,539 and £1,646 respectively. For the eight months of the current year ended August last, the value of imported flowers was £182,168.

NEW ROSES.

It is not the intention of the writer to enter at length into a discussion of the new roses and their respective merits at present, because this subject will be dealt with fully by that most competent judge and grower, the Rev. J. H. Pemberton, in succeeding issues. It may be well, however, to remind readers of a few of the more striking varieties that have appeared this season, many of which have been figured in these columns. Messrs. A. Dickson and Sons, Newtownards, co. Down, Ireland, have been especially successful this season, and growers will not soon forget their grand stand at the Holland House Show. They have received the National Rose Society's gold medal for the bright cream-coloured Nita Weldon; for the beautiful yellow tea-scented Alexander Hill Gray, figured herewith; G. C. Waud, a crimson H.T.; and Dr. O'Donell Brown, a rosy magenta variety. They have gained cards of commendation for several new varieties, and Awards of Merit from the Royal Horticultural Society for Florence Edith Coulthwaite (H.T.), George C. Waud (H.T.), Mrs. David Jardine (H.T.), and Molly Sharman Crawford—surely a good record judged only by the awards gained.



NEW TEA-SCENTED ROSE ALEXANDER HILL GRAY.
Exhibited by Messrs. Alex. Dickson and Sons, Newtownards, at the N.R.S. Show of September 17, and awarded a Gold Medal. Colour, clear soft yellow.

Mr. Hugh Dickson, Belfast, was awarded a gold medal at Manchester for Simplicity, a fine single white variety, and Dr. Campbell Hall gained a similar award for the cream and pink Mrs. J. Campbell Hall, a charming tea rose. Messrs. McGredy and Son, Portadown, Ireland, are helping to maintain the Irish standard. At Regent's Park they gained a card of commendation for the rose-red Earl of Gosford, and at the autumn show last week they gained a gold medal each for His Majesty and Lady Alice Stanley, the former red and crimson and the latter pink and silvery-pink, both handsome broad-petalled roses. Messrs. Paul and Son, Cheshunt, are taking up garden roses seriously and endeavouring to secure new and distinct classes of roses. Their Shower of Gold is very pretty, and their new Iceberg, a white, dwarf Wichuraiana rose, should prove very useful. Messrs. B. R. Cant and Sons, Colchester, have scored with the White Dorothy Perkins, a lovely white counterpart of the popular pink variety, which gained for them a gold medal at Manchester.

Messrs. William Paul and Son, Waltham Cross, have scored a signal success with Refulgence, a gorgeous hybrid sweet briar, with very large single flowers of a vivid scarlet or crimson-scarlet hue. As a garden rose this promises to be a great favourite. This, as well as Elaine, have gained the A.M. of the Royal Horticultural Society. The latter, so well shown at the Temple Show, is a pale cream yellow H.T., flushed and tipped with pink. Christian Curle, a pale cream-pink sport from Dorothy Perkins, was well shown recently at Edinburgh by Messrs. James Cocker and Son, of Aberdeen, and it gained a card of commendation at the Royal Horticultural Hall last week.

These make up a dozen and a-half of new varieties, but there are many more, all proving that enthusiasm for roses shows no decline.

K.

ARCHES OF ROSES.

The introduction of new and improved varieties annually adds considerable interest to the cultivation of the free-flowering types of roses, and encourages the increase of planting on all available sites.

No better site can be imagined for these climbing, free-flowering sorts than over arches, as the latter can be arranged in so many parts of the garden without interfering with the general surroundings. I need hardly say that there should be some aim in arranging arches in a garden. They should be over or alongside paths, whether of grass or gravel. The charming Dorothy Perkins is quite one of the best of roses for arches. This variety possesses freedom of growth, a semi-drooping habit, good foliage, great freedom in flowering, the blossoms lasting a long time, and, what is of great importance, it is later than the bulk of climbing varieties in opening its blossoms, thus prolonging the display until the end of August.

The other illustration represents that old favourite Crimson Rambler, which has done more than any other variety to encourage the increase of what are now known as free-flowering garden roses. Even now, with almost a plethora of sorts, there is not one to compete with this old favourite in freedom and brilliancy of colour. I note with regret that plants established for some time are prone to attacks of mildew, which not only disfigure them, but prevent the blossoms developing, and thus these plants are a failure for the season. I know of several instances this year where mildew has so disfigured the plants that they are to be replaced with other varieties this autumn. Any defects in culture that can be remedied should be kept in mind; I think this weakness in the plant is due to loss of chlorophyll consequent on a reduction of proper food at the roots. It is useless to attempt to check mildew when it has attacked the flower stems and buds. The endeavour should be to supply plenty of rich food in the autumn, solid or liquid, and syringe the plants quite early with one of the many mildew antidotes.

Arch Construction.

When constructing the arches a variety of materials can be employed; larch poles, which are probably the most convenient, have a distinctly rustic appearance in the garden until the plants have thoroughly covered them. The bark should be left on the poles, with the exception of that portion which enters the ground, and this should be creosoted to preserve the wood. Next to larch, peeled oak is the most desirable wood to employ, especially for the cross pieces, as this, when well selected, has a fine appearance, while its lasting qualities are undoubted.

Where wood is not easily obtained iron can be employed, or even galvanised wire will suffice. Some object to the latter on the score of injury to the tender bark of the roses, but this is much more fancied than real, because a coat of paint will obviate all fear of injury. Iron arches should be painted. In what form the arches are to be constructed depends upon the position, and the taste of the owner. Some prefer them flat on the top, others prefer that the centre of the arch should be pointed; indeed, there is no limit to constructive design. In the long run it matters little, because any architectural feature of the arch will be hidden as the plants grow and

[Photo: H. N. King.

FINE ARCHES OF CRIMSON RAMBLER ROSE AT HILLINGDON COURT, UXBRIDGE, THE RESIDENCE OF LORD HILLINGDON.

it. Some build what I term a single en, that is, they employ one upright on ach side of the path. I prefer two up- ghts at a distance of 2ft. apart, employng cross pieces between. In this way a much bolder effect is obtained, because two r more plants can be employed on each e of the arch, thus producing a double effect and making a distinct feature in the garden.

The preparation of the site is very im- tant, because on this so much of suc- depends for the next twenty years. d hardly say deep trenching of the is important, not only in providing a rooting medium, but also in obtainmoisture during the summer. If the light, sandy, or chalky, remove a tion of it, and add a heavier material, for example; this, with some of the portion, provides an ideal rose soil. in quantity is essential. If that from the farmyard is unobtainable add bone-meal and basic slag.

Planting and Pruning.

Early planting is very important, and the end of October is a good time, as the plants put in the warm soil make roots freely, becoming well established by the following March.

Pruning is important; too many persons like to obtain a crop of flowers the first year, and do not think of the future. They simply take the point out of the shoots, which in some sorts will be 8ft. in length. The result of such treatment is that the plants break freely from 2ft. or so upwards, but lower down the stems remain bare, and in the future it is difficult to induce shoots to spring from the base sufficiently freely to fully furnish the arch. It is better to wait a season for flowers, and prune the plants down to within 12in. or 18in. of the base, thus securing more vigour in the growth the first year and providing for a full crop of flowers the following season, and well-furnished plants.

Summer treatment is simple: the provision of abundance of moisture at the roots during dry weather, and copious syringing overhead in the evening after a hot day. The usual remedies for the destruction of greenfly, rose maggots, and the prevention of mildew, should be early attended to.

When the arches are upon grass it is a mistake to allow the grass to grow close up to the base of the roses; leave at least one foot clear all round, watering and feeding the plants is so much easier then. Some object to the bare soil, but this may be covered with some low-growing plant or rockery stone.

What is termed winter pruning is too often carried out at the wrong time; March is too often selected. The proper time is August, or, at the latest, in September; in fact, immediately the flowering season for each variety is past is the best time to prune, cutting away all surplus shoots, admitting light and air to those remaining, and thus ripening them up. Roses well matured in early autumn pass through the winter better than those with soft sappy stems.

Varieties.

As to variety, there is abundant material to choose from. I will give a short list of really desirable varieties; too often hybrid teas are recommended, but these, in my opinion, are distinctly unsuited for the purpose, as they fail to grow sufficiently well to cover the space required. Freedom of growth, coupled with abundance of flowers, should be the aim. Only one variety should be employed for each arch: Crimson Rambler, crimson; Dorothy Perkins, shell-pink; Lady Gay, rosy-pink; Félicité Perpétue, white; Claire Jacquier, yellow, flushed orange; Mrs. F. W. Flight, rich rose-pink; Rubin, deep rich crimson; Tausendschon, pink; Brunonis, white, single; Psyche, white, suffused salmon-rose; Abel Carriere, white, flushed pink, early; Waltham Rambler, delicate pink, single; and Paul Transon, rose, tea-scented.

Swanmore Park.

Potatoes in 1908.—The potato crop in Great Britain for the current year has an area of 256,101 acres, or an increase of 13,185 acres as compared with last year.

ROSES FOR THE ROCK GARDEN AND ROOTERY.

The advent of the numerous forms of rambling roses has been the means of adding many pleasing features to the garden, and by their judicious use it is possible to clothe unsightly objects with a mantle of foliage and flowers.

The ways in which these roses may be used are many, for they are equally at home against walls or on pergolas, rambling over the sides and roof of a summerhouse, or clothing unsightly banks. They are also admissible in the vicinity of the rock garden, and may be effectively placed in elevated positions where the branches can hang negligently and naturally over rough stones or boulders. At Kew an attractive feature is formed by planting these rambling roses in a sunk garden. The position was at one period excavated to obtain gravel for the garden paths, and some twelve or thirteen years ago the sides were irregularly terraced, the terraces being faced with large tree butts. When completed the garden represented numerous bays and terraces of irregular width, and each terrace or bay was planted with a single variety of rose. In this way large masses of distinct colours were obtained, as well as a large collection of sorts.

The plants are encouraged to grow in as natural a manner as possible, and in some places great garlands of flowers may be seen hanging loosely over the old tree roots, whilst in other cases the branches have ascended evergreen trees in the vicinity, and the flowers are set off by dark foliage. In the flowering season such a garden is most attractive, the effect being greatly in advance of a garden made on level ground.

THE BEAUTIFUL ROSE PSYCHE CLAMBERING OVER OLD ROOT STUMPS AT KEW.

The set of varieties known collectively as Wichuraiana roses may be used on banks in a way that would hardly do for the multiflora set. As the majority are prostrate growers they are useful for pegging down, and being evergreen they form an excellent covering for banks. During the flowering season they are very pretty grown in this manner, as the flowers rarely rise more than four or five inches above the soil. To keep a bank neat it is necessary to attend to the plants once a year, as soon as the flowers are over, and remove all the old shoots, leaving only those of the present season. If this cutting out is neglected it is impossible to keep the plants within bounds, and a uniform bank of flowers is out of the question.

The multiflora varieties are also assisted by being cut over annually as soon as the flowers fade. As much as possible of the old wood should be removed so that there is plenty of room for strong, young shoots to grow and ripen. Some varieties after thinning, require a little staking, but this must be done judiciously. If left unstaked they are frequently weighed down with flowers so that their true beauty is not seen. In such a case stakes should be inserted to reach about halfway up the branches. If put in correctly these stakes will support the branches without giving any appearance of stiffness.

Wichuariana roses of the Dorothy Perkins type are improved when grown in masses by having rough oak branches from eight to fifteen feet in height placed among them. Their branches will form a tangle over the support, and an undulated group will be the result. By growing them in this manner the full value of the flowers is obtained, whilst if grown in a dense mass many of them are hidden.

When preparing a site for these roses care should be taken to provide rich soil at the outset, for, to obtain the best results, it is absolutely necessary that there should be plenty of rich food material. It is also a good plan to give a mulch of rotten manure each spring, while one or two applications of liquid manure during the growing period is attended with good results.

Possibly the two worst enemies these roses have are greenfly and mildew. The former may be held in check by spraying now and then with a mixture of soft soap and tobacco extract, while a good way to prevent mildew is to spray the plants two or three times during early spring with Bordeaux mixture. This usually has the result of keeping the plants fairly clean until after the flowers are over, when the same remedy may be applied should a recurrence of the disease take place.

Good roses to plant on banks or in semi-wild rose gardens, are as follows: Wichuraiana roses — Alberic Barbier, Elisa Roubichon, Auguste Barbier, Paul Transon, Dorothy Perkins, Lady Gay, Pink Roamer, and Hiawatha. The last-named has been in commerce but a few years, but it bids fair to rival in merit many of the older varieties. The flowers are of a rich shade of red, and though single last in good condition for a considerable period.

Of other rambling roses the following are first rate sorts: Helene, white flushed with pink; the well-known Crimson Rambler; Philadelphia Rambler, deep red; Una, cream; Electra, cream; Psyche, light pink, an illustration of a large mass growing in the Kew Rose Garden accompanies these notes; Tea Rambler, pink; Flora, blush; Rosa multiflora, single white, and R. moschata, a strong-growing species with white flowers. The single pink variety Kathleen is an extremely pretty and free variety, and its flowers last in good condition for several weeks.

Another set of roses suitable for banks are the R. spinosissima or Scotch roses. They sucker abundantly, and form dense masses which bloom freely. Single and double forms may be obtained with white, yellow, red, or purplish flowers, and many of them produce good crops of round, black fruits after the flowers are over. The variety altaica is a strong grower with single white flowers two inches across. It looks well when part of the branches are pegged down and the remainder left erect. The Japanese Rosa rugosa is excellent for exposed situations, and for places where the soil is poor, for it usually grows and flowers well, whilst the rich red fruits in autumn are very attractive. In addition to the type there are many varieties and hybrids with single and double red and white flowers. They are specially useful for planting in cold places when other roses prove tender. W. Dallimore.

Kew.

PLANTING ROSES.

The approach of autumn is a reminder that the season of rose planting is near at hand. It is not always possible to prepare the ground for planting roses very long beforehand, unless one is forming new beds or a new garden, when early preparation is a comparatively easy matter, and the planter can take advantage of dry weather for turning the ground.

ROSES AT THE AUTUMN ROSE SHOW.
Messrs. Paul and Son's First Prize group of Roses at the N.R.S. Exhibition on September 17.

The kind of soil we have to deal with is not always what we would like to grow roses in; usually the natural soil of the garden has to be studied and made the best of. There are few soils in which roses will not grow with a greater or lesser degree of success, and, although any kind of land will not grow exhibition blooms, most land can be considerably improved by the admixture of suitable materials. The ideal soil for roses is a sandy or moderately heavy loam; I draw the line at clay, and yet the tenacity with which some people cling to the idea that clay is essential for growing roses is worthy of the clay itself. There is a "Clay" which is very beneficial to roses, but it is sold in bags in the form of a fine powder!

I do not say that in some soils the addition of clay is not beneficial; indeed, I believe it would be if thoroughly incorporated with soil of a very sandy or porous character, and one that requires some holding substance to consolidate it. But after some considerable acquaintance with various soils for growing roses, the one I prefer is a moderate loam.

The ground intended for planting should be trenched two feet deep, if possible, but if naturally well drained, eighteen inches might suffice. In the trenching process, should the bottom soil be inferior to the top, then leave it in the bottom of the trench, or, better still, if possible, remove it and put fresh soil in its place. As the trenching proceeds, so also should the manure be worked in, as it can be more thoroughly mixed with the soil before planting than after. While the ground is being turned is also the time to add any heavier soil if the land requires it.

The question of a suitable manure has also to be considered. There is probably no better manure for roses than pig manure; it certainly makes a lasting impression. In naturally warm and light soils, cow manure would be beneficial as being cool in nature and lasting, while in heavy land good horse-droppings and stable manure should be used. In dealing with light land the manure should be kept near the surface, as it is not then so easily washed away from the roots. Artificial or compounded manures are best left alone until the plants are in active growth; they play an important part in the development of good blooms, but have not the mechanical action on the soil which organic manures have. Bone-meal is used by some, but this I prefer to use when the plants commence to grow.

Planting should only be done when the ground is sufficiently dry to prevent any clogging of the land when treading; it is better to defer planting than do it when the land is sticky. Planting any kind of tree or bush should never be done slovenly or carelessly, as the labour is well spent where the work is well done. Planting is something more than digging a hole, stuffing in the roots, and covering them with soil. Have the holes made large enough, and then spread the roots carefully out before covering with soil. It is not unusual to meet the man who knows how to plant, or fancies he does, but whose idea of planting is sticking the plant in, filling up the hole with soil, just a tread, and hey, presto! the work is complete from his point of view. Assuming the hole is ready, the plant should be carefully held in position, roots spread out, and some of the finest soil put over the roots; then carefully tread down firmly, add more soil, and make firm until the hole is filled up.

In the planting of dwarf roses, ramblers, and those budded near the ground, the union should be covered to the depth of an inch; with standards, plant the same depth as they were in the nursery. All standard and rambler roses should be securely fastened after planting.

When the roses have been planted, the surface of the soil should be lightly forked over, making good any inequalities of the surface; this stirring of the soil will aerate the land, and allow heavy rains to pass through into the subsoil, and prevent the land becoming water-logged. In cold districts where severe frosts may be expected, cover the surface of the beds with good bracken, or some similar light material in early winter; this will keep out most of the frost, and will not keep the land too wet. The practice of covering the ground with a thick coating of heavy manure is not always to be commended. It may be of some benefit on the surface of light land. The plants, being dormant cannot assimilate manure. It will be more beneficial to give such dressings lightly forked into the soil after the spring pruning, when growth is commencing.

Poltimore Gardens. T. H. Slade.

Fruit Culture in Great Britain.—According to the preliminary statement relating to the acreage of the various crops in Great Britain that has been issued by the Board of Agriculture, the area now under orchards amounts to 250,288 acres. This is an increase of 112 acres as compared with 1907. The area under small fruits is 84,873 acres against 82,175 acres last year.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

SEASONABLE NOTES.—The deciduous dendrobiums will in many cases have completed their growth, and every care will be necessary to prevent the early matured kinds from commencing secondary growth. There are some, such as D. Wardianum, that naturally break into new growth, often before the previous one has reached maturity. This species starts into secondary growth in its native habitat and often advances some distance before the plants actually enter upon their resting season; but, with the return of favourable conditions, these growths re-start with renewed activity, and little or no ill effects are apparent. I do not consider it desirable for the bulk of this section to commence secondary growths thus late in the season, for it will generally be found that such growths are of a stunted nature, and they rarely reach full size even under the most favourable conditions. It is no easy matter, I know, to prevent secondary growths, especially where orchids have to be treated with other plants. The recently matured growths are naturally soft, because of the necessary shading used, and these I find are the most difficult to prevent from growing at the base. Keep the plants as dry as possible, but do not allow the pseudo-bulbs to become shrivelled. It is not desirable to remove such plants to a lower temperature, but it is advisable to afford them every advantage to be obtained from the available light at the present time, and as soon as the growth has become sufficiently ripened, the plants may be removed to cooler and drier conditions, where they may have suitable treatment.

PERMANENT SHADING.—Where permanent shading has been used beneath the roof blinds during the hottest month of the year, such shading should now be removed. The light during the few weeks that remain before the winter season sets in should be taken advantage of for the benefit of the plants in all divisions. There will be very little shading required now in the warm divisions, excepting during the hottest parts of the day. In the cool division also, excepting where repotting has been recently done, the blinds should only be brought into use when there is danger of the foliage becoming scorched. We hear a great deal of complaints about the durability of odontoglossum flowers. We am quite satisfied that the want of texture and substance in the flowers is caused chiefly by improperly-matured pseudo-bulbs. It should be distinctly borne in mind that we are now producing larger pseudo-bulbs by the use of semi-decayed leaves, etc.; and the moisture-retaining compost allows the plants to stand a great deal more light without injury than was the case when a smaller bulk of potting compost was used. The more light we can give the plants, reasonably, the more satisfactory are the results we find among the flowers. The plants that are likely to be in flower during the winter are those that should have chief attention, for, unless they become ripened, there is very little possibility of their maturing when the outside conditions are the least favourable for the purpose.—H. J. CHAPMAN, Oakwood Gardens.

STOVE PLANTS.

EUPHORBIA JACQUINIÆFLORA.—Plants of this serviceable winter-flowering subject ought now to be exposed to as much light as possible, and each growth looped up to the central stake. Careful attention must be given to watering during the autumn and winter. An occasional watering of clear soot water and light top-dressing of some approved chemical fertiliser will be found most beneficial. As previously recommended in this calendar, the plants are best grown as near the glass as possible, this ensuring dark, healthy green foliage, and somewhat counteracting the straggling habit of the plants. Specimen plants that have been formed by bending down the points of the growth during summer must now be given a little freedom, so that the extremities may be induced to throw out their flowering sprays in a graceful form, which is so desirable with the specimen plants. Brown scale appears to infest all euphorbias, hence it is advisable to have the plants thoroughly cleansed previous to flowering. Should the first batch of flower spikes be cut for decorative purposes a second crop of blooms will be provided for the New Year if the plants are subjected to warm conditions.

CREEPERS.—As the wood of climbing plants becomes thoroughly ripened, it is advisable to shorten back the growths, and where possible, remove them to a cooler and drier position. This will give the occupants of the stove more light, which at this season is most essential. Climbers that are permanently planted in borders may be thoroughly examined with a view to renovating the borders as time permits. The borders may be kept somewhat drier as the season advances.

CROTONS AND DRACÆNAS.—Specimens which become unsightly through losing their foliage at the base, and were notched and mossed up some time ago, are now ready for the removal of their tops. The smaller tops, if well rooted, are best cut off, potted up, and placed in the cucumber house, where they soon recover. Larger specimens are separated by the stem being partially cut through at intervals of a few days. Shade from the hot sunshine will be found necessary until the plants have started to grow again.—JOHN DONOGHUE, Bardon Hill Gardens.

FRUITS UNDER GLASS.

POTTING FRUIT TREES.—Peaches and nectarines should now be taken in hand; the material for potting should be the best loam that can be obtained, and if it is too stiff, some spent mushroom bed material may be added, with bone-meal and mortar or plaster rubble. The latter must not be coarse, as the amount of room given will not allow a very rough compost. Everything should be got in readiness for this work, pots thoroughly cleaned and crocked, with a good layer of turf over the crocks. If the potting has to be done outside, a dull, quiet day is preferable, so that the roots do not become dry, or the sun make the foliage flag. If any of the trees potted last season are still healthy, it is not necessary to pot them now, but the drainage must be clean, and if there are any doubts about it, they should be turned out, fresh drainage put in, and the tree placed back in the same pot, and in the same position as before. As a rule, the trees are best potted every season. If left too long the roots become matted together, and in reducing them to the required size more damage is done than when potting is of annual occurrence. Before potting, if any trees are dry when turned out, place them in a tub of water, as no amount of top watering will soak them after they are potted, and the buds will drop.

REDUCE THE BALL OF SOIL by the use of a knife and pointed stick, starting at the top and working downwards. Enough material should be removed to permit the operator to place the ball back in the same sized pot. Pot firmly, adding the compost in small quantities as the work proceeds, so that no cavities are left. Any that are deficient in roots and sickly may be reduced considerably, and, if necessary, washed out and repotted; these should be labelled, so that they are not forced the next season. After potting stand the plants in the shade for a few days, keeping them well syringed. If watered well as soon as potted they will not require more water for some time. Cherries, as a rule, do not require so much root room, and the compost for these should contain plenty of rubble and charcoal.

EARLY PEACHES AND NECTARINES.—Those planted out should, if required, be lifted or root pruned if growing strongly. The border should not be more than 2ft. 6in. deep, concreted at the bottom, and with drain-pipes to take away surplus water. Start well away from the tree and cut all strong roots with a knife, but before proceeding with this operation, have some good loam, with plenty of lime and mortar rubble ready. When placing the roots back keep them well up to the surface, and make the soil firm, well ramming it underneath the tree with a stout stick. If hot weather prevails a slight shading may be given and frequent syringings.

LATE PEACH HOUSES.—As soon as the fruits are gathered, cut out all useless and overcrowded wood, and let the growths hang loosely to ripen. If necessary the borders may have a good soaking of liquid manure, and the trees be syringed twice a day. Preparations should be made for planting any young trees, and the soil for these should be rather poor, as they generally grow fast for a few years, and they can always be mulched.—A. B. WADDS, Paddockhurst Gardens.

THE KITCHEN GARDEN.

FRENCH BEANS.—A good batch of these should now be sown, choosing 6in. pots for this sowing. Place them in a cool vinery or peach house until they are two or three inches high, then they can be accommodated on a shelf well up to the glass, so that they may have all the light possible. Osborne's Prolific and Canadian Wonder are fine old sorts.

STORING ROOTS.- Roots must now have attention. Beetroot will not stand much frost, so that it is the best plan to lift this crop, twist the leaves off, put the roots in a pit outside, cover them up with straw, and soil the pit over. They will keep in this way much better than when placed in a dry shed, for the roots soon become shrivelled if kept too dry. Carrots may be stored in a similar manner.

ONIONS. The spring-sown crop, and especially those sown in boxes and planted out, are quite ready for harvesting. If the weather is showery it is a good plan to place them in cool fruit houses or cold frames until they are dry, then they can be roped any time during wet weather. They keep much better this way than placed on stages, as more air can play about the bulbs.

ENDIVE.—This very useful salad plant should now have daily attention. Place inverted flower-pots over some of the best plants. For the next three months shooting parties will be numerous, and good salads are sure to be in request. Lift the plants that are for a later supply, and plant them in cold frames, when they will come in most useful during the early months of the year.

CUCUMBERS.—When cucumbers have to be provided during the winter months, a few seeds should now be sown of Telegraph or Lockie's Perfection, in a hotbed or propagating pit. Plants that are coming into bearing should be top-dressed with some rich material and have all surplus growths cut out. The fruits should be cut as soon as they are of a suitable size, so that the plants will not be over-exhausted. Cucumbers still growing in frames may be prolonged a little, if the frames are kept lined with fermenting material to maintain the necessary heat. Attend to thinning out the fruits, only retaining those that are likely to swell up. Give them plenty of weak liquid manure, and add rich top-dressings as required.—T. W. BIRKINSHAW, Hatley Park Gardens.

MATURITY OF PEACH WOOD

Those of us who have had much to do with the outdoor culture of the peach are aware of its uncertain character with regard to cropping. This can doubtless be rightly attributed to various causes, amongst which there is probably a no more common one than that of the wood not being properly matured. For this defect again various reasons might be given.

In the first place the effects of the weather from this point of view may be referred to, for much depends upon its condition during the growing season whether the wood is, or is not, satisfactorily matured. If the weather is sunny, warm, and otherwise favourable, the wood, other conditions being suitable, will be strong, well-ripened, and thickly studded with plump flower buds by the end of the season of growth. As the result one of the principal steps towards securing a satisfactory crop of fruit will have been gained. On the other hand, a continuation of dull, wet weather acts most detrimentally upon the growth, by promoting strong, sappy shoots, that fail to ripen well enough to produce blossoms sufficiently perfect to permit of fertilisation, and the consequence is, no matter what the state of the weather may be during the flowering season, they fail to produce fruit. There are, it is to be feared, many manifest examples of the effect of last year's wet and dull weather to be witnessed at the present time to prove the truth of this.

Another and not uncommon reason for the wood failing to properly mature, is the unsatisfactory state of the roots of the trees. This may be due to the border being composed of too rich ingredients, too deep, and cold, or wet through being imperfectly drained. When one or more of these conditions obtain soft and sappy wood is the result. The remedy for this is to renovate, or remake the border upon improved lines, and especially advisable is it to do this in low, damp situations, as in cases of this kind the evils are aggravated by the damp, sluggish state of the atmosphere.

Then, again, the position in which the trees are placed with regard to aspect and elevation has a marked effect upon their [illegible]. A position upon a wall facing south is the best, though peach trees will mature their wood well, other things being favourable, upon walls with a south-east or south-west aspect, that is, in the warmer parts of the British Isles. With regard to elevation, it may be said the wood does not, except in very favourable seasons, become thoroughly ripened and fruitful in low-lying places. Under such conditions it is liable to remain comparatively green, and retain its leaves late, and, moreover, be subject to attacks of mildew.

But whatever other conditions may be, to a considerable degree the proper ripening of wood is influenced by cultural management, for by skilful treatment trees even grown amid unfavourable surroundings, may be made to yield good results, while others, placed under the most favourable natural circumstances, will be unsatisfactory unless their cultural requirements are carefully attended to. In the first place, the roots must have a suitable rooting medium to grow in, and even then they may require, in order to develop satisfactory branch growth, to be skilfully manipulated, in the way of being lifted, or [illegible]. The branch growth likewise requires correct treatment, some of the most important points attending it being those of timely disbudding of the young shoots, and allowing those left to carry fruit ample space to permit them to be well matured by the sun and air, but it should be observed that even if proper attention is paid to these details of culture, they will be of little avail unless the trees are kept free from injurious insects and mildew, thus giving the leaves every means of fully carrying out their functions. For, after all that has been said, the wood cannot become thoroughly ripened without its leaves properly develop and mature.

Something might be said relative to this subject about the varieties of peaches, but I will conclude my remarks by observing that Bellegarde ripens its wood, and consequently more regularly carries good crops of fruit outdoors here, than does any other that we grow. T. COOMBER.

The Hendre Gardens.

TORCH LILIES.

A question which often arises in garden circles, is the one regarding the adornment of the herbaceous borders, etc., in late summer. One may note in many gardens the wealth of blossom during May, June, and July, but ofttimes August reveals a lack of material for providing plenty of colour during that month and September. The remedy for this state of affairs is only found in a closer study of the later-flowering subjects, and amongst these one might well devote a little time to a consideration of the claims of the Torch lilies or tritomas, or kniphofias. I know of nothing which gives the same glorious display of brilliancy in the gardens as do these Torch lilies. **Brilliant in colouring, picturesque in formation, and lavish in their** beauty, the kniphofias should be represented in every garden where hardy plants are a feature.

We cannot reproduce the picture of the Torch lilies as they exist in Africa's marshy lands, where great stretches of them create those "firelit sweeps of glowing grandeur," which are more readily imagined by the reader than described with the pen. Nature's pictures are replete with beauty, and she paints her colours with a lavish hand, and, though one cannot quite compete with such daring colour schemes, yet we can certainly utilise more fully the decorative Torch lilies.

For the wild garden and for woodland clearings the kniphofias are of immense value. Place yourself alongside some of the finest varieties when they are in full beauty, and picture to yourself the glorious effect of a massed array aglow amid the beauty of the wild garden. A marvellous wealth of colouring, alike valuable for effective beauty as for a long-distance display, for whether you view these subjects at close quarters or from a distance, you have to admit sterling value. For cut flower purposes our subjects are becoming more fully appreciated, and if one can devote a corner where a selection could be grown for cutting, it would prove a boon to the decorator.

It would be a difficult matter to decide which varieties are of most value for garden adornment, but a few notes regarding the various species and varieties of note may be of service.

Amid the wealth of colourings, there comes the call for a white variety, based upon the effect of the Natal species, Kniphofia modesta, which has white blossoms, but which is not sufficiently hardy or even of high enough quality to justify planting it upon an extensive scale. Seedlings from K. modesta vary in character, so as to suggest improvement upon the lines of selecting and recrossing of the finest forms. That much may be accomplished in this direction we have no doubt, and patient, steady work will result in improved varieties. The white colouring would be splendidly received if one could get with it grand, well-balanced spikes, of the character of such forms as R. C. Affourtit or John Benary.

There are several light-growing species and varieties which combine a natural elegance with a range of rich colourings, and the gardener could often utilise some of these dainty forms in positions where the more robust and stronger habited species would appear out of place. Among these miniature types one notes such useful ones as K. Nelsoni, a delightful flaming species from Orange River Colony. K. breviflora, the dainty yellow species somewhat akin to the preceding, is less rarely seen, and can be recommended as a useful little subject. K. pauciflora is another light-habited species, giving a wealth of dainty spikes of yellow blossoms. Those pretty hybrids, Goldelse, with its wealth of gold-clad flower spikes, and Torchlight, a rich-hued flaming form, rank high among the miniatures, and their floriferous character and their light, grassy foliage combine to make them exceedingly useful varieties.

The stronger-growing tritomas are legion, and space demands that I should confine my notes to a brief chat concerning some of the newer and noteworthy forms. R. C. Affourtit, a fine variety, derived from K. corallina, should certainly be secured. Its sturdy, well-filled spikes, its natural freedom, and glorious colouring appeal with no uncertain voice to the garden decorator. R. Wilson Ker is a fine variety, its glowing display of coral-red colouring making it of great value for massing. A soft clear yellow variety of great merit is Lemon Queen, which produces a wealth of showy spikes of blossom. The pale straw-yellow of K. pyramidalis is wonderfully pleasing, and its vigorous growth renders it a fitting subject for roomy borders. In Redcap we have the form and basal colouring of Lemon Queen, but the firelit apex of the flower spikes gives it quite a distinctive glow of colour. Chloris is grand, its massive spikes clad with rich apricot blossoms, and a striking, robust habit, give it precedence over many other forms. In Ideal we have a sterling variety with the richest of scarlet colouring, and stately, well-filled spikes. Indeed, one may regard Ideal and John Benary, a glowing fiery crimson gem, as two of the most effective of the richer-hued forms. Leda demands a passing notice, its waxy blossoms shading from orange to coral-scarlet are very distinct and pleasing. Egypt, a lovely shade of deep amber, a strong, vigorous novelty, is worthy of a good position. Meteor is a grand clear yellow with stately growth, and Beacon is a bright form with coral-scarlet colouring.

Other notably fine kniphofias are Seraph, a pleasing yellow with coral tips; Tricolor, with its rounded pokers of gold, red, and pale yellow; Cloto, carmine-scarlet, and the immense bronzy-yellow Star of Baden-Baden.

Though space forbids an excursion among the species, I must note in closing the pleasing habit and colouring of a cross between K. Nelsoni and K. citrina. The result has been a sturdy, erect variety, with well-filled spikes of glowing red flowers. The unique shade of colour, and the dwarf, sturdy habit should make it especially valuable for the border.

With the aid of the foregoing and many other distinct gems it should be possible to give some touches of glowing colouring to the gardens in late summer.

P. S. HAYWARD.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

National Rose Society.

The autumn exhibition of this flourishing society held on September 15 at the Royal Horticultural Hall, Westminster, in beautiful weather, was a great success. There was an excellent competition in the majority of classes, and the flowers were numerous and good enough to convince the most sceptical of the great value of roses in mid-September.

NURSERYMEN—GENERAL SECTION.

The premier class for cut flowers was the one for thirty-six blooms, distinct; there were six entries, Messrs. Jas. Cocker and Son, Aberdeen, winning the chief award with large, clean, fresh blooms of Chas. J. Grahame, Betty, K. A. Victoria, Caroline Testout, Frau Karl Druschki, Mrs. Laing, Countess of Caledon, Mrs. E. Mawley, La France, etc.; Mr. Hugh Dickson, Belfast, second, and Messrs. A. Dickson and Sons, Newtownards, third.

There was a grand competition in the class for thirty-six roses, distinct, not fewer than three trusses of each. There were five good exhibits, and the one set up by Messrs. Frank Cant and Co., Braiswick Nursery, Colchester, was awarded the first prize. This firm had lovely bunches of Mrs. E. Mawley, Dean Hole, W. A. Richardson, Dr. Felix Guyon, Marie Van Houtte, Frau Karl Druschki, Mrs. Sharman Crawford, Mdme. Constant Soupert, La Tosca, Mrs. J. Laing, Wm. Shean, and Souv. de Pierre Notting. Messrs. B. R. Cant and Sons, Colchester, came second with a very effective display that was little behind the premier one; Marie Van Houtte, Dr. Grill, Hugh Dickson, and Florence Pemberton and White Maman Cochet were well shown in this exhibit. Mr. John Mattock, Headington, Oxford, came third.

Messrs. Jefferies and Sons, Cirencester, led for eighteen teas and noisettes, with fairly good blooms, among which Georges Schwartz, Maman Cochet, Mrs. E. Mawley, and Souv. d'un Ami were the best. Mr. George Prince, Oxford, second, and Messrs. D. and W. Croll, Dundee, third. There was a good competition in the class for twelve vases of roses, distinct varieties, seven blooms in each, and here the chief prize winner was Mr. Hugh Dickson, Belfast, who had very fine examples of Mdme. W. Comtesse de Turenne, Caroline Testout, Chas. J. Grahame, Messrs. J. Laing, Captain Hayward, Mrs. S. Clark, Frau Karl Druschki, Gladys Harkness, Ulrich Brunner, and Hugh Dickson; Messrs. Jas. Cocker and Sons, Aberdeen, came a good second, and Messrs. W. and R. Ferguson, Brucefield, Dunfermline, third. Messrs. J. Jefferies and Sons, led for a vase of any one rose, with Frau Karl Druschki; Messrs. W. and R. Ferguson, Dunfermline, second, and Messrs. D. and W. Croll third.

First prize for two dozen bunches of decorative roses was well won by Mr. J. Mattock, Headington, Oxford, with charming bunches of Beryl, Mons. Paul Lede, Peace, Mdme. Abel Chatenay, Isabelle Sprunt, Mdme. Ravary, Sulphurea, etc.; Messrs. Frank Cant and Co., Colchester, second; and Messrs. J. Jefferies and Sons, third. Mr. J. Crossling, Penarth Nurseries, S. Wales, had the best dozen vases of decorative roses, and he set up Papa Gontier, Eugenie Lamesch, Mdme. Ravary, Gustave Regis, and Mdme. Abel Chatenay, finely; Messrs. W. and R. Ferguson, second, and Mr. G. Prince, Oxford, third.

Mr. John Mattock, Headington, Oxford, led for a dozen stands of roses, a distinct variety in each; the stands were of bamboo tubes of varying height, and the best roses were La Tosca, Gustave Regis, Bardou Job, and Mdme. Abel Chatenay; Messrs. J. Jefferies and Sons, Cirencester, came second.

First prize for a dozen bunches of polyantha roses was accorded to Messrs. B. Cant and Sons, Colchester, whose Leonie Lamesch, Eugenie Lamesch, Perle d'Or, and Etoile d'Or were very good; Messrs. Paul and Son, Cheshunt, second, and Messrs. W. and J. Brown third.

NURSERYMEN'S GROUPS OF ROSES.

In the class for a representative group of roses, including pot plants and cut flowers, artistically arranged, Messrs. Paul and Son, Cheshunt, won the premier award with a very pretty and interesting exhibit that included examples of the new dwarf perpetual Wichuraiana, named Iceberg, pure white; the Marechal Niel-scented variety Paula, Eugenie Lamesch, Gottfried Keller, and fine baskets of Frau Karl Druschki, Caroline Testout, S. M. Rodocanachi, Kaiserin A. Victoria, Trier, Mrs. J. Laing, La France, etc. A few palms and an edging of ferns gave an elegant finish to the display. Messrs. Hobbies, Dereham, came second with a good exhibit, in which, however, the small half-standard polyantha roses were scarcely at their best.

For a representative group of cut roses, arranged on a space 18ft. by 6ft., Mr. George Prince, Longworth, was a good first with a very effective and bold arrangement, in which flowers of Frau Karl Druschki, La France, Marie Van Houtte, Mdme. Abel Chatenay, and Mdme. Pierre Cochet were set up in large numbers and fine style. Smaller vases of tea roses were set under the larger stands, and made up a beautiful exhibit. Second prize was won by Messrs. W. and J. Brown, Peterborough, and third by Messrs. Hobbies, Lim., Dereham, the latter firm using arches, baskets, and stands of blooms, but a recent heavy storm had damaged many of their blooms. Messrs. A. Dickson and Sons, Newtownards, were awarded an extra prize.

First prize for a group of cut roses, arranged on a table space of 60 square feet, was well won by Mr. F. M. Bradley, Church Street, Peterborough, with a very handsome and well-arranged exhibit, in which long, clean growths of Wichuraiana roses were freely used in the background. There were tall stands filled with fine flowers of Frau Karl Druschki, Caroline Testout, Captain Hayward, etc., and below these were smaller vases of a great variety of T. and H.T. roses. Messrs. R. Harkness and Co., Hitchin, came second with fine flowers of Mdme. Abel Chatenay, Gustave Regis, Frau Karl Druschki, etc.

OPEN CLASSES.

Mr. J. Mattock scored for a bowl of China roses with a charming red design; Messrs. F. Cant and Co., second, and Messrs. W. and J. Brown third. The class for rose hips was an interesting one, but the hips were not yet fully coloured; Messrs. Paul and Son won first place for nine distinct kinds, and their best sprays were of Rosa lucida, R. pomifera, R. rugosa, R. rubrifolia, and R. alba. Messrs. B. R. Cant and Sons second.

AMATEURS.

There were eight competitors in the class for eighteen blooms, distinct, Messrs. R. and T. Park, Bedale, winning first place with flowers that would have stood well at a July show; their best were Pres. Carnot, Gladys Harkness, White Maman Cochet, Frau Karl Druschki, Ulrich Brunner, Veyrat Hermanos, Mrs. J. Laing, and Mildred Grant; Rev. J. H. Pemberton, Havering, Romford, second with clean flowers, and Mr. Conway Jones, Hucclecote, Gloucester, third. Mr. Lindsell was not even placed in the prize list.

The best dozen blooms, distinct, were from Mr. W. O. Times, Hitchin, whose best flowers were Frau Karl Druschki, Lady Ashtown, Bessie Brown, Countess Gosford, and Countess of Derby; Mr. G. Speight, Market Harborough, was a good second: and Mr. M. Whittle, Belgrave Avenue, Leicester, was third. Seven entries.

The best stand of nine blooms was set up by Mr. W. Upton, Claremont Street, Belgrave, Leicester, who showed Maman Cochet, White Maman Cochet, Mrs. J. Laing, J. B. Clarke, Frau Lilla Rautenstrauch, Mdme. W. Comtesse de Turenne, Frau Karl Druschki, Mdme. Hoste, and S. M. Rodocanachi; Mr. E. B. Lehmann, Ifield Lodge, Crawley, was second; and Mr. C. F. H. Leslie, Epcombe, Hertingfordbury, third.

Mr. Walter Bentley, 21, Lombard Street, E.C., led for six roses, distinct, followed in order by Mr. S. J. Hogg, Leaside, Hertingfordbury, and Mr. E. S. Robinson, Glencoe, Emerson Park, Hornchurch. The Rev. J. H. Pemberton won first place for a dozen varieties of roses in vases, not fewer than three trusses of each, with handsome bunches of Frau Karl Druschki, Fellenberg, White Maman Cochet, Caroline Testout, Florence Pemberton, and Trier, etc.; Mr. H. R. Darlington, Potter's Bar, second.

The finest stand of twelve teas or noisettes came from Mr. Conway Jones, Hucclecote, Gloucester, who had full, clean examples of Maman Cochet, Lady Roberts, Mrs. Edward Mawley, White Maman Cochet, Mdme. Constant Soupert, Mdme. Antoine Marie, Marechal Niel, Souv. d'Elise Vardon, Mdme. Vermorel, Auguste Comte, Anna Olivier, and The Bride; Messrs. R. and T. Park, Bedale, second; and Mr. O. G. Orpen third; eight entries. For nine tea roses, distinct, Mr. C. F. H. Leslie led the way with Ernest Metz, Innocente Pirola, Marie Van Houtte, Souv. de Pierre Notting, etc.; Mr. F. Slaughter, Steyning, second; and Mr. M. Whittle, Leicester, third. Mr. W. O. Times, Hitchin, had the best six tea roses, his Marie Van Houtte and White Maman Cochet being very good; Mr. S. J. Hogg second, and Mr. W. Upton third; seven entries.

ROSES IN VASES.

From six competitors the Rev. J. H. Pemberton, Havering, won the leading award for six vases of roses, distinct, five flowers of each, with Frau Karl Druschki, Earl of Warwick, Hugh Dickson, Caroline Testout, Bessie Brown, and Florence Pemberton; Mr. E. M. Eversfield, Denne Park, Horsham, second; and Mr. W. Leggett, Roseville, Maldon Road, Colchester, third.

Mr. O. G. Orpen, West Bergholt, Colchester, led for four vases of tea roses, five blooms in each, with pretty blooms of Souv. de Pierre Notting, Maman Cochet, Mrs. Edward Mawley, and White Maman Cochet; Mr. Conway Jones second, and Messrs. R. and T. Park, Bedale, third.

LADIES' CLASSES.

Mrs. O. G. Orpen was once more successful in the class for a table decoration, open only to ladies, and here she won with a charming arrangement of Irish Elegance flowers and buds, with a few lygodium sprays on the table cloth; second prize fell to Mrs. Munt, Stagenhoe Park Gardens, Welwyn; and third and fourth places fell respectively to Miss A. F. Harwood, St. Peter Street, Colchester, and Mrs. H. L. Sell, Kempton Villa, Luton. There were ten competitors.

First prize for a bowl of exhibition roses was won by Mrs. J. Walter Smith, Sparrows, Herne Hill, Bushey, with fine flowers; Mrs. G. A. Hammond, Burgess Hill, second; and Mrs. H. E. Molyneux, Brantwood, Purley, Surrey, third. For a bowl of decorative roses the first place was secured by Mrs. J. Walter Smith with Mdme. Abel Chatenay; Miss Jessie Langton and Mrs. C. C. Williamson, Canterbury, equal second.

DECORATIVE ROSES.

The best basket of cut roses was a very pretty one of pale yellow flowers, and sprays of Rosa rubrifolia, arranged by Mrs. O. G. Orpen; Miss Jessie Langton, Raymead, Hendon, was second; and Miss Scott, Harley House, Regent's Park, third. Rev. J. H. Pemberton scored for a dozen decorative roses, in bunches, his best being Gruss an Teplitz, Mdme. Berard, Gustave Regis, and Laurette Messimy.

For six varieties of garden roses Mr. E. Mawley, V.M.H., Rosebank, Berkhamsted, was well to the front with handsome blooms of Mdme. Ravary, Liberty, Perle d'Or, W. A. Richardson, Mdme. Abel Chatenay, and Gruss an Teplitz; Mr. H. R. Darlington, Park House, Potter's Bar, second; and Mr. C. S. Gordon Clark, Fetcham Lodge, Leatherhead, third. The Rev. J. H. Pemberton scored for seven stands of decorative roses, and he was followed by Mr. Conway Jones.

MEDAL BLOOMS.

In the nurserymen's section the silver medal blooms were: H.T., Chas. J. Grahame, shown by Messrs. Jas. Cocker and Son; H.P., Mrs. J. Laing, from Messrs. A. Dickson and Sons; and T., Gladys Harkness, from Mr. Hugh Dickson.

In the amateurs' section the silver medal flowers were: H.P., Mrs. J. Laing, from Mr. E. B. Lindsell; H.T., Mdme. W. Comtesse de Turenne, from Mr. Speight; and T., White Maman Cochet, from Mr. O. G. Orpen.

NEW GOLD MEDAL ROSES.

No fewer than four gold medals were awarded to new roses:

Alexander Hill Gray.—A finely-formed, soft yellow tea-scented rose of great beauty. Messrs. A. Dickson and Sons, Newtownards.

Dr. O'Donell Brown. — A large, broad-petalled H.P. rose of deep rosy magenta colour. Messrs. A. Dickson and Sons, Newtownards.

Lady Alice Stanley.—A lovely rich rose-pink H.T. rose, with silvery rose-pink colouring on the inner face of the petals. Messrs. McGredy and Son, Portadown.

ROSES AT THE AUTUMN ROSE SHOW.

In the foreground is Messrs. Frank Cant and Co.'s first prize exhibit of 36 bunches of roses. Next, to the right, is Mr. J. Mattock's third prize group, while at the end of this fine bank is Messrs. B. Cant and Sons' second prize exhibit. All the exhibits shown were in the same class.

His Majesty.—A handsome deep rose-red H.T. rose, broad-petalled, and full, tinged with cherry red. Messrs. McGredy and Son, Portadown.

A card of commendation was granted to Messrs. Paul and Son, Cheshunt, for Iceberg, a pure white dwarf Wichuraiana, mildew-resisting rose, and a similar award was made to Messrs. J. Cocker and Son, Aberdeen, for a [illegible] pink sport from Dorothy Perkins, named Christian Curle.

Messrs. Garaway and Son, Bristol, showed a new, bronzy-buff tea rose.

Royal Horticultural Society.

SCIENTIFIC COMMITTEE, Sept. 15.

Present: Dr. M. C. Cooke, M.A., V.M.H. (in the chair); Messrs. W. Fawcett, J. Fraser, W. Hales, H. T. Güssow, A. Worsley, A. W. Sutton, L. Crawshay, and F. J. Chittenden, secretary.

MUSHROOMS FROM SPORES. — Dr. M. C. Cooke, V.M.H., read a communication concerning a mushroom, Agaricus elvenis, which had occurred in two gardens after pieces of this species had been thrown out, and which had evidently grown from the spores so distributed. They had, after their first appearance, grown in the same spot year after year.

DISEASED PLANTS.—Mr. H. T. Güssow reported that he had examined the apples referred to him at the last meeting, and had found nothing upon them except punctures made by some insect. He had also examined the yew shoots, and was of opinion that they had been injured either by something having been poured over them or by fumes.

USTILAGO HYPODYTES.—Dr. C. B. Plowright sent a specimen of Ammophila arundinacea "affected by the so-called Ustilago hypodytes. The affected plant has been growing in my garden for the last fifteen years, annually producing the fungus. The spores are produced inside the leaf sheaths, so that the sheaths look as though they were filled with snuff packed in between the stem and the leaf. This year, however, the stems are contorted, and the growth very much distorted. The plant came originally from Wells-next-the-Sea, Norfolk."

ASTER TRIPOLIUM.—Mr. Fraser, F.L.S., drew attention to the strongly entomophilous character of the Sea Aster (Aster tripolium), and especially to the great variation in the number of ray florets found in the flower; many plants had the outer florets with broad rays, in some the rays were narrow, though numerous, in others the ray florets were very few, while quite frequently no ray florets were present at all. He found, however, that the various forms were all alike regularly visited by insects, especially the hive bee, the humble bee, and various flies (Syrphideæ). The pollen was spiny in all, and there were numerous papillæ (from which an odour was exuded ?) upon the corolla and other parts of the flower.

SISYMBRIUM SOPHIA.—Mr. Fraser also showed specimens of Sisymbrium Sophia, in which, unlike the usual condition of things, the petals were less than half the length of the sepals.

CARROTS SPLITTING.—Several specimens of carrots splitting lengthwise were exhibited, and Mr. Sutton said that this almost invariably happened when the roots were left in the soil for a considerable time after they had reached maturity. Another cause of the splitting was the rapid absorption of water after a period of drought.

British Gardeners' Association.

At the last meeting of this association, Mr. E. F. Hawes in the chair, six new members were elected, bringing the total up to 1,333. The question of honorary members was deferred for further consideration. A sub-committee was appointed to consider and report whether it would be possible to establish a garden on co-operative principles so as to give employment to any members out of work, and to serve as a centre from which employers could obtain professionally trained gardeners. The secretary will be pleased to receive any ideas or suggestions on this matter.

Cardiff Gardeners' Association.

On Wednesday, September 9, the members of this society visited the Fair Oak Nurseries, Bassaleg, for the purpose of looking over the fruit quarters, and it was a great surprise to everyone to find what a quantity of fine fruits the trees were carrying considering the disastrous gales of the previous week. Mr. Basham said that considerably over a ton of apples were blown down, and yet a huge crop remained on the trees maturing finely as regards size, quality, and colour. Ribston Pippin and Peasgood's Nonsuch deserve special mention, for very rarely are such fine samples to be seen.

Owing to the cold spring the pear crop is scarcely so heavy as usual, but, nevertheless, there was an abundant crop all round. Other kinds of fruit were of an equally high standard. A large number of various fruit trees in pots were carrying extra fine samples, and these were in the orchard house quite recently erected.

After the tour the members were entertained to tea, and before leaving Mr. Treseder, on behalf of the party, thanked Mr. and Mrs. Basham for their kind hospitality, to which Mr. Basham briefly responded. In the absence of the chairman and hon. secretary, who were from home holiday making, the arrangements were carried out by Messrs. Mountney and Julian.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

VANDAS NOT FLOWERING. — L. G., Wimborne: Failure to flower is probably due to overshading, but of this we cannot be certain. We shall be better able to help you if you send us a brief outline of the conditions under which the vandas have been grown, referring especially to the temperature, aspect of house, shading, and watering.

APPLE TREES FOR SMALL GARDEN.—R. R., Blackpool: Thanks for the note. In the case of a small garden such as yours appears to be it will be much more interesting and profitable if you plant cordon apple trees rather than two or three bush or pyramid trees. Whether the trees are to be trained to walls, fences, or trellises, the ground should for a width of four or five feet be thoroughly broken up to a depth of two feet. If the soil is much exhausted, a light dressing of well-rotted stable or farmyard manure may be incorporated with the soil when broken up. Otherwise the application of manure should be deferred until the trees are producing their first crop. They usually make sufficient growth during the first year or two without the aid of fertilisers, and one of the cardinal points in the management of cordons is to avoid an excessively vigorous growth. There will be no objection to the use of a mulch of partially rotted manure during the first summer, should the weather be dry, for the purpose of conserving the moisture; in fact, a mulch will be found highly beneficial. The distance at which to plant cordons is a point of special importance, and in many cases the trees are allowed too much space, and, in consequence, the growth is too vigorous to be fruitful. Single cordons—i.e., trees with single stems—should be planted twenty inches, and double cordons — i.e., trees with two stems— should be thirty-six inches apart. The trees may be trained erect, provided the wall is not less than fifteen feet in height, or oblique at an angle of from forty to fifty degrees. When first planted, any side shoots that have been allowed to extend should be shortened to within one or two buds of the base, and the leading shoot should be left its full length and secured. The leader should not, in fact, be shortened until necessary, but be trained in until the stem has attained the desired length. Stop all side shoots at the end of June or the beginning of July, according to whether the district is early or late. A second growth will result, and these shoots should, early in September, be cut back to the first bud from their base. The stopping in June or July will result in the production of flower buds at the base of the shoots, as well as growth from the upper buds, and it is therefore important to stop at the right time.

SELECTION OF HARDY CLIMBING PLANTS.—B. P., Swindon: The range of hardy climbing plants is a wide one, but, all things considered, the following will be a good selection for your particular case:—Ampelopsis hederacea (Virginian creeper), A. tricuspidata, Hedera helix canariensis (Irish ivy), H. h. chrysocarpa, H. h. Madeirensis variegata, H. h. rhomboidea ovata, Vitis Coignetiæ, V. heterophylla, all plants of vigorous growth, cultivated for their foliage. Bignonia radicans and Wistaria sinensis, two robust-growing plants remarkable for the beauty of their flowers. Clematis flammula. C. montana, C. Blue Gem, C. Henryi, C. Jackmanni superba, C. Mrs. J. Bateman, Jasminum nudiflorum, J. officinale grandiflorum majus, Lonicera brachypoda aurea reticulata, L. Periclymenum, Late Dutch, L. sempervirens, Passiflora Constance Elliott, all of which are of moderate growth. Climbing roses, comprising Gloire de Dijon, Crimson Rambler, Dundee Rambler, L'Ideal, Reine Marie Henriette are also valuable for arches, trellises, and walls of moderate height.

NEGRO LARGO FIG OUT-OF-DOORS.—W. S., Surrey: The cause of non-fruiting is not to be found in the cultural conditions or even in the position of the tree, and the climate of your district. It is to be found in the variety itself, for Negro Largo is emphatically not suitable for outdoor culture. Cut down and root out the old tree, remove the old soil, and make up a narrow border of sound loam, mixed with old mortar or plaster rubble, and in this plant a good tree of Brown Turkey, White Marseilles, or Brunswick figs, the first for preference, though White Marseilles is also excellent, while Brunswick fruits better as an old or large tree than as a young one. Plant firmly. Two and a-half feet of soil will be ample depth, and if the roots are confined within four feet of the wall by means of brickwork or slate slabs so much the better, because a free root run for young figs produces gross and unfruitful growth. Of course, an alternative to this course would be the building of a glass house over the old fig.

GARDENING YEAR BOOK FOR 1909.—R. R., Blackpool: Just at the moment it is not possible for us to say precisely when the new edition will be published, but all the work is being pushed on as speedily as possible in the hope that the book may be published early in December.

HEDGES.—C. R., Loughton: Trench the ground at once so that it may settle down by planting time, which should be as nearly at the end of October as possible. For the production of successful hedges there is nothing of more importance than thorough ground preparation, and yet this is a matter all too frequently overlooked. Three-year-old, or, preferably, four-year-old plants of Quick should be secured and planted about eight inches apart, and they should be cut back to about six inches of the ground level. This severe beheading pays, as it induces very strong growths to start away from the base next season and consequently the hedge is well furnished from the base upwards. Save under exceptional circumstances we prefer a single row of plants rather than a double one because, if properly cared for, the single row will afford all the security and shelter necessary, and will be much more easily kept free from weeds than a double row. Keep the hedge bottom clean for at least two or three years after planting, and if it is a garden hedge it should always be kept clean, and be regularly forked over. Hornbeam makes a good hedge, and need not be planted so closely as thorns.

NETTLES.—L. L. S., Essex: Fork out all the nettles you possibly can, and burn them root and branch; then give the ground a dressing of fresh gas-lime. A few weeks later the ground should be trenched ready for use next spring. Hoeing and forking out, and never permitting a nettle to seed will soon rid the garden of a vile weed. The garden frames should face south. Brick pits will be the most serviceable, though you should have at least one wooden one for placing over a hotbed of stable litter and old leaves next spring, in which to raise seedlings.

NAMES OF PLANTS.

West Surrey.—Gaultheria Shallon.

J. S., Taunton.—1. Begonia Haageana; 2, Bryophyllum calycinum; 3, probably Polypodium chnoodes.

J. S., Ascot.—1, Veronica cupressoides; 2, Clethra alnifolia; 3, a garden variety of Michaelmas Daisy.

W. D., Leatherhead.—The flower was too faded for us to identify it with certainty, but we believe it to be Stanhopea Wardi.

NEW PLANTS, ETC.

CATTLEYA HARRISONIÆ ALBA STANLEY'S VARIETY.

A beautiful variety that is a great improvement upon the original albino form, both in shape and substance. The blooms are shapely and substantial, pure white, save for a faint tinge of lemon-yellow in the throat of the lip. F.C.C., R.H.S., Sept. 15. Messrs. Stanley and Co., Southgate.

CATTLEYA MARONI AUREA.

A distinct orchid with moderately large flowers. The sepals and petals are bright yellow, and the broad apex of the lip is finely coloured with purple, crimson, and gold. A.M., R.H.S., Sept. 15. Mr. W. H. White, orchid grower to Sir Trevor Lawrence, Bart., Dorking.

POPULUS ALBUS LASIOCARPA.

A very fine poplar with great heart-shaped leaves fully a foot long, and almost as wide. This is a quick growing Chinese variety that promises to be very useful. No doubt if cut down annually after the manner of Rhus typhina and Paulownia imperialis at Kew, it would make a splendid foliage bed for large parks and gardens. F.C.C., R.H.S., Sept. 15. Messrs. Jas. Veitch and Sons, Chelsea.

APPLE RED VICTORIA.

A handsome, brilliantly coloured early apple, somewhat resembling both Emperor Alexander and Gascoigne's Scarlet. It is earlier than the latter, a free cropper, and should prove a splendid market variety. A.M., R.H.S., Sept. 15. Mr. G. W. Miller, Clarkson Nursery, Wisbech.

DAHLIAS.

Flora.—A very pretty, fair sized cactus variety, yellow, with white tips; good form. A.M., R.H.S., Sept. 15. Mr. J. T. West, Brentwood.

Nellie Riding.—A handsome and beautiful cactus variety of excellent form; deep rich crimson, with white tips. A.M., R.H.S., Sept. 15. Mr. J. T. West, Brentwood.

Adela. — A clear cream-white pompon variety, of excellent form. F.C.C., L.D.U., Sept. 10; A.M., R.H.S., Sept. 15. Mr. Chas. Turner, Slough.

Crusoe.—A very pretty show dahlia of a soft lavender tint, with the florets tipped with a deeper shade. F.C.C., L.D.U., Sept. 10. Messrs. Keynes, Williams, and Co., Salisbury.

Una.—A wonderful cactus dahlia of pink colour, with a yellowish glow in the centre. The outer florets incurve a little, and are narrow, slightly twisted and divided into three and sometimes four parts for half their length. F.C.C., L.D.U., Sept. 10. Messrs. J. Burrell and Co., Cambridge.

Lufra.—A good pompon variety of a dark red colour; a self. F.C.C., L.D.U., Sept. 10. Mr. Chas. Turner, Slough.

Snowdon.—A large white cactus dahlia, that, as shown, had a rather large centre. F.C.C., L.D.U., Sept. 10; A.M., R.H.S., Sept. 15. Messrs. J. Stredwick and Son. St. Leonards.

Indomitable.—A large cactus variety with narrow, twisted florets; colour, rose-red, the points paler. F.C.C., L.D.U., Sept. 10. Messrs. J. Stredwick and Son.

Fairy Queen.—A full-sized cactus dahlia, the central florets a trifle flat; colour, creamy white. F.C.C., L.D.U., Sept. 1 Mr. H. Shoesmith, Woking.

Echo.—A shapely cactus variety, with very narrow florets; colour, purplish rose. F.C.C., L.D.U., Sept. 10. Messrs. J. Burrell and Co.

Brigadier.—A very fine cactus dahlia, with clawed florets; the colour, a very deep shade of crimson scarlet. F.C.C., L.D.U., Sept. 10; A.M., R.H.S., Sept. 15. Messrs. J. Burrell and Co.

Evening Star.—A charming cactus dahlia with long, narrow florets; centre yellow, outer florets bright buff pink. F.C.C., L.D.U., Sept. 10. Messrs. J. Stredwick and Son.

Mrs. Alfred Dyer.—A very pretty and refined cactus dahlia, soft yellow, shading to white at the tips of the narrow florets. F.C.C., L.D.U., Sept. 10. Messrs. J. Stredwick and Son.

Rev. T. W. Jamieson.—A bold cactus variety, with substantial florets that are slightly twisted; soft yellow centre, rose-pink tips. F.C.C., L.D.U., Sept. 10. Messrs. J. Stredwick and Son.

Glory of Wilts.—A very beautiful, refined cactus dahlia of a clear bright golden yellow colour throughout; one of the very best additions. Messrs. Keynes, Williams, and Co., Salisbury.

[illegible].—A neat new single variety; very [illegible] maroon crimson. F.C.C., L.D.U., Sept. 10. Messrs. J. Cheal and Sons.

Flora.—A beautiful single variety; old gold colour, with a ring of rich crimson round the yellow eye. F.C.C., L.D.U., Sept. 10. Messrs. J. Cheal and Son.

Betty.—A shapely and neat single variety of bright rosy-mauve colour, with a crimson zone round the eye. A.M., R.H.S., Sept. 15. Messrs. J. Cheal and Son, Crawley.

Monarch.—A handsome deep reddish salmon-coloured cactus variety, with bright yellow centre. A.M., R.H.S., Sept. 15. Messrs. Burrell and Co., Cambridge.

Satisfaction.—A rosy cactus variety shaded with pink, and with a whitish centre. A.M., R.H.S., Sept. 15. Messrs. J. Stredwick and Son, St. Leonards.

FORTHCOMING ENGAGEMENTS.

MONDAY, September 28.—National Chrysanthemum Society's Floral Committee meeting at Essex Hall, at 3 p.m.

TUESDAY, September 29.—Royal Horticultural Society; Committees meet at 12 o'clock; lecture at 3 p.m. on "Garden Design," by Mr. T. H. Mawson; Scientific Committee at 4 o'clock.

WEDNESDAY, September 30.—Royal Society of Arts.

WEDNESDAY, October 7.—Royal Society of Arts. National Chrysanthemum Society, Crystal Palace, two days; Floral Committee at 12 o'clock.

NOTES OF OBSERVATION.

◆

Rose Frau Karl Druschki.—Possessing, as I do, an Englishman's respect for "The Times," it is with some diffidence that I venture to question the accuracy of its statement that the flowers of this rose are too large for the plants. It may be correct if giant blooms for exhibition are grown, but for a simple amateur this rose is certainly most desirable. We have had flowers of moderate size at intervals during the past three or four months, and have seldom cut blooms which have been too large for the dinner table. This rose certainly produces flowers of excellent form when grown as an ordinary garden plant.—C. J.

Destroying Wasps' Nests.—Every one will agree with "East Sussex" that a great amount of loss and inconvenience is caused by wasps, and that all possible means should be taken to destroy the pests. I am pleased to see "East Sussex" recommending cyanide of potassium as the best thing to use, but I should like to point out that it is not necessary to wait till after dark to apply it, and most people would find it more convenient to work in the day time. I pour a little of the cyanide into an earthenware pot and saturate a little cotton wool in it, sufficient to plug up the entrance hole, and with a pointed stick push it in, and all the wasps that are out, as they come back and try to enter, inhale the fumes of the cyanide and fall down dead; it is interesting to stand by and watch them. The nest should be dug out next day and broken up, as the grubs would not be killed, and may hatch out, but not a live wasp will be seen. I have destroyed hundreds of nests in this way, and have recommended the method all I can.—H. T. Bradley, Dyffryn Gardens, Neath.

Autumn Crocuses.—Crocuses can be had to brighten the garden in autumn quite as effectively as the cheap Dutch varieties which are so popular in spring. Autumn crocuses are mostly species that begin to flower in September, and continue right into December. The best varieties include: Longiflorus, medius, pulchellus, speciosus, Aitchisoni, and zonatus. All these are cheap to obtain, therefore, plant them in good deep masses in borders, or try them naturalised in grass, and in a very short time you will have an autumn effect in your garden of which you may be justly proud. Lastly, do not confuse crocuses with colchicums, as is frequently done; the former for garden decoration are distinctly the best.—Thomas Smith, Walmsgate Gardens.

Summer Pruning of Fruit Trees.—I thoroughly endorse what Mr. T. H. Slade says in his practical notes on summer pruning (p. 650). As a rule we require a dry season to check rampant growths, for the greater the number of strong growths the smaller the number of fruit buds, unless the trees were root-pruned the previous autumn or winter. I have noticed for many years that summer pinching has very little effect upon the formation of fruit buds. If any interested person will take the trouble to examine his fruit trees in May, he will notice the formation of fruit buds taking place. There will be the young shoots commencing to run out, and the embryo fruit buds forming; it is the previous summer and autumn treatment that rules the quantity of fruit buds formed the following year. Those persons that possess fruit trees producing strong fruitless shoots should moderately root-prune in September, or not later than the middle of October, and they will probably be well pleased with the little extra trouble this incurs and the production of extra fruit buds.—Geo. Picker, Hesslewood Gardens, Hull.

OBITUARY.

MR. GEORGE NICHOLSON, F.L.S., V.M.H.

It is with feelings of the deepest and most sincere regret we have to record the death, on Sunday last, of one who has for long held a foremost place in the world of horticulture, and a very large place in the affections of all who had the privilege of a close acquaintance with him—Mr. George Nicholson. Although Mr. Nicholson had been in failing health for some time and had suffered several severe illnesses, it was the hope of his many friends that he would yet recover and once more move again among the plants and flowers he knew so well, and the friends who so highly appreciated his great worth. But it was not to be, and on Sunday last, at Larkfield Road, Richmond, he passed into the Great Beyond, to the deep sorrow of relatives and friends.

THE LATE MR. GEORGE NICHOLSON, F.L.S., V.M.H.

The son of a nurseryman, and born at Ripon in 1847, Mr. Nicholson received his early training at his father's hands, and subsequently worked in the nurseries of Messrs. Fisher and Holmes, of Sheffield; Messrs. Hugh Low and Co., then of Clapton; and at La Muette, Paris. In 1873 he entered the Civil Service, and became Clerk to the Curator of the Royal Gardens, Kew, and so well did he take advantage of the great opportunities Kew offered, that in 1886 he was appointed Curator. As an organiser, as a cultivator, and as a botanist, Mr. Nicholson was unusually well fitted for this position, as was shown by the splendid manner in which, under Sir Wm. Thiselton Dyer, he improved the appearance and increased the usefulness of the Royal Gardens. Widely read, a man of excellent judgment, a ready and entertaining writer, and gifted with a wonderfully pleasant manner, it is small wonder that his closest friends and the Kewites of his time have ever held him in a high respect that was litle short of worship. He also possessed a keen sense of humour and a fund of anecdote that made him an extremely pleasant companion.

Mr. Nicholson made hardy trees and shrubs a close study, and he was recognised as the first authority in this country upon a subject he made so peculiarly his own. But his knowledge of plants went far beyond trees and shrubs; indeed, we do not know anyone who knew plants, exotic or native, so well as he. This extensive knowledge was devoted to the service of horticulture in the "Dictionary of Gardening," edited by him, and published in 1891, and which still remains the finest work of its kind. As an acknowledgment of his services to botanical and horticultural science, Mr. Nicholson was made an Associate of the Linnean Society in 1886. In 1894 he was awarded the Veitchian Medal, and he was one of the original recipients of the Victoria Medal of Honour in Horticulture.

In the interests of the Royal Gardens Mr. Nicholson went to America in 1893, where he inspected the important horticultural establishments of the United States, and acted as a judge in the horticultural section of the great Chicago exhibition. In 1901, owing to failing health, he retired from the position of Curator at Kew, but he continued in close touch with the Gardens, as has been shown by the keen interest he took in, among other things, the working out of the native flora and fauna of the Royal Gardens, as recorded in the "Kew Bulletin." Relief from the pressure of administrative duties brought a return of health, and in 1902 Mr. Nicholson went to America as a delegate from the Royal Horticultural Society to the "Conference on Plant Breeding."

With his usual modesty, Mr. Nicholson declined the honour of a public dinner upon the occasion of his retirement from Kew, but a complimentary dinner was given in his honour at the Cannon Street Hotel on October 30, 1901, presided over by Dr. Masters, and attended by all the leaders of horticultural activities. Anything in the form of a public testimonial Mr. Nicholson strongly opposed, but a fine silver salver was presented to him by his friends and colleagues "who, while admiring his qualifications as a man of science and a gardener, have a warm appreciation of his worth as a friend." And it is as a friend, in the broadest and fullest sense of the word, that Mr. Nicholson will be long and best remembered by many. His keen interest in the young men at Kew, his many years of work on behalf of the Gardeners' Orphan Fund, and his presidency of the Kew Guild, all point to those finer qualities of mind and heart with which our friend was so liberally endowed. Mr. Nicholson rendered great service to the Royal Horticultural Society in many ways, and was, right up to the time of his death, a member of its Floral and Scientific Committees. Until recent years Mr. Nicholson was a keen and clever Alpine climber, and used to spend his annual vacation in Switzerland.

Mr. Nicholson has passed from us, but his work at Kew remains as a splendid monument to his ability, while his worth as a friend and gentleman will be remembered for long, long years to come. We sorrow with those who mourn in the home at Richmond, and extend to them our deepest sympathy.

The War on Rats.—Lord Strathcona, the veteran High Commissioner for Canada, is the latest convert to join in the crusade against rats. His island home of Colonsay in the Hebrides, inhabited by some ninety families, has just been the scene of a campaign against these vermin, in which the islanders under skilled supervision laid down bait made specially with the contents of hundreds of tubes of Danysz virus jelly, a preparation which is very deadly to rats but quite harmless to other animals. Every farm and homestead was systematically treated, the owners cheerfully lending their co-operation. It is confidently anticipated that as a result this remote "fair island in the sea" will now be freed from the plague of rats, which have added considerably to the many troubles and difficulties with which the crofters of late years have had to contend.

KELWAY GARDENS,
Greenock,
26th August, 1908.

Messrs. Kelway and Son,
Langport, Somerset.

Dear Sirs,—You will be pleased to hear that the £10 or so which I have sent you in the last few years have made my garden (¼ acre) one beautiful mass of colour all the year round.

This year especially the place has been a perfect picture—quite as fine as any of the pictures in Walter Wright's "Perfect Garden."

I am,
Yours faithfully,

FOR AUTUMN PLANTING.

PLANTERS of FRUIT TREES should write for our fully descriptive catalogue and supplement, 6d., post free; and gratis to customers.

Well-ripened trees of all kinds, and our large, developed specimens of Vines, Figs, Peaches, and Nectarines, are especially good.

An inspection solicited.

CANNELLS, Loddon, Norfolk.

TO-DAY! AND FOR YEARS AND YEARS PAST the XL ALL Specialities are and have been the best on the market. Where is the Gardener who does not pin his faith to one or the other of these celebrated Insecticides or Fertilisers? XL ALL FERTILISER has pleased all who have used it this season. The Sales of XL ALL FUMIGATOR prove that it is more popular than ever. XL ALL LIQUID NICOTINE INSECTICIDE is always spoken of by gardeners and growers as the best remedy for Mealy Bug, Thrip, etc. XL ALL WINTER WASH for Fruit Trees acts like magic, clearing the Trees and Bark of all Insects' Eggs, Moss, and Fungoid Growth. XL ALL LAWN SAND, a weed eradicator and fertiliser for weedy and poor lawns. XL ALL WEED KILLER used once a year "No weeds can live." Please ask your Nurseryman, Seedsman, or Florist for a copy of my small pink list, giving particulars of these and many other XL ALL Preparations which can be obtained from the Horticultural Trade throughout the World. G. H. RICHARDS, Manufacturer and Patentee, 234, Borough High Street, London, S.E.

WORKING MANAGER or FOREMAN, all-round life experience in growing for good local trade, Wholesale and Retail; Fruit, Cut Flowers, Trees, and Shrubs; abstainer. FERGUSON, 52, Wood Street, Blackpool.

JOURNEYMAN (Inside), age 21, 7 years' experience; private place; Roman Catholic. J. F. W. HARDY, c/o Just, Cleadon, Sunderland.

GARDENER (Under), age 19, seeks SITUATION; five years' experience Inside and Out; three years' good character. A. WORSFOLD, Benenden, Cranbrook, Kent.

UNDER GARDENER seeks SITUATION, age 19; good knowledge of all Carnations, Malmaisons, Cucumbers, and Chrysanthemums; life experience in kitchen garden; abstainer; good character. S. N., Summerleigh, Stubbington, Fareham, Hants.

WANTED, by a YOUNG MAN, age 1 SITUATION as UNDER-GARDENER, look after a pony and trap; four years' good cha ter. Address B. PYE, Burbage Vicarage borough, Wilts.

YOUNG MAN, age 19, requires SITUAT as UNDER GARDENER; three years' e ence Inside and Out; can be well recommended. A. BOSWELL, The Gardens, Lancing Manor, W ing, Sussex.

GARDENER.—SITUATION WANTED good all-round man; 12 years' experienc chrysanthemum, tomatoes, cucumbers, etc.; mar age 29. J. MOONEY, Oaks Cottage, Balco Sussex.

GARDENER seeks SITUATION as KITCHEN GARDENER; good knowle Rose Trees and Carnations, all Hardy Annuals, et also good knowledge of Poultry; good charact THOMAS RUSSELL, 25, Stockwell Road, Sunny East Grinstead, Sussex.

GARDENER, SITUATION required Gentleman's Garden, age 21; 3½ years in place. Sussex or Surrey; highest references; di gaged. L. F. BAGG, Freshfield, Sesynes Hill, ward's Heath.

IMPROVER, age 17.—W. MEADS stro recommends C. COLLIN as above; 2 years sent place. C. COLLIN, Goldicote Cottages, S ford-on-Avon.

RICHARD SMITH and CO., LTD., beg announce that they are constantly rec plications from Gardeners seeking Situations a they will be able to supply any Lady or Ge with particulars, etc. St. John's Nurseries, W

CARPENTER and JOINER seeks SIT TION on gentleman's estate; well up in a kinds of repairs; also can do painting, paperhanging, and glazing; married, no family; age 34, experience; 10 years' good reference. E. CO 8, Nye Road, Burgess Hill, Sussex.

GARDENING, YOUNG LADY wish DAILY ENGAGEMENT in Flower or Fren Vegetable growing; small salary after first month. Q., 9, Cricklewood Broadway.

HANDY MAN seeks SITUATION estate; charge of electric plant; fill up in garden; good references. DORLING, Lon Road, Brandon, Suffolk.

HANDY MAN on Nurseryman's or Gent man's estate; hot and cold water fitter, painting stoking, and do all general repairs; look after eng and pumps; age 38. H. R., 33, Sperling Road, To tenham.

SITUATION required as GARDENER. Son to assist if necessary; used to Pigs, Poult Horses; not object to one cow; age 36; good re personal or otherwise. E. AUSTIN, c/o Vine C Middle Road, Leatherhead.

STOKER, 10 years' experience in l London Market Nurseries; age 34; marr Apply STOKER, 48, Fifth Avenue, Bush Hill Park.

TWO thoroughly experienced MEN, with knowledge of Ground Levels, Cricket and Ten Grounds, Bowling Greens, etc., etc., are prepared undertake any of the above jobs at once; best re ences; any district. Address Mr. W. PAGE, Standen Road, Southfields, S.W.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Vegetable Poisons.

So much interest has recently been evoked by Sir E. Ray Lankester's remarks on the Poison Ivy (Rhus Toxicodendron) and other poisonous plants, that a word or two on the subject generally cannot be out of place. As has been pointed out, the susceptibility to some of these subtle poisons varies greatly in different individuals. Some may handle such plants as the one in question and Primula obconica, or other toxic plant on a larger scale, with impunity, while others suffer seriously, [illegible] maybe, by too close approach. What the difference is in the human constitution which determines such immunity or susceptibility is quite unknown, as it is in the not rare cases where honey cannot be eaten without serious toxic effects, independently apparently of the flowers which yield it. The production of most vegetable poisons we must probably regard as a means of self-defence on the part of the plants concerned. The stinging hairs and toxic juices must be admirably adapted to keep a host of foes at bay. There are also many poison drugs, popularly regarded rather as boons than banes, such as quinine, salicin and other tonics, which are really poisons in the sense that only very small quantities can be taken without severe results or even death. These pervade the barks of the trees concerned, and by their bitterness are presumably well adapted to prevent the attacks of boring insects, which are so often fatal to tree life. It is a curious fact that most of the deadly poisons are vegetable: Strychnine, Aconite, Nux Vomica, and Prussic acid may be cited as instances, the last-named, by its pronounced almond-like odour, betraying its presence in the stones of some of our most prized fruits, such as the peach and nectarine. Belladonna or the Deadly Nightshade constitutes another of these curious associations with nutritious foods, not indeed in itself, but as a member of an order which includes the familiar potato, the foliage and berries of which have slightly narcotic qualities. This order, viz., the Solanaceæ, is peculiar in not merely embracing the two plants named, but also Tobacco, which is deadly enough in its concentrated form; the Henbane, the roots of which have sometimes been mistaken for parsnips, with fatal results; the Datura, of which many species are powerfully narcotic; and the Capsicum, which, if not actually poisonous, is intensely irritant; while, on the other hand, it includes the Tomato, the edible Winter Cherry, and physalis, the so-called Cape Gooseberry, also edible. It is very remarkable that seeds of all of these boons and banes might be planted in precisely similar soil, exposed to precisely similar conditions, and yet the little formative cells of each would form such different chemical combinations out of precisely the same ingredients, the innocuous earthly salts and the equally innocuous, or at any rate, inert, carbonic acid of the air. These are absorbed through the roots and the stomata of the foliage, and, on the one hand, transformed into nutritious tubers or luscious fruits, while on the other these harmless constituents are broken up and rearranged to form some of the most virulent poisons known. It is, however, somewhat a mistake to dub these poisons banes, implying deleterious qualities only, since the physician, by careful study of the effects they produce on the human system, has acquired the power in most cases of utilising them in minute doses as curative boons instead. Nearly every poison, if not all, is only fatal if taken in excess. In effects they differ very markedly from each other, affecting different organs in different ways as many diseases do; and thus by studying the effects of the latter, those of the former are brought in to counteract by opposite action, and thus restore a healthy equilibrium. We thus see that an assumed bane may be a boon in disguise, knowledge only being required as to its application. The plant world is exceedingly rich in material for study of this kind, every species contrives to distil its own particular juices, pleasantly aromatic or nauseous, stimulating or narcotic, nourishing or poisonous, sweet or bitter, and so on ad infinitum. In the old herbals we see an immense accumulation of absurdities based on false assumptions in this connection, but in these later days the researches of the chemist and physician have led to deeper and therefore better knowledge, though, as with all study of Nature's wonders, they do but stand upon the threshold.

MR. GEORGE MASSEE, V.M.H., F.L.S.

Mr. George Massee, V.M.H., F.L.S., the celebrated mycologist, is well known by name and by his works to most of our readers. Mr. Massee has for many years been principal assistant (cryptogams) at the Herbarium of the Royal Gardens, Kew, and it has been his duty not only to identify cryptogams, chiefly fungi, and establish new species, but also to work out the life history of the numerous fungi that attack cultivated plants. Mr. Massee's "Text-Book of Plant Diseases caused by Cryptogamic Parasites" is one of the handiest and best on the subject. Since the Royal Gardens, Kew, came under the Board of Agriculture and Fisheries, much of Mr. Massee's work on plant diseases has been published in leaflet form or in the "Journal" of the Board, and by this means information relating to the cause, identity, and cure of many pests of the farm and garden has been widely distributed. Mr. Massee's work is, naturally, not of a showy character, but it is eminently useful and valuable work, and has been recognised as such by the Royal Horticultural Society, which conferred the honour of V.M.H. upon him a couple of years ago. In his younger days the spirit of adventure drew Mr. Massee to many countries, and placed him in many curious and sometimes dangerous positions, and he has a fund of anecdote relative to his travels which, coupled with a keen sense of humour, makes him a splendid companion, especially when he takes the Kew Botany Club for a ramble, or when he goes on tour for a few days in Yorkshire or Essex, with a naturalists' or field club, in search of rare fungi.

The Pleasaunce Gardens, Overstrand.—For some years previous to his death, the late Lord Battersea very generously gave his neighbours and others an opportunity of participating in the enjoyment which the marvellously beautiful gardens of his marine residence at Overstrand are so well able to afford, by opening them to the public on Sunday afternoons during the summer. This generosity has been highly appreciated and taken full advantage of both by residents in, and visitors to, the district of which Cromer is the centre, and some thousands have visited the gardens each year. The generosity shown by the late Lord Battersea has been continued during the past summer by Lady Battersea, who takes the keenest interest in the delightful gardens of the Pleasaunce; and on the Sunday afternoons during July, August, and September, upwards of 8,000 visitors passed through the gates. A charge of threepence is made for admission, and the whole of the amount received is devoted to charitable and other beneficent objects. The amount received this year is about £100, and from it the Gardeners' Royal Benevolent Institution will receive a grant of £5. It is gratifying to learn from Mr. Naylor, her ladyship's head gardener,that not the slightest damage has been done to plant, fruit, or flower by visitors to the gardens on Sunday afternoons.

Wisley School of Horticulture.—The report of H.M. inspector on the Wisley School of Horticulture for the year 1907-08 is highly satisfactory, inasmuch as it shows that the educational work at Wisley is being well carried out. The inspector reports that the course of instruction is designed to cover two years, but as yet only the first year's course is in full operation. The course is extremely well planned, and is carried out by an efficient staff of instructors. The advantage of the well-fitted laboratory, with good equipment for instruction in the sciences bearing on practical horticulture is pointed out, and it is mentioned with satisfaction that "The laboratory is under the charge of a well-qualified and skilled instructor, and the students receive a very thorough training in the scientific side of their craft." With reference to the practical side, the report states that the students appear to have an unique opportunity of acquiring a knowledge of the cultivation of all the plants that they are likely to meet with in the course of their employment.

John Laing and Sons, Lim.—This company has been formed for the purpose of acquiring the business of Messrs. John Laing and Sons, at Forest Hill, which was purchased some time ago by Mr. William Henry Russell, of Haverstock Hill, and is now carried on by him under that name. The prospectus is now before us, and from this we learn that the capital is fixed at £5,000 in £1 shares, and that the purchase price to be paid to Mr. W. H. Russell, who is the vendor and promoter of the company, has been fixed at a sum of £4,000, payable as to £3,000 in cash and as to £1,000 in fully-paid ordinary shares of the company of £1 each. The leases, stock, etc., mentioned in the contract of sale have, it is stated, been valued by Messrs. Protheroe and Morris as a going concern at £2,906 13s., but no information is given in the prospectus with respect to the area of the nurseries, the length of time the leases have to run, or the value of the stock, points of primary importance to the intending investor. The goodwill is valued by the vendor at £1,093 7s., and that amount of the purchase price will be paid in respect of the goodwill. This appears to us a very liberal estimate of the value of the goodwill, seeing that, according to the prospectus, "the business has for some years been neglected, and allowed to fall off, and, since 1902, it has practically made no profit."

Festivities at the Lowfield Nurseries.—On Saturday, the 26th ult., Messrs. J. Cheal and Sons entertained their employees, with their wives and families, to celebrate the recent marriage of the second daughter of Mr. and Mrs. J. Cheal with Mr. E. Wright, of Manchester. The guests numbered about 250, and having received a hearty welcome from the members of the firm, proceeded to take part in the cricket match, or to explore the nurseries, the great display of dahlias proving highly attractive. At the close of the match the company adjourned to a large marquee, where a substantial tea was served. This function was followed by a tug of war, and in the evening there was a lantern entertainment in the marquee. On the party reassembling for the entertainment, Mr. J. Cheal, in the course of a short speech, referred to the pleasure the firm had in meeting their employees in social intercourse. Mr. Alex. Cheal spoke in similar terms, and Mr. E. Wright thanked the employees for the handsome present they had made Mrs. Wright. Mr. C. W. Chantler and other of the leading members of the staff made brief speeches appropriate to the occasion.

The Public Parks and Gardens of the United Kingdom form a very interesting feature of our national horticultural life, and as the editor of the "Gardening Year Book" for 1909 is anxious to record the correct title and area of these parks and open spaces, he will be very greatly obliged if the superintendents will send him these particulars, as well as their own name and address. Secretaries of horticultural and gardening societies are also requested to furnish him with particulars of their societies, with dates of exhibitions, etc. The information should be sent as early as possible to the Editor, "Gardening Year Book," 148 and 149, Aldersgate Street, E.C.

American Gooseberry Mildew in Kent.—At the monthly meeting of the Maidstone Farmers' Club it was reported that the American gooseberry mildew had now made its appearance in practically every part of Kent where gooseberries are grown in any quantity. One member, who resides in the neighbourhood of Maidstone, stated that he had been obliged to destroy as many as 45,000 trees, and he regarded the outlook of the gooseberry industry in Kent as very gloomy. It was the opinion of the majority of the members that nothing short of the destruction of the affected trees could stamp out the disease. The club passed the following resolution: "That this meeting regrets the inaction of the Board of Agriculture in the earlier stages of the American gooseberry mildew, when the disease might have been stamped out, and urges upon the Government the crying need of a properly qualified department to deal only with fruit culture, upon the lines laid down by the Departmental Committee of 1905."

Damson Crop in Shropshire.—The Market Drayton, Shropshire, damson market was held on the 23rd ult., and for the second successive year, the local crops were so large that fully 100 tons of fruit were sold in the open streets. The price ranged from 4s. 6d. to 5s. 6d. per pot of 90lb., and the greater proportion was consigned to the principal Lancashire and Yorkshire centres, and the Potteries.

The Potato Crop continues in a satisfactory condition, notwithstanding the wet weather experienced during the month of September. Disease has made its appearance in many districts, but, owing to the low temperature that obtained, it has not spread sufficiently to do serious damage, excepting in a few instances. As the late-keeping varieties have practically completed their growth and are in capital condition for lifting, we strongly advise their being taken up and clamped or otherwise stored with as little delay as possible. In some cases a slight increase in bulk might be obtained by leaving them in the ground a little longer, but there will be a risk of loss from disease and a considerable deterioration in quality, more especially in the case of crops on heavy soils.

Mr. H. Hemsley, the author of "Rock and Alpine Gardening," who has for many years been with Messrs. J. Cheal and Sons, Crawley, has now commenced a business of his own, at Crawley, as nurseryman and seedsman. He purposes to make a special feature of Rock and Alpine Gardening, and the laying out of grounds and gardens.

The Dahlia Difficulty. — The beauty and usefulness of the dahlia seems to be in very great danger of being overlooked, chiefly because of the consistency with which raisers strive after exhibition blooms rather than garden plants. If proof of the possibility of this danger is needed, it can be found in the lack of general interest in dahlia exhibitions and the want of widespread enthusiasm for the flower as a class. More dahlias of use for garden decoration are needed, especially among cactus varieties, and we feel sure that a thorough trial of these latter, in some place where it could be readily inspected, would be of immense value to those engaged in the dahlia trade. Could not the National Dahlia Society and the London Dahlia Union combine to conduct such a trial in the London district? "The Times," in an article on "Florists' Flowers," recently pointed out that "the public taste in flowers would be far better and less fickle than it is, if it considered not the flower alone, but the flower in its relation to the plant that bears it." In a large measure this is correct, but if the flower-loving public had an opportunity of determining the relative merits of the varieties for garden decoration, as such a trial would afford, it would soon leave exhibition varieties to competitors and [illegible] those of real garden value.

LILIUM UMBELLATUM.

Originally introduced from Siberia, and named Lilium davuricum, this lily is now generally cultivated in gardens under the name of Lilium umbellatum. This name is clearly derived from the form assumed by the flowers, which usually crowd the stems in the form of an umbel, though not always approximating to the best type of its inflorescence.

Lilium umbellatum is a common lily, robust in growth, free in flowering, and, if it does not approach in beauty the more chaste forms, the fact of being so readily amenable to cultivation in gardens gives it a strong claim to recognition. By judicious planting it is always possible to so [illegible] it that the showy flowers will impart to the less important parts of the garden a spirit of cheerfulness, especially where there are heavy masses of foliage subjects.

The question of soil, which to so many of the best lilies is of much importance, is a matter of extreme indifference to these vigorous subjects. I may instance such [illegible] soils as peat and chalk, in which they not only grow with marked freedom, but in which they increase in a most surprising manner. The plants obtained from a small parcel of bulbs which I had four years ago are now a perfect thicket of [illegible]. The original bulbs of Incomparable—which well merits the name—is this year producing stems fully 4½ft. in height, and crowned by what may be fittingly described as myriads of blossoms. Crowding around the parents are the baby bulbs, which, in many instances, already bear [illegible] developed heads of flower.

The depth to plant these lilies may not always be regarded as of primary importance, yet I find that shallow-planted bulbs have neither the vigour in stem nor yield the flowers with the same freedom as bulbs which are planted a good 6in. deep. This lily develops, under deep planting, a perfect system of basal roots, and to this fact I attribute its marvellous powers of life and its capacity for contesting the ground with the hungry roots of shrubs, for it is evident that these roots will always tap moisture in the lower strata of soil, even in periods of extreme drought.

Lilium umbellatum succeeds either in full sun or in positions not too densely shaded. It is very effective when liberally planted in informal groups among shrubs, to which it makes an effective and pleasing contrast, the strong colouring of some varieties being effectively toned down by the dull foliage of evergreens. This lily may be planted any time after the stems begin to ripen until spring. September is an ideal season for the work, as the bulbs have then every chance of becoming established, and consequently cannot fail to bloom well the following year, the flower-season being from the middle of June till the second week in July.

Varieties of L. umbellatum are numerous, though some are not very distinct; the best is unquestionably Incomparable, which has rich deep crimson flowers, the segments forming a neat goblet-shaped blossom. Grandiflora is second in vigour, the stems are scarcely so tall, the flowers more open and coloured orange-scarlet, with irregular splashes of a deeper colour. Maculatum is similar in colour to the last-named, having small black spots freely scattered along each segment. Erectum is also orange-scarlet, with large blotches of a deeper colour marking the petals. Sappho has light orange-yellow flowers tipped with red. Cloth of Gold, rich yellow, and aurantiaca, orange-yellow, are both hybrid lilies from Umbellatum; in these the colouring is more refined, the stems more flexible, and their general character more elegant than in the forms of Umbellatum already named.

Thomas Smith.

Walmsgate Gardens, Louth, Lincs.

DOROTHY PERKINS ROSE.

This fine rose is unquestionably one of the very finest of our rambling varieties, and it makes a fine companion for such splendid roses as Crimson Rambler and the newer single Hiawatha. I have seen Dorothy Perkins used in a variety of ways, and while it is extremely beautiful when grown up a stout oak post, so as to provide a very fountain of beauty and fragrance, I fancy it is never seen to better advantage than when it adorns a rustic arch. Its merits as a pot plant we all know full well, but the fullest freedom of growth and bloom are only to be seen when, planted in good soil, a plant or plants takes possession of an arch, as in the case of the example shown in the accompanying illustration. Ravenscourt Park, Hammersmith, is not considered an ideal rose district, for it is within the Metropolitan area, but there are many good gardens in the district, and Mr. Gingell, the superintendent of Ravenscourt Park, always provides an excellent display. As a town rose Dorothy Perkins has unquestionably strong claims to attention from owners of gardens large enough to afford room for roses.

FINE ARCH OF DOROTHY PERKINS ROSE IN RAVENSCOURT PARK, HAMMERSMITH.

RHODODENDRON ARBOREUM AND ITS VARIETIES.

The example of Rhododendron picturatum, herewith so admirably illustrated, represents a group of rhododendrons which are rarely, if ever, seen in perfection in gardens north of London, except it be in a few favoured localities, such as the West coast of Scotland, where the climatic conditions are very similar to those of Cornwall, though it is, perhaps, the commonest type of the genus grown in the south-west counties of England, Ireland, and Wales. This group is composed of a very large assortment of varieties and hybrids, all of which bear more or less resemblance to R. arboreum, which may be cited as the type of this particular group. R. arboreum is a Himalayan species, and thrives excellently in Cornwall, growing to a height of between 30 and 40ft., with tree-like trunks a foot or more in diameter. The best type of R. arboreum bears dense, shapely trusses of blood-red flowers, but there are numerous varieties found wild, with white and pink blooms. These particular forms have been crossed and the various coloured varieties now in cultivation are the result. Very fine examples of R. arboreum and varieties in Cornish gardens are to be found at Tregothnan, Carclew, Penjerrick, Tremough, etc. The last-named garden has long been famous for its rhododendrons, its owner Mr. Shilson being specially interested in the genus. W.

RHODODENDRON PICTURATUM IN AN IRISH GARDEN.

NOTES FROM KEW.

◆

Erica ciliaris var. Mawiana.

This is possibly the choicest of the autumn-flowering heaths, and, although now stocked in quantity by some nurserymen, it has only been during the last five years or so that large numbers of it could be purchased. It is a strong-growing and very free-flowering variety of the European E. ciliaris, and, like that species, it is extremely hairy. E. ciliaris is found in some parts of Britain, notably in the south-west counties, whilst it is common in many parts of the Continent. The variety has a local distribution, and occurs in Portugal. It differs from the species in its denser and more upright mode of growth, more luxuriant leafage, and denser heads of large red flowers. The flowers individually are larger than those of any other hardy heath, and are peculiar by reason of the inflated corolla. The first blooms open during late July, and throughout August a very fine effect is produced. These terminal heads of flowers die, and after about a fortnight with few flowers, a second lot appear from secondary shoots which last in good condition until well on into October. Like other ericas, this is seen at its best when planted in large masses, either alone or associated with E. ciliaris. It may also be used with the white form of E. vagans, and in this way is very effective.

Ulex Galli.

The French gorse, as this species is commonly called, is one of the most effective of our British plants during September, and many a hillside and common is made gay with its rich golden blossoms intermixed with ling and heather. It differs from the other species of gorse by reason of its dwarf, compact habit. Very often it is confused with U. nanus, which, however, is very different, being looser in habit, with softer and less ferocious spines than the French gorse, whilst it is less free in blooming and the flowers are smaller. U. Galli may be distinguished by its dense habit, forming, as it does, dense cushion-like masses a foot or so high with stout, strong spines. At the flowering period the blossoms are borne with such profusion as to almost hide the spines, giving each plant the appearance of a golden globe. Although usually seen in a wild state, it is a subject that might well be introduced into the wilder parts of park or garden, and in conjunction with its natural companions, heather and ling, very effective pictures could be formed.

Nymphæa stellata.

For the past two or three months a fine example of this blue water-lily has been flowering finely in the water-lily pond in the arboretum at Kew, it rarely being without two or three flowers open, whilst on sunny days upwards of half-a-dozen have sometimes been developed at once. N. stellata is a native of tropical Africa and Asia, and is usually grown indoors, though several records have been made of its blooming out-of-doors; in fact, Mr. Hudson, of Gunnersbury House Gardens, has grown it in the open for part of the year for a long while. In the position where it is flowering at Kew it has one great advantage, that being, that the water in its immediate vicinity is slightly warmed, for near by a pipe, carrying waste warm water from the pumping engines enters the pond. That it is quite at home in this position is evidenced by its large, healthy foliage, and large rich-coloured flowers which are thrown up well above the water on strong stalks. The plant was started indoors and placed out in May, the leaves then being about three inches across. A couple of specimens of N. lotus devoniensis have been tried in the same position, and these have also answered well.

Cotoneaster horizontalis.

Of the dwarf-growing cotoneasters this is one of the most beautiful, as it is of distinctly ornamental appearance when in leaf only, whilst it is very attractive in autumn when covered with its bright scarlet berries, and doubly so when the leaves have taken on the orange and scarlet shades previous to falling. As a flowering plant it cannot be recommended, for although it blossoms profusely, the flowers are poor and never open widely, as those of many other sorts. When grown in the open ground it rarely exceeds 1½ or 2 ft. in height, spreading out horizontally to some considerable distance. Planted against a wall it behaves in a rather peculiar manner, for it grows up the wall to a height of 8 or 10ft., and throws out flat branches almost at right angles from the parent stem. It is in this position that the full beauty of the berries is obtained, for they are brought up on a level with the eye, whereas when grown as a low bush they are partly hidden by leaves.

Hibiscus syriacus "Blue Cœleste."

During August and September the hardy hibiscuses make a fine feature in the garden and brighten up many a shrubbery with their purple, white, blue, or parti-coloured flowers. The variety under notice is one of the most distinct of all as regards colour, for the flowers are blue, whereas most of the others are of various shades of purple, red, or white. Like other sorts, it forms an upright bush, and attains a height of from 5 to 7ft. It thrives in ordinary garden soil, likes a sunny position, and may be increased by means of cuttings placed in sandy soil in a warm case in August, by thoroughly ripened wood planted out-of-doors in November, or by grafting on to pieces of root in spring. For the first two or three years growth is slow, but after the plants have attained the height of a foot or so growth is more rapid.

D. K.

REHMANNIA ANGULATA IN THE OPEN.

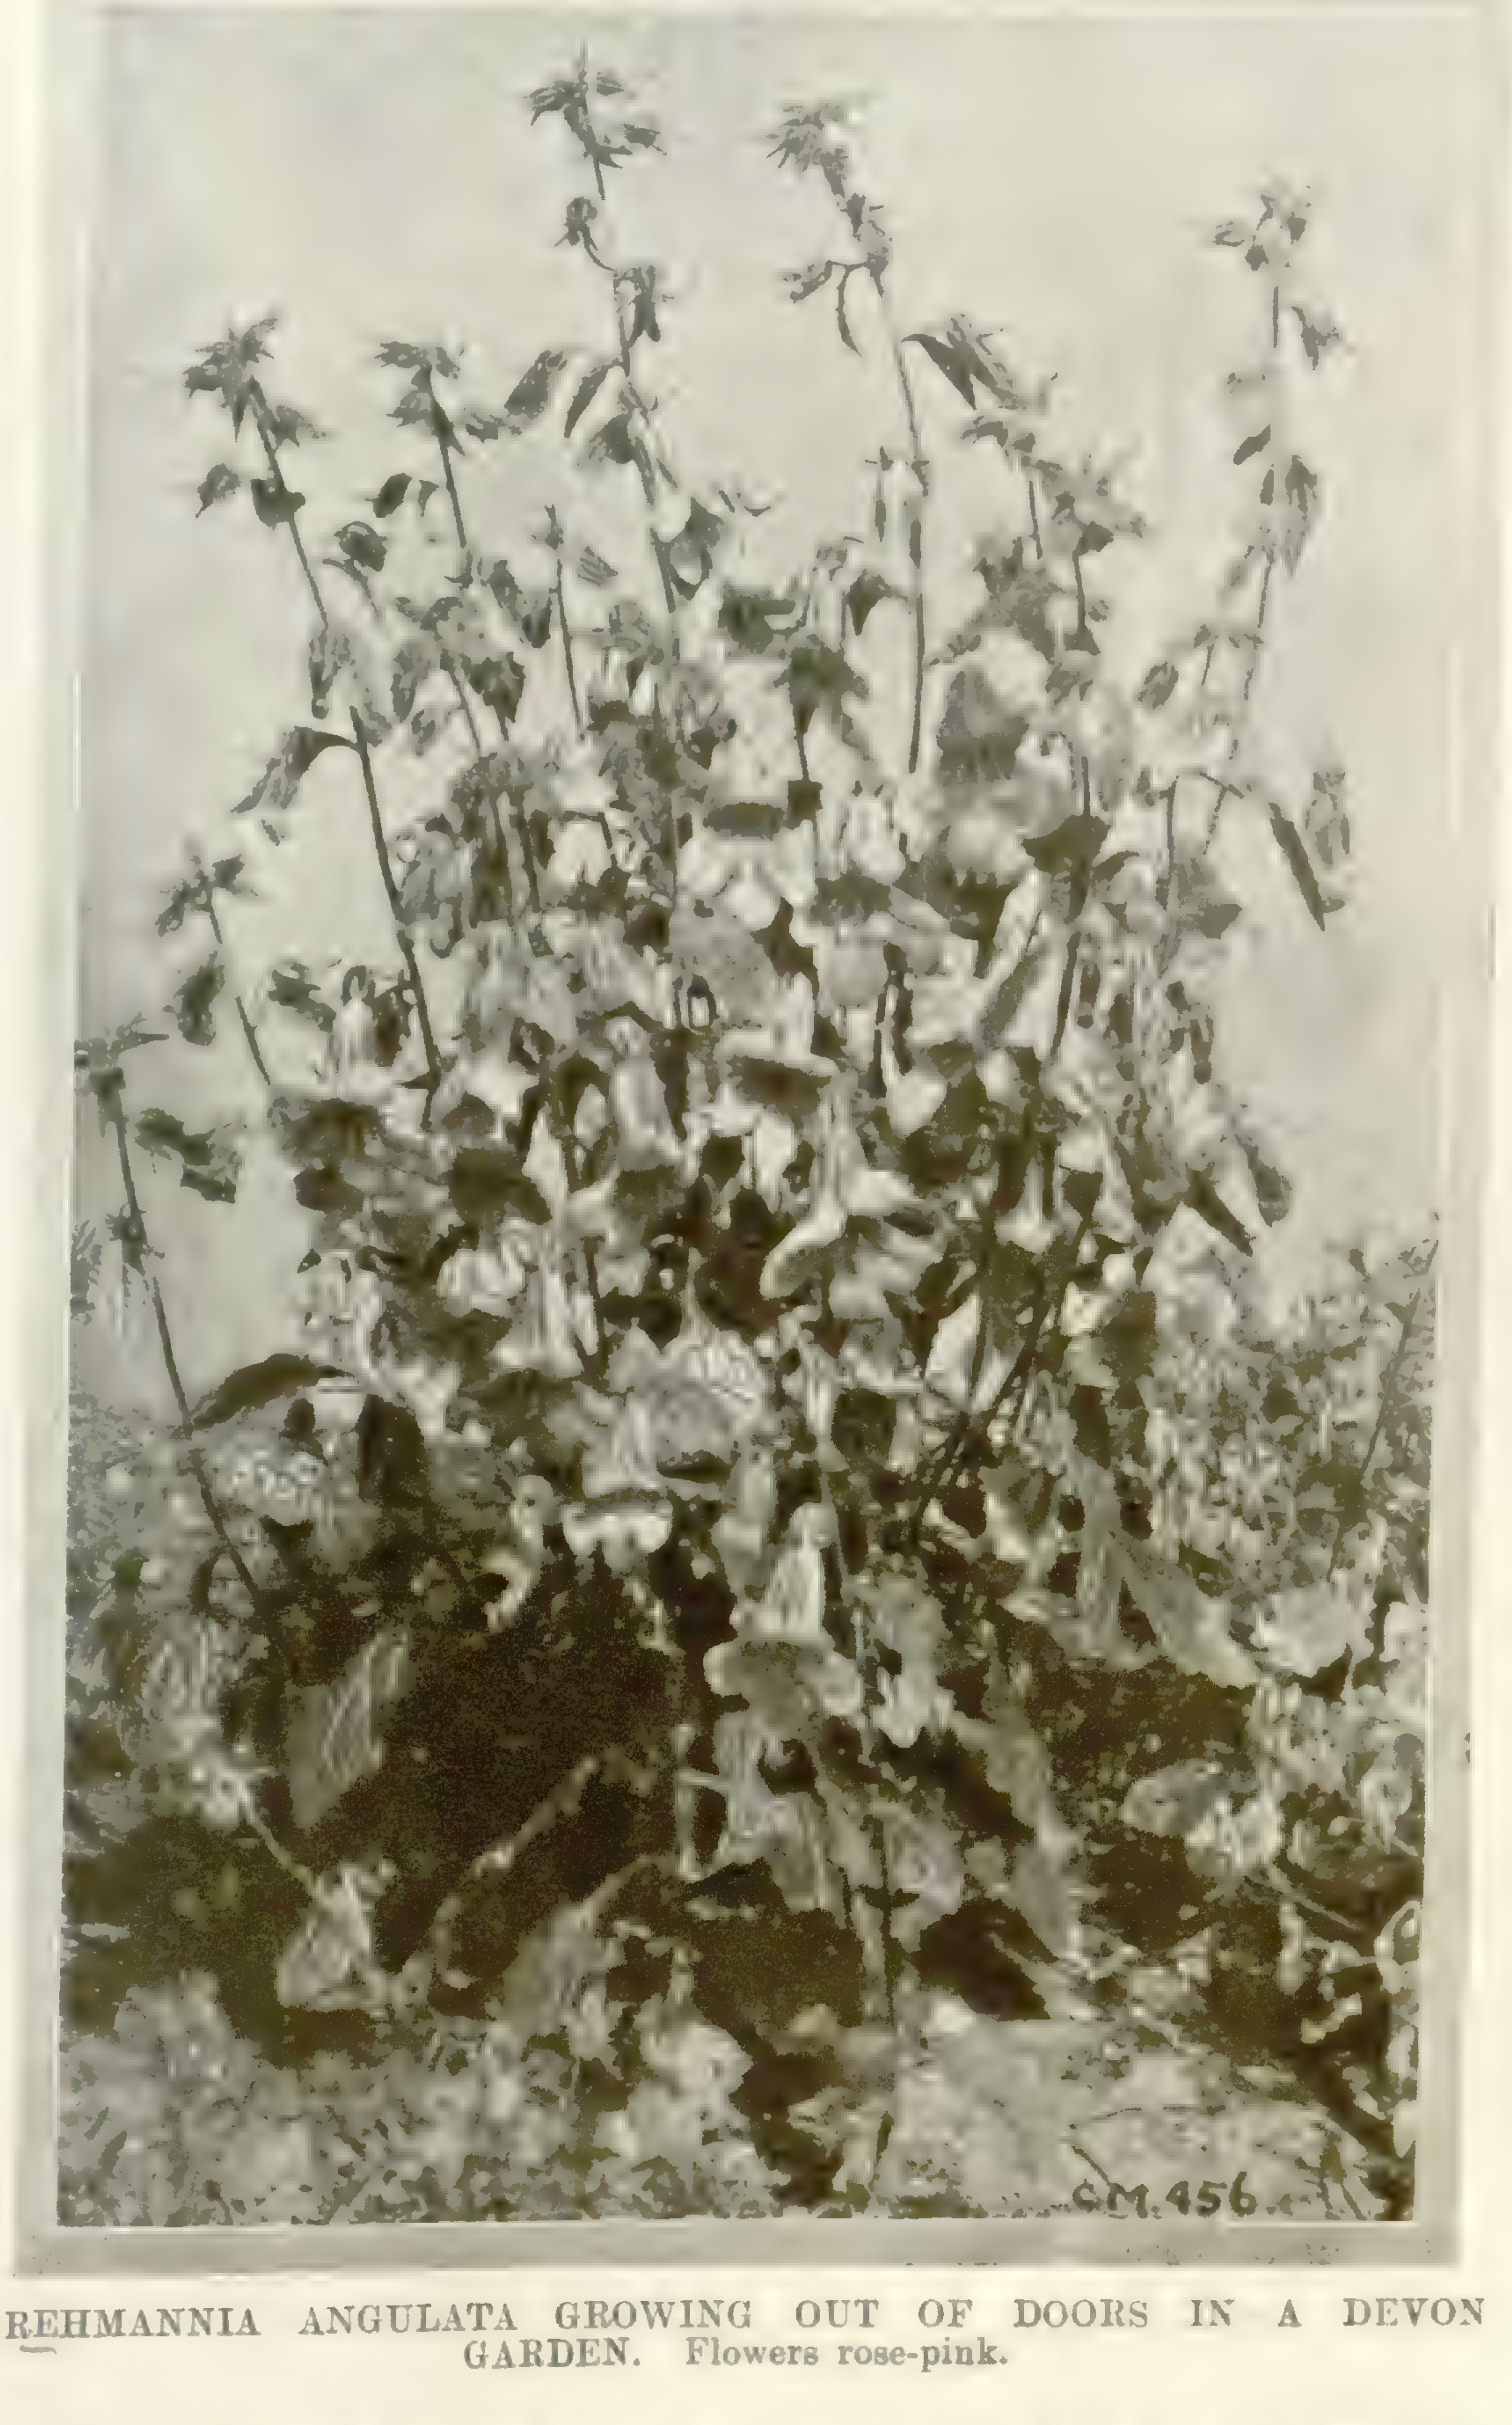
This fine perennial was introduced by Messrs. James Veitch and Sons from Central China a few years ago. In the south-west it proves perfectly hardy, having been uninjured by the two last winters, which were exceptionally severe for that district, though entirely unprotected. The specimen shown in the illustration was well over 3ft. in height, and was covered with flower for many weeks, being a most attractive object in the border. This year, although alive and flowering, it is not so fine, and it is probably advisable to raise plants from seed every year and to plant the seedlings in the open in the spring in order to obtain the best effect, as the old plants appear to decrease in vigour with age. A fine variety of this plant, named Pink Perfection, has been raised by Messrs. Robert Veitch and Son, of Exeter, the colour of which is clearer and more pleasing than that of the type. The large blossoms are of a bright pink tint, and have a distinct pale throat, heavily mottled with crimson-maroon. The spikes are often from 4ft. to 5ft. in height, and it is a notable improvement on the type.

As regards its cultivation, seed should be sown in July or August for flowering the following year, and the seedlings, as soon as they are large enough to handle, should be pricked out of the seed-pan and transferred to 2½in. pots in a compost of one part leaf-mould, two parts loam, and sufficient silver sand to render it porous. The plants should be grown in a frame close to the glass, plenty of air being given them to ensure sturdy growth. When they are thoroughly established they may be shifted into 5in. pots, with a little cow manure introduced into the compost, and in these they will flower well. Should, however, extra large specimens be desired they may be given another shift into 8in. or 9in. pots. This should be done at the beginning of the year. Weak liquid manure given from the time they are established will add appreciably to their vigour.

The plants increase rapidly by offsets, which are often thrown up at some distance from the main clump. It is very useful for the conservatory, where a group will form a very striking and distinct feature with its large bignonia-like flowers. It is of the easiest possible culture, and can be grown well by any amateur.

S. W. Fitzherbert.

Primula Kewensis. — Plants from seed sown in spring are coming into flower, and a few of the stronger ones may be potted on, removing all the flower buds until they are established in the new soil. Help the remainder with weak liquid manure, and give them a light position in the house at all times.—T. B. Field.



REHMANNIA ANGULATA GROWING OUT OF DOORS IN A DEVON GARDEN. Flowers rose-pink.

COLCHICUM BORNMUELLERI.

The variety of the meadow saffrons awaiting the cultivator of such flowers is now much greater than formerly, and the acquisitions of comparatively recent years have added much to the delights given by these flowers in autumn time, even if some have too much of that aggressive purple hue obnoxious to a number of people.

These recent acquisitions, combined with the cheapening of such fine colchicums as C. speciosum, have rather cast into the shade the single varieties of our common meadow saffron, Colchicum autumnale, but they have otherwise increased the store of good things available for our gardens, and, as they are such fine plants in themselves, they are worth securing, even if the price is rather heavier than we care for.

One of the finest of the newer meadow saffrons is C. Bornmuelleri, which differs much from C. speciosum, and is one of the finest of the larger forms. It comes a light lilac, almost white, but gradually passes into a deeper lilac, with a broad white centre, which gives it a good appearance when fully open in the sun. It has flowers of considerable substance, and these thus last longer in perfection than those of some of the other meadow saffrons. The leaves, which do not appear until spring, are bold and veratrum-like in their size and contour.

Like the others of the genus, as a whole, this meadow saffron prefers a strong and rather heavy soil, with a fair amount of moisture, but these are not essential, and it will thrive in any ordinary border or in the grass. Planting should be effected as early as the corms can be secured from the bulb dealers, and the crown should be from four to five, or even six, inches beneath the surface of the soil.

S. Arnott.

There is no better guide to the kitchen garden than Vegetables and Their Cultivation, by T. W. Sanders. It is a complete treatise on the general management of the garden, and the successful culture of vegetables saladings, and herbs for home use. Price 5s. net, by post, in box, 5s. 6d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

NATURALLY-GROWN BULBS.

The naturalisation of bulbous and kindred plants in shrubberies, under trees, and amongst the grass in the wilder parts of gardens, parks, and woodlands, forms one of the most pleasing features of modern gardening, and in many instances the judicious introduction of these charming subjects has effectively changed uninviting and uninteresting spots into fairy lands of beauty. At the present time a great many more bulbous plants of various kinds are used for grass-land than for formal beds, and they are infinitely more lovely sprinkled about haphazard amongst grass, than when huddled together in a round or oblong group, as sometimes happens.

Some bulbous plants, of course, are much better suited for naturalisation than others, and with some reservations, species, or good botanical varieties are better than highly-bred garden forms. For instance, several species of tulip may be used effectively, but it is of no use to attempt the many garden varieties. Hyacinths, represented by ordinary garden varieties, are of little value, whilst few sights are more charming than our common wild hyacinth. Many varieties of narcissi, on the other hand, naturalise splendidly, and continue to improve year after year, showing fewer signs of deterioration than those which are grown in beds and lifted annually.

AN EXCELLENT EXAMPLE OF TRUMPET DAFFODILS NATURALISING IN THE GRASS AT KEW.

Some consideration also must be paid to colour for different situations; for instance, reds look out of place in dark places, whilst yellows, whites, and blues can be accommodated almost anywhere. On the other hand, a few small patches, or single examples of a good red tulip are very effective in open grass-land. Then, too, to be successful, one must know whether a particular subject will continue to grow year after year amongst thick turf, for there are some subjects which last but one or two years when placed amongst thick or close turf, but grow luxuriantly in places where the grass is thin.

To obtain good results from bulbs grown in a wild or semi-wild state it is necessary to exercise great judgment in planting, for many an effort has been entirely spoilt by untasteful distribution of the plants. It is very difficult to get some men into the way of distributing the plants in a natural manner. Some have a leaning to perfect squares, others form irregular-shaped patches of unbroken outline, whilst the height of others' ambition is true circles. Anything like formality must be avoided, and wherever a large group is placed it should be of irregular outline, and carried away into the surrounding grass by means of smaller groups, with here and there single bulbs or small patches of two or three. In forming large masses it is a mistake to distribute the bulbs evenly, for they look much better if half-a-dozen or so are placed thickly together, then a few odd ones, and another or larger patch, and so on, with here and there a small space left for bare grass. A very good plan to adopt is to sow the bulbs on the ground, placing both main groups and outriders in position before any are planted. A glance at the bulbs as they lie on the ground will give an idea of the floral effect the following spring, and if any formality appears it can be rectified before it is too late. The planter will then follow on, taking care to plant each bulb where it lies. In planting, one of two methods must be adopted. In one case holes three inches deep may be made with a crowbar, into each of which a bulb can be dropped, after which the holes are filled with good soil. The other plan is the better one, especially where the ground is hard. This is to remove large or small irregular patches of turf, dig up the soil beneath, plant the bulbs, and replace the turf. Foresight must be used with regard to positions, for it must be remembered that although most bulbous plants are very beautiful when in blossom they become rather an eyesore before the leaves are ripe enough to remove, a period, in the case of most narcissi, which is little if any, before the end of June. From this it will be seen that it is not wise to place bulbs indiscriminately on lawns, for most people like to see their lawns close cut. Crocuses can be mown over a month or five weeks earlier than narcissi, consequently they are more appropriate for positions where the grass must be cut early. If planted in fairly good soil bulbs do not readily deteriorate, in fact they usually improve in quantity and vigour for many years.

It is not advisable for amateur planters to try rare or new kinds of bulbs for this work, for if this is done a very great deal of money will have to be expended for a comparatively small display. Old, well-tried varieties, that can be purchased at a few shillings a hundred, are quite as lovely as those which are priced at as many shillings or pounds each, whilst by taking care of old bulbs that have been forced an inexpensive start can be made.

For broad effects there is nothing to equal narcissi, and all are beautiful, from the tiny species minor and its varieties, which open very early in the year, to the common double daffodil, which makes many a wood and park beautiful with its rich golden blossoms during March, and later on to hosts of yellow, cream, and white varieties, some of which last into May. Particularly effective are such standard varieties as Emperor, Empress, Barri conspicuus, Stella, Sir Watkin, Burbidgei, Horsfieldi, and poeticus. The jonquil and campernel are also very lovely, but in dense grass they do not last many years in good condition.

A pretty effect is made in some places with Tulipa sylvestris, a yellow-flowered, somewhat rare British species. It likes light, warm soil, and thin grass, or bare ground beneath shrubs. It blossoms in May.

Among blues we have, during February and March, the pretty, tiny-growing Chionodoxas. Although they deteriorate in dense grass they thrive admirably in places where the grass is thin, beneath trees, etc., and are excellent for carpeting shrubberies and beds. In the latter positions they increase very fast, and may be thinned out every few years. They possess the advantage of losing their leaves quickly after the fall of the flowers. The best are C. Luciliæ, and varieties gigantea and sardensis. The wild hyacinths, or bluebells, are a never-ending source of pleasure to sightseers during May, and they have the advantage of thriving well under the shade of trees; in fact, that is their best place. The Spanish squill, Scilla hispanica, has larger flowers than our common bluebell, and is worth planting extensively. There are varieties with pink and white flowers. A plant far too seldom seen naturalised is Muscari conicum, known under the name of Heavenly Blue. It thrives well, and increases fast in shrubberies, and would doubtless do the same beneath trees.

Crocuses, yellows, whites, and blues, are all excellent for planting amongst grass. They are specially attractive when planted on rising ground, mounds beneath trees for instance, and even in poor sandy ground which is continually trodden during summer, they continue to thrive and increase almost indefinitely. They have the advantage of being cheap, and the leaves die off fairly early. Whether each colour is placed in a separate group or an indiscriminate mixture is made, the effect is equally charming.

Snowdrops are less adapted for planting in dense grass than crocuses, and frequently die out after two or three years. They, however, succeed well in places where the grass is thin, and increase rapidly beneath the shade of trees. For carpeting shrubberies they are also well fitted, and may be procured in large quantities at a cheap rate.

Although not frequently used, the Snake's-head Fritillary, Fritillaria meleagris, looks charming amongst grass. The bell-shaped, speckled flowers having an uncommon appearance.

Among plants other than bulbous there are several which are well worth attention. The winter aconite, for instance, always attracts attention in February when covered with large yellow, buttercup-like flowers, and it thrives excellently as an undergrowth for shrubberies. It rarely exceeds four or five inches in height, and dies down in early May. It possesses a thick, fleshy rhizome, which may be broken up when planting, as each little piece will grow. In the milder and moist counties Cyclamen coum is naturalised in lawns, and when in flower the myriads of rosy-pink flowers are very attractive. Dwarf anemones, such as blanda, nemorosa, and apennina, form excellent subjects for positions beneath trees where the grass is thin, whilst Anemone pulsatilla provides a beautiful spectacle when carpeting a thin shrubbery.

Although there are many more subjects that may be called into requisition, those mentioned will be sufficient to serve as a guide for intending planters.

Kew. W. Dallimore.

BLUEBELLS IN KNOWLE WOODS, KIMBERLEY, NOTTS. [Photo: A. W. Smith.

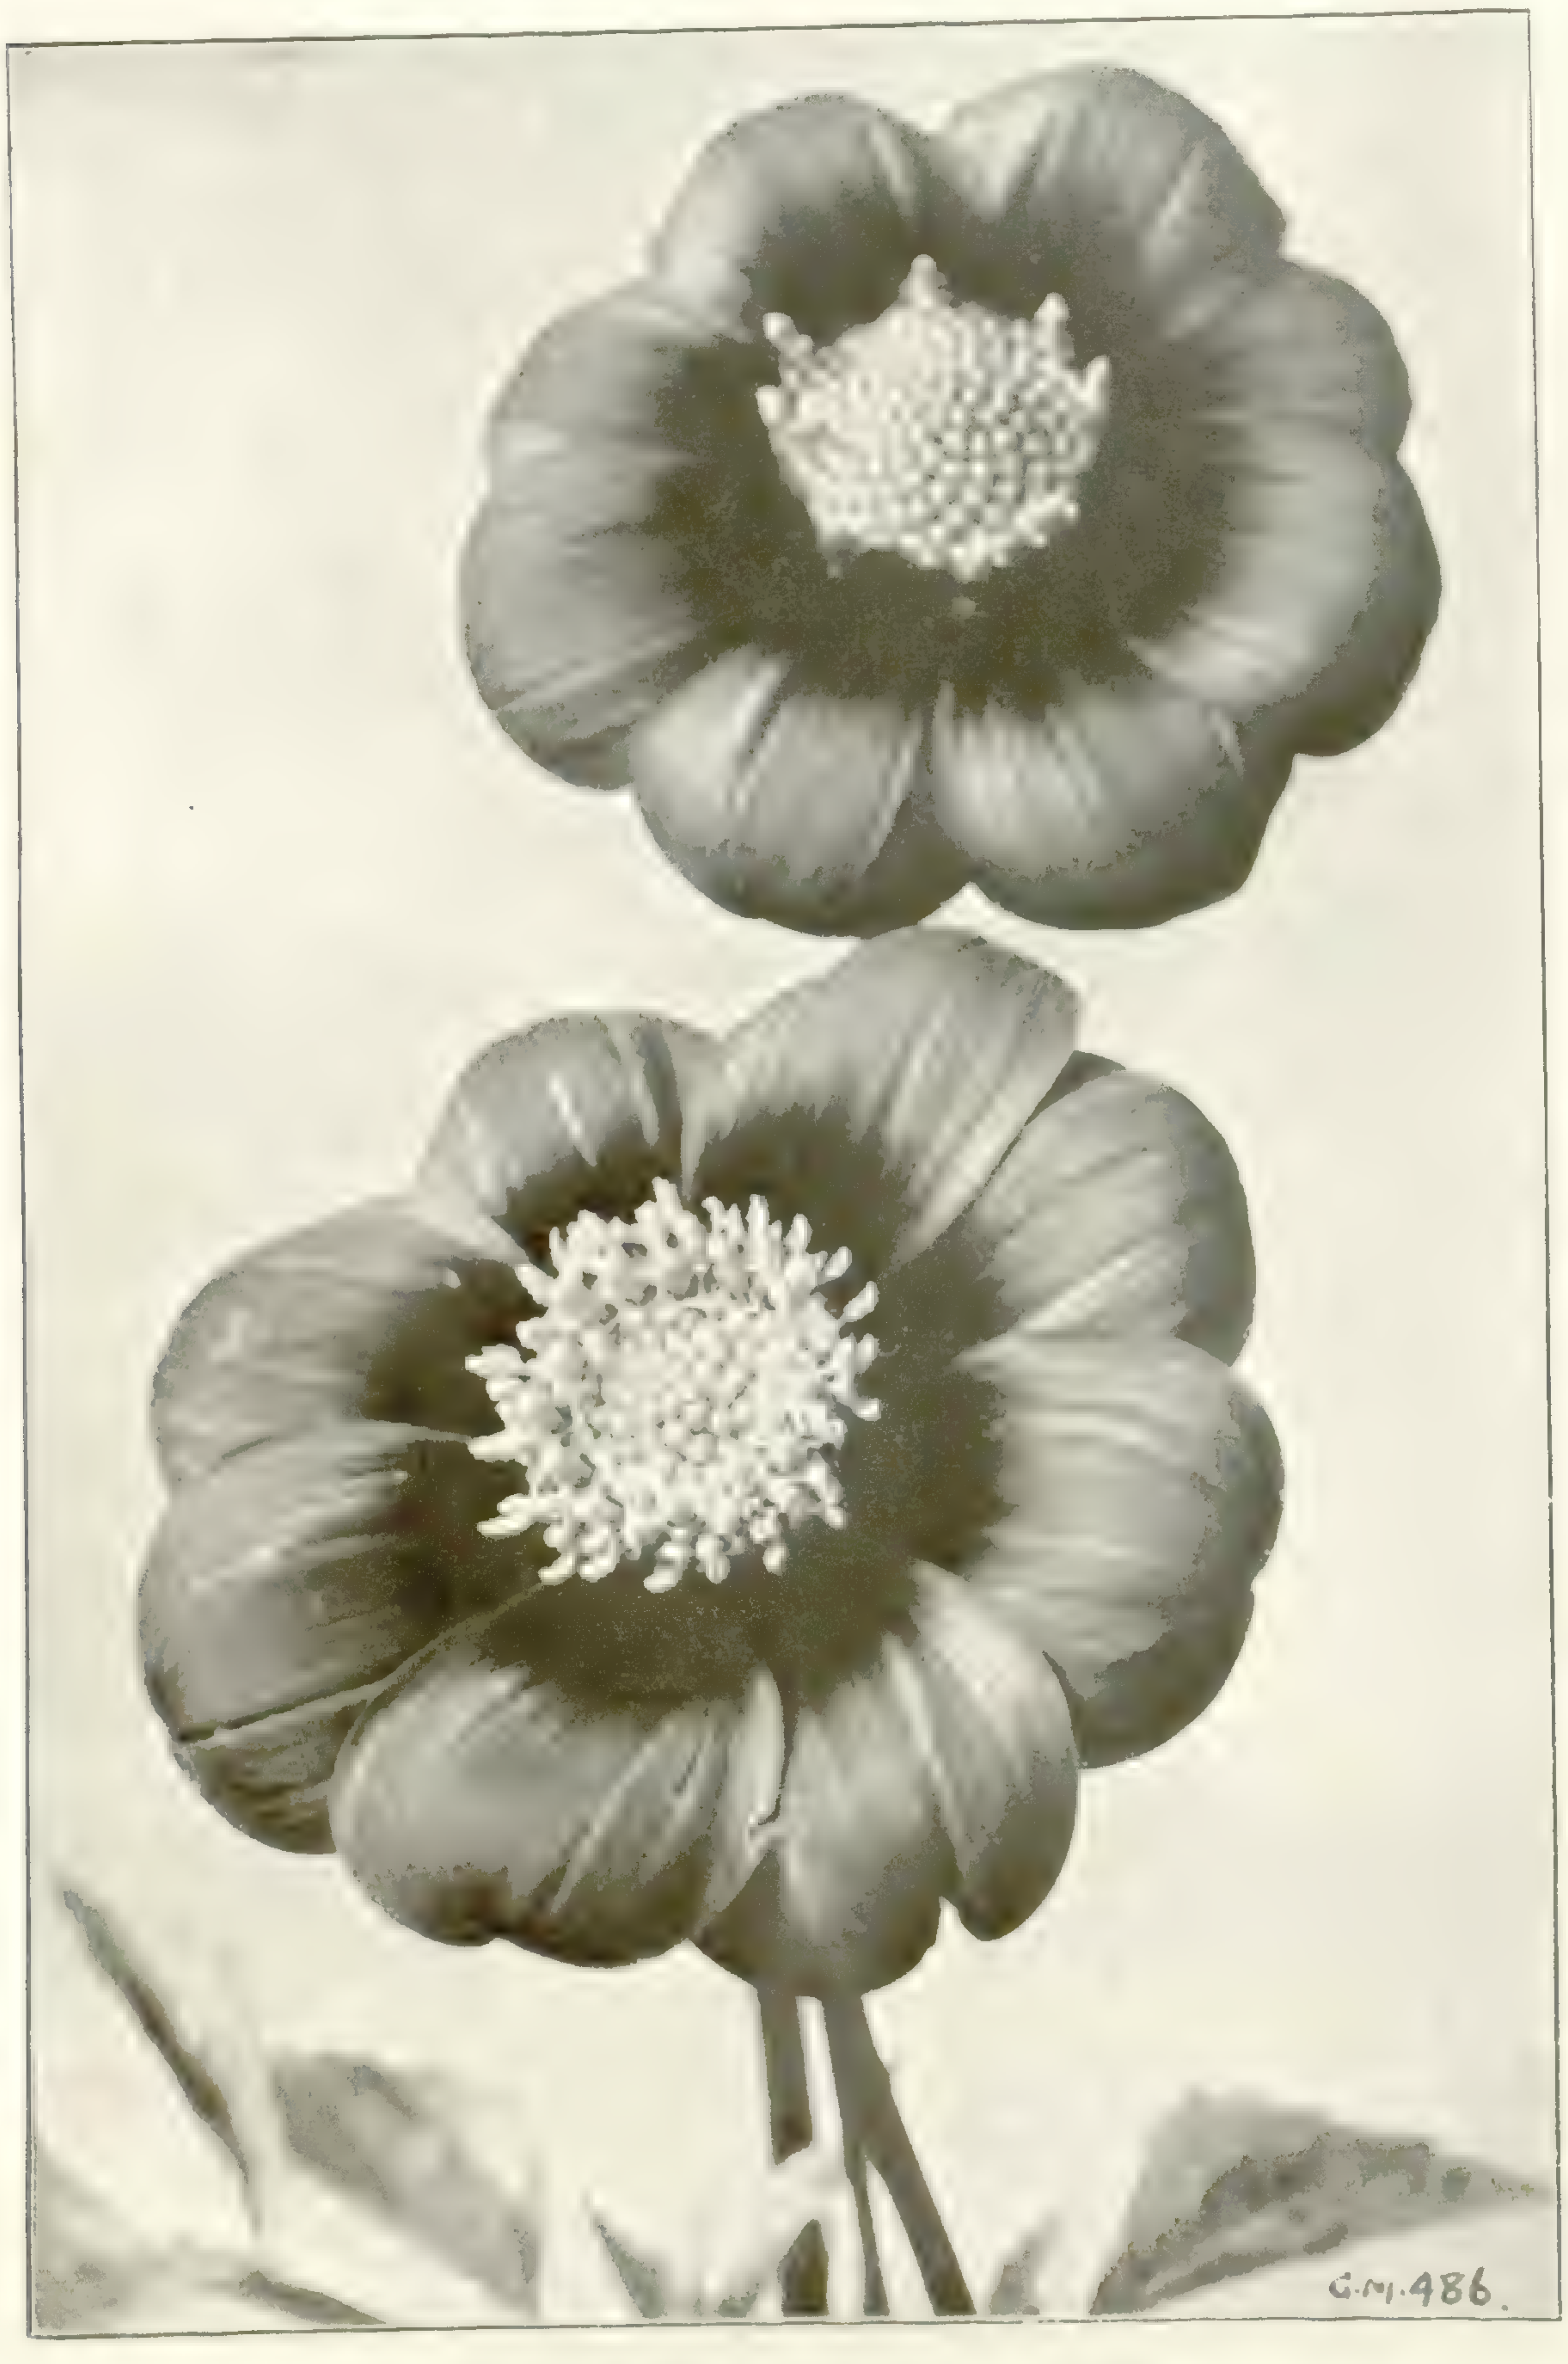
The woods are several acres in extent, and in due season they are carpeted with a mass of beautiful large bluebells, many of the spikes being 3ft. long. The woods are upon Mr. Holden's estate, Nuttall Temple, Notts, and they are visited by large numbers of people who travel long distances to enjoy the lovely bluebell display.

FRUIT TREES UNDER ADVERSE CONDITIONS.

The spring and summer have been fairly favourable for fruit crops generally, as the absence of excessive cold enabled the trees to set a good crop of fruit, and the warmth and showers have fostered its development. I have met instances, however, where fruit trees and bushes have suffered from dryness at the roots through a too porous soil, and others where the trees have been badly treated and their wants not attended to owing to an insufficient knowledge of their requirements, or an insufficiency of labour for supplying them.

A case in point was met with in a garden with a rather heavy loamy soil, situated at the foot of a hill, and having ample means for drainage. Here pyramidal fruit trees, on crab stocks, were growing in the borders alongside the walks in the vegetable quarters. The trees had been planted too close to the edge of the walk, and now they have to be pruned hard back to prevent them blocking the passage. This crude repressive measure gives the balance in favour of the roots, and the result is excessive branch growth. Pinching and summer pruning in all their forms have been practised upon the trees, and various methods condemned because crops of fruit did not follow the processes. As will be readily understood by the experienced fruit grower, the operations were performed at the wrong end of the trees. The buds of the early pinched shoots burst forth, and the resulting growth progressed with so much vigour as to convert the trees into dense masses of foliage and strong succulent shoots, and there was no possibility of light and air being able to play among the branches. Under such conditions the trees could not mature their wood, and fruit buds could not be formed.

The first mistake in the management was in the selection of trees on the crab stock when the area they had to grow in was limited; the second was in planting them within four feet of the edge of the walk; the third in not periodically root pruning them; the fourth in applying a dressing of farmyard manure annually; and the fifth in digging the ground occupied by their roots. This last mistake destroyed all the most valuable roots for producing fruit, and compelled the trees to seek their food in the subsoil. In this stratum the plant food was crude, excepting the nitrogenous compounds washed down from the surface layer. The sun's beneficial influence would also be felt less in this medium than in the surface soil. A crop of fruit on trees growing in such ungenial soil, and treated in this irrational manner, would, indeed, have been a surprise to any enlightened and up-to-date fruit grower.



NEW SINGLE DAHLIA BETTY.

This is a finely formed new single dahlia, shown by Messrs. Joseph Cheal and Sons, Crawley. Rosy-mauve, with crimson shading round the disk. F.C.C., N.D.S., September 3; A.M., R.H.S., September 15. (See pp. 714, 738.)

An example of failure of a fruit crop due to other causes than those referred to, came under my notice recently, and may also be mentioned as illustrating the many things that have to be considered in planting fruit trees and bushes, and the best conditions for producing an annual crop of fruit. In this case the soil was deficient in lime, phosphates, and potash, and no matter what root and branch pruning was done, no fruits made their appearance. This perplexed the grower—a keen and able gardener in other things—and induced him to consult an expert. On learning the deficiencies in the composition of the soil for fruit growing, he worked round the roots of a few of his trees one autumn with a liberal supply of finely-ground bonemeal, and topdressed with lime and sulphate of potash. The following summer attention was given to the early pinching of a number of shoots, so that by autumn those trees were bristling with fruit buds, and the next year (this year) all the trees treated are carrying a heavy yield of what promises to be very fine fruit.

From the foregoing particulars it is very evident that the first step that should be taken by all who wish to make fruit growing a success is to see that the soil contains an ample supply of the necessary constituents of plant food, especially phosphates, lime, and potash, and that the trees are on the stock suited to the purpose for which they are intended. The manipulating of the shoots, and pruning of the roots, are only aids to fruitfulness when rationally performed; but even under the best management in this respect little will avail unless the soil in which they are growing is a rich store of the plant foods most essential to the production of fruit. An excess of nitrogenous manures should be avoided.

The weather is, of course, a potent factor in determining "fruit years," as frosts and cold winds will destroy the blossom, drought will prevent the trees obtaining an ample supply of moisture to enable them to properly develop their various parts, and an absence of sunshine will foster immaturity in the growths. This is generally accompanied by excessive moisture, which favours the same result.

Perhaps Mr. T. H. Slade may have trees similar to some of those referred to in these remarks, as my wall and espalier plants are now showing more than the usual number of fruit-producing buds on the early pinched growths. In fact, King of the Pippins and Cox's Orange Pippin apples are exceptionally fine in this respect this year. I only prune and repress the growths on wall and espalier trained trees. Standards and pyramids are left to grow naturally, and it is only when the weather is bad at the time the blossoms are open that I have any failure of crops.

PEDESTRIAN.

DOG'S TOOTH VIOLETS.

In continuation of my notes on the American erythroniums, which appeared in the GARDENERS' MAGAZINE of the 12th ult., I now give a brief description of other interesting species.

E. albidum is a useful dog's tooth violet which has flowers of a kind of bluish-white or white, produced one on each stem, and having rather long and narrow leaves, which are only occasionally met with mottled. The want of this mottling detracts from the beauty of this Eastern species, which is from six to nine inches high. It requires only the treatment generally indicated.

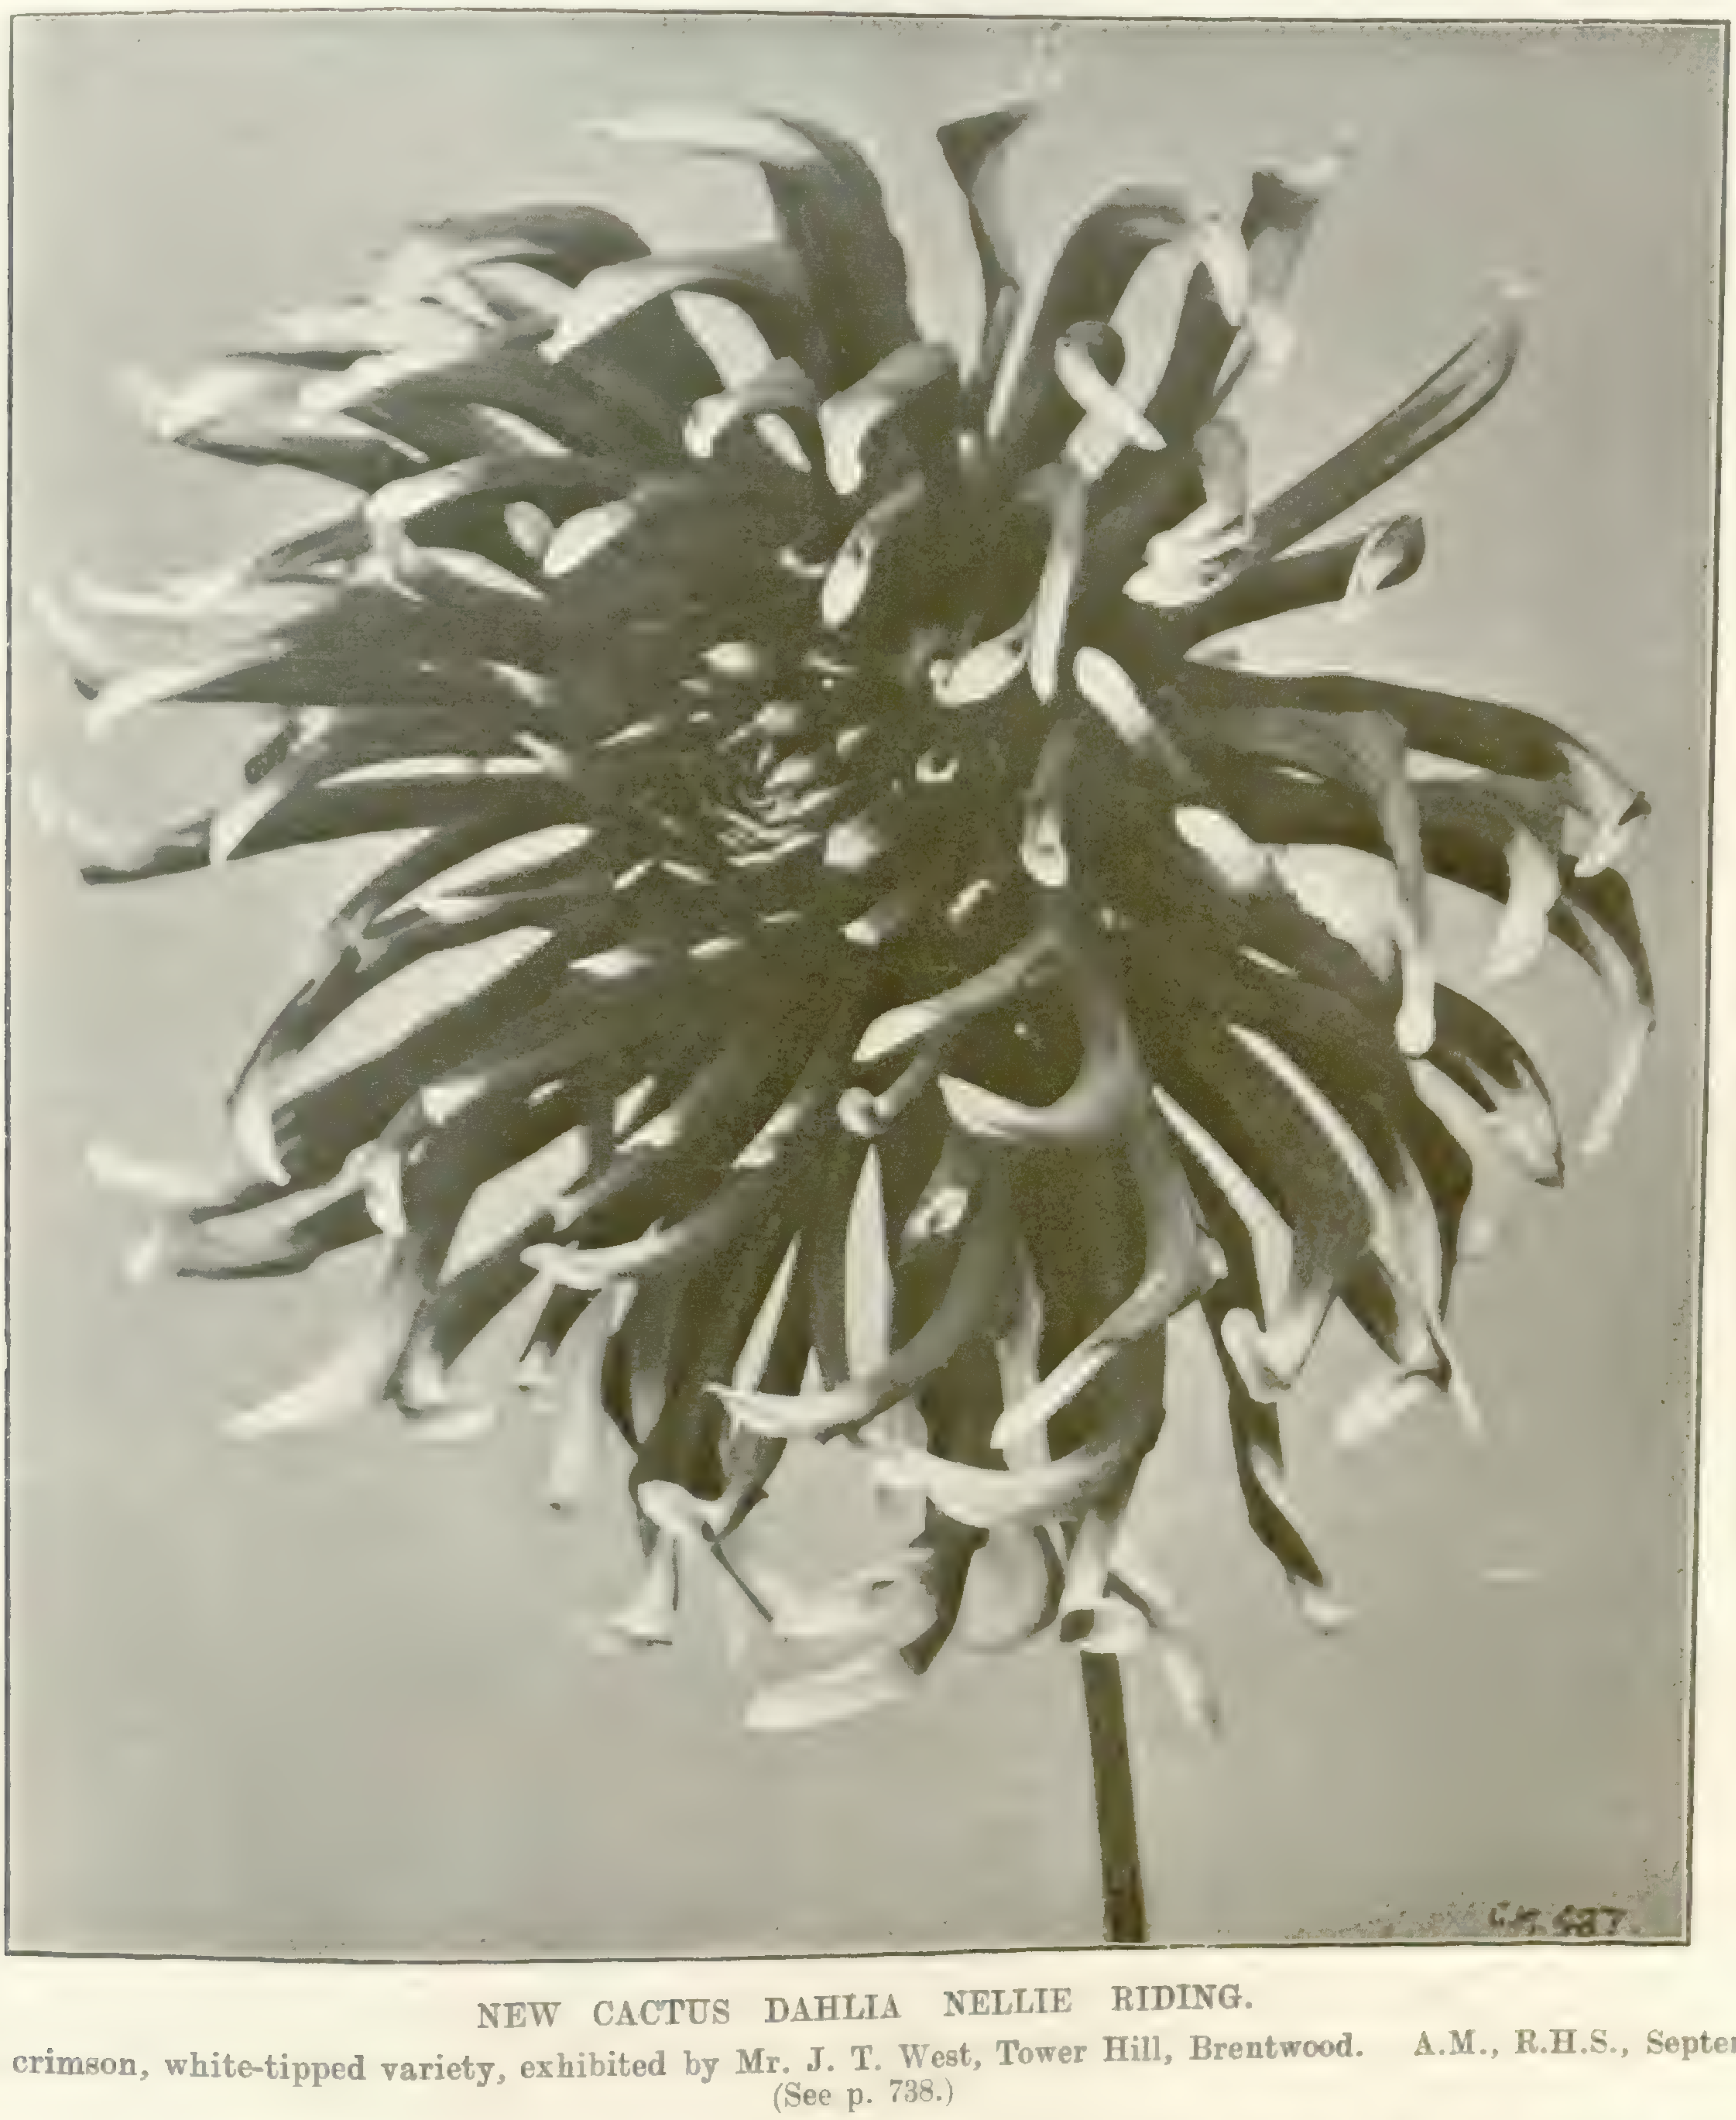
E. citrinum.—Although this is a good species, and its coming from Oregon would almost attest its hardiness, it is rather thin in the substance of its segments for my taste. It has usually three flowers on a scape, these being light yellow, with an orange-colour base, the tips occasionally coming purple.

E. giganteum.—What is understood to be the true E. giganteum is a very beautiful plant, with handsome mottled leaves and creamy-coloured blooms with a reddish band. It is sometimes sold as E. revolutum var. Watsoni, and grows from six to twelve inches high or so.

E. Hartwegi.—This is a pretty dog's tooth violet, with creamy and orange flowers produced in a sessile umbel. Its earliness is in its favour, as it is one of the first to bloom. On the other hand, I have seen its flowers caught by late frosts, and as they are somewhat thin they are not so good as those of some others. The leaves are nicely mottled, a considerable point in favour of this species.

E. Hendersoni.—The colouring of this fine erythronium always appeals to me as giving it a character of much beauty, while I have also found it a good doer. It has pleasing blooms of a fine pale lilac or purple, with a base of deeper purple and yellow, the drooping flowers, on stems six or eight inches long being faintly scented. The dull green leaves are spotted with a kind of purple-brown.

E. Howelli.—This is another good erythronium which is in the market, and which has much to commend it. It bears some resemblance to the preceding species, the flowers being palish pink, with an orange spot at the base, and with white stamens. Some forms of this species come with creamy flowers, passing off to pinkish or purplish.



NEW CACTUS DAHLIA NELLIE RIDING.

A beautiful crimson, white-tipped variety, exhibited by Mr. J. T. West, Tower Hill, Brentwood. A.M., R.H.S., September 15. (See p. 738.)

E. Johnsoni.—One of the most desirable of the genus. E. Johnsoni claims our admiration for its bright salmon-pink flowers, their beauty being enhanced by a yellow centre. As it grows to ten inches high in most gardens it is a most ornamental species, and one which should be widely cultivated.

S. Arnott.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

DENDROBIUM FORMOSUM GIGANTEUM.—There are few orchids more useful than this at the present season of the year, and where there is a demand for flowers during the month of October it should be extensively grown. D. formosum is not always found to grow satisfactorily for successive years after imported, but I think if the plant is treated practically as a stove plant, that is to say, grown suspended in an ordinary stove, and the hard and fast lines of the so-called necessary seasons of growth and resting periods departed from, many of the difficulties would disappear. This, at any rate, is my experience. The plants are annually imported in large quantities, and as they do not belong to the more popular sections of orchids, the imported plants are procurable for a reasonable outlay. I find that if they are removed from their growing quarters immediately the flowers have become expanded, and placed in a cooler and drier atmosphere than that of the stove, there is not so much likelihood of the flowers becoming spotted, and they last longer on the plants, and also when used for cut flower purposes.

VANDA CŒRULEA.—There is no winter-flowering orchid more popular than this blue vanda. Where grown near towns, and in smoky manufacturing districts, unless the plants can be induced to expand their flowers under the favourable atmospheric conditions of September and October they can be rarely induced to display their true colour. A pure, clear atmosphere is essential to the successful flowering of V. cœrulea. It is one of the few orchids which I consider should not be cultivated in districts where fogs are prevalent, for it suffers perhaps more than any other orchid, and if the buds are not entirely destroyed, and the flowers do expand, the latter look washed out, and are worthless. Some of the finest plants I ever saw of this species were grown throughout the year in a Muscat vinery, and the only shade received was from the leaves of the vines. There can be no doubt that where a pure atmosphere is obtained, an intermediate temperature suits the plants. Plants that are at the present time developing their flower scapes should have every encouragement that can be afforded, the more light they receive the better will they develop their colour, but as soon as the flowers have expanded the plants should be shaded, as the colour will quickly bleach out if exposed to strong light.

SOPHRONITIS GRANDIFLORA.—Among the dwarf-growing cool house orchids there is nothing more attractive than this scarlet-flowered species. The plants are at the present season in full growth, and must have every assistance and encouragement to enable them to complete their growth and expand their flowers. Although recognised as a cool house plant, I find that it is benefited if placed in a cool cypripedium house, where the normal temperature is about 55 degrees, but I would not recommend removal from the cool house until the leaves are beginning to open, and the flower bud may then be seen within the leaf. The flowers grow much larger when expanded under warmer conditions. As soon as the flowers have expanded the plants may be placed in the cool house again, where they last a long time in perfection.—H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

CHRYSANTHEMUMS.—Up to the time of writing the weather is still remarkably fine, mild, and dry, and some of the more backward pot plants may remain outside for the present with perfect safety. The late flowering varieties in particular ought to remain out of doors as long as possible, for bringing them into the comparatively warm atmosphere of the greenhouse or conservatory naturally causes the buds to expand more quickly, while the object is to retard them as much as possible. As long as the weather continues fine, and frost and cold rains remain at a respectful distance, leave such plants outside. Care should be taken to house the plants when the foliage is perfectly dry; they must be ventilated as freely as possible subsequently, and also be watched with the greatest care for some little time. If removed to a close, stuffy atmosphere from the open air a number of the lower leaves will be lost, and the general appearance of the plants be injured, perhaps seriously. Do not crowd the plants—this is a fatal error, particularly when cuttings from them are required. The more space each can be allowed the better. The incurved varieties should be placed where their heads are within a foot or two of the glass, if possible, but in the case of the Japanese varieties this is not of so much consequence. Plants that have been well fed previously should have less liquid manure after being brought inside, and this should be gradually decreased in both strength and frequency until, when the blooms are expanding, they are receiving little or no stimulant.

SALVIA SPLENDENS GRANDIFLORA, and others, should now be put under glass, where they will soon make a bold display. The object of removing them indoors so soon is to avoid soft lateral growth, which is likely to result when they are exposed to the autumn rains and heavy dews. Light feeding should be given if the pots are well filled with roots. Stand them well apart, and give plenty of air. Eupatoriums should be treated in like manner, and no further pinching will be required.

RICHARDIA ÆTHIOPICA.—If wanted to flower at Christmas these should be given a light position in a warm house, but keep a number of the plants in the frames to come on gradually for flowering at Easter. Some of the varieties are perpetual flowering, so that with very little trouble good blooms can be cut all the year round. Plenty of water is necessary, and liberal feeding when the pots are full of roots.

CINERARIAS.—The secret of growing these plants well is to grow them quickly. They want no coddling, but they will not stand neglect, and too much or too little water, carelessness in potting, and the attacks of insect pests, will bring about disastrous results Aphides are the bane of the cineraria at this season, and they should be kept in check by means of fumigation. Do not be in too great a hurry to get the plants into the greenhouse, as the cooler they can be kept the better, as long as frost does not touch them, and abundance of air should be given. I always feel sorry when it becomes necessary, on account of the weather, to remove the plants from the cold frame, where they have grown from the seedling stage, to warmer quarters. They seem to enjoy so thoroughly the conditions of the cold frame. —T. B. Field, Ashwellthorpe Gardens.

THE FLOWER GARDEN.

SUMMER BEDDING.—The brightness of the display is now passing away, or over, so that clearing the beds should be proceeded with, and autumn planting done. If shrubs are to be used for immediate effect, and a number of beds to be filled, it is better to use only one or two sorts in a bed, and all such beds are better not absolutely filled with shrubs, but space should be left between for some of the dwarfer spring bedders or bulbs. Large beds having pyramidal hollies in them might have, as a groundwork, small Berberis aquifolium and wallflowers alternately. Golden privet, with myosotis and scarlet tulips; box, with arabis and daffodils; Retinospora plumosa aurea, with violas and hyacinths, and many other similar arrangements suggest themselves. Beds entirely filled with wallflowers are always appreciated if two or more varieties are used. Clumps of the early doronicums dotted among dark wallflowers are attractive, and tend to break up any evenness of surface. Primroses and daffodils have a natural and pretty effect, but much depends upon the tastes of those concerned; some may still like panels of different colours in each bed, and this can easily be provided by judicious selection. Wallflowers, myosotis, silene, arabis, violas in variety, and primroses may all be used; aubrietias make nice edges or belting to beds, or beds may be entirely carpeted with this, and bulbs in variety allowed to come up through it. Saxifraga umbrosa (London Pride) can be used in same way.

WHERE BULBS ONLY are used for beds the sooner these are planted the better will be the prospect of early and strong flowering, vigorous root action before throwing up flower spikes insuring success. As a rule, the larger the bulbs the deeper they should be planted, though snowdrops are best placed not less than three inches deep, preferably a little more. In all planting I think more pleasing results are obtained from large breadths than small patches.

HERBACEOUS BORDERS must still have attention, and replanting and alterations may soon be commenced. Pæonies re-establish themselves better now than later on, root action being quite active; these should be planted in deeply-dug, well-enriched soil, a liberal application of well-decayed manure being very helpful. Bury the crown of each plant an inch or two below the surface. Aquilegias, doronicums, trollius, Papaver orientale, lupins, and others may all now be attended to. The Michaelmas daisies, some of the heleniums, rudbeckias, helianthus, kniphofias, Anemone japonica, etc., must, of course, wait until their flowering season is past; but where anything has reached a large size and is becoming weak or bare in the centre do not allow another season's growth without lifting, dividing, and replanting.

IN THE ROSE GARDEN all recently-budded plants should be examined, and where necessary ligatures loosened. Briars may be shortened back slightly, but not so as to force the sap into the inserted bud. Where new beds are to be formed, or planting done, these may now be dealt with: give a liberal dressing of well-decayed manure at the bottom of the beds below where the roots will be placed, so that when growth commences the roots will soon find the food and revel in it. Manure should not be placed in direct contact with the roots. Gruss an Teplitz has again given of her abundance, proving her merits to the most favourable consideration for masses of rich colour in autumn.

IN THE ROCK GARDEN remove all old flower stems, seed pods, decaying foliage, weeds, etc., and as the foliage from trees fall guard against any accumulation on or over plants in any of the nooks or recesses. As fern fronds ripen it is generally best to allow them to remain, to afford protection to the crowns during winter.—E. F. Hazelton, Knowsley Gardens.

HARDY FRUITS.

GATHERING AND STORING FRUITS.—Every attention must now be given to the gathering and storing of apples and pears. The store room must be clean, sweet, and well ventilated, as the flavour of good apples and pears greatly depends on a sweet atmosphere. It is no uncommon ocurrence to meet with sound, well-preserved fruits late in the spring, but possessing a musty and disagreeable taste that is traceable, in many instances, to a foul atmosphere produced by damp hay, straw, or some such material. We generally gather our choice dessert varieties at intervals, taking a portion of the most forward fruits each time. The fruits are very carefully handled and packed, when perfectly dry, on clean shelves, over which have been placed sheets of clean paper. When the crops are heavy and plentiful, and room scarce, the fruits are placed in suitable sizes two and three layers thick, and when looked over at intervals, any decaying fruit is removed at once without handling or disturbing the good ones. Bruised or damaged fruits are kept apart from the rest, and used up as they are wanted. All very late varieties should be allowed to remain on the trees as long as they are safe, as the fruits will then keep without shrivelling. One of our very best apples for late use is Bramley's Seedling. Old Round Winter Nonsuch, Lane's Prince Albert, and Wellington are likewise excellent kitchen varieties. The best dessert apples with us this season are Cox's Orange Pippin, which has produced heavy crops, the fruits being clean and of good colour from both bushes and espaliers. Kerry Pippin, Worcester Pearmain, and Quarrenden have also borne freely.

NUTS.—As soon as these are in a fit state to gather, "dry and ripe," they should be picked, dried, and stored. Nuts indicate readiness for gathering by the ease with which they part from the twiggy branches, and the outside being of a brownish colour. If placed in a dry, airy position for a few days, and then put into boxes or barrels, and stored in a cool place, not so dry as to cause the kernels to shrivel, they will keep plump and fresh for many weeks. Keep a sharp look-out for vermin, both rats and mice, otherwise much of the crop may be taken in a few nights. This sometimes happens so quickly that most of the crop has been taken without being noticed. Where nuts are appreciated a few bushes might be grown in the place of some other and less profitable crop. When neatly trained, basin-shape, kept properly pruned and attended to, they soon commence to bear fruit. A rather sandy loam, resting on a well-drained subsoil, and not too freely enriched with manure, appears to suit them well.

STRAWBERRIES. — Plants that were raised in July, and planted in August on a well-chosen border, for the production of an early supply of fruit, should be kept free from runners and weeds, and encouraged to form well-developed crowns. Sometimes the balls of roots are apt to become dry, so the plot ought to be examined, and watered if required.—H. Markham, Wrotham Park Gardens.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Royal Horticultural Society.

SEPTEMBER 29.

So far as exhibitors were concerned the R.H.S. had to (metaphorically) hang out the sign of "House Full" several days before the date of the show, and those who were late in sending their entries found themselves left out entirely, while others had to be content with limited areas. It will be gathered from this that there was a fine show, and such indeed it was, for hardy flowers were greatly in evidence, dahlias were abundant, fruit was well shown, and the Wisley grapes were a notable attraction; vegetables were plentiful, and orchids also made a brave show. Novelties were numerous, but chiefly florists' flowers.

FLORAL COMMITTEE.

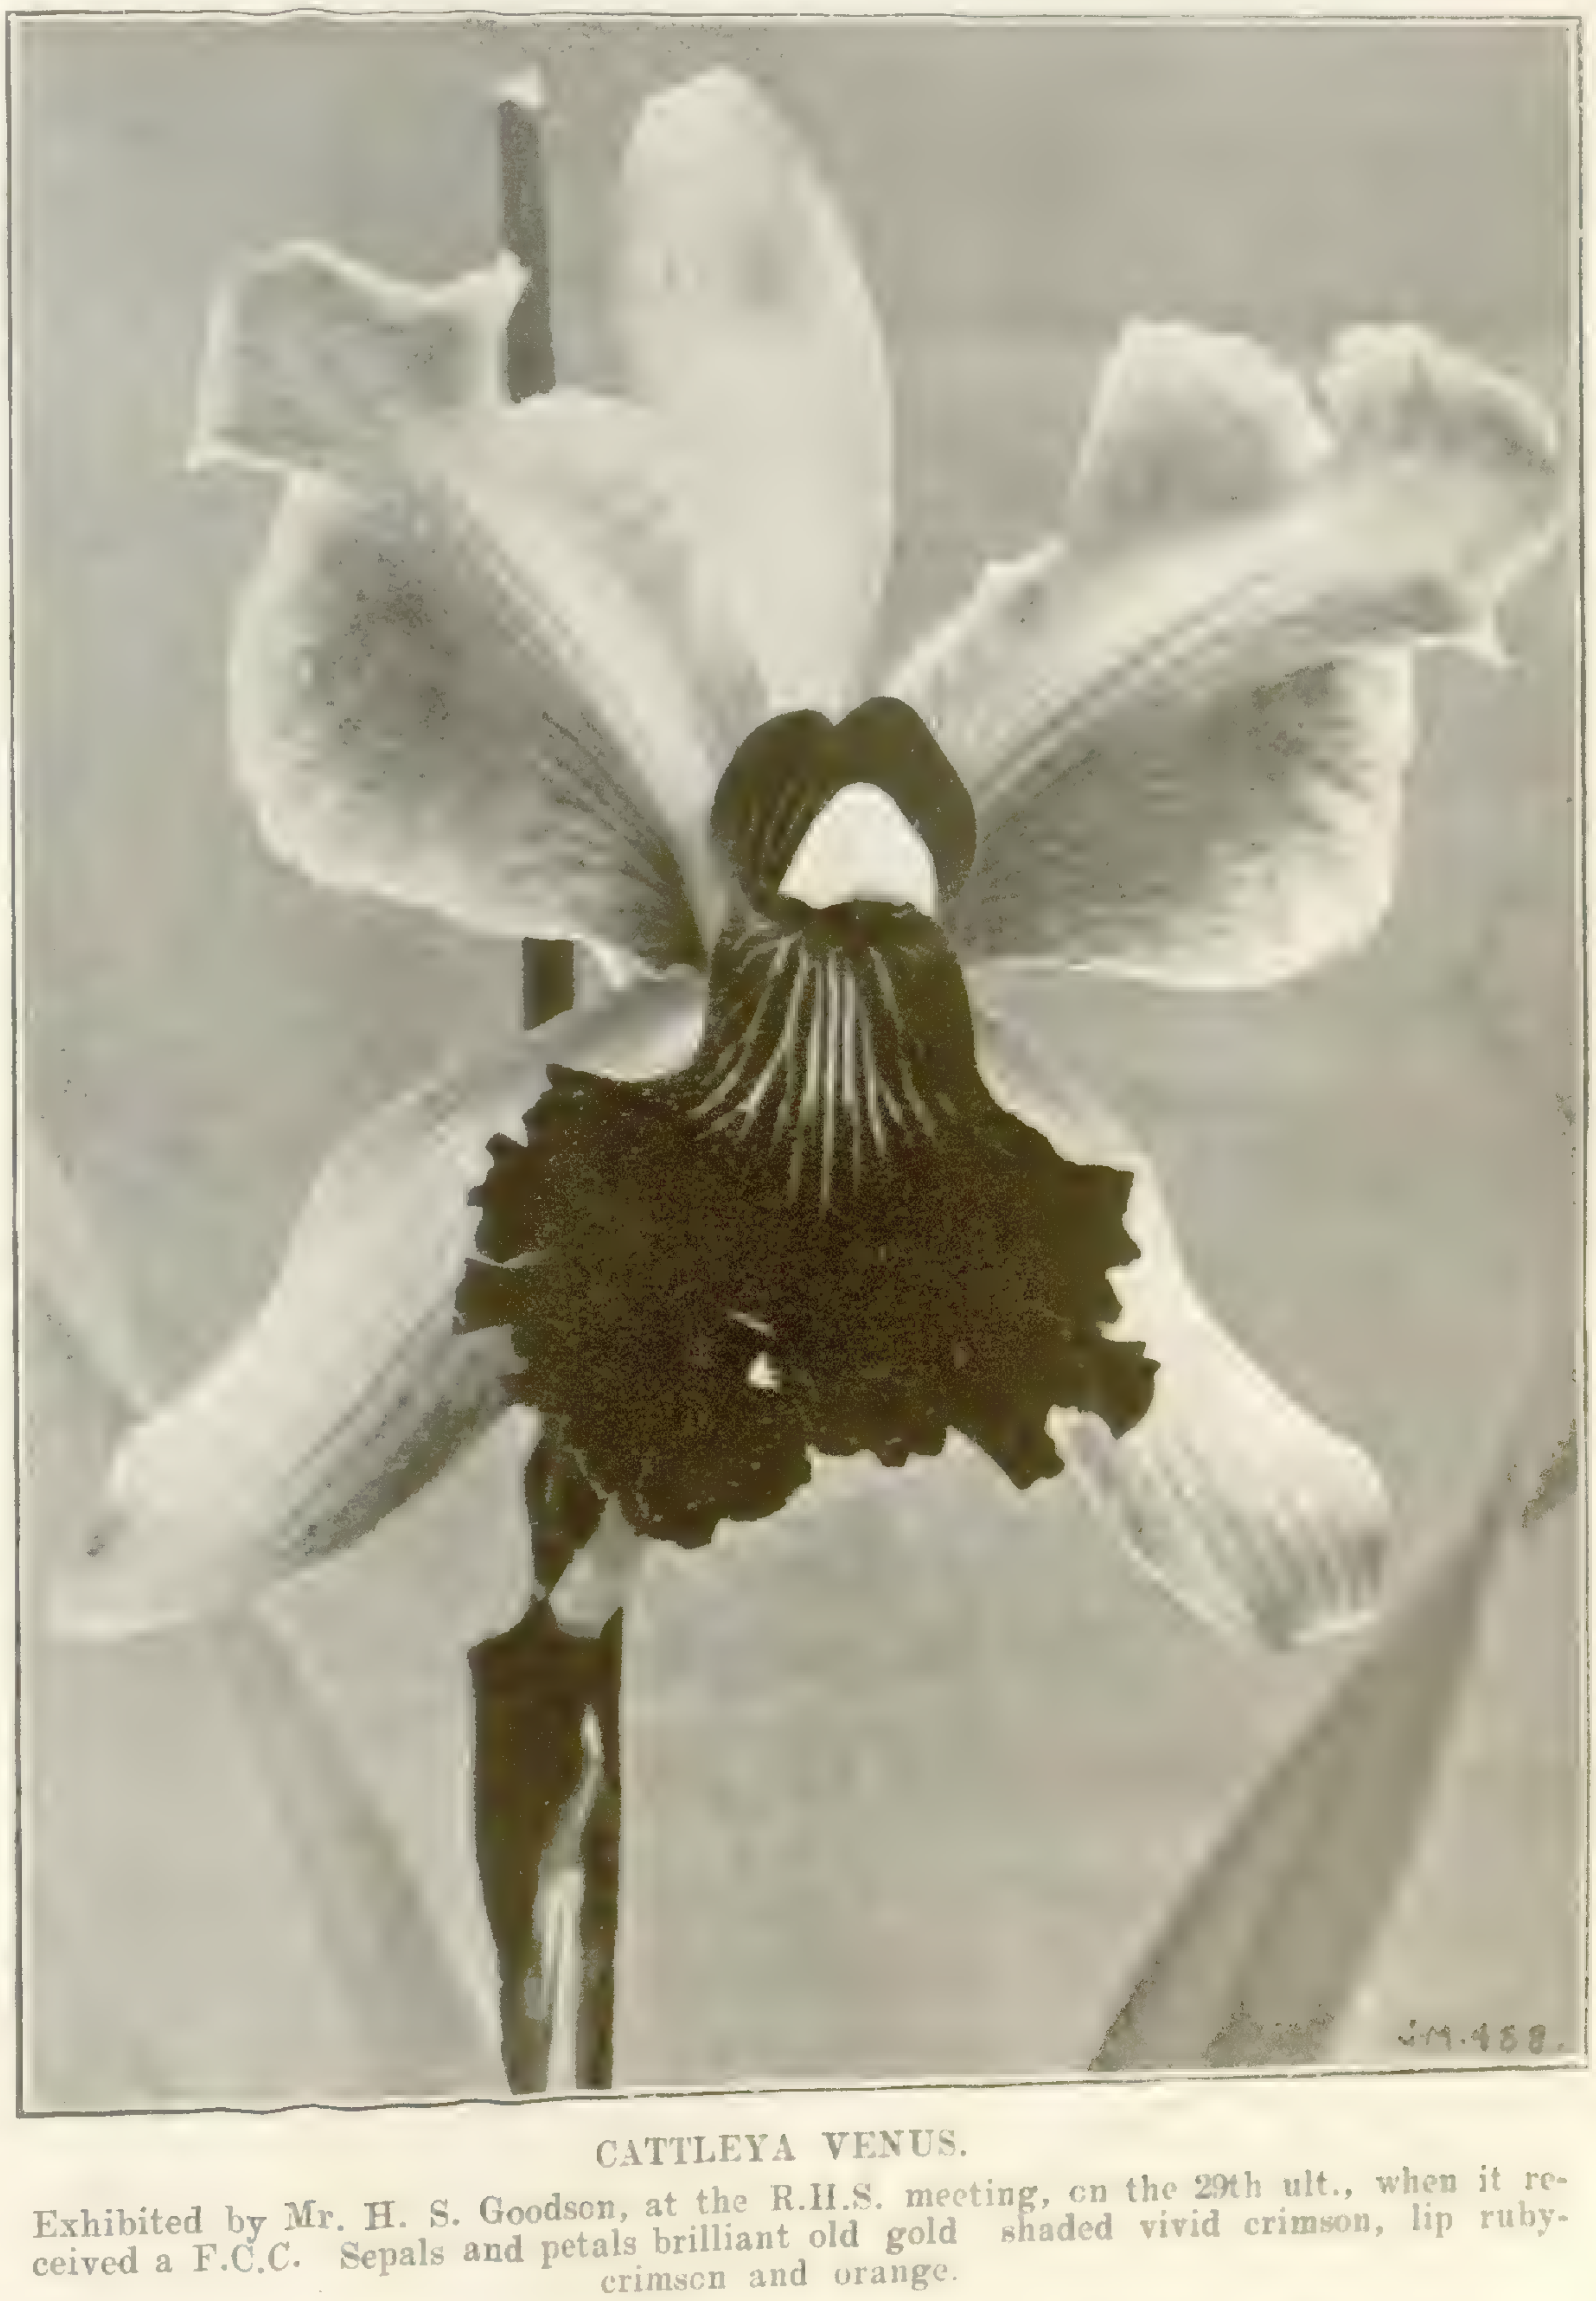
Messrs. Barr and Sons, Covent Garden, were represented by Michaelmas daisies in variety, early chrysanthemums, Gladiolus primulinus, phloxes, etc. A handsome and interesting collection of selaginellas, submitted by Mr. J. Davis, gardener to J. Gurney Fowler, Esq., Glebelands, South Woodford, was a great attraction. Mr. Davis grows these well, and he had splendid pans of S. elegans, S. Schottiana, S. Douglasi, S. viridis, S. grandis (cultural commendation), S. Vogeli, S. patula, the handsome S. [illegible], and the pretty little S. Poulteri, as well as many others. The whole group was a fine display of comparatively rare plants all finely grown. Mr. J. Emberson, Grove Road Nursery, Walthamstow, had an exhibit of dahlias and early-flowering chrysanthemums. Mr. Russell, Richmond, contributed sprays of berried shrubs, etc.

Messrs. Jas. Veitch and Sons, Chelsea, contributed a finely-grown batch of nepenthes that included grand examples of N. Burkei, N. stella, N. Dicksoniana (splendid), N. Chelsoni excellens, N. Tiveyi, N. Mixta sanguinea, N. Curtisi, N. rubella, N. Dr. J. Macfarlane (F.C.C.), and the useful N. Mastersiana. All were splendidly grown, and carried fine pitchers in plenty. Besides the nepenthes the Messrs. Veitch showed greenhouse rhododendrons, streptocarpuses, nerines, the handsome and useful Begonia Mrs. Heal, B. Elatior, and B. Success, all very beautiful and bright. The Chelsea firm had also a very big exhibit of their new ornamental vines, many of them of exquisite beauty for autumn effect. Vitis Coignetiæ, V. Henryana, V. sinensis, V. Thunbergi, V. armata, V. a. Veitchi, V. flexuosa major, and Ampelopsis Veitchi were especially fine, but there were many others of great merit, beauty, and usefulness. Messrs. Frank Cant and Co., Braiswick, Colchester, contributed a fine bank of late outdoor roses that proved a great attraction, and included handsome bunches of Mons. J. Hill, Frau Karl Druschki, Mrs. Sharman Crawford, Peace, G. Nabonnand, Irish Elegance, etc. Messrs. J. Peed and Sons, West Norwood, submitted alpine plants in variety and Michaelmas daisies.

Sprays of hardy flowering and foliaged trees and shrubs were somewhat thinly displayed by Messrs. J. Cheal and Sons, Crawley, who showed varieties of Veronica Andersoni, forms of Hibiscus syriacus, late [illegible] ceanothuses, maples, liquidamber, [illegible] crabs, heaths, etc., and also, in addition, a selection of single dahlias. Mr. S. Mortimer, Rowledge, Farnham, contributed a number of new dahlias, including [illegible] (A.M.), a new show variety, and [illegible] Turner (A.M.), a pretty salmon buff fancy variety. Messrs. Stredwick and Son, St. Leonards, sent up Monarch, Satisfaction, Saxonia, and Wellington, all cactus varieties, each of which gained an A.M. An interesting collection of sprays of useful subjects for autumn effect, shrubs and trees carrying coloured foliage, berries, or flowers, was shown by Mr. Chas. Turner, Slough, who also had a handsome collection of cactus, decorative, and pæony-flowered dahlias. Montbretias, notably Prometheus, Lady Hamilton, Messidor, and Norvic, were finely shown by Messrs. R. Wallace and Co., Colchester, who also contributed kniphofias and liliums, and Michaelmas daisies, as well as Colchicum speciosum album and some late gladioli.

A bright and attractive exhibit, but one scarcely so elegantly set up as on some occasions, was made by Messrs. W. Wells and Co., Merstham, with early chrysanthemums in great variety, including several new things, and also some pentstemons and Michaelmas daisies. An effective array of beautiful cactus dahlias was set up by Mr. J. T. West, Tower Hill, Brentwood, who showed many very handsome varieties. Pompon dahlias were also well shown, and Mr. West sent a few vases of the increasingly popular pæony-flowered kinds. Very charming was the exhibit of Michaelmas daisies so pleasingly set up by Mr. H. J. Jones, Ryecroft Nursery, Lewisham. Mr. Jones had fairly large vases of each variety, and stood these over a ground of white paper. Ideal, Mrs. S. T. Wright, Grace, Delight, Hilda Morris, Mrs. J. G. Day, St. Patrick, Nancy, Mrs. Gwym Powell, Maggie Matthews, and Nell Fardell were a few of the best varieties, and all were beautiful. A very large, bold, and grand exhibit of cactus and pæony-flowered dahlias was made by Messrs. Thos. S. Ware, Lim., Feltham, who also had a fine mass of their new and useful double Michaelmas daisy named Beauty of Colwall.

Messrs. Gunn and Sons, Olton, sent a couple of baskets of Viola cornuta purpurea, smothered with its small but brilliant violet-purple flowers. Eighteen varieties of heaths, double and single, and in various colours, were shown by Mr. Jas. Hudson, gardener to Leopold de Rothschild, Esq., Gunnersbury House, Acton. Some fine plants of Primula capitata, lifted from the open ground, and full of flower spikes, were also shown by Mr. Hudson, and proved their usefulness for autumn flowering. Decorative and pæony-flowered dahlias in great variety were set up in formal bunches by Messrs. H. Cannell and Sons, Swanley; these made a very brilliant display that commanded a great deal of attention. Cut blooms of double and single tuberous begonias, as well as a few gloxinia flowers, were shown by Mr. A. L. Gwillim, New Eltham, Kent, the begonias were all seedlings from the open air. A new



CATTLEYA VENUS.

Exhibited by Mr. H. S. Goodson, at the R.H.S. meeting, on the 29th ult., when it received a F.C.C. Sepals and petals brilliant old gold shaded vivid crimson, lip ruby-crimson and orange.

deep salmon-red tree carnation, named Hon. R. H. Eden, was submitted by the West of England Rose Farm, Lim., Henlade, Taunton; it has a good calyx, and is of medium size. Messrs. J. Backhouse and Sons, Lim., York, submitted beautiful flowers of Colchicum speciosum album, C. s. atro-rubens, and varieties of Colchicum autumnale.

The Guildford Hardy Plant Company, Guildford, was represented by a small collection of hardy flowers. Mr. G. Reuthe, Keston, had a selection of Michaelmas daisies and sprays of Desfontainea spinosa, Guvina avellana, and Lycium barbata in fruit. The new coleus Cordelia was again well shown by Messrs. Wm. Cutbush and Son, Highgate, who also again contributed a very fine lot of perpetual carnations in considerable variety. Some of the older tree carnations, such as Fair Maid, Enchantress, Liberty, etc., were shown in blocks among ferns in variety by Messrs. H. B. May, Edmonton. In one annexe Messrs. J. Hill and Son, Edmonton, exhibited a lot of magnificent plants of the handsome bird's nest fern, Asplenium Nidus-avis; there were a few cyatheas at the back, and many smaller plants in front, and all were perfect and in the perfection of health. Messrs. R. H. Bath, Lim., Wisbech, sent early flowering chrysanthemums, Michaelmas daisies, and carnation Winona (A.M.). Messrs. Carter Page and Co., London Wall, contributed a large collection of cactus dahlias and early flowering chrysanthemums. Roses in pots, chiefly new varieties, in flower, were submitted by Messrs. Paul and Son, Cheshunt, who set up a quite large group in one corner of the hall.

ORCHID COMMITTEE.

Messrs. Charlesworth and Co., Heaton, Bradford, had a comparatively small but choice group of orchids, and the feature of the display was Vanda cœrulea, Sophro-lælio-cattleya Marathon, Cattleya Iris, Vanda Kimballiana, and Brasso-cattleya Mdme. Chas. Maron. Mr. H. T. Pitt, Rosslyn, Stamford Hill, sent a flowering specimen of Acineta densa with a spike of eleven fleshy blooms. Messrs. Hugh Low and Co., Enfield, showed Cattleya Iris, Cypripedium callo-Rothschildianum, C. Godefroyæ leucochilum, and L.-c. Bletchleyensis, etc. Messrs. Sander and Sons, St. Albans,contributed an interesting display of orchids, and the chief attractions were Lælio-cattleya Hildegard, L.-c. Lycidas, L.-c. Nysa, Brasso-cattleya Mdme. Chas. Maron, Brasso-lælia Doria, Catasetum Russellianus, Cypripedium Olivia, and C. Fairrieanum in quantity.

The group of orchids set up by Mr. G. Day, gardener to H. S. Goodson, Esq., Fairlawn, Putney, was a pretty one, and contained the charming Odontioda Charlesworthi, Goodson's var. (F.C.C.), the splendid Cattleya Venus (C. Iris x C. aurea) (F.C.C.), Miltonia Bleuana, Lælio-cattleya Golden Oriole (A.M.), Cypripedium insigne Sanderæ, and numerous odontoglossums and Lælio-cattleyas. Mr. W. H. White, orchid grower to Sir Trevor Lawrence, Bart., Burford Lodge, Dorking, sent Cynorchis purpurascens, Habenaria geniculata, and the quaint Cirrhopetalum Andersoni. From Messrs. Stanley and Co., Southgate, came a fine Cypripedium bellatulum and Cattleya T. W. Wigan. Messrs. Moore, Lim., Rawdon, Leeds, sent a very fine form of Cypripedium Charlesworthi, Cattleya Iris, etc. Sophro-cattleya Saxe Westonbirt var. (A.M.), a cross between C. Trianæ and Sophronitis grandiflora rosea, a handsome purple flower with yellow throated lip; and Cypripedium Bianca superba (F.C.C.), a beautiful yellow-green hybrid with a splendid white upper half to the dorsal sepal.

Cattleya Iris and several hybrids from it were contributed by Mr. J. M. Black, gardener to R. G. Thwaites, Esq., Chessington, Streatham; Cattleya Miss Williams, soft lilac colour, was also very pretty in this group, and was interesting because C. Gaskelliana alba and C. Harrisonæ alba were its parents. Messrs. J. Cypher and Sons, Cheltenham, sent a few cypripediums, notably C. Fairrieanum and C. triumphans. M. Chas. Maron sent over splendidly flowered plants of Lælio-cattleya Henry Greenwood, C. Maroni, and C. Davisi, as well as Brasso-lælio-cattleya Ernesti-Digbyana, and the new and brilliant red Cattleya Rutilant (F.C.C.), a cross between C. Maroni and C. Vigeriana. Messrs. J. and A. McBean, Cooksbridge, Sussex, submitted several odontoglossums, Epiphronitis Veitchi, and some good cypripediums. Mr. Ballantine, gardener to Baron Schröder, The Dell, Egham, sent a large plant of Oncidium incurvum (A.M.).

FRUIT AND VEGETABLE COMMITTEE.

A particularly notable and interesting exhibit was the one of grapes shown from the Royal Horticultural Society's gardens at Wisley, and with each variety were a few of the vine leaves. The grapes shown were Black Monukka, Lady Downe's Seedling, Alicante, Mrs. Pearson, Lady Hutt, Gros Maroc, Muscat Champion, Diamond Jubilee, Foster's Seedling, Diamant Traube,Chasselas Napoleon, Prince of Wales, Barbarossa, Syrian, White Nice, Trebbiano, Madresfield Court, Alnwick Seedling, Black Hamburgh, Muscat Hamburgh, Canon Hall Muscat, Muscat of Alexandria, Golden Queen, Lady Hastings, Black Prince, Appley Towers, Bowood Muscat, Duchess of Buccleuch, Muscat of Hungary, Grizzly Frontignan, and Directeur Tisserand. Very fine were the fruited pot vines shown by Messrs. H. Lane and Son, Great Berkhamsted, who showed Gros Maroc, Appley Towers, Melton Constable, Buckland Sweetwater, and Black Hamburgh, laden with luscious fruits.

Potatoes were once again grandly shown by Messrs. Dobbie and Co., Rothesay, who invariably exhibit well. On this occasion they had big baskets of clean, fine tubers of about forty-five varieties, and among these The Factor, Dobbie's Favourite, Sharpe's Victor, Mr. Bresse, Windsor Castle, Duke of York, Milecross Early, British Queen, Midlothian Early, Table Talk, The Crofter, Alpha, and Waverley, attracted our attention. Mr. Chas. Foster, University College Gardens, Reading, showed several dozen superb fruits of James Grieve apples grown on young trees in the college gardens. Miss Nichol, 14, Ashley Gardens, W., showed some splendid Washington Navel oranges from South Australia, and also a few dishes of the rounder Renmark Navel variety.

Some magnificent apples were shown by Mr. R. C. Notcutt, Woodbridge, Suffolk, who had grand dishes of Cox's Orange Pippin, Lady Henniker, Cellini, Chas. Ross, Jas. Grieve, Peasgood's Nonsuch, Allington Pippin, Ribston Pippin, and Blenheim Pippin, the fruits being of large size and grand colour. Of considerable interest were the big American Squash gourds, custard marrows, Pie melons, Trombone gourds, Turk's Cap pumpkins, etc., contributed by Mr. J. T. Boase, Billinghurst, and all grown in the open air.

CERTIFICATES AND AWARDS.

First-class Certificate. — Cypripedium Bianca superba, from Mr. H. Alexander, orchid grower to Lieut.-Col. Holford, Westonbirt; Odontioda Charlesworthi Goodson's var., and to Cattleya Venus, from Mr. Day, gardener to H. S. Goodson, Esq., West Hill, Putney; Cattleya Rutilant, from M. Chas. Maron, Brunoy, France; Prince of Wales grape, from the R.H.S. Gardens, Wisley; Nepenthes Dr. J. Macfarlane, from Messrs. J. Veitch and Sons, Chelsea.

Award of Merit.—Sophro-cattleya Saxe, Westonbirt var., from Lieut.-Col. Holford; Lælio-cattleya Golden Oriole, from Mr. H. S. Goodson; to Renmark Navel, and Washington Navel oranges, from Miss Nichol, 14, Ashley Gardens, S.W.; Apple Rencow (Peasgood's and Cox's), from Colonel Archer Houblon, Newbury; potato Weranha, from Mr. J. Yule, Aberdeen; potato British Champion, from Mr. G. Carter, Cottenham; Willow-leaved beet, from Messrs. Dobbie and Co., Rothesay; and Blood Red and Pineapple beets from Messrs. Sutton and Sons, Reading; cactus dahlias Satisfaction, Monarch, Wellington, and Saxonia, from Messrs. Stredwick and Son; cactus dahlia Elsie Turner, and show dahlia El Vino, from Mr. S. Mortimer, Farnham; Viola cornuta purpurea, from Messrs. Gunn and Sons, Olton; Pennisetum japonicum, from Mr. Amos Perry, Enfield; Selaginella Emileana aurea, from Messrs. J. Hill and Son, Edmonton; Carnation Winona, from Messrs. R. H. Bath, Lim., Wisbech; Nora Reynolds (pompon), and Lady Bountiful (cactus) dahlias, from Mr. M. V. Seale, Sevenoaks; and Nellie Riding, cactus dahlia, figured in this issue, from Mr. J. T. West, Brentwood.

MEDALS.

Gold.—Messrs. Jas. Veitch and Sons, Chelsea.

Silver-gilt Knightian.—Messrs. Dobbie and Co., Rothesay, for potatoes.

Silver-gilt Flora.—Mr. Day, gardener to H. S. Goodson, Esq., Putney.

Silver-gilt Banksian.—Mr. R. C. Notcutt, Woodbridge; Mr. J. Davis, gardener to J. G. Fowler, Esq., Glebelands, South Woodford; Messrs. Thos. S. Ware, Lim., Feltham.

Silver Flora.—Messrs. J. Hill and Sons, Edmonton; Messrs. R. Wallace and Co., Colchester; Messrs. Charlesworth and Co., Heaton, Bradford.

Silver Knightian.—Messrs. H. Lane and Sons, Berkhamsted.

Silver Banksian.—Messrs. Barr and Sons, Covent Garden; Mr. L. R. Russell, Richmond; Messrs. J. Cheal and Sons, Crawley; Messrs. Frank Cant and Sons, Colchester; Mr. Chas. Turner, Slough; Messrs. H. Cannell and Sons, Swanley; Messrs. Wm. Cutbush and Son, Highgate; Messrs. Paul and Son, Cheshunt; Mr. J. T. West, Brentwood; Mr. H. J. Jones, Lewisham; Messrs. H. B. May and Sons, Edmonton; Messrs. Sander and Sons, St. Albans; Messrs. J. Cypher and Sons, Cheltenham.

Bronze Banksian.—Mr. J. T. Boase, Billinghurst; Messrs. Carter Page and Co., London Wall; Messrs. R. H. Bath, Lim., Wisbech; Messrs. W. Wells and Co., Merstham.

Flower Show at the Franco-British Exhibition.

On Wednesday, September 30, a very fine exhibition of horticultural produce was opened at the Franco-British Exhibition at Shepherd's Bush. The Palace of Music was crowded with exhibits, and these overflowed into the court around the building, while a quite considerable portion of the show was to be found in the Congress Hall, above one of the Lyon's cafés, but comparatively few found this portion on Wednesday afternoon. The show was favoured with wonderful weather, and there were crowds of sightseers. There were several competitive classes, but as the various exhibits in these were often far apart, and as the prize cards were not affixed when our representative was compelled to leave, just before two o'clock, we cannot now give the names of the prize-winners. The judges had an unenviable task, and a long and hot one also. A display of this kind, where there are competitive classes, should be judged the day previous to opening, or be ready for judgment at 9 a.m. We may explain that the whole show was arranged chiefly for effect, hence the difficulty of making comparisons with exhibits far apart. An entirely non-competitive display would have been easier to manage.

There have been loud and bitter complaints from competitors because of curtailment of space at the eleventh hour, and in some cases because entries were entirely rejected. A large amount of space was reserved for French exhibits, and many of these might with advantage have occupied a smaller area. The French pears and outdoor grapes were splendid, and though they did not teach us much, they spoke eloquently of bright sunshine and genial climate. We do not think the authorities of the Franco-British Exhibition have made the most of their opportunities, from a horticultural point of view, and they do not, apparently, appreciate the attractive power of flowers and fruits, or the value of cultivating a pleasant feeling among exhibitors.

BRITISH EXHIBITS.

A large and elegant display of fruits, flowers, and vegetables was made by Messrs. James Carter and Co., High Holborn. The flowers, chiefly single and double asters, carnations, begonias, and liliums, were very well set out in vases and hanging baskets, while the whole group was margined with apples and pears. Here and there were baskets of Sunrise tomato, while gourds, marrows, cucumbers, Chinese artichokes, peas, and turnips in variety completed the display. Messrs. Thomas Rivers and Son, Sawbridgeworth, Herts, submitted a grand lot of pot fruit trees, their Cox's Orange Pippin, James Grieve, Cox's Pomona, and Allington Pippin apples, Beurre Fouqueray, Charles Ernest, Pitmaston Duchess, and Louise Bonne pears, various figs, and late cherries won great admiration. Pot vines, and dishes and boxes of selected apples, pears, and Monarch, Primate, President, Golden Transparent, Admiral, Late Orange, and Grand Duke plums were all magnificent. Pot fruit trees were well shown by Messrs. William Paul and Son, Waltham Cross, who had dwarf trees of apples and pears laden with excellent fruits. Dishes and baskets of selected dessert and cooking apples added materially to the general effect, and gave evidence of high culture. The Waltham Cross firm had also a collection of cut roses that included a large number of their own excellent varieties. Messrs. Sutton and Sons, Reading, had a fine lot of tomatoes as picked from the open air, and carrying grand crops; with these were batches of fine Primula obconica, liliums, stocks, etc., and a central display of fringed and other single begonias, and lily of the valley. The picked tomatoes and the Reading melons were a great attraction.

The exhibit of tuberous begonias—a very fine lot of seedlings—together with the new Beauty of Colwall double Michaelmas daisy, and a selection of pæony-flowered dahlias, from Messrs. Thomas S. Ware, Lim., Feltham, was a very bold and beautiful one. Messrs. Stanley and Co., Southgate, had a group of orchids, in which mounds of Oncidium varicosum, Cattleya bicolor, odontoglossums, Cattleya Gaskelliana, and the useful Cypripedium A. de Lairesse were the leading features. Mr. W. P. Bound, who is relinquishing his charge at Gatton to Mr. Collier, set up Sir Jeremiah Colman's group of orchids effectively with nepenthes. The leading features were Dendrobium Phalænopsis, Cattleya Iris, Cattleya Mrs. Pitt, Brassocattleya Mary, Cypripedium Maudiæ, and the very curious and new Bulbophyllum leminscatoides, B. grandiflora, and Cattleya Brownæ.

Messrs. Bunyard and Co., Maidstone, were very large exhibitors, and they arranged a long group of Michaelmas daisies and other autumn flowers in front of the platform in the Palace of Music, but in addition, or rather chiefly, they had a display of pot fruit trees, but even these were not by any means so effective as the splendid apples and pears set up in dishes and baskets in the foreground. We much regret that limits of space and press day prevent us from commenting at some length upon this magnificent exhibit of British fruits.

The platform in the Palace of Music was splendidly filled by three firms. Messrs. W. Wells and Co., Merstham, put up a bold and beautiful display of early chrysanthemums, pentstemons, and Michaelmas daisies; the flowers were in large masses, and admirably and boldly set up. On the one hand Messrs. H. B. May and Sons, Edmonton, arranged a grand lot of specimen ferns, chiefly the newer nephrolepis, and some brilliant crotons; and on the other hand Messrs. Paul and Son, Cheshunt, arranged a striking display of cut roses in great variety, with palms and shrubs. Messrs. J. Cheal and Sons, Crawley, had a grand display of two dozen bunches of cactus dahlias, and Mr. Chas. Turner, Slough, had a fine lot of pompon and pæony-flowered dahlias, as well as show varieties. Mr. S. Mortimer, Farnham; Messrs. Keynes, Williams, and Co., Salisbury; and Mr. W. Tressider, Cardiff, all showed dahlias, show varieties, in great style.

Messrs. J. Stredwick and Son, St. Leonards, showed their newer cactus dahlias grandly, setting up beautiful flowers in great bunches. Messrs. G. and A. Clark, Dover, set up a bright exhibit of kniphofias, delphiniums, pyrethrums, dahlias, colchicums, etc. Mr. M. V. Seale, Sevenoaks, contributed dahlias, as also did Messrs. Carter Page and Co., of London Wall. Mr. J. Knight, Wolverhampton, showed cactus and pæony-flowered dahlias in great variety. Mr. Edwin Beckett, V.M.H., gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree, put up one of his wonderful displays of vegetables, showing magnificent examples of Ailsa Craig onions, Scarlet Emperor runner beans, celery, Maltese parsnips, cauliflowers, etc.—a superb exhibit and a large one also. Messrs. Clibrans, Altrincham and Manchester, were large exhibitors of finely grown vegetables, and their produce was admirably staged; all the vegetables were grown—and well grown—at the firm's trial grounds at Bramhill. Messrs. J. K. King and Co., Coggeshall, had a splendid lot of roots and other vegetables. Messrs. Toogood and Sons, Southampton, showed a good collection of vegetables arranged on boxes of seedling grass. Mr. B. Ashton, gardener to the Earl of Lathom, Lathom House, Ormskirk, set up a collection of splendidly grown potatoes, consisting of about sixty dishes of beautifully clean tubers of well-known varieties. Messrs. G. Massey and Sons, Spalding, had a big group of potatoes, and their collection of first-year seedlings shows that the firm is continuing its work of raising new varieties.

FRENCH EXHIBITS.

The pears and apples somewhat formally displayed in wire stands by Messrs. Croux and Sons, Châtenay, Seine, France, were greatly admired, as the group contained fine specimens of Souv. de Congres, Chas. Ernest, Beurre Dumont, Beurre Sterckmans, Doyenne du Comice, Belle Angevine (our Uvedale's St. Germain), very fine, Beurre Fouqueray, Beurre Diel, Beurre Baltet Pére, Duchess d'Angouleme, etc. The firm was fortunate in having an abundance of space, and in this matter they were specially favoured. Messrs. Lecomté and Martin, Louveciennes, contributed a large collection of apples and pears, but beyond Beurre Lebrun they had nothing of outstanding merit. From the National School of Horticulture, at Montpelier, France, there came a very wonderful and interesting exhibit of grapes. These had suffered in appearance during transit, but they showed the grand variety of grapes that exists. The fruits were shown in papier-mache dishes, and also in boxes as marketed. There were many familiar kinds, and also large bunches of lesser known ones, some of them with extraordinary names. Flanking this display there were numerous smaller exhibits of grapes, but when our notes were made there were no cards to indicate the owners. Dattier de Beyrouth, white; Picardon, white; Aramon, black; and Reusetti, white, were varieties that appealed to us by reason of their size of bunch and berry, and general appearance. Messrs. Omer Decugis and Sons, Paris, were also large exhibitors of outdoor grown grapes, and they had Gros Guillaume, Muscats, Bicane, Gros Colmar, and Black Hamburgh in good condition. Mons. Nomblot, Bruneau, showed a large collection of apples and pears, all grown in the open.

M. G. Compoint, St. Ouen, sent asparagus in quantity, and examples of seeds, and seedling plants of various ages up to those ready for forcing; the salsafy was also interesting. Messrs. Millet and Sons, Bourg la Reine, Seine, sent Quatre Saisons, St. Antoine de Padoue, Laxton's Perpetual, Alpine, Odette, and other strawberries of a late or perpetual character. Mons. Passy showed pears largely; Doyenne du Comice was grand. M. Louis Granel, Chateau de Bouffar, Aix, brought over a collection of Provence grapes that contained large bunches of Rosaki, Olivette Blanc, the red Angelino, Golden Queen, Sultineih Muscat Hamburgh, etc. M. J. Leccinté, Paris, contributed peaches and pears. The Société Regionale d'Horticulture of Montreuil, had a large and formal display of apples, pears, and peaches, and they had numerous big fruits of Emperor Alexander apples, on which various signs and pictures had been nature printed. These probably attracted far more attention than the fine Beurre Diel, Curé, Doyenne d Hiver, Chas. Ernest, and Doyenne du Comice pears, etc.

Mons. Charles Maron, Brunoy, brought along his orchids from the R.H.S. exhibition, and on these we have commented elsewhere. M. Gustave Chevillot, Thomery, had a very choice collection of grapes, the bunches of good size, tastefully disposed, and carrying their full bloom. Messrs. Vilmorin, Andrieux, and Co., Paris, contributed a selection of varieties of Primula obconica and papilio cyclamens. This firm had also a magnificent group of pumpkins, tomatoes, beans, cucumbers, turnips, beet, capsicums, etc., these making up a brilliant and extensive display that was a great attraction. Messrs. Cayeux and Le Clerc, Paris, had a large collection of rather rough potatoes. The Syndicale des Maraichers de la Seine contributed an interesting collection of vegetables and salading, the latter including dandelion, chicory, capsicums, lettuces, etc. A wonderful display of capsicums, and tomatoes, and potatoes was made by Mons. L. Férard, Arcade Street, Paris.

EXHIBITS IN THE CONGRESS HALL.

In the Congress Hall, upstairs, Messrs. Sutton and Sons had the most wonderful exhibit of potatoes that even the Reading firm has ever set up. It comprised about 500 dishes and baskets, and 300 varieties of potatoes, every tuber clean and beautiful. In addition to the usual kinds there were numerous curiosities, such as Fir Apple and Congo varieties. A remarkable part of the display was that one-half of it consisted of 1907 crop, and the other half of 1908 crop, and one could hardly tell the difference in appearance. The new variety for 1909 is White City, a handsome kidney-shaped potato, very shallow eyed, and a maincrop variety of fine quality.

The Royal Horticultural Society of Jersey sent over a collection of apples and pears, and in this the rich colouring of the apples was the remarkable feature, Peasgood's Nonsuch, Charles Ross, James Grieve, Cox's Orange Pippin, and Cox's Pomona being very fine. Durondeau, Doyenne du Comice, Louise Bonne, Souv. de Congres, Belle de Jersey, Pitmaston Duchess, and Duchess d'Angouleme pears were also magnificent. The secretary of the society is Mr. Aubin, Sunnyside, Claremont, Jersey. Mr. W. T. Stowers, Sittingbourne, had a splendid lot of apples, every fruit a grand one. Mr. R. C. Notcutt, Woodbridge, brought along his fine samples of apples from the R.H.S. meeting.

There were several competitive displays of fruit. Mr. J. H. Goodacre, gardener to the Earl of Harrington, Elvaston Castle, Derby, showed splendid grapes, peaches, melons, nectarines, apples, and pears, all of the usual high quality we expect from Elvaston. There was another display in which the apples were of remarkable colour, the grapes finely coloured, and the peaches large and tempting; this, we gathered, came from Mr. Barnes, gardener to the Duke of Westminster, Chester, but in this, and several other instances, there was nothing to indicate ownership.

Messrs. H. Cannell and Sons, Swanley, were represented by a large and fine exhibit of apples, in which the samples of popular varieties were all perfectly clean and very bright; it was a fine lot of fruit. Messrs. J. Peed and Son, Norwood, contributed a collection of apples and pears, and Messrs. S. Spooner and Sons, Hounslow, sent a big collection of clean apples. Mr. W. Poupart, Twickenham, sent bottled fruits that appeared to be as near perfection as it is possible to get them. From the Horticultural College, Swanley, came good samples of apples and pears. Messrs. W. and J. Brown, Peterborough, were also exhibitors of fruit.

Messrs. Dobbie and Co., Rothesay, once again showed potatoes finely, their heaped-up baskets of clean tubers of the best old and new varieties attracting a great deal of attention. Messrs. Dobbie and Co. were also exhibitors of dahlias, and they had their exhibit in the cool Congress Hall. Roses in great variety were well set up by Messrs. Harkness and Co., Hitchin, and Messrs. W. and J. Brown, Peterborough.

National Chrysanthemum Society.

The Floral Committee met at Essex Hall on Monday, September 28. There was a good attendance and a large number of flowers. Messrs. W. Wells and Co., Merstham, made a fine display of new singles and earlies, and Mr. W. J. Godfrey, Exmouth, and Mr. E. F. Hawes, Royal Botanic Gardens, Regent's Park, were other exhibitors.

Sandhurst Gardeners' Association.

The first meeting of the new session of the above association was held in the church schools, Sandhurst, on Tuesday, September 22, when Mr. M. Goddard presided over a good attendance of members. Mr. D. Moyes, The Gardens, Firgrove, Eversley, read a most interesting and instructive paper on "Fires and Firing." This paper was of great interest to the younger members. The various kinds of fuel, and the different makes of heating apparatus, and the most economical way of working them were fully dealt with. The members taking part in the discussion that followed included Messrs. M. Goddard, Evans, Dupond, Cooper, Collins, Pendrey, and Sumner. A hearty vote of thanks was accorded Mr. Moyes for his excellent paper. Mr. M. Goddard, The Gardens, Ambarrow, Sandhurst, staged cut blooms of seedling double and single tuberous begonias.

British Gardeners' Association.

LONDON BRANCH.

The second monthly meeting of the autumn session will be held at Carr's, Strand, in the Charles Dickens Room, on Thursday, October 8, at 8 p.m., when the chairman and other members of the Executive Council will address the meeting on "The B.G.A.: Its influence, and how to increase it." Full discussion and questions are invited. All who are professional gardeners are welcomed. A large attendance of nursery employees is expected. It should be pointed out that gardeners in all branches who have had seven years' professional training, and those under 23 years of age with five years' experience, are eligible for membership.

OBITUARY.

MR. JOHN OUVRARD.

Mr. J. Ouvrard, who for upwards of forty years was a conspicuous figure in the Flower Market, Covent Garden, passed quietly away, in his eighty-fourth year, at his residence at Child's Hill, on Tuesday, the 22nd inst., after a very short illness. Deceased, who kept his mental faculties to the last, was a most energetic man. He was the President d'Honneur of the Société Française d'Horticulture de Londres, and a most successful grower of flowering and of foliage plants for market. He started as a propagator at the world-renowned Wellington Nurseries, when these were in their glory. As one of the early fern growers he had few equals, and Pteris Ouvrardi, which is still grown by millions, testifies to his skill and ability.

GARDENING ENGAGEMENT.

Mr. John Podmore, who has been appointed head gardener to Cornelius Hanbury, Esq., The Manor House, Little Berkhampstead, Hertford, was for some years previously head gardener to Lord Lawrence, Chetwode Manor, Buckingham, and for the past two years at Owlbrigg, Cambridge.

R.H.S. EXAMINATIONS IN HORTICULTURE.

The enclosed letter has been sent to the directors of the Botanic and other gardens in our Colonies, as well as to the Colonial Press and others. As the information contained in the letter may be of interest to your readers abroad, I hope you will be able to find room in the columns of your paper for a notice thereon. With very many thanks in anticipation.

W. Wilks, Secretary,
Royal Horticultural Society.

On the invitation of the Government of the United Provinces of India, the "General Examination" of this society in the principles of horticulture is to be modified so as to fulfil the local requirements, and a first examination will be held in April, 1909, at Saharanpur. This suggests that possibly other countries and districts may feel it desirable to enter candidates for a similarly modified examination, in which case the council would doubtless be prepared to organise it.

The examiners are leading horticulturists in England, and, for examinations abroad, will be assisted by suitable experts acquainted with the special horticultural conditions of the various countries desiring to adopt our tests.

The general examination is now an acknowledged standard of qualification in horticulture in Great Britain, and it is thought it may be of similar advantage and assistance in your country. Other details arranged will be communicated on application for the examination, but the prospectus as arranged for 1909 will indicate its general lines and the sort of knowledge required.

If you should think at any time of adopting this proposal, I shall be glad to hear from you, when also I should greatly value the suggestion of the name and address of a competent person in Great Britain, versed in the horticultural conditions of your country, whom we might ask to co-operate with the other examiners appointed by the society.

W. Wilks.

FORTHCOMING ENGAGEMENTS.

WEDNESDAY, October 7.—Royal Society of Arts.
National Chrysanthemum Society, Crystal Palace, two days; Floral Committee at 12 o'clock.
Hayward's Heath Gardeners' Society.
FRIDAY, October 9.—Carluke Horticultural Society.
THURSDAY, October 15.—Royal Horticultural Society's Fruit Show; two days.
Brighton Horticultural Society meeting.
FRIDAY, October 16.—Royal Horticultural Society; Conference on "Spraying." Morning session, 11 a.m. to 1 p.m., chair to be taken by Colonel Warde, M.P., and lectures given by Mr. G. Massee, V.M.H., and Mr. H. F. Getting; afternoon session, 2.30 p.m. to 4.30 p.m., chair to be taken by Colonel Long, M.P., and lectures given by Professor F. V. Theobald, M.A., and Mr. G. Hammond.

THE COWPER AND NEWTON MUSEUM, OLNEY, BUCKS.

AN APPEAL FOR ENDOWMENT.

EIGHT years ago, on the occasion of the Centenary of the death of the Poet Cowper, the house in which he lived at Olney was presented to the town to form a memorial and museum. The Trustees have, with a number of gentlemen resident in the district, formed an Endowment Committee, of which the Bishop of Durham is the chairman. The object in view is clearly stated in the following extract from a letter signed by the Bishop:—

"At present the Institution has an income of only eighteen pounds a year, and this is insufficient for its due maintenance. The front of the Museum has recently been restored, but the two rooms now used for exhibits are overcrowded, and we feel that the whole of the house should be devoted to the public, who would then be admitted to the "John Gilpin" room and other rooms now occupied by the Curator. For this purpose it will be necessary to form a small endowment, and it has been calculated that the sum of £2,200 is required. We sincerely trust that the public will respond generously to this appeal.

HANDLEY DUNELM,
Chairman of the Committee.

The Hon. Treasurer is Mr. Frank Littleboy, of Newport Pagnell, Bucks, to whom contributions should be addressed.

ANSWERS TO CORRESPONDENTS.

MANURE FROM THE FOWL-HOUSE.—A. R. A., Devonport: A good method of dealing with fowl manure is that of mixing it with an equal bulk of very dry, finely sifted soil, and storing it in a dry place. It is a splendid manure for top-dressing various crops, or for incorporating with the soil. About 2lb. of the mixed dry earth and manure per square yard is a good dressing.

SOWING LAWN GRASS SEED.—D. W., Leicester: As the ground is ready, the work of sowing should at once proceed. It would be foolish to wait until next spring now you have an opportunity of beginning. The seeds will germinate and make blades of grass, but the roots will spread out, and then next spring the plants will make rapid progress. Use the seed at the rate of one pound to every 16 or 18 square yards, and sow as regularly as possible.

LONGEVITY OF SEEDS.—C. T., Hailsham: We believe that at one of the American universities experiments are in progress for testing the longevity of seeds. A given number of seeds of certain plants are buried in a jar each year, and at stated intervals these will be uncovered, and some tested for germinating power, and the rest put back for further tests. Speaking broadly, the limit of the germinating power of the commoner garden seeds, in years, is as follows: Asparagus, 6; Bean, 3; beet, 6; borecole, 6; broccoli, 6; cabbage, 7; cardoon, 8; carrot, 4 or 6; cauliflower, 6; celery, 7; chervil, 3; chicory, 8; cress, 5; cucumber, 9; endive, 10; gourds, fancy, 6; kohl rabi, 5; leek, 4; lettuce, 5; melon, 7; mustard, black, 4; mustard, white, 4; onion, 2; parsnip, 2; parsley, 3; pea, garden, 3; pumpkin, 6; radish, 5; rhubarb, 3; sage, 3; salsify, 2; scorzonera, 2; seakale, 2; spinach, 5; strawberry, 3; thyme, 3; tomato, 4; turnip, 5; vegetable marrow, 6.

PRINCESS OF WALES VIOLETS.—F. M. A., Chesham: We have made enquiries, and cannot find that this variety is treated in any materially different way to others prepared for winter flowering. We advise you to follow the system that has proved successful in the cultivation of other violets.

WHITE BLISTERS ON SALSAFY.—T. O., Abergavenny: The trouble is the result of an attack of a white rust named Cystopus tragopogonis, that attacks a number of umbelliferous and some composite plants. Nothing can be done now beyond trimming off and burning the leaves, and taking care not to plant the infected plot with a similar crop next season.

PERENNIAL SUNFLOWERS.—W. E. C., Leighton Buzzard: A large number of species and varieties of helianthus will not be required, except in the largest of gardens. The type, H. multiflorus, is eminently attractive, and should be included in the smallest collection. It attains a height of about four feet, has an elegant habit, and produces an abundance of bright yellow flowers. H. multiflorus major is about the same height as the type, and has rather larger flowers. H. multiflorus maximus grows about two feet taller, and, while not so elegant as the foregoing, is of much value for the back rows of the herbaceous border, and also in the shrubbery. H. multiflorus Bouquet d'Or is the finest of the double forms, and H. multiflorus Météore and Soleil d'Or are two effective forms, with handsome golden flowers with anemone centres; that is to say, clusters of small yellow florets in the centre instead of the usual black disc. H. mollis and H. tomentosum are two handsome species, with flowers of a golden shade, and about four feet high.

OAT SMUT OR SLEAN.—F. E. G., Northants: Select as clean a lot of seed as possible, and, a little previous to sowing, steep the seed oats in a mixture of sulphide of potassium and water, using 1½lb. of the former to each 25 gallons of water. Use a wooden or earthenware vessel, and steep the seeds for twenty-four hours, stirring the whole well at intervals.

CONTRACTORS TO HIS MAJESTY'S GOVERNMENT.

W. RICHARDSON & CO.,

MANUFACTURERS OF ALL KINDS OF

HORTICULTURAL BUILDINGS. Also HEATING ENGINEERS.

CONTRACTS in course of completion:—

His Grace the Duke of Northumberland, Syon House, Brentford.

BEST MATERIALS AND WORKMANSHIP ONLY. ESTABLISHED IN THE YEAR 1808.

SWEET PEA NANCY PERKIN.—P. S., Cardiff: We believe that this new sweet pea is to be distributed by Mr. W. J. Unwin, of Histon, Cambridge. It was raised by Mr. H. A. Perkin, of Reigate, but, owing to untoward circumstances, he almost lost his stock last year, hence we expect the seeds will not be cheap this season.

NAMES OF PLANTS.

W. G., Leeds.—Rhus Toxicodendron—the Poison Ivy.

F. E. F., Chertsey.—1, Berberis Darwini; 2, Cratægus Lælandi.

H. D., Bidston.—1, not recognised—looks like a tiny Eucomis; 2, Helxine Solieroli.

M. G., Hilperton.—1, Oncidium tigrinum; 2, Cypripedium cardinale; 3, Cattleya Harrisoniæ.

F. L. D., Exeter.—1, Primula capitata; 2, Gleichenia Mendeli; 3, Morisia hypogæa; 4, Leycesteria formosa.

P. C. T., Newbury.—1, Aspilia bupthalmiflora; 2, Eupatorium purpureum; 3, Aster patulus; 4, Polygonum cuspidatum.

B. D. T., Preston.—1, Aster linosyris; 2, Statice Bonduelli; 3, Helenium striatum; 4, Helianthus multiflorus; 5, Lilium auratum platyphyllum.

Mr. A. Mitchell, Corrour R.S.O., writes us Mar. 5th, 1908:—

"Kindly send on another pair of your splendid Boots. The last pair has worn me over two years, and when I mention my house stands **1,350 feet above Sea level**, you can imagine the awful weather, we have nothing but snow and slush the greater part of the year. When I state I never had a wet foot it speaks well for your Boots. Enclosed P.O. 16/-.

KELWAY GARDENS.
Greenock,
26th August, 1908.
Messrs. Kelway and Son,
Langport, Somerset.
Dear Sirs,—You will be pleased to hear that the £10 or so which I have sent you in the last few years have made my garden (½ acre) one beautiful mass of colour all the year round.
This year especially the place has been a perfect picture—quite as fine as any of the pictures in Walter Wright's "Perfect Garden."
I am,
Yours faithfully,

FOR AUTUMN PLANTING.

TO DAY! AND FOR YEARS AND YEARS PAST the XL ALL Specialities are and have been the best on the market. Where is the Gardener who does not pin his faith to one or the other of these celebrated Insecticides or Fertilisers? XL ALL FERTILISER has pleased all who have used it this season. The Sales of XL ALL FUMIGATOR prove that it is more popular than ever. XL ALL LIQUID NICOTINE INSECTICIDE is always spoken of by gardeners and growers as the best remedy for Mealy Bug, Thrips, etc. XL ALL WINTER WASH for dormant trees acts like magic, clearing the Trees and Bushes of all Insects' Eggs, Moss and Fungoid Growths. XL ALL LAWN SAND, a weed eradicator and fertiliser for weedy and poor lawns. XL ALL WEED KILLER used once a year. "No weeds can live." Please ask your Nurseryman, Seedsman, or Florist for a copy of my small pink list giving particulars of these and many other XL ALL Preparations, which can be obtained from the Horticultural Trade throughout the World. G. H. RICHARDS, Manufacturer and Patentee, 234, Borough High Street, London, S.E.

(40 Bush and 10 Climbers).

Specially selected for their free and continuous flowering. This collection will give a grand display of bloom from the end of June until October; it consists of two plants each of the following splendid varieties:

Antoine Rivoire.
Betty.
Caroline Testout.
Chas. J. Grahame.
Dean Hole.
Duchess of Bedford.
Earl of Warwick.
Frau Karl Druschki
Gruss an Teplitz.
Helen Keller.
Hugh Dickson.
Killarney.
La France.
Mad. Abel Chatenay.
Maman Cochet.
Mrs. E. Mawley.
Mrs. J. Laing.
Mrs. Sharman Crawford.
Prince Arthur
Ulrich Brunner
Dorothy Perkins
Crimson Rambler
Penzance Briars
Gloire de Dijon
W. A. Richardson.

Descriptive Catalogue post free on application.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Waste of Effort.

Fully appreciating the importance of giving cultivators and raisers opportunities for presenting the products of their skill to public notice, we have at all times consistently supported both provincial and special societies, as well as the great London organisations that have for their object the promotion of horticulture generally. In urging the claims of the special societies upon our readers, and recording their proceedings, we have been careful to keep in view the need of a concentration of effort, and have from time to time directed attention to the injurious results of an excessive multiplication of special and local societies. When the chrysanthemum was at the zenith of its popularity, and local societies were springing up in all directions, we called attention to what would happen if the course entered on was persisted in, and societies multiplied far beyond the requirements of the case. Some heed was paid to our note of warning, but it is extremely difficult to check a large body of enthusiasts when they have entered on a certain course without having carefully considered what the results were likely to be. The usual course in the case of the chrysanthemum was to establish a society in a central position, and when it had become successful to form half-a-dozen or more societies in the district, some being within a quite short distance of the central organisation, which soon became more or less weakened by the diversion of financial support and interest to the small societies. We might mention many instances, but as we are not now specially concerned with chrysanthemums there is no occasion to proceed to details. What we are now anxious to call attention to is the waste of effort in relation to horticultural pursuits that is represented by having two dahlia societies in London. There are, as a matter of fact, three organisations associated with the dahlia in the Metropolis, but as the third is local in its aims, it is not for our present purpose necessary to refer to it. The existence of two central societies would, under any circumstances, be undesirable; but in this case it is all the more remarkable from the fact that they are not in any way opposed to each other, or conducting their operations on different lines. They are, in fact, doing their work in precisely the same manner, and managed by practically the same executive. There are different presidents and secretaries, but the president of one society is a member of the committee of the other, and the two committees differ but little in constitution. From our personal knowledge we are able to say that the two societies are managed as economically as they possibly could be; but, however economical may be the management, there must, as the result of this duplication, be some unnecessary expenditure and a waste of effort. It is surprising this state of things should have existed for some years, but it is satisfactory to know that the principal members of the two societies have at last recognised the desirability of such concentration of effort as would result from the combination of the two organisations. This recognition is indeed so complete that before the close of the year steps will be taken to effect the amalgamation of the National Dahlia Society and the Dahlia Union, and we have no doubt as to this being successfully accomplished. With the strengthening of the National Dahlia Society that should result from the amalgamation we shall hope that it will initiate a more vigorous policy, and take a broader view of its responsibilities and opportunities. More especially does it appear desirable the society should give largely increased attention to dahlias suitable for beautifying the garden. Exhibition dahlias have their merits, but they are for the few and not for the many, and no society can accomplish its work satisfactorily unless it fully recognises the requirements of the general body of cultivators. Let those who derive pleasure from the production of exhibition dahlias have opportunities for entering into friendly rivalry with each other, and let also the varieties producing blooms of the finest form receive encouragement. But, and here we cannot be too emphatic, the whole of the efforts of the society should not be concentrated upon its exhibitions and varieties that are only suited for competitive purposes. We would strongly urge as a matter of the highest importance to all concerned, the encouragement and the bringing into prominence of varieties that are capable of producing a good display of colour in the flower garden. It should have long since been obvious that as the chief value of dahlias consists in the aid they can give in enhancing the attractions of the garden, special encouragement should have been given to varieties that are free in blooming, and bear their flowers on stiff stalks well above their foliage. Somehow the two societies and the raisers have regarded the production and encouragement of varieties producing finely developed blooms, without regard to their habit, as of the greatest importance. As the result large numbers of cactus varieties have been raised, certificated, and distributed, that, owing to the shortness or the weakness of their flower stalks are of but little value for garden

MR. ARTHUR CHAPMAN.

decoration. In consequence thereof, the interest in dahlias has undergone a material decrease among the great flower-loving public of late years, and with this falling off of interest there has been a considerable decline in the number annually planted. Some waste of effort is also seen in the existence of two societies within the Metropolis devoted to the cause of the carnation. In this case the existence of the second, or younger society has full justification, but there should have been no need for its foundation: nor would there have been had the National Carnation Society been alive to its responsibilities, and recognised the fact that a carnation society should bring within the scope of its operations all sections of this fragrant flower.

Mr. A. Chapman, head gardener to Lieut.-Colonel Holford, at Westonbirt, Tetbury, Gloucester, has charge of one of the finest demesnes in the country. Mr. Chapman is well known to our readers as he has during several years contributed calendarial notes under our general heading of "Work for the Week." At Westonbirt Mr. Chapman's duties are many. He has a very large and splendidly stocked arboretum to care for, pleasure grounds of great beauty and extent to keep in perfect trim, the management of large areas of fruits and vegetables, and the varied contents of many glasshouses to consider. Mr. Chapman's position is by no means a sinecure, but, fortunately, he has a generous and sympathetic employer who not only loves his home at Westonbirt, but also understands the difficulties and appreciates the successes of a gardener. There are several departments of horticulture, in which Mr. A. Chapman greatly excels, but perhaps he is best noted as a fine grower and successful raiser of hippeastrums. The Westonbirt collection of these magnificent flowers is probably the best private one in the country, and that it is so is chiefly due to Mr. Chapman's skill as raiser and grower. Those who have seen the Westonbirt hippeastrums at Westminster, or who saw the grand collection staged at the Ghent Exhibition in the spring of this year, will understand that Mr. Chapman is a gardener of no mean ability, and if any of our readers have visited Westonbirt they will know that this ability is not confined to one class of plants.

A Holiday on the Nile. At the Horticultural Club, on Tuesday, October 13, Mr. A. W. Sutton, V.M.H., will give a lecture, freely illustrated with lantern slides, entitled "A Holiday on the Nile." Those who have heard Mr. Sutton's previous "holiday" lectures will be sure not to miss this one.

Hot Weather and the Apple Crop. From various quarters we have received information concerning the rapid fall of not a few varieties of apples a few days after the commencement of the recent spell of hot, bright weather, and in every case emphasis is laid upon the fact that the apples fell from the trees during the still weather, and were not blown down. We had a similar experience in our own garden, where Lane's Prince Albert began to drop its fruits without any apparent cause. At Gunnersbury, Mr. Hudson had the same tale to tell, and Mr. George Bunyard tells us that during two or three days one large grower near Maidstone picked up 400 bushels of apples in his orchards, and another grower picked up 110 bushels of fallen fruit, all sound, and not windfalls. The reason for this early fall of sound fruits would appear to be found in the weather itself. Evidently the hot weather, following a period of wet weather, caused a great rush of sap in the trees, and the fruits, preparing for their separation from the stem, were literally pushed off by the unusual and untimely flow.

Memorial to Mr. George Nicholson.—A committee is being formed with a view to inaugurating a fitting memorial to the late Mr. George Nicholson, V.M.H., F.L.S., ex-curator of the Royal Gardens, Kew, and editor of the well-known "Dictionary of Gardening." Those who are interested in the proposal may obtain further particulars from Mr. Wilfred Mark Webb, the honorary secretary of the Selborne Society, at 20, Hanover Square, London, W.

Wart Disease (Black Scab) of Potatoes.—The Board of Agriculture and Fisheries desire to make it known that the potato disease known as wart disease, cauliflower disease, or black scab, first drawn attention to publicly in the columns of the Gardeners' Magazine, has been scheduled under the Destructive Insects and Pests Order of 1908. This order requires all occupiers of land on which the disease has appeared to report the fact to the Board of Agriculture and Fisheries, 4, Whitehall Place, London, S.W. Wart disease has been somewhat prevalent in the potato crop this year, and cases have been reported from Lancaster, Cheshire, Derbyshire, Leicester, Salop, Stafford, Warwick, Worcester, Merioneth, Glamorgan, and Dumfries. Growers are therefore recommended to examine their potatoes carefully while the crops are being lifted, with the view of detecting this disease, which, if neglected, may do serious injury. When the potato is only slightly attacked warty excrescences grow out from the eyes; in a bad attack, the whole tuber has a distorted, almost sponge-like appearance. A leaflet, describing the disease, and suggesting preventive measures, will be forwarded post free on application to the Secretary, Board of Agriculture and Fisheries, 4, Whitehall Place, S.W.

Penny Postage with America.—On Thursday week the advantages of the penny post were extended to the United States, and the charges for the conveyance of letters from the United Kingdom to America are now the same as those in operation between Great Britain and her Colonies.

The Recent Fine Weather.—Dr. Hugh R. Mill, the famous meteorologist, points out, in "The Times," that "the recent run of hot days so late in the season is without precedent within the last half-century." The temperatures recorded at Camden Square were as follows: Tuesday, September 29, 75 degrees; Wednesday, September 30, 79 degrees; Thursday, October 1, 77.5 degrees; Friday, October 2, 79 degrees; Saturday, October 3, 77.9 degrees; Sunday, October 4, 75.9 degrees. The high temperature of October 2 has only once been exceeded in October since Mr. Symons commenced his records in 1858, and this was on October 4, 1859, when the shade temperature was 80.9 degrees. The only comparable run of hot weather in late autumn occurred in 1895, but this was in the last week of September, and did not extend into October.

The Public Parks and Gardens of the United Kingdom form a very interesting feature of our national horticultural life, and as the editor of the "Gardening Year Book" for 1909 is anxious to record the correct title and area of these parks and open spaces, he will be very greatly obliged if the superintendents will send him these particulars, as well as their own name and address. Secretaries of horticultural and gardening societies are also requested to furnish him with particulars of their societies, with dates of exhibitions, etc. The information should be sent as early as possible to the Editor, "Gardening Year Book," 148 and 149, Aldersgate Street, E.C.

New Hardy Lily Tank for Kew.—It was as far back as 1873 that the aquatic tank in the herbaceous garden at Kew was constructed. Its position in front of the Joddrell Laboratory has never been wholly satisfactory, inasmuch as it is somewhat out of the way, and, moreover, being raised several feet from the ground, the tank suggested nothing more than a low wall from even a short distance. We understand that this state of things is to be remedied, and that in the sunken garden in front of No. II. Museum, where herbaceous plants of economic value have long been grown, a new and suitable aquatic tank will be made. The site seems to be an eminently suitable one, and the work of excavation is now proceeding thereon.

Brussels International Exhibition, 1910.—As we have already announced, horticulture will occupy an important position at the international exhibition to be held at Brussels in 1910. Horticultural products will be included in a separate group, and in this there will be five classes, and for making the arrangements the same number of committees have been formed with from twenty to thirty members each. The committee of organisation is as follows: Messrs. V. Du Pré and F. Lambeau, presidents; secretaries, Messrs. L. Gentil and N. Seghers; members, Messrs. J. Buysseus, F. Claes, E. Draps, C. de Foullon, L. Herrewege, A. Moret-Jamar, F. Stepman, T. Verniewe, and Vander Swallman. The presidents of the group committee are Messrs. Firmin de Smet and M. Firmin Lambeau.

American Gooseberry Mildew in Norfolk.—At a recent meeting held at the Shire Hall, Norwich, Mr. W. U. Hill, the inspector, reported that 285 gardens, in which the gooseberry bushes were infected by mildew, had been scheduled during the current year. In only five cases have the gardens been closed owing to the severity of the attack, and in these the growers were allowed to gather the fruit under the necessary precautions. In two cases legal proceedings were taken against two growers for failing to comply with the order, and in one case a fine of £10 was inflicted, and in the other the fine was £5.

Gooseberry and Currant Leaf-Spot.—Black currant specimens from St. Mary Cray and Norwich, and gooseberry specimens received by the Board of Agriculture from Fakenham and Shanklin, were found to be infested with the gooseberry and currant leaf-spot, Glœosporium ribis, Mont. Injured leaves fall early in the season, and as the disease usually increases in intensity each succeeding season, the bushes are weakened and eventually killed if nothing be done to arrest the disease. It is important that all diseased leaves should be collected and burned. During winter the ground under and around the bushes that have been infected should be turned over and dressed with lime. In the next spring, just at the time when the leaf buds are expanding, a thorough spraying with a solution of potassium sulphide (liver of sulphur), 1oz. in 4 gallons of water, should be given. A second spraying should be given after an interval of three weeks.

The Cedar of Lebanon in England.—Concerning the introduction of the cedar into England, Mr. J. Landfear Lucas, of Hindhead, writes: "While many have thought that cedars were first brought here by John Evelyn (1620-1706), the famous Surrey publicist, of Wotton, Dorking—who travelled abroad at an early age, Lord Pembroke states that the third Earl of Devonshire, who was Lord Chamberlain of the Household to Charles I., and Chancellor of the University of Oxford, together with the Bishop of London of that day, sent out two collectors to the Holy Land, who returned from Lebanon in 1640, with, among other things, some cedars, now flourishing in Wilton Park. Lord Savile states that the great cedar at Rufford Abbey was planted by Charles II., about 1675, as being quite a new importation into England. A specimen at Enfield House was planted about 1683, by Dr. Robert Uvedale, a distinguished botanist of his time. At Oatlands Park, Weybridge, is a cedar said to have been planted by Prince Henry, youngest son of Charles I. One of the most beautiful examples of the tree in full growth is at Titchmarsh Rectory, Northamptonshire. The Rev. F. M. Stopford informs me that this was planted in 1627, and was said to be then twenty years old. It is now over 76ft. in height, and its spread 100 yards in circumference."

Tasmanian Apple Industry.—Within recent years Tasmania has acquired considerable importance as an apple producing country, and now contributes liberally to the supplies of apples in this country during the late spring and early summer months. According to the "British Australasian," forest land is being rapidly cleared on all sides for the purpose of planting it with apples, and the growers are obtaining fairly remunerative rates for their fruit. In the south of the island, in the Huon district, where the apple orchards are oldest and most numerous, they extend in a long, narrow strip on both sides of the river Huon for a distance of over ten miles. Huonville, Franklin, Geeveston, and Lovett are now thriving townships entirely dependent upon the apple industry. In the Glenorchy district the Derwent Valley and the Bagdad Valley the apple is also largely cultivated. For years the people in the south of the State have had the trade of the island in their own hands, but they will soon have a rival, for it has been discovered that apples thrive equally as well in the Tamar country in the north, and orchards are being planted on a considerable scale. At the present time some 20,000 acres in the island are devoted to the cultivation of the apple, and the annual harvest is estimated at over 1,000,000 bushels, of which over 600,000 bushels are shipped to Europe. The orchard land is held in small areas. A block of 100 acres is rare; one of 25 to 40 acres is considered large, and five or six acres of good orchard land are said to be enough to support a family. With few exceptions all the apple country was originally forest land. The present owners obtained it from the Government at the modest sum of 10s. per acre, but the cost of clearing and fencing it brings it up to about £15 per acre. Then from the time the young trees are planted until the orchard begins to pay some six years must elapse. A few farmers have met some of their expenses by growing various crops, such as hay, oats, or small fruits—raspberries, strawberries, etc.—between the rows of apple trees. The favourite varieties are New York Pippin, Scarlet Pearmain, Ribston Pippin, Sturmer Pippin, and Jonathan.

SWEET PEA JOTTINGS.

My wanderings have been many, and far, since the publication of my last "jottings." In each country of the United Kingdom I have had the pleasure of inspecting well-grown sweet peas, and though I should like to be able to state that the best I have seen were in the "West Countrie," truth compels me to write that the best were in Scotland.

The Duns growers form a remarkable group of enthusiasts who fully understand the value of high cultivation, and practise it, and who are favoured with a climate that favours growth and depth of colour. The great trouble at Duns is that the season is rather late, and all too often the heavy autumn rains and cold nights stain the wonderful blooms, and so detract from their merits as exhibition flowers. We all know Mr. Alex. Malcolm, and how he fills his garden with giant clumps of sweet peas and forms great fragrant screens also. It is also becoming known that Mr. Malcolm has gone whole-heartedly into the subject of raising new varieties. I have been to Duns and spent a few hours with Mr. Malcolm, and have seen his seedlings. They are wonderful; especially his new waved lavender; his glorified Helen Lewis; his own-raised Earl Spencer; and his brilliant scarlet varieties. Mr. Malcolm works on Mendelian lines, and secures fixed varieties. The one weakness at Duns is the difficulty of ripening seeds, but glass shelters are now being used to trap the sunshine and keep out the wet.

We, Mr. Malcolm and I, cycled over to see Mr. Ness, Captain Aitkins' gardener, and here it was that I saw the finest cultivated sweet peas that have yet come under my notice. I have a record from the Newcastle district of sweet peas grown in almost pure manure, growing 17ft. (seventeen feet) high; but they gave few flowers. Mr. Ness grows them 13ft. high year after year, and his rows of tall clumps, the plants trained to curved pea trainers, were a picture. They were clothed with flowers from base to summit, and the flowers were beautiful in size, substance, and colour, and the stems were of good length, without being ungainly. We all agreed that excessive length of flower stem detracted from the merits and beauties of sweet peas. I believe that, in August, if he were an exhibitor, Mr. Ness could beat Messrs. Jones, Stevenson, Basile, Usher, and Co. eight times out of ten. What a grand sweet pea show these Duns people could make in their own town!

The Sweet Pea Show at Dublin, in August, was ample proof that the popular annual is increasing in popularity in the Sister Isle. I took the new Provincial Cup over on behalf of the N.S.P.S. and kept a close watch on Mr. Edward's generous gift, from Brentford to Dublin, but I might as well have left it at home, or at any rate in the cloakroom at Euston for Mr. Stevenson to call for on his return. It would have saved a deal of trouble, and I was morally certain the cup would come back to Surrey.

Mr. Andrew Dickson is a sweet pea enthusiast, as many will remember who knew him when he joined forces with Mr. Mackereth at Ulverston. Mr. Dickson has now returned to the Green Isle, and has charge of the new Oakley Park Nurseries at Blackrock, Dublin. These form a branch establishment of Messrs. A. Dickson and Sons, Newtownards. The sweet peas were well grown here in rows, and there were several promising seedlings, including one that is a very pleasing and distinct shade of lavender. The American stocks were very untrue, but the Irish stocks, though not rogueless, were very clean and true, showing that rigid selection is being carried out.

In South Wales I saw sweet peas in abundance, and at Wenvoe Castle I found untrimmed larch poles used effectively for the support of clumps of sweet peas. I found here, as elsewhere, that there are three subjects upon which every gardener is willing (and often waiting) to talk, i.e., the newest sweet peas and fixed stocks; the newer hybrid tea roses; and the prospects of a new disease-resisting maincrop potato to succeed Up-to-Date.

At Penarth I called upon Mr. Gerhold, and over an afternoon cup of tea we discussed the raising of new sweet peas and the right road to fixity of stocks. Mr. Gerhold has long been a raiser, and he keeps faithful records of his crosses. He knows the parentage of almost every one of the newer sweet peas, or at any rate he knows what crosses will give a percentage of these varieties. Mr. Gerhold is a chemist, and he finds healthful recreation in the culture and raising of sweet peas, and he is, moreover, a capital missionary on behalf of the N.S.P.S.

Two early sweet pea catalogues arrived a fortnight or more ago. One from Miss Hemus and one from Mr. H. J. Wright. Both are neat little booklets, but whereas Miss Hemus confines her attention to an almost overwhelming list of novelties, Mr. Wright makes an early offer of new seed of the best varieties already in commerce. I sincerely hope that raisers will not attempt to swamp us with novelties for 1909. I may be quite wrong, but I cannot help thinking that one or two really good and fairly well fixed novelties will prove more effectual from a business point of view than a large number that may or may not be good.

C. H. Curtis.

LILIUM NEPALENSE.

Fears have been more than once expressed that this charming and most distinct lily, which created such a furore twenty years ago when first shown, would soon become lost to cultivation. Present doubts were, however, dispelled at the meeting of the Royal Horticultural Society, held on August 18, when a grand vase of flowers was shown. I well remember the meeting of the Royal Horticultural Society when L. nepalense was first shown, and the excitement caused by the fact that it was so different from the anticipations of everyone, and so distinct from any other lily. Briefly L. nepalense may be described as bearing gracefully reflexed blossoms, which in size and shape are somewhat suggestive of Lilium Szovitzianum, but in colour they are yellow or greenish yellow, with a large chocolate-purple centre. A good deal of individual variation, however, exists in the shade of yellow, and also in the extent over which the purplish portion extends.

Like Lilium neilgherrense, which a few years ago we used to receive in large numbers, L. nepalense does not seem amenable to cultivation in this country, and imported bulbs quickly deteriorate. In a state of nature I believe that L. nepalense, L. Bakerianium or Lowii and L. sulphureum often grow in close association, yet while the first two are difficult to keep in health year after year, the last named not only thrives under cultivation, but can be rapidly increased by the bulbils which form in the axils of the leaves. Perhaps, if seedlings of L. nepalense were raised in this country, their growth would be more satisfactory, as in an instance that lately came under my notice considerable success attended the raising of L. rubellum from seeds.

W. T.

Inoculated Sweet Peas.—Mr. C. H. Curtis said, a few weeks ago, that he had received only negative evidence in regard to the use of nitro-bacterine. I sowed seed of four or five varieties so treated, on May 31. All the plants have made very strong growth, some five or six feet in height, but I doubt if there are twenty flowers on five times as many plants.—C. J.

"DIE-BACK" OF PEACH SHOOTS.

The following contribution by Mr. George Massee, V.M.H., to the current issue of the "Kew Bulletin" is of so much interest to growers of peaches and nectarines that it should have the most careful consideration.

About 58,000 species of fungi have been described, and of this number at least 10,000 are placed by mycologists under the heading "Fungi imperfecti," on the assumption that such are in reality nothing more than stages in the life-cycle of species of the higher fungi, belonging to the phycomycetes, ascomycetes, and basidiomycetes respectively. This line of reasoning is supported by the fact that in many instances such relationship has, by means of pure cultures, been proved to exist. There remain, however, many thousands of these forms that have not yet been connected with any of the higher species, and as it is important, both from a scientific and economic standpoint, that such should be accurately described, they are grouped under "form-genera" and "form-species," thus implying that they are stages which have not as yet been connected with higher species.

Such form-species or conidial stages are unknown in connection with the primitive species of aquatic fungi, and were only evolved as supplementary stages when the fungi passed from their original aquatic habitat and established themselves on dry land. These conidial stages possess many features in common. They are all asexual in origin. The conidia are produced in immense numbers, and in rapid succession, throughout that portion of the season when the host of the fungus is in active growth. The conidia germinate at once when mature, and being dispersed wholesale by wind, birds, insects, etc., are constantly infecting new hosts. In fact, the special function of conidia is to extend the geographical area of the species, while the spores of the original or higher form of the species, which require a period of rest before they are capable of germinating, are only concerned with the survival of the species in time, by tiding it over that period when the host is not in a condition to furnish food for the fungus.

From the above account it will be seen that the conidial form of a fungus is invariably the cause of an epidemic or of a rapid spread of a disease, except in those instances where even this method has been superseded by the presence of hybernating mycelium in the host plant. Conidial forms, as a rule, are rampant parasites, whereas the primitive or sexual stage of the same fungus is usually a saprophyte, and only appears when the host is on the wane, if not quite dead.

The members of the Peronosporeæ illustrate the gradual transition of a primitive group of fungi from an aquatic to an aerial habitat. The sexual and oldest stage of the fungus as yet retains so much of its original nature that the reproductive bodies take the form of zoospores, whose only mode of dissemination is by means of water, which obviously limits their dispersion on land. By the addition, however, of a conidial stage, whose reproductive bodies are dispersed by wind, animals, insects, etc., the various members of the peronosporeæ have been enabled to extend the area of their distribution to the utmost limits of range of the hosts to which they have become adapted.

The parasite which causes the disease about to be considered presumably belongs to the category of "form-species," but as yet there is no direct evidence on the point, since pure cultures of the conidia have hitherto failed to produce any other form of fruit. The fungus is called Næmospora crocea, Sacc., and belongs to the family Melanconieæ, which is characterised more especially by the absence of a definite perithecium or fruit enclosing the reproductive bodies or conidia.

During the past few years numerous inquiries have been addressed to Kew respecting the disease, aptly termed by one correspondent as "die-back of two-year-old peach shoots."

In the spring the leaf-buds expand normally, without any suggestion of disease, but just about the time when the blossom is fully expanded the young leaves suddenly wilt, turn brown, and die within a few days. At the same time the petals change to a rusty brown colour, and the flowers droop, but remain attached to the branch for some time, as also do the leaves. Finally the shoots bearing diseased leaves and flowers assume a deep claret-red colour, and shrivel more or less as the season advances.

The above are the distinctive and unvarying naked-eye characteristics of the disease under consideration. About midsummer, when the dead leaves and flowers have been removed by wind and rain, trees that have been badly diseased can be recognised by the presence of numerous naked shoots, ranging from one to two feet in length. During the months of May and June of the following year these dead branches, if carefully examined, will be found to be more or less thickly studded with minute, dull-orange-coloured, tendril-like bodies, consisting of myriads of spores of a parasitic fungus.

If a section is taken through a branch at the point where such a tendril-like body is protruding, the fungus will be seen to consist of a more or less depressed sphere situated in the cortex. These spheres, which are quite numerous, consist at first of a minute, solid mass of mycelium, which gradually increases in size, becomes hollow, and is eventually lined with closely-packed, slender threads or sporophores, which originate from the cells forming the inside wall of the sphere, with their free tips projecting into the cavity of the fruiting body. The minute spores are produced in rapid succession from the tips of the sporophores, and soon fill the cavity of the fruiting body, which now begins to indicate its position by a slight wart-like protuberance under the epidermis of the host plant. When the fruiting body of the fungus is replete with spores, the sporophores deliquesce and form a highly hygroscopic substance, which increases very considerably in volume when in contact with water. This peculiar property of the distintegrated sporophore-material enables the spores to escape from the fruiting body into the air.

When the spores are mature and the sporophores have deliquesced, the whole are extruded from the fruit through a rupture in the epidermis caused by the increasing pressure of the spore-mass. This extrusion takes the form of tendrils, consisting of myriads of spores immersed in mucilage, and takes place after a shower of rain, the water causing the mucilage to swell to a remarkable extent. At the moment of extrusion these tendril-like bodies are very soft and gelatinous, but they commence to dry and harden the moment they come into contact with the air, and in the act of drying usually become spirally coiled and variously contorted. The extrusion of the entire mass contained in a spore-cavity usually occupies about five minutes. In dry weather the tendrils are rigid and horny, but they become soft and glairy when moistened with rain or dew. These spore-masses are not dispersed by wind, but depend for their dissemination to a great extent on birds, who convey the spores when moist and gelatinous from diseased to healthy shoots by means of their feet.

The shoots are only capable of infection while quite young, but when the mycelium has gained an entrance into the tissues it spreads rapidly and infects the entire growth of the season. Four shoots infected respectively at one point only, when three inches long, and protected from the visits of birds by netting until the end of the year, were found the following year to be infected throughout their entire length—about fifteen inches—and produced numerous tendril-like masses of spores. In another experiment a branch bearing six shoots was selected; three of the shoots were infected with spores, whilst the remaining three were left uninfected as controls. All these shoots were protected by netting, and the following year the three infected shoots were badly diseased, while the uninfected control shoots remained healthy. No success attended the many attempts to infect branches more than one year old, not even when spores were placed in a wound made in the cortex.

The spores do not retain their power of germination for more than about three months.

A NOTABLE TOMATO.

Tomatoes we have galore, a host of varieties and forms which find favour with various sections of the gardening community.

It is a moot point as to which is the favourite tomato with the majority of growers, but I suspect I could give a good guess as to which would come out at the top if a poll were taken amongst the cultivators of the ruddy fruit. Be this as it may, there is always a willingness among growers, especially in private posts, to give a trial to new varieties when they come with good credentials.

At any rate, no apology is needed for introducing America's best tomato to the readers of the Gardeners' Magazine.

This tomato, known as Dwarf Champion, is largely grown in the different States, and has earned fame for itself among the gardeners overseas. But, as far as I am aware, it is but little known in the British Isles. Of its origin I know little, but an extended trial has given me a good idea of its qualities. In growth it is distinct from any other form I have met with. Short and sturdy, close-jointed, with thick, massive leaves, it forms a conspicuous object, whether utilised for glass or outside culture.

The fruits are large, about seven to the bunch, very fleshy, and with fewer seeds than any other variety I know. In colour it is a bright magenta-red, very different to the crimson-hued forms we usually grow, and connoisseurs to whom fruits have been submitted have stated that it is the best-flavoured tomato they have tasted.

For low houses, where the ordinary varieties seem too rampant, this tomato should find a place, and for outside culture it is worth a good trial. Under both phases of culture it has proved itself a meritorious cropper. It cannot be classed as an early tomato, as it is about a week later than Sunrise, but for maincrop purposes it should serve a good purpose.

One other point about Dwarf Champion is that it makes a handsome decorative plant when grown in pots. Its thick, spreading, well-arranged leafage, and sturdy habit, making it quite a useful foliage plant for the summer months.

I do not press the opinion that this tomato should be substituted for tried favourites, but would rather suggest that gardeners should give it a trial, and find out its merits for themselves. It is my opinion that Dwarf Champion might be further improved as a "cropper" by careful selection, and it may yet find an honoured place in our English gardens.

P. S. H.

Pæonies. — Herbaceous and tree pæonies ought to be planted without further delay, as the ground, being yet warm, enables the roots to become partly established before winter. The ground should be deeply dug and liberally manured at planting, thereby enabling them to remain for some years without replanting, an operation they particularly resent.—T. S.

SCHEMES FOR SPRING BEDDING.

The perfection surely, of art has been expended upon the beautiful creation of summer bedding arrangements, but many gardeners are content, as a rule, to repeat each season the same effects in spring beds and borders. There are, of course, fewer flowers and foliage plants with which to construct harmonies, yet I think a number of neglected opportunities might be noted. Rose pink aquilegias may be used to advantage; gardeners who have not raised seedlings of this strain can purchase plants. A charming way to plant them in beds is alternately with double white gardenia-flowered narcissi above a carpet of the pink viola William Niel; another method is to fill a large central place with the columbines and merely broadly edge with the rose Aubrietia Moerheimi. A pure white aquilegia similarly employed with the crimson Aubrietia Leichtlini can be relied on for a fair display.

Scarlet-crimson cowslips give a colour show that is brighter than any gained from polyanthuses, in my experience; the flowers, though smaller, are so numerous and of so true a scarlet, looking almost orange as the light shines through them, that the vivid effect is almost dazzling. Unless massed they lose half their value, so they may well be used as a broad border belt around a taller plant, or round one of equal height if it is desired to see at once the whole expanse. I have found the giant variety of white Bellis perennis excellent as their companion; this is named The Bride, and grows easily to the nine inches of height advertised. Any nearly white late-blooming daffodil would be suitable, or the centre could consist of double white arabis, which is one of our best spring bedding plants when thoroughly staked and tied, not allowed to spread out unduly or to be beaten down by gales and heavy rains. All who treat the double arabis in this style will find it of immense service; edge it with yellow dwarf daffodils or pansies, or give it a centre of golden wallflowers, and it shows up equally well.

Instead of invariably filling a bed almost full with scarlet tulips and giving an edging of white, at least one good-sized bed should be planted with groups of three tall red late tulips at half-yard intervals, and all the rest of the space be given up to Iberis correæfolia Climax, a very fine-blooming variety of the white evergreen candytuft. This carpet can be left on the bed all the year, if wished, and a pelargonium of some rare shade be placed in the spots vacated by the tulips.

Myosotis sylvatica, so commonplace as seen in all gardens bordering wallflowers, gives a new effect as a carpet around deeper blue hyacinths, and can be recommended also as offering an original colour harmony with orange tulips. The white form of Myosotis sylvatica will make a noteworthy delicate bed, with pale salmon-pink hyacinths, while I have seen it employed satisfactorily with a mingling of white hyacinths and tall late white tulips on a lawn between beds in which the colours were vivid. Myosotis dissitiflora is a much better forget-me-not for spring bedding, because it is less tall, and larger as well as brighter of bloom. Yet M. sylvatica should not be discarded altogether, because its effect in a mass is prettier from a slight distance.

There are now special strains of spring-bedding stocks to bloom freely as early as May, of which great advantage should be taken. The white variety makes a pleasing bed, alternated with double gold wallflowers, while the crimson, or magenta one, surrounding a group of double blush white pæonies, and doubly-edged by Aubrietia Leichtlini and Aubrietia purpurea, is certain to give satisfaction.

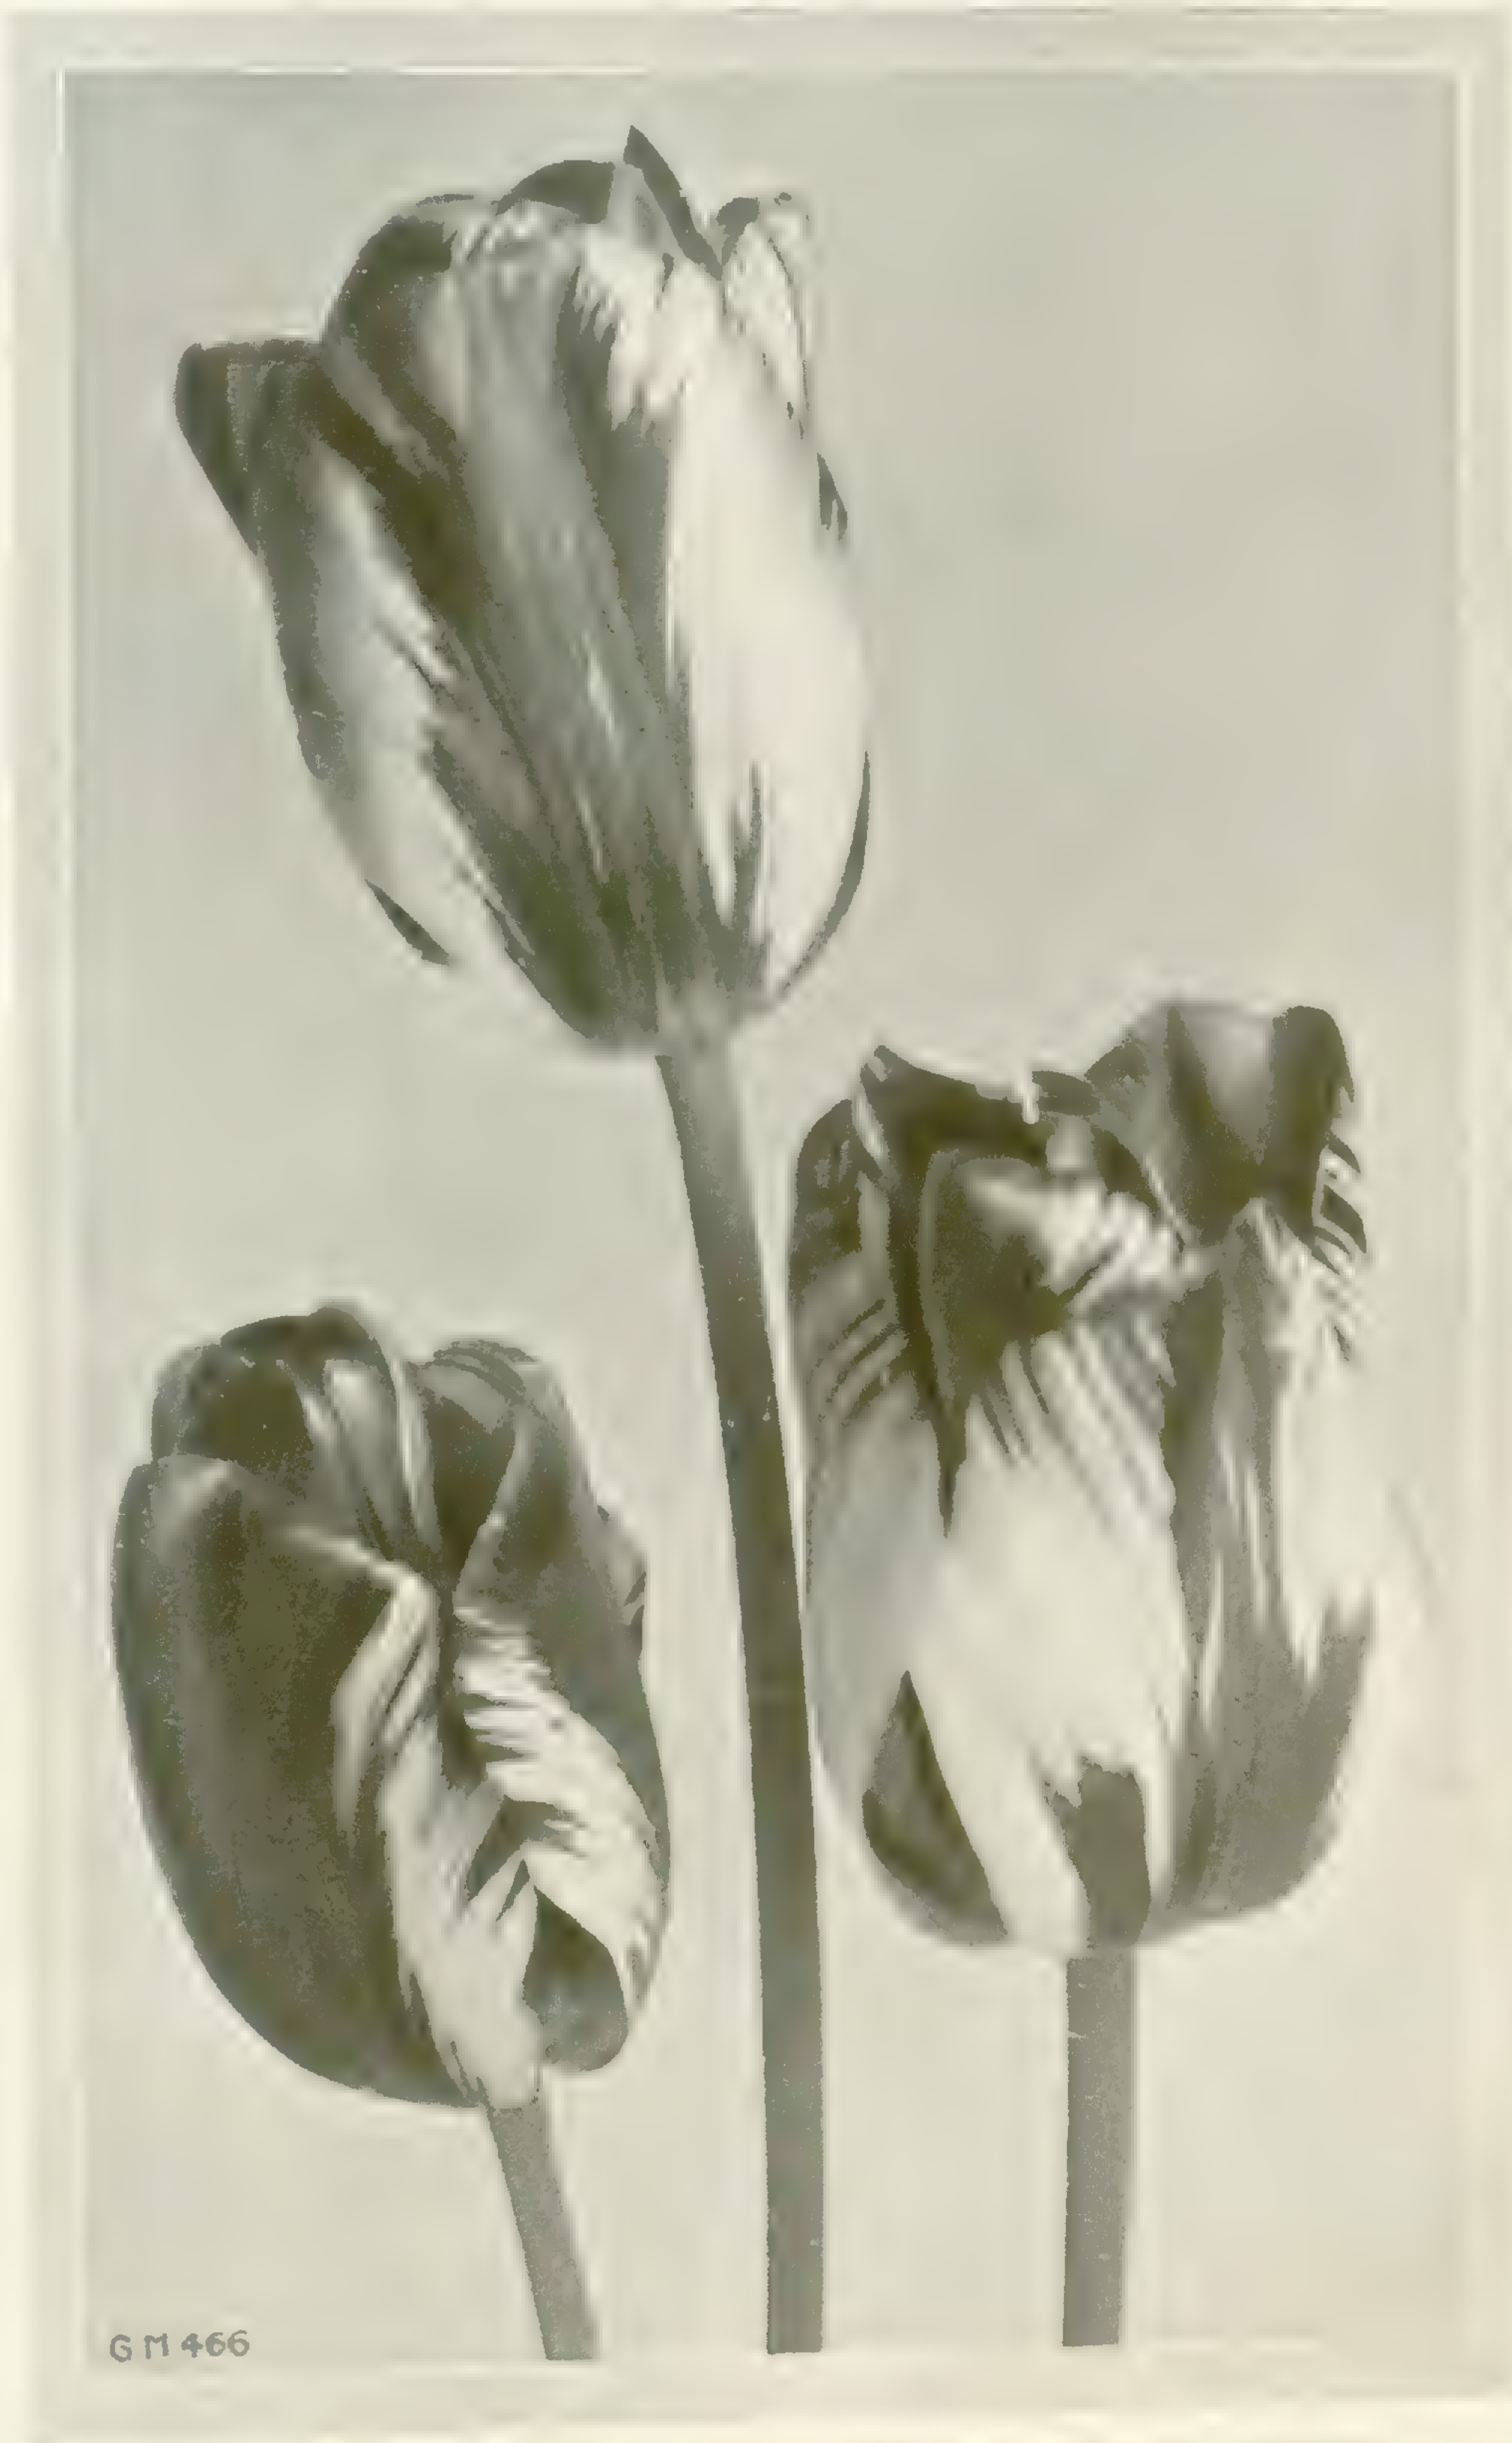
The use of small standard-trained trees as bed centres in spring is not half enough adopted. It is possible to grow many such ornaments in giant pots, sink them in autumn and remove them in June, but in most cases large beds can keep these centre-pieces all the year round without the summer and autumn effect being spoilt. Red and pink hawthorns are charming, and their foliage remains ornamental; a bed in which a standard double-red hawthorn bloomed above white biennial stocks, alternated with double white narcissi, and edged by double red daisies, would undoubtedly be successful. Later on, when summer plants were substituted, a centre ring of white cistus could be set round the hawthorn. Laburnums are especially beautiful when drooping above spring flowers in beds, and small almond trees are now becoming fashionable, as they deserve to be.

M. H.

HARDY FLOWERS are always popular, as they make the garden bright and attractive, and require but little attention. All the information required for their successful culture is given in EASILY GROWN HARDY PERENNIALS, by G. H. Vos. Price 5s. net, by post in box, 5s. 6d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London

REMBRANDT TULIPS.

The Rembrandt tulips, to which a brief reference was made in the issue of the GARDENERS' MAGAZINE of September 12, constitute such a distinct and attractive group that a few of the many beautiful varieties should be included in selections of tulips that bloom during the month of May. In habit and in the size and form of their flowers the Rembrandts somewhat closely resemble the Darwins, with which all who take an interest in gardening are now familiar, but there is a wide difference in the colouration of the flowers of the two sections. The Darwins are self-coloured, with occasional breaks, while the Rembrandts have rectified flowers, and in all cases the combination of colours is of the most delightful description.



A BEAUTIFUL REMBRANDT TULIP, VICTOR HUGO.

The flowers are of fine form and feathered brilliant carmine-red and pure white.

As in the case of the Darwins and other May-flowering varieties, the Rembrandts are of much value in the production of broad effects; but I prefer to grow them in such manner that their distinctive characteristics can be more readily seen and fully enjoyed than is possible when they are planted in large masses. I have grown them in various ways, but the method by which the greatest pleasure has been derived from them has been their arrangement in groups in the herbaceous borders. Planted in groups consisting of from twelve to twenty-four bulbs of one variety in each, they produce a rich display of colour, while the markings of the individual flowers are readily seen. The Rembrandts thrive under precisely the same conditions as the other tulips that bloom in May, and the only reference that need be made to cultural matters is to advise the planting of the bulbs as early as possible. I have planted them as late as the end of December for experimental purposes, and have obtained admirably developed blooms in the following season, but I do not recommend the bulbs being kept out of the ground until so late a period. There is no advantage in so doing after this, but there is some risk, and if the bulbs have not been fully matured, the results from late planting will be more or less unsatisfactory.

The following varieties will form an excellent selection: Anne Mary, feathered lilac; Hebe, white, lilac, and maroon; La Coquette, feathered deep maroon on a lilac ground; Eros, white suffused lilac and striped with rose; Marco Spado, white, feathered with bright red; Purity, white, marked with pink; Rosy Gem, bright rose, feathered deep red; Salome, white, marked with rose; Semele, white, with pink feathering; Vesta, lilac, feathered bright red; Victor Hugo, white, feathered brilliant carmine-red, a beautiful variety, as so well shown in the accompanying illustration; Zenobia, white, suffused purple-rose and striped maroon.

The Rembrandts, it may be added, were introduced some years ago by Messrs. Krelage and Son. G. G.

TROUBLE WITH CHINA ASTERS.

In the ordinary course of things these useful annuals should be at their best in September, but this year I have seen a good many beds with bare patches in them, and heard numerous complaints about the way in which asters have damped off and died, even after they appeared to be well established. This, by the way, is no new trouble where the China aster is concerned, but this year the plant seems to have been more disappointing than usual in the above respect. Perhaps propagation has something to do with it, and in my experience plants that are not coddled at all are the least liable to fail. In many cases, however, asters are raised in a high temperature and are planted out when the summer bedding is done, say, at the end of May. These are the plants which frequently damp off, and a better plan is to sow early in a low temperature, so as to secure sturdy specimens, and plant them in their permanent quarters early in May. I followed this course in the present season, planting the asters out about May 9, and, in addition to having a splendid display of bloom, I have not lost a single plant. Some years ago I used to lose a good many bedding calceolarias through the plants dying off in the beds, and it was not until I adopted the method of hardening the plants and getting them out early in May instead of at the end of the month that the trouble was overcome. The difficulty with calceolarias is to clear the beds of other occupants in time for early planting, but I would advise readers who are troubled with the failure of asters to try cool propagation and early planting.

H.

NEW PLANTS, ETC.

◆

CYPRIPEDIUM BIANCA SUPERBA.

A particularly fine cypripedium, derived from C. Leeanum Prospero and C. insigne Sanderæ. It much resembles the latter in the yellow-green colouring of the petals and lip, but differs from it in having a bolder and ampler flower, and in having the upper and larger portion of the dorsal sepal pure white, as shown in the accompanying figure. F.C.C., R.H.S., September 29. Mr. H. Alexander, orchid grower to Lieut.-Colonel Holford, Westonbirt, Gloucester.

CATTLEYA VENUS.

This very beautiful cattleya was raised by Messrs. Charlesworth and Co., Heaton, Bradford, but passed into Mr. Goodson's collection. Its parents are C. Iris and C. Dowiana aurea, and thus it is a C. Iris with a large addition of D. aurea in its composition. In general outline C. Venus resembles C. Iris, but the parts are rather broader and a little less stiff. The sepals and petals are rich yellow tinged with deep crimson, and giving a lovely old gold effect. The splendid lip is ruby-crimson with orange shading and golden veins. A grand new autumn-flowering orchid; figured on p. 751. F.C.C., R.H.S., September 29. Mr. G. Day, gardener to H. S. Goodson, Esq., Fairlawn, Putney.

ODONTIODA CHARLESWORTHI, GOODSON'S VAR.

This is a beautiful orchid, crimson-scarlet with yellow markings. The flowers shown appeared to be rather larger than those of the type exhibited at the last Temple Show, but we could not see that they differed sufficiently to merit such a high award. F.C.C., R.H.S., September 29. Mr. H. S. Goodson, Putney.

CATTLEYA RUTILANT.

A very bright and distinct cattleya, obtained by crossing C. Maroni and C. Fabia Vigeriana. The flowers are of large size, and have ample segments. The colouring is difficult to describe; it is purple with a heavy crimson suffusion; lip very deep crimson-purple. F.C.C., R.H.S., September 29. Mons. Charles Maron, Brunoy, France.

POPULUS LASIOCARPA.

This is a fine addition to our list of useful poplars. It was inadvertently exhibited as P. albus lasiocarpa, but it is a distinct species, and was named P. lasiocarpa by Oliver in the "Icones Plantarum." A native of Central China, it was found among the Hon Shan Ho Mountains by Mr. E. H. Wilson, who described it as a "fine tree, growing 50ft. to 60ft. high. The leaves of P. lasiocarpa are broadly cordate, and, borne on young plants, they are a foot long by about ten inches wide. The footstalk and chief ribs are of a reddish colour, and these show up well against the deep green of the leaf proper. P. lasiocarpa should prove to be one of our most useful deciduous trees for ornamental planting. F.C.C., R.H.S., September 15. Messrs. James Veitch and Sons, Chelsea.

NEPENTHES DR. J. MACFARLANE.

Another very fine new hybrid nepenthes, with large, bold, and richly-coloured pitchers. The parents are N. sanguinea and N. Curtisi superba. In shape the newcomer most resembles N. sanguinea, but the bright red colouring of the pitcher is freely splashed with the deep crimson found in N. Curtisi superba. The largest pitcher shown was eight inches long. F.C.C., R.H.S., September 29. Messrs. J. Veitch and Sons, Lim., Chelsea.

SOPHRO-CATTLEYA SAXA, WESTONBIRT VAR.

The parents of this dwarf and beautiful orchid are Cattleya Trianæ and Sophronitis grandiflora rosea. Considering the size of the plant, the flower is of large size, and it is finely formed. The colour is very bright rose-purple, with pale orange shading in the throat, and a deep purple apex to the lip. A.M., R.H.S., September 29. Lieut.-Colonel Holford, Westonbirt.

SELAGINELLA EMILEANA AUREA.

Although selaginellas are not very popular, there are signs that these elegant plants, as well as ferns, are returning to favour. Those who are familiar with the beautiful and well defined S. Emileana will fully appreciate the value of this new comer, which has fronds of a soft yellow-green hue. A.M., R.H.S., September 29. Messrs. J. Hill and Sons, Barrowfield Nurseries, Edmonton.

VIOLA CORNUTA PURPUREA.

An exceptionally beautiful variety, and one that blooms with the utmost freedom. The plants shown were a mass of brilliant violet-blue flowers, and though these latter were not individually large, they were abundant. For late flowering, and doubtless also for spring flowering, this viola is excellent. A.M., R.H.S., September 29. Messrs. Gunn and Sons, Olton.

ONCIDIUM INCURVUM.

A well-known species, with long, branching spikes of small rose and white flowers that are charming for many kinds of floral decorations. A.M., R.H.S., September 29. Mr. H. Ballantine, gardener to Baron Schröder, The Dell, Egham.

LÆLIO-CATTLEYA GOLDEN ORIOLE, GOODSON'S VAR.

A useful orchid, with deep golden-yellow flowers, heavily overlaid with bright crimson. The parents are L.-c. Charlesworthi and C. Dowiana Rosita. A.M., R.H.S., September 29. Mr. H. S. Goodson.

PENNISETUM JAPONICUM.

A very beautiful Japanese grass that is of perennial character, and said to be quite hardy. It is a very elegant garden plant, the flower heads being about three inches long and of a light reddish, violet-tinted colour, and silky appearance. Spikes and leaves are about 2½ft. long. A.M., R.H.S., September 29. Mr. Amos Perry, Enfield.

CARNATION WINONA.

A finely formed tree carnation, with fragrant flowers of a deep pink hue. A.M., R.H.S., September 29. Messrs. R. H. Bath, Lim., Wisbech.

ORANGES.

Washington Navel.—A very fine orange of round form, and with a curious navel-like end. The flavour is excellent.

Renmark Navel.—This differs from the former in having rounder or broader fruits, and a less prominent apex. A.M., R.H.S., to each variety, September 29. Miss Nichol, 144, Ashley Gardens, S.W.

APPLE RENOWN.

A fine cropping apple of the same origin as Charles Ross. It is a brilliant variety, not unlike Emperor Alexander, of excellent flavour and fine cooking quality. A.M., R.H.S., September 29. Mr. Charles Ross, Welford Park Gardens, Newbury.

ROSE LADY GWENDOLEN LITTLE.

A decorative variety belonging to the tea-scented section and of considerable value in the garden and for the supply of cut flowers. In growth it is vigorous and free branching, and the medium-sized flowers are freely produced throughout the season, and are attractively coloured golden-yellow and bright pink. Card of Commendation, National Rose Society, September 17. Messrs. John Jefferies and Son, Cirencester.

DAHLIAS.

El-Vino.—A large and well-formed show dahlia of soft lilac hue, the colour deepening at the tips of the florets. A.M., R.H.S., September 29; F.C.C., N.D.S., September 29. Mr. S. Mortimer, Farnham.

Elsie Turner.—A very large cactus dahlia of a soft fawn-buff shade. A.M., R.H.S., September 29; F C.C., N.D.S., September 29. Mr. S. Mortimer.

Lady Bountiful.—A shapely single variety of a deep rose-red hue, with a zone of crimson round the disc. A.M., R.H.S., September 29; F.C.C., N.D.S., September 29. Mr. M. V. Seale, Sevenoaks.

Nora Reynolds.—A bright red self-coloured pompon dahlia of neat form. A.M., R.H.S., September 29; F.C.C., N.D.S., September 29. Mr. M. V. Seale, Sevenoaks.

Monarch. — An orange-tinted amber-coloured cactus dahlia with yellow centre. A.M., R.H.S., September 29; F.C.C., N.D.S., September 29. Messrs. J. Stredwick and Son, St. Leonards.

Wellington.—A cactus variety, deep purplish-red, with white tips. A.M., R.H.S., September 29; F.C.C., N.D.S., September 29. Messrs. J. Stredwick and Son.

Saxonia.—A fine rich red-purple cactus variety, with bright purple shading and white tips. A.M., R.H.S., September 29; F.C.C., N.D.S., September 29. Messrs. J. Stredwick and Son.

Satisfaction.—A very pretty pink cactus dahlia with quite pale centre. A.M., R.H.S., September 29; F.C.C., N.D.S., September 29. Messrs. J. Stredwick and Son.

Nellie Riding.—A handsome crimson, white-tipped cactus variety, figured on p. 749. F.C.C., N.D.S., September 29. Mr. J. T. West, Tower Hill, Brentwood.

POTATOES.

Dewaeka Seedling.—A white, round, maincrop potato. Tested at Wisley for cropping and at Westminster for quality. A.M., R.H.S., September 29. Mr. J. Yule, Aberdeen.

British Champion.—Another white, round variety, and a free cropper. Tested at Wisley and Westminster. A.M., R.H.S., September 29. Mr. J. Carter, Cottenham.

BEET.

Willow-leaved.—A narrow-leaved variety, tested at Wisley. A.M., R.H.S., September 29. Messrs. Dobbie and Co., Rothesay.

Blood Red.—A fine deeply-coloured beet that has been tested at Wisley. A.M., R.H.S., September 29. Messrs. Sutton and Sons, Reading.

Pineapple.—A bright variety that is very attractive. A.M., R.H.S., September 29. Messrs. Sutton and Sons, Reading.

CHRYSANTHEMUMS.

Ethel Blades.—A very fine early-flowering chrysanthemum, with stiff, erect growths that are freely branched, and carry fair sized reflexed blooms of a rich and brilliant crimson scarlet hue with old gold reverse. F.C.C., N.C.S., September 28. Messrs. W. Wells and Co., Merstham.

Tapis d'Or.—A splendid and very free-flowering early chrysanthemum, that has massive sprays of bloom, and comes quite large when disbudded. The flowers are broad petalled, and of a bright canary-yellow colour. A fine variety for massing or for market. F.C.C., N.C.S., September 28. Messrs. W. Wells and Co.

Leslie.—A low-growing, free-branching, and free-flowering early chrysanthemum, with medium sized, graceful Japanese blooms of the richest golden yellow. Long, stiff flower stems. F.C.C., N.C.S., September 28. Messrs. W. Wells and Co.

J. Bannister.—A splendid sport from Perle Chatillonaise, and one that bears a profusion of large and elegant blooms on freely-branched growths. Appears to be a very fine grower. The large flowers are rich fawn-yellow with a delicate tinting of rosy-pink. F.C.C., N.C.S. Messrs. W. Wells and Co.

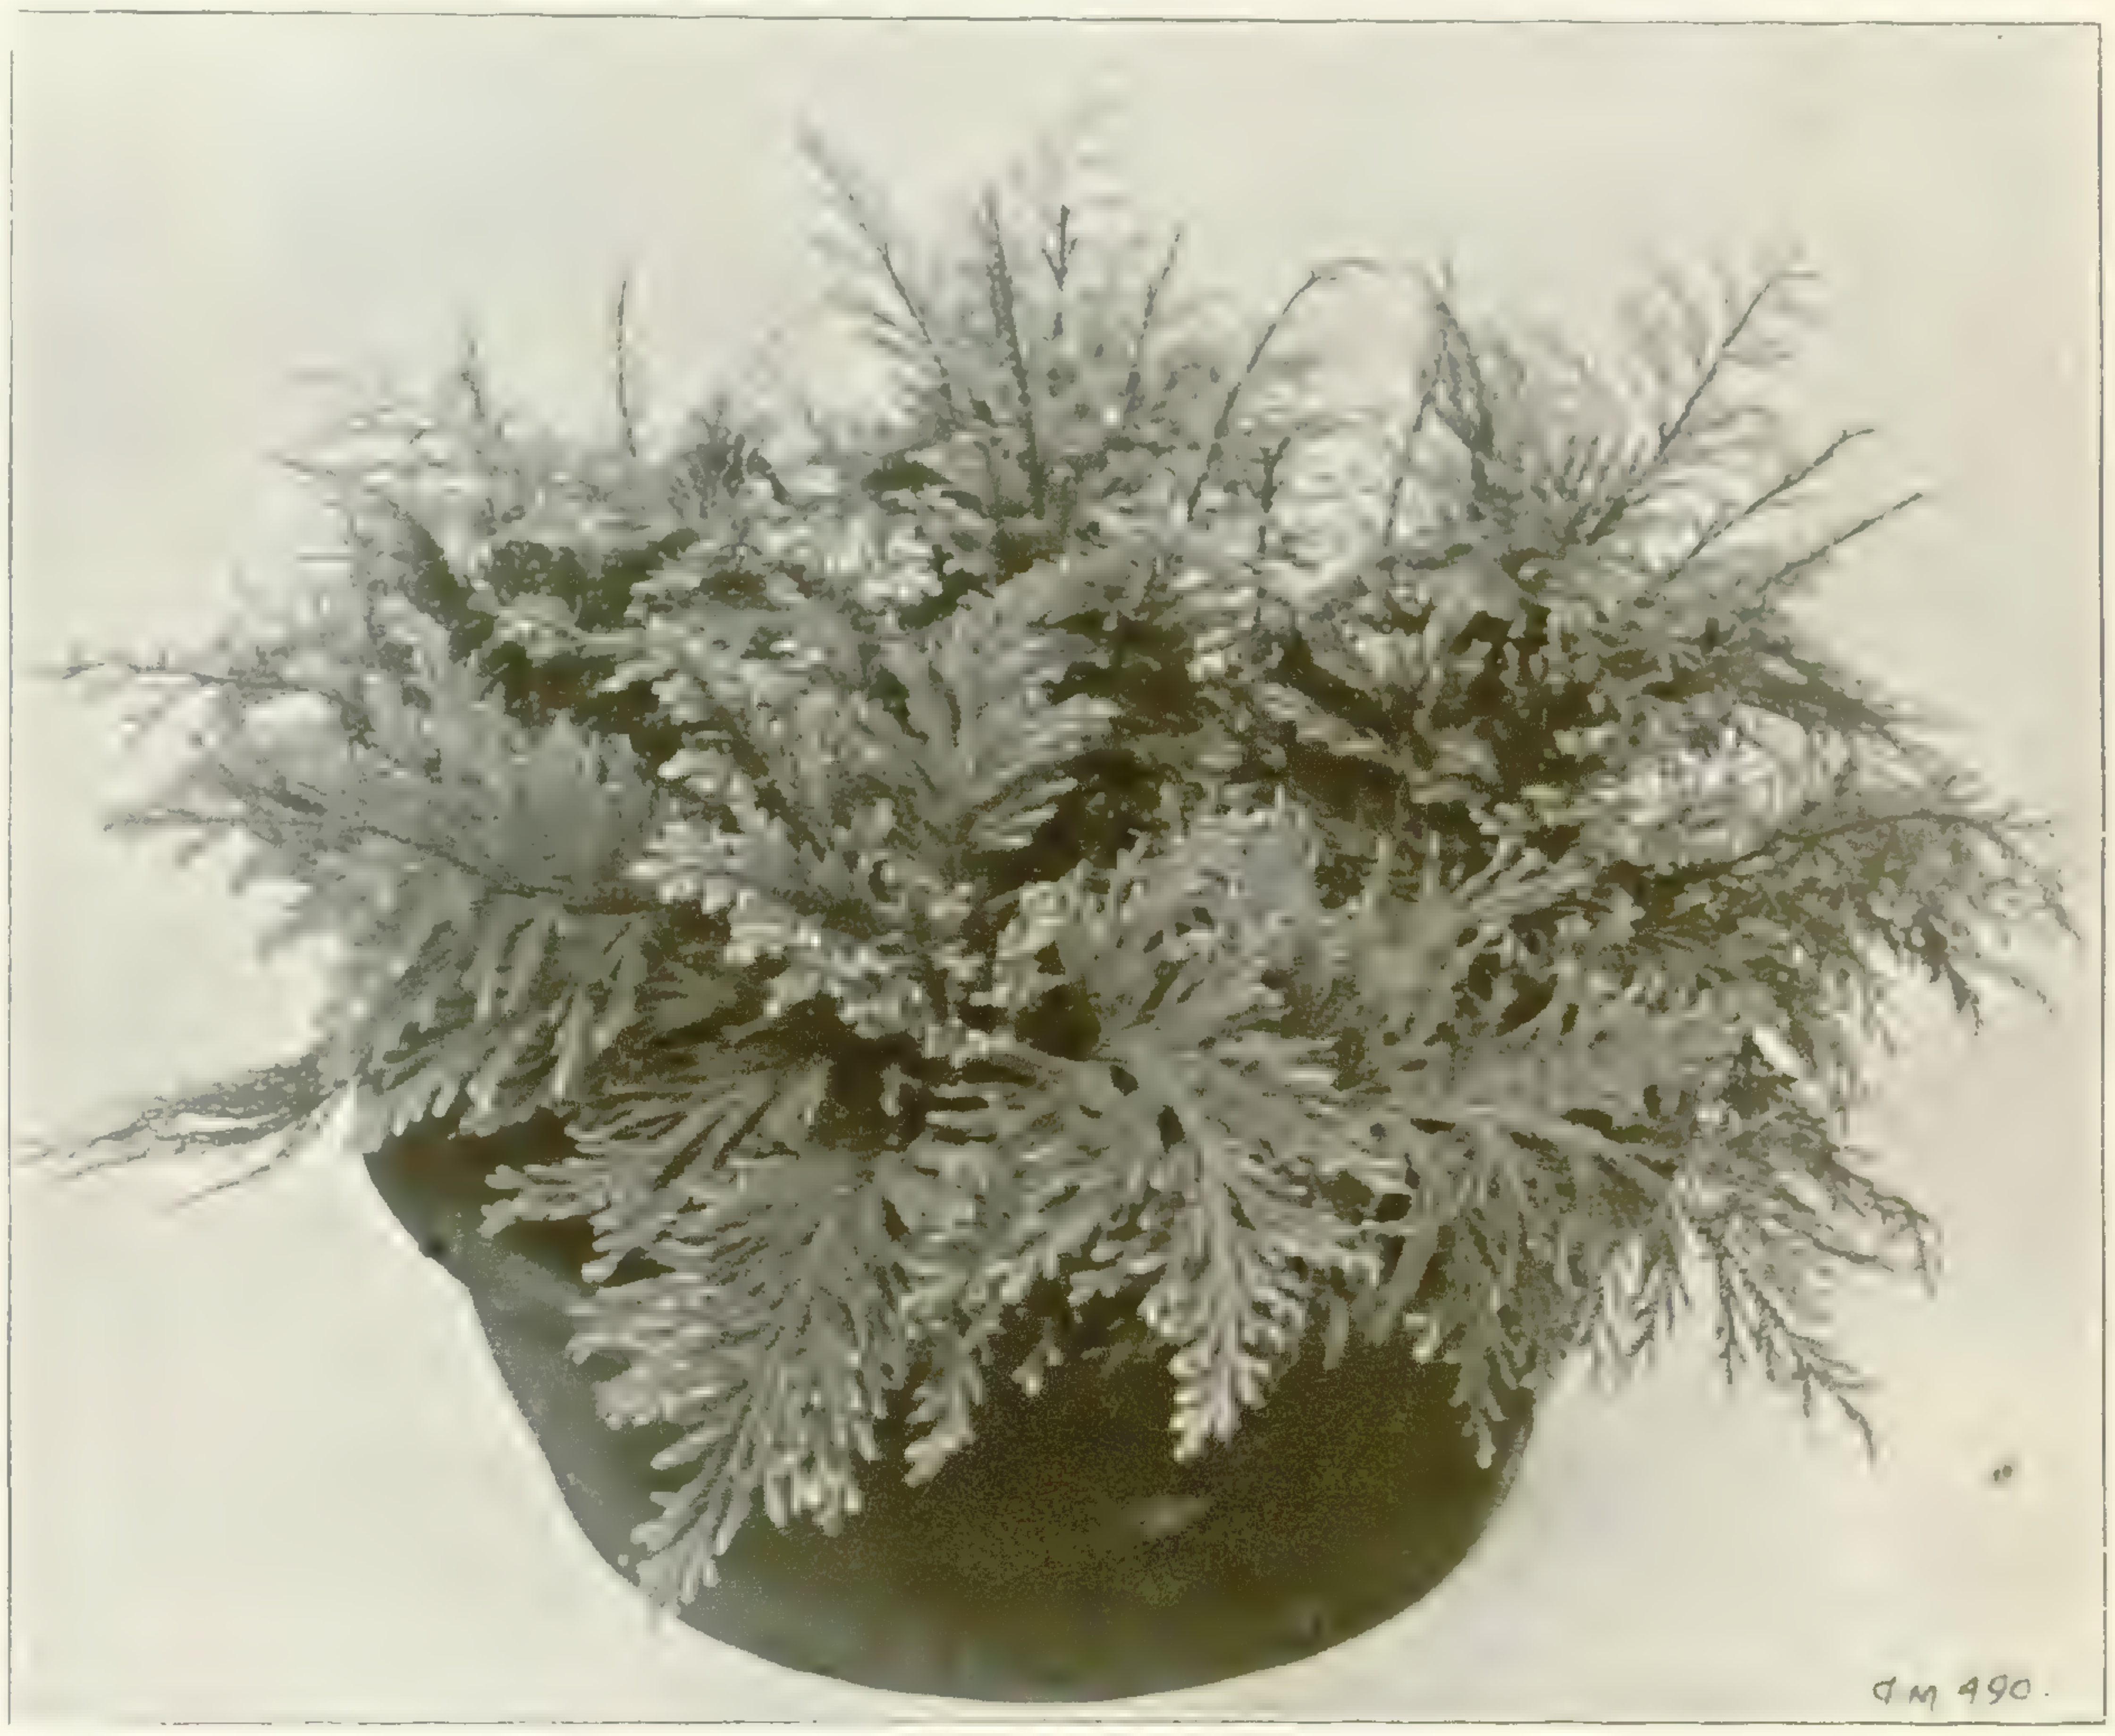
Kathleen.—An effective single variety, free flowering, and of good size. Colour, bronzy-buff, with yellow zone around its high, deep yellow centre. F.C.C., N.C.S., September 28. Messrs. W. Wells and Co.

Normandie.—A very beautiful early-flowering variety, that blooms in fine clusters. The flowers are reflexed, but not stiff, and the outer petals are elongated prettily. The colour is a lovely shade of silvery pink. This is one of M. Nonin's varieties. F.C.C., N.C.S., September 28. Mr. Wm. Sydenham, Melbourne, Derbyshire.

Golden Glow.—A very early flowering, large-flowered, incurving Japanese variety, that will produce big canary-yellow blooms in mid-September. F.C.C., N.C.S. (as a market variety), September 28. Mr. W. J. Godfrey, Exmouth, Devon.

CROCUS SPECIES.

Some years ago we planted a collection of species of crocus in the grass to test their merits in this district. The way we proceeded with the work was as follows. After removing the turf to a depth of about two inches the ground was broken up with a fork, this was then covered with about six inches of light, rich, sandy soil, which was worked in to give a greater depth; when this was completed the surface was made smooth and even with a rake. The corms were then scattered broadcast over the ground, taking care in doing so to keep the various shades together as much as possible, and so prevent one colour from becoming intermingled with the other. That they might be the more readily distinguished, each species was then labelled. The corms were afterwards planted where they fell, using a dibber, taking care in doing so not to put them in too deeply as there was the two inches of turf to be replaced.



SELAGINELLA EMILEANA AUREA.
A.M., R.H.S., Sept. 29. Messrs. J. Hill and Sons, Barrowfield Nurseries, Edmonton.
Colour bright yellow-green.

When a patch had been planted, the surface of the soil was again made smooth, boards were then laid on that the turf might be replaced without again trampling on the ground. As the work proceeded the turf was slightly beaten with the back of the spade, excepting this, the turf was allowed to sink naturally, that the flower buds might the more readily push through the grass.

Some of the more tender species require the shelter of shrubs to ward off the cold winds, as they bloom very early; but given a warm sunny position, and a rich, light, well-drained soil, their flowers are most attractive from February onwards until April. By scattering the corms broadcast on the surface, and planting where they fall, a more natural appearance is given when they are in bloom than would be the case were the bulbs placed at regular distances from each other.

Some may think it unnecessary to prepare the ground as recommended, but where the bulbs are required to remain in the same place for several years, this extra labour will well repay the cultivator for the trouble taken.

When selecting the different species for planting in grass it is necessary to take the locality into consideration, for though as a rule they are hardy enough, some of them bloom during the winter and will thus need protection if their flowers are to be of any value, otherwise they would be spoiled by the frost and snow, and the only reward one would get for his trouble would be a crop of grass-like foliage in spring. Of the vernal species the earliest with us to bloom is Imperati, which in sheltered situations in mild seasons expands its delicate flowers in the early part of February. C. banaticus is a lovely species, the flowers of which are a deep rich purple colour, forming a fine contrast to the green grass during February and March. C. versicolor is a handsome species, flowering during March and April. There are several autumnal flowering species that are well worthy of notice, such as speciosus, sativus, irridiflorus, cilicius, and some others. Anyone who is interested in these gems of the garden, and who live in districts where they will not thrive in the open, would do well to plant them in well prepared beds in cold frames that their flowers can be protected from the inclement weather sometimes experienced during the dull days of winter.

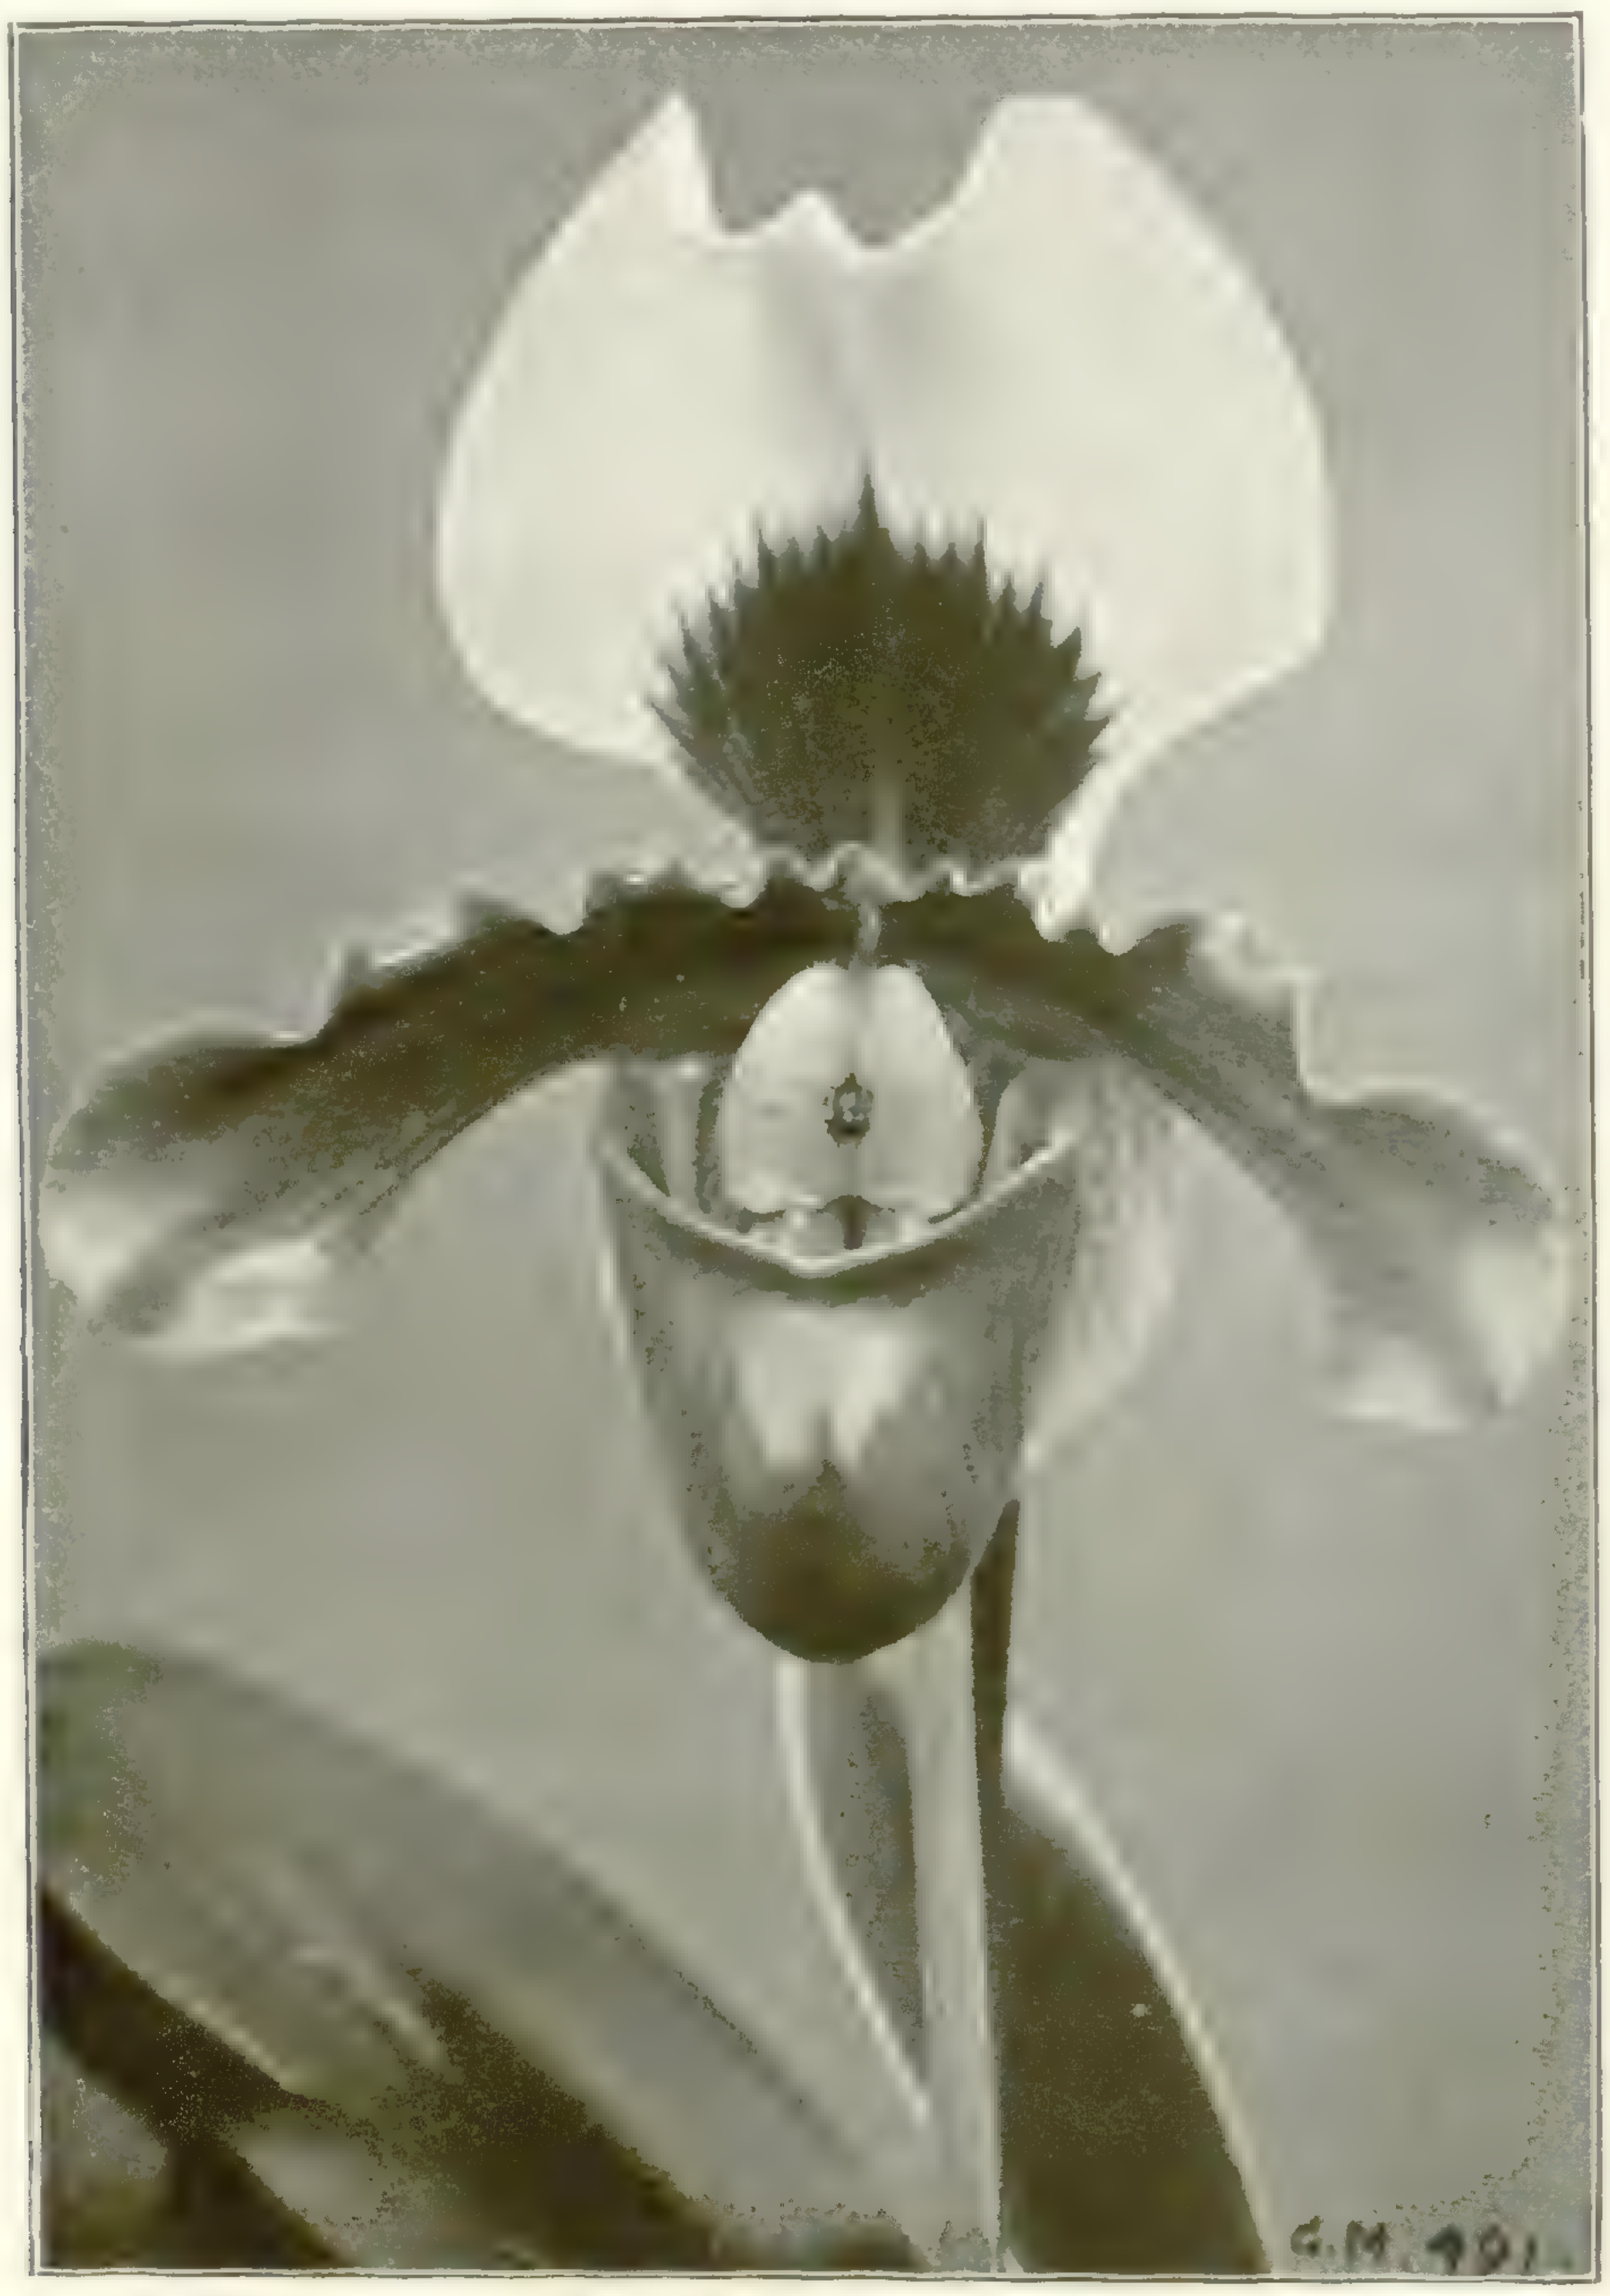
H. C. Prinsep.

Buxted Park Gardens.

Box Edgings may now be replanted, and if such have become irregular or patchy it is best to lift all of it and replant; tall plants may be shortened at both top and bottom. Dig the ground to a good depth, make it absolutely firm and level, stretch a line along, and cut a trench out, leaving one side quite perpendicular, and against this the box should be planted, leaving not less than four inches above ground. Be sure and keep all the plants quite upright or the effect will be spoiled.—E. F. H.

EARLY TULIPS FOR FORCING

For forcing many early tulips are excellent, and a display may be had from December to April without fail, though the very earliest batches are not invariably satisfactory, and unless there is a special demand I should prefer to leave the tulips until well over the New Year, after which, if they have been boxed or potted up early enough, they will readily be brought into flower in three weeks from the time they are taken indoors. The main points in their culture is to get good, heavy, but not necessarily large bulbs potted or boxed up early in September, so that they may have time to root well before any attempt is made to force them. I prefer ordinary propagating boxes to pots, and in each of these are placed from forty to fifty bulbs, in sandy soil, on good drainage, and the bulbs with their tips just showing above the soil.



CYPRIPEDIUM BIANCA SUPERBA.
F.C.C., R.H.S., Sept. 29. Mr. H. G. Alexander, orchid grower to Lt.-Colonel Holford, Westonbirt, Gloucester. Flowers reduced in size, yellow-green and white.

As the boxes are filled they are stood on a bed of ashes and covered with finely-sifted old ashes to a depth of four inches to six inches, and here they remain till wanted, or until the tops have made two inches of growth, by which time they will be well rooted and ready for forcing purposes. If not then wanted they are removed from the ashes and stood in cold frames, shaded for a few days until the blanched appearance has gone from the growth, and protected from sharp frosts. From time to time, as required, batches are brought into a house with an intermediate temperature and stood under the staging, so that they may become slightly drawn to lengthen the stems. When this has been done they are lifted on to the stagings and allowed to develop their flowers, taking care that they at no time become dry at the roots.

If pots of flowers are required they can be made up by lifting a given number of bulbs from the boxes and putting them into the pots, when the buds have almost reached the opening stage. In this way, if well watered in, no harm comes to the flowers, and the pots may be made up to a more uniform height than they became if put into pots at first, as it is generally found that some bulbs take longer than others to develop, and that pots made up at potting time generally contain one or two laggard bulbs that spoil the symmetry of the whole.

During the past few years vendors of bulbs have introduced what they term extra-early ripened consignments, for the purpose of giving flowers at or about Christmas-tide. These I have not found satisfactory, for though the bulbs appear to be good the flowers are produced on very short stems, and lose their symmetrical form, and become squat and ungainly. The fault of this is in the treatment of the bulb before it comes to hand, for I have purposely kept back some of these bulbs, and brought them on gently side by side with later consignments of the same varieties, and they have still retained their faults, while the others have been tall and shapely.

The main points with early forced tulips is to have them well rooted before bringing them into warmth, to let the warmth be gentle, to commence with at least, and to provide plenty of moisture both to the roots and in the atmosphere of the house or pit in which they are being grown, to draw the stems by keeping them in shade during the early stages, and to get them up to the light while the flowers are still in bud.

Satisfactory varieties for forcing are those mentioned below, and they are placed as nearly as possible in the order in which they can be brought into flower: Thomas Moore, Mon Tresor, Yellow Prince, Vermilion Brilliant, Le Matelas, Proserpine, Crimson King, White Pottebakker, White Joost van Vondel, Primrose Queen, La Reine, La Belle Alliance, White Swan, Rose Gris-de-Lin, Duchess de Parma, and Couleur Cardinal. As with the outdoor varieties, there are many others that force well, but in this matter it is best to depend on well-tried varieties for the bulk of the stock, and to test newer ones in small quantities until they have been proved good for the purpose.

J. C. Tallack.

Shipley Hall Gardens.

ZAUSCHNERIAS.

The Humming Bird Trumpets, or Mexican fuchsias, are brilliant flowers of the autumn, and at a season when rock garden plants in bloom are too few and too far between, the brilliant vermilion-scarlet blossoms of the zauschnerias are welcome indeed. They are ideal rock garden flowers for the autumn, and their warmth of colouring is everywhere appreciated when they are in bloom.

Unfortunately, there have been many disappointments experienced with these zauschnerias, as some of them are so late in forming their flower buds, and require so much sun to induce them to open, that they are worthless in our average climates in the United Kingdom. It is wonderfully difficult to secure the best form, and there is only one, I think, and one may order plants as Z. splendens and Z. californica, and be favoured (?) with plants of exactly the same appearance, which, in nine cases out of ten, are of the worthless variety for our climate. This variety is one which differs from the free-flowering, or, rather, early-flowering, one in the presence of a dense pubescence or downy covering on the leaves and stems, while that which flowers freely is much less pubescent. The shy-flowering one is also denser in its habit of growth, and runs more freely at the roots than the best form, which I take to be the correct Z. splendens, and which, I think, may be the variety of Z. californica called mexicana in the Kew Handlist.

This free-flowering or early variety is a little more tender than the late-blooming one, but when it has once obtained a hold among the stones there is little fear of its being lost. I had it in my former garden, where it was hardy and bloomed freely, the others never coming in early enough to flower before frost. It was left behind when I removed to my present garden, and I have only been able to replace it this year. The firm from whom I had this good form once told me they had a quantity of it, but on sending again I received the pubescent, late one. No doubt the latter will flower in some places, but it is worthless mostly, and may be said to take among the zauschnerias the place held by some of the tricyrtises, or the late variety of Stokesia cyanea. There is no lack of buds, but these do not open, save in the warmest and sunniest localities. On the other hand, the early one rarely fails to give a long succession of its bright trumpet-shaped flowers, even in wet and dull localities, although it revels in sunny places and in dryish rockwork.

S. Arnott.

TREATMENT OF SICKLY FERNS.

As a practical example of remedial measures when ferns are out of condition and have even gone so far as to be apparently dead, the following particulars should be of interest to those who have collections, especially of rare varietal forms of hardy ferns, though the same procedure would doubtless equally well apply to many choice exotics.

A friend of mine acquired last year a collection of original wild finds and acquisitions which in its time had been practically unique, embracing many very fine varieties discovered by the owner and confined to his possession. For many years, however, it had been greatly neglected, and most of the ferns, polystichums, scolopendriums, athyriums, and lastreas had developed into masses of impoverished offsets, which were, moreover, heavily handicapped by an unchecked invasion of rank weeds and seedling trees and bushes of many kinds. The ferns which survived were lifted, and, pending preparation of a fitting place at their new home, were all potted on receipt in the autumn, being subsequently replanted in the spring in the open in somewhat dense soil. As a result of original lack of vigour, loss of roots by removal, and the double check involved by the two shifts, very few indeed showed any growth during the past season, practically all, indeed, except some of the athyrias and lastreas, being quite moribund.

Under these circumstances, I was asked for my advice, and, acting upon my experience in connection with propagative operations, particularly with the polystichums, which embraced the choicest forms in the collection, the plants were treated in the following way. All those which showed no sign of life at all were pulled up, all the roots cut close off by scissors, and the caudex thoroughly washed. Commencing then at the base of the caudex or root-stock, which is formed by the persistent bases of the old fronds, which retain vitality for years, all the dead and rotten ones were pulled away until those were reached in which life still remained, as evidenced by their adherence to the caudex, and their appearance when cut across. In nearly every case a living portion was reached in this manner, and from this with a sharp knife all rotten parts were cut away, and the mass then washed again. Each piece was then installed in a thumb pot, in sandy, peaty soil, in which it was embedded halfway, leaving the top exposed. A tumbler fitting inside the pot was then placed over the caudex, and the plants set side by side in a close but well-lighted frame.

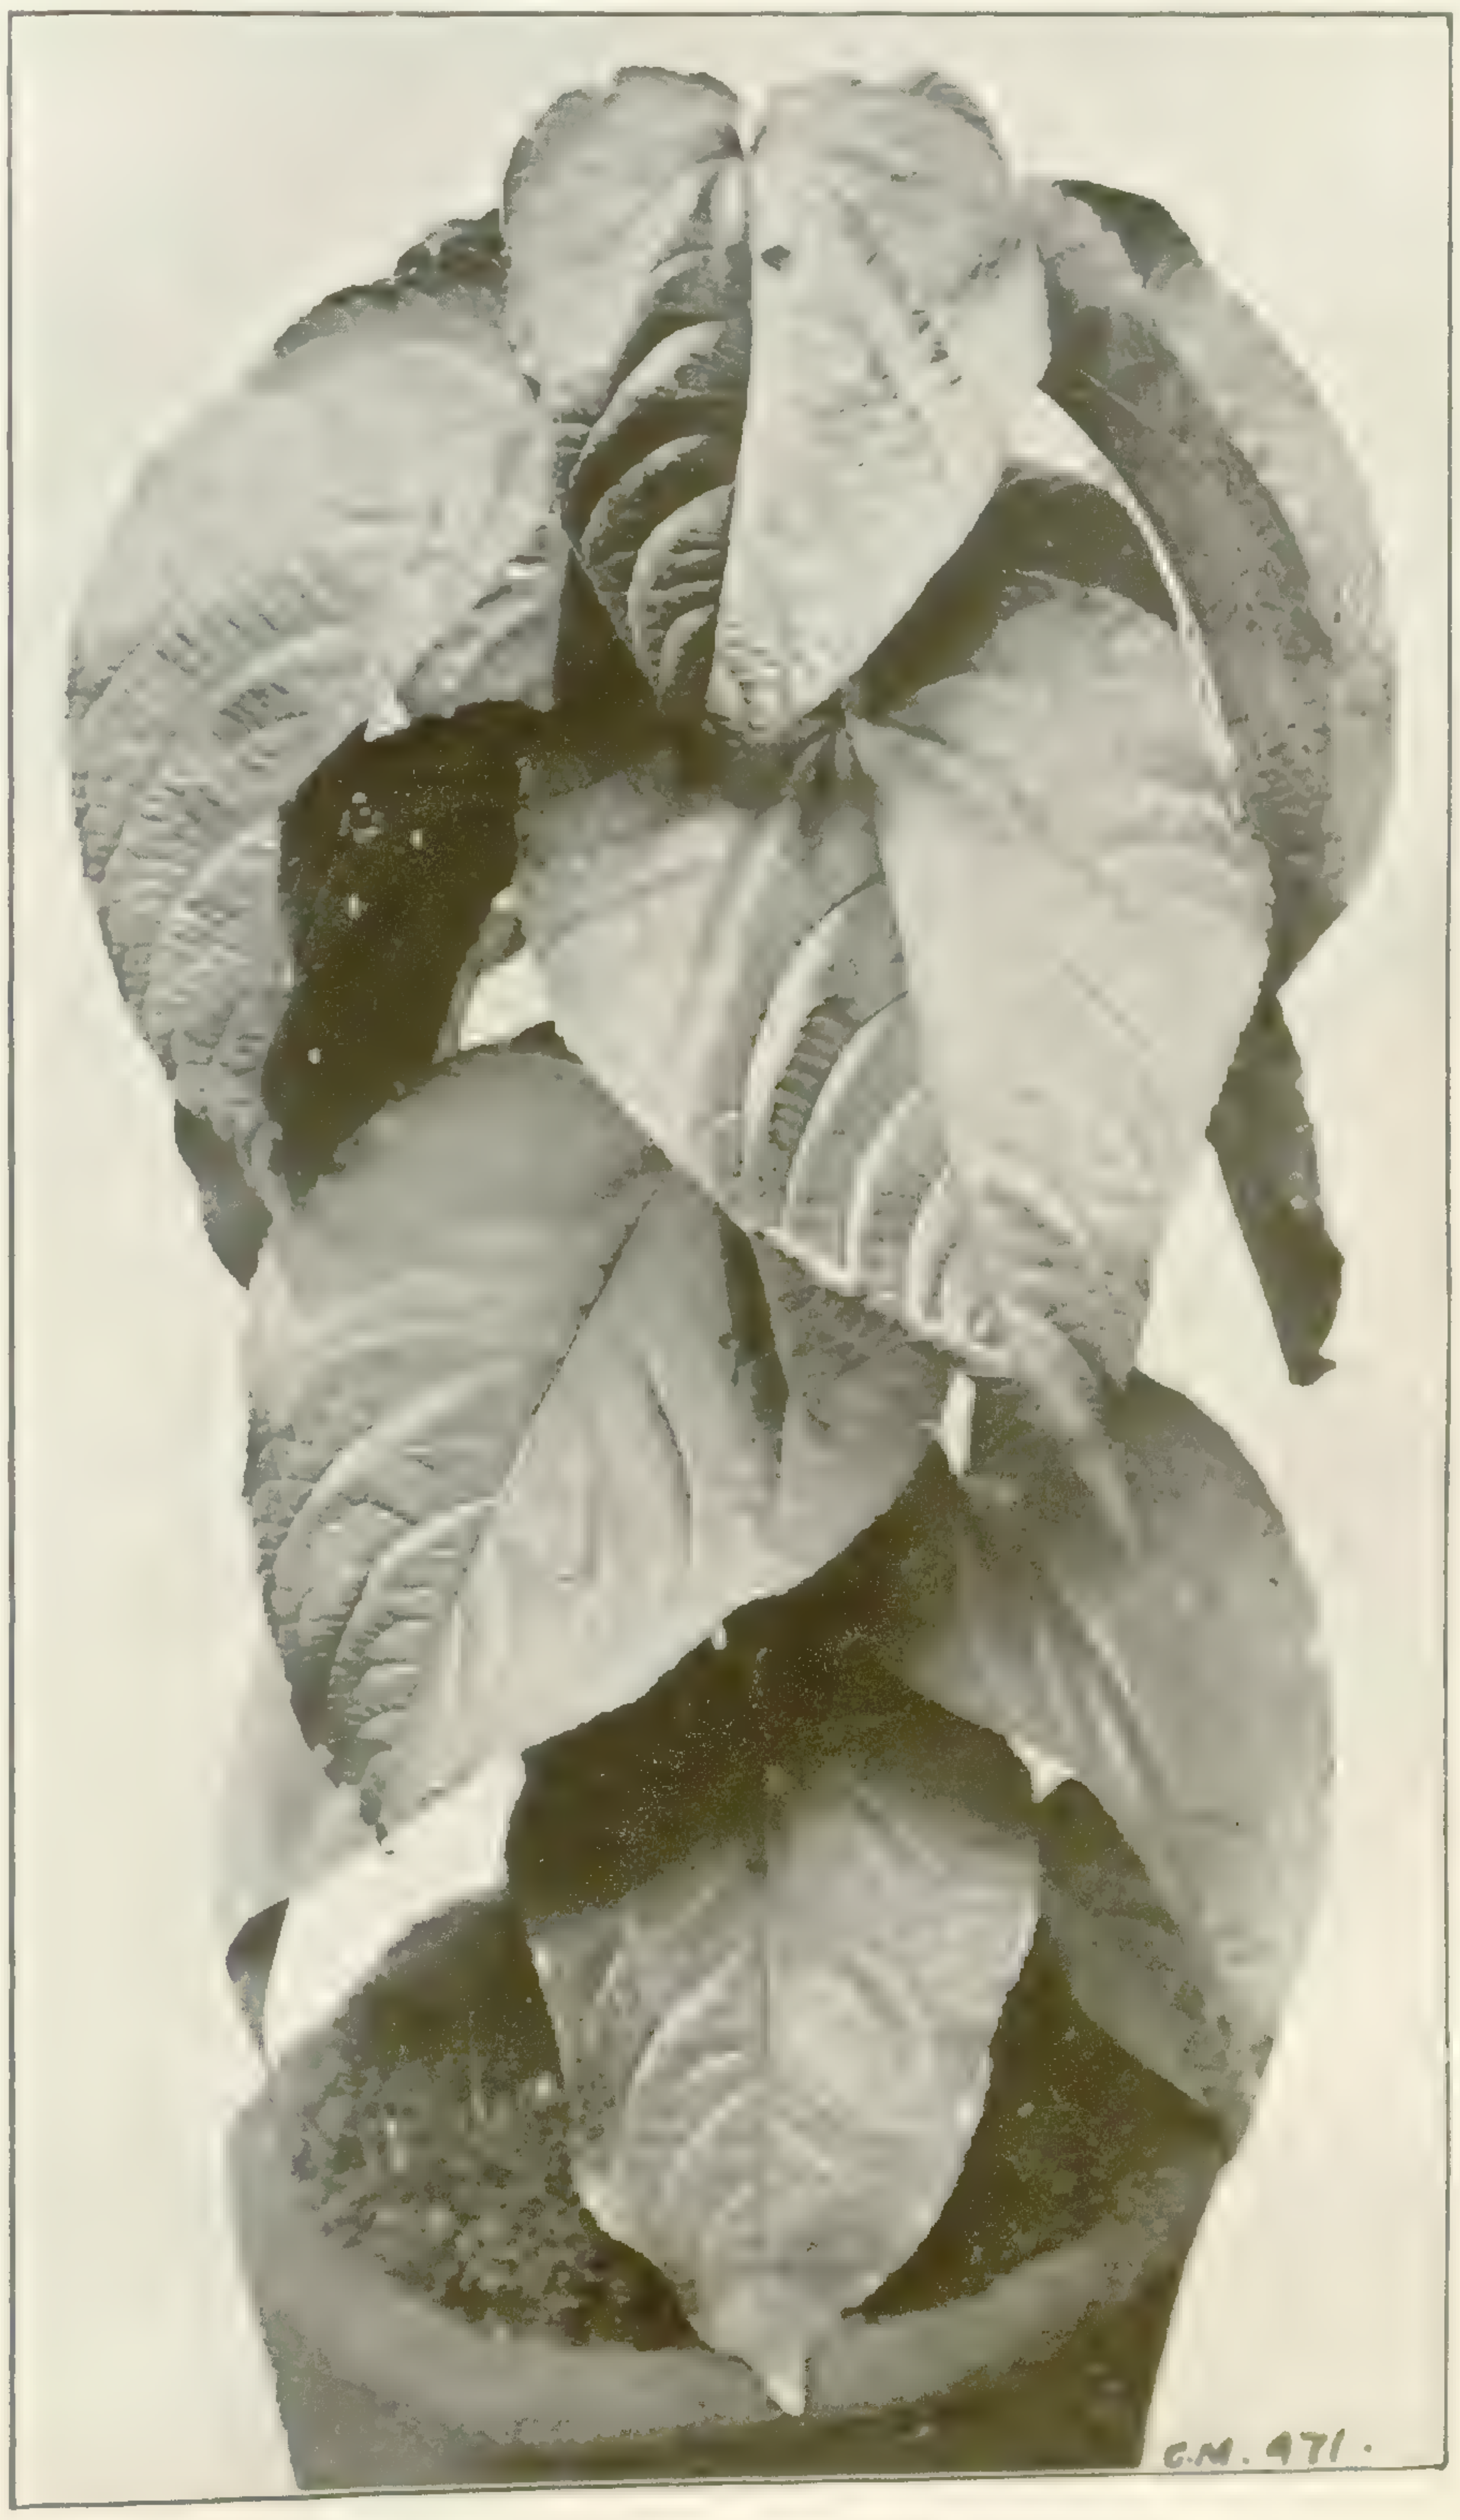
Out of 360 plants thus treated not one has failed to start into growth, either from the central axis or from lateral buds induced by its suppression. Such a wholesale case of resurrection of plants which were to all intents and purposes dead is probably without parallel, and affords incontestable proof that so long as any internal vitality exists, this can be assisted to assert itself if certain principles of fern growth are borne in mind. A fern is distinguished from a flowering plant by the fact that each frond as it rises produces its own independent bunch of roots close to its base, as an adjunct to the general system of roots which have been similarly produced by previous fronds, and which persist as feeders when these perish.

For healthy growth it is essential that these new roots find easy access to nutritive soil or the fronds will not perfect, and under a succession of such checks they will become smaller and smaller, and, deprived of the stimulus healthy foliage imparts to root action, the whole root system becomes weakened and the bulk of it dies. As a result of this, matters become worse and worse, especially with pot plants, since the soil is soured for lack of the circulation induced by healthy root action, and in time becomes a mere mass of dead roots and utterly unfit for plant development. The fern, however, probably continues to produce fronds, but these are entirely at the expense of the stored-up sap in the rootstock, and are consequently stunted in growth, and become weaker and weaker, the rot from below gradually spreading until finally it reaches the very growing point itself, and the fern is absolutely dead. From the success, however, which attended the operations described, it is evident that at any time before this period a fresh start can be induced and the plant be reinstated.

It is obvious, in the first place, that drastic as the treatment appears, it has the effect of permitting new roots to reach fresh soil at once, while the full exposure of the still living parts of the caudex to daylight, and the close, humid conditions, stimulate to the utmost either the renewed growth from the centre of the caudex or the formation of bulbils, which most ferns are capable of producing, as a means of self-preservation if the central growth be destroyed. The Hartstongue, indeed, is so gifted in this respect that the persistent green frond bases which make up the bulk of the old rootstock may be pulled off it, and, after cutting off the roots attached, dropped into a tumbler containing an inch of clean wet silver sand, when, if covered with a glass slip, they will in a month or two, each develop bulbils, at first like little white pimples, which speedily develop into typical plants. The bases thus removed, the central core, with the growing tip intact, if potted up, will soon restore the original specimen.

The above-described operations only embraced Polystichum angulare and Scolopendrium vulgare varieties, but both Lady Ferns and lastreas are open to resuscitation in a similar fashion; these species, however, are less liable to go wrong and must be treated very badly indeed to become as moribund as the Shield Ferns concerned. None of them, indeed, in the collection cited, failed to stand the removals, or required to be treated surgically to preserve them.

Chas. T. Druery, V.M.H., F.L.S.



POPULUS LASIOCARPA.

A fine large-leaved poplar from Central China. Introduced by Messrs. Jas. Veitch and Sons, Chelsea. F.C.C., R.H.S., Sept. 15.

ROSE NOTES.

In no previous season in Devon have our roses been so satisfactory as during the passing summer, which may be attributable to one or two things, partly, perhaps, to liberal feeding, and partly to the season. Although the dry, hot weather set in early, it was surprising the length of time the plants continued flowering. To the clear, brilliant weather may have been due the intense colouring which some varieties showed. The sun did not, as sometimes happens, take out the colour, neither did the darker shades scald, as they are liable to under brilliant sunshine. It may have been a drier atmosphere which had a beneficial influence.

TEA-SCENTED ROSE LADY GWENDOLEN LITTLE.
Awarded a card of commendation by the National Rose Society, Sept. 17. Flowers golden-yellow and bright pink.

Of the varieties which have been especially fine in colouring and quality the following are well deserving of mention:

Madame Jean Dupuy stood out prominently, among others, for in its blooms there is some of the colouring of the old Homere, with the shading sometimes seen in Marie Van Houtte, combined with freeness which makes this rose attractive.

Lady Roberts was exceptionally good, showing a beautiful combination of colour in its long-pointed buds.

Madame Ravary is still the best rose of its distinct shade of colour. It is a very clean-growing rose, with us, being far ahead of Le Progrès; not an exhibition flower, but excellent for all other purposes.

Marie Croiber, a darker Caroline Testout, was of remarkable colour and clean growth.

Victor Hugo, brilliant, without a blemish.

Liberty holds its own well against Richmond, and for shape and floriferousness one of the best.

Hugh Dickson, sweet and good.

Mildred Grant, was well favoured by the season, the blooms being simply immense.

Prince de Bulgarie showed that delicate colouring which is more visible some seasons than others.

Gladys Harkness and Gustave Grunerwald assumed their most attractive colour.

Souvenir de Pierre Notting was again superb. It is to be regretted that the flower stems are too weak to support the blooms, otherwise it would possess all the attributes of a good rose.

Etoile de France.—We really had a good bloom of this disappointing rose.

Earl of Warwick.—Of this fine rose we had some splendid blooms; from other quarters I hear favourable accounts of this rose.

Boadicea was charming; this is a free blooming rose, and delightful in colour; good for massing and cutting.

Sulphurea is free, of the colour indicated by its name, a thin flower, but good in the bud.

Varieties that fell some points behind the foregoing were:

Bessie Brown.—Last season, in a damp summer, and not much sunshine, this rose was good; this season, which one might think just the weather for its thick, full buds, it was useless with us, the blooms not opening.

Mrs. Edward Mawley was another variety which did not come up to last season, probably best from maidens.

Charles J. Grahame was disappointing.

Some of the pink-shaded roses fell far behind the summer of 1907, notably Mrs. Sharman Crawford, Mrs. J. Laing, La Tosca, bad shape and too loosely formed to become a favourite.

These are a few of the not quite satisfactory varieties. Yet withal, the roses have been simply grand during 1908. A recent rain of .92 of an inch is most beneficial in helping to make an autumn show of the Queen of Flowers. T. H. SLADE.

Poltimore Park Gardens.

SCHIZANTHUSES.

These lovely annuals are gaining rapidly in public favour, and there are few more elegant plants for conservatory and corridor decoration during the spring and early summer months. They are often called Butterfly Flowers. S. pinnatus, S. retusus, and S. Wisetonensis are all useful, and possess a great variety of colours, including pure white, orange, pink, and various shades of purple.

When liberally treated S. pinnatus will make specimens quite 8ft. high. The seeds should be sown in early autumn, using a light compost, and placing the boxes in a cold frame to germinate. Transplant the seedlings, placing four in a 3in. pot, and grow on a shelf in a greenhouse, maintaining a temperature of from 50 deg. to 55 deg. As soon as nicely rooted, they should be potted on into 6in. pots, using a compost consisting of two parts loam and one part leaf-soil, with the addition of a little silver sand and charcoal. When well established pinch out the points of growth to induce a bushy habit and promote a sturdy, vigorous growth.

Be careful with the airing, for, although schizanthuses enjoy plenty of air, they are liable to mildew if it is carelessly admitted. Should this attack the plants dust them over with flowers of sulphur. At the end of January the plants will be ready for their final potting, which should be into 10in. pots, using the compost recommended above, to which may be added a little Thompson's plant manure. Do not make the soil too firm, and be careful with the watering when the plants are newly potted, it being advisable to keep them a little dry until well rooted. It will now be necessary to stake the plants, using tall bamboo canes, and looping the growths up neatly with green raffia, taking care not to tie them tightly.

It is beneficial to syringe between the pots on bright days, and a light spray overhead is often desirable in the afternoon. When the pots are full of roots a light top-dressing with Clay's Fertiliser may be given with advantage. Soot water and farmyard liquid manure are also valuable, and may be given twice a week, an excellent plan being to mix the two together.

S. Wisetonensis and S. retusus are rather dwarf in growth, and are best flowered in 6in. pots. The latter is very useful for cutting, being especially stiff in the stem. As basket plants the schizanthuses are among the most graceful I have seen. Those who saw Messrs. J. Carter and Co.'s exhibit at the Temple Show had ample proof of their value when so grown.

J. GARDNER.

Eaton Hall Gardens, Chester.

Roses may be grown to perfection by following the instructions given in ROSES AND THEIR CULTIVATION, by T. W. Sanders. A selection is given, with description of all the best varieties, and full details for culture outdoor and under glass. Price 2s. 6d. net, by post, in box, 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

OSTROWSKIA MAGNIFICA.

The ostrowskia is, without doubt, when seen in vigorous health, the most splendid of all our hardy perennials. It was first introduced into this country from Bokhara in 1887, but, although it has been cultivated in England for over twenty years, it can scarcely be considered a success in the majority of gardens. It apparently appreciates a heavy soil impregnated with lime, as this is the nature of the ground at Lilford Hall, where the splendid specimen shown in the accompanying illustration was grown. The tallest growths of this plant measured seven feet two inches in height, and the bulk of the shoots were five feet six inches high. It is but seldom that this glorious plant is to be seen in such magnificence, and if it could invariably be grown in such superb form, it would, when in flower, be the cynosure of every garden that possessed it.

Unfortunately, however, it is but in few cases that such success is attained. As a rule, in the south it does not exhibit the robust health that it evidences in Northamptonshire, and I have seen numbers of plants whose height did not exceed three feet or four feet, while many have been considerably smaller. It apparently dislikes a hot, dry soil, even when this has been well mixed with old mortar rubble, as in such staple it has made but poor growth. A heavy soil is evidently to its liking, and this should be provided where possible. Its roots are exceedingly brittle, so much so that it is almost impossible to lift a plant from the open ground, even with the greatest care, without breaking them—a circumstance which renders its transplantation without damage a most difficult proceeding.

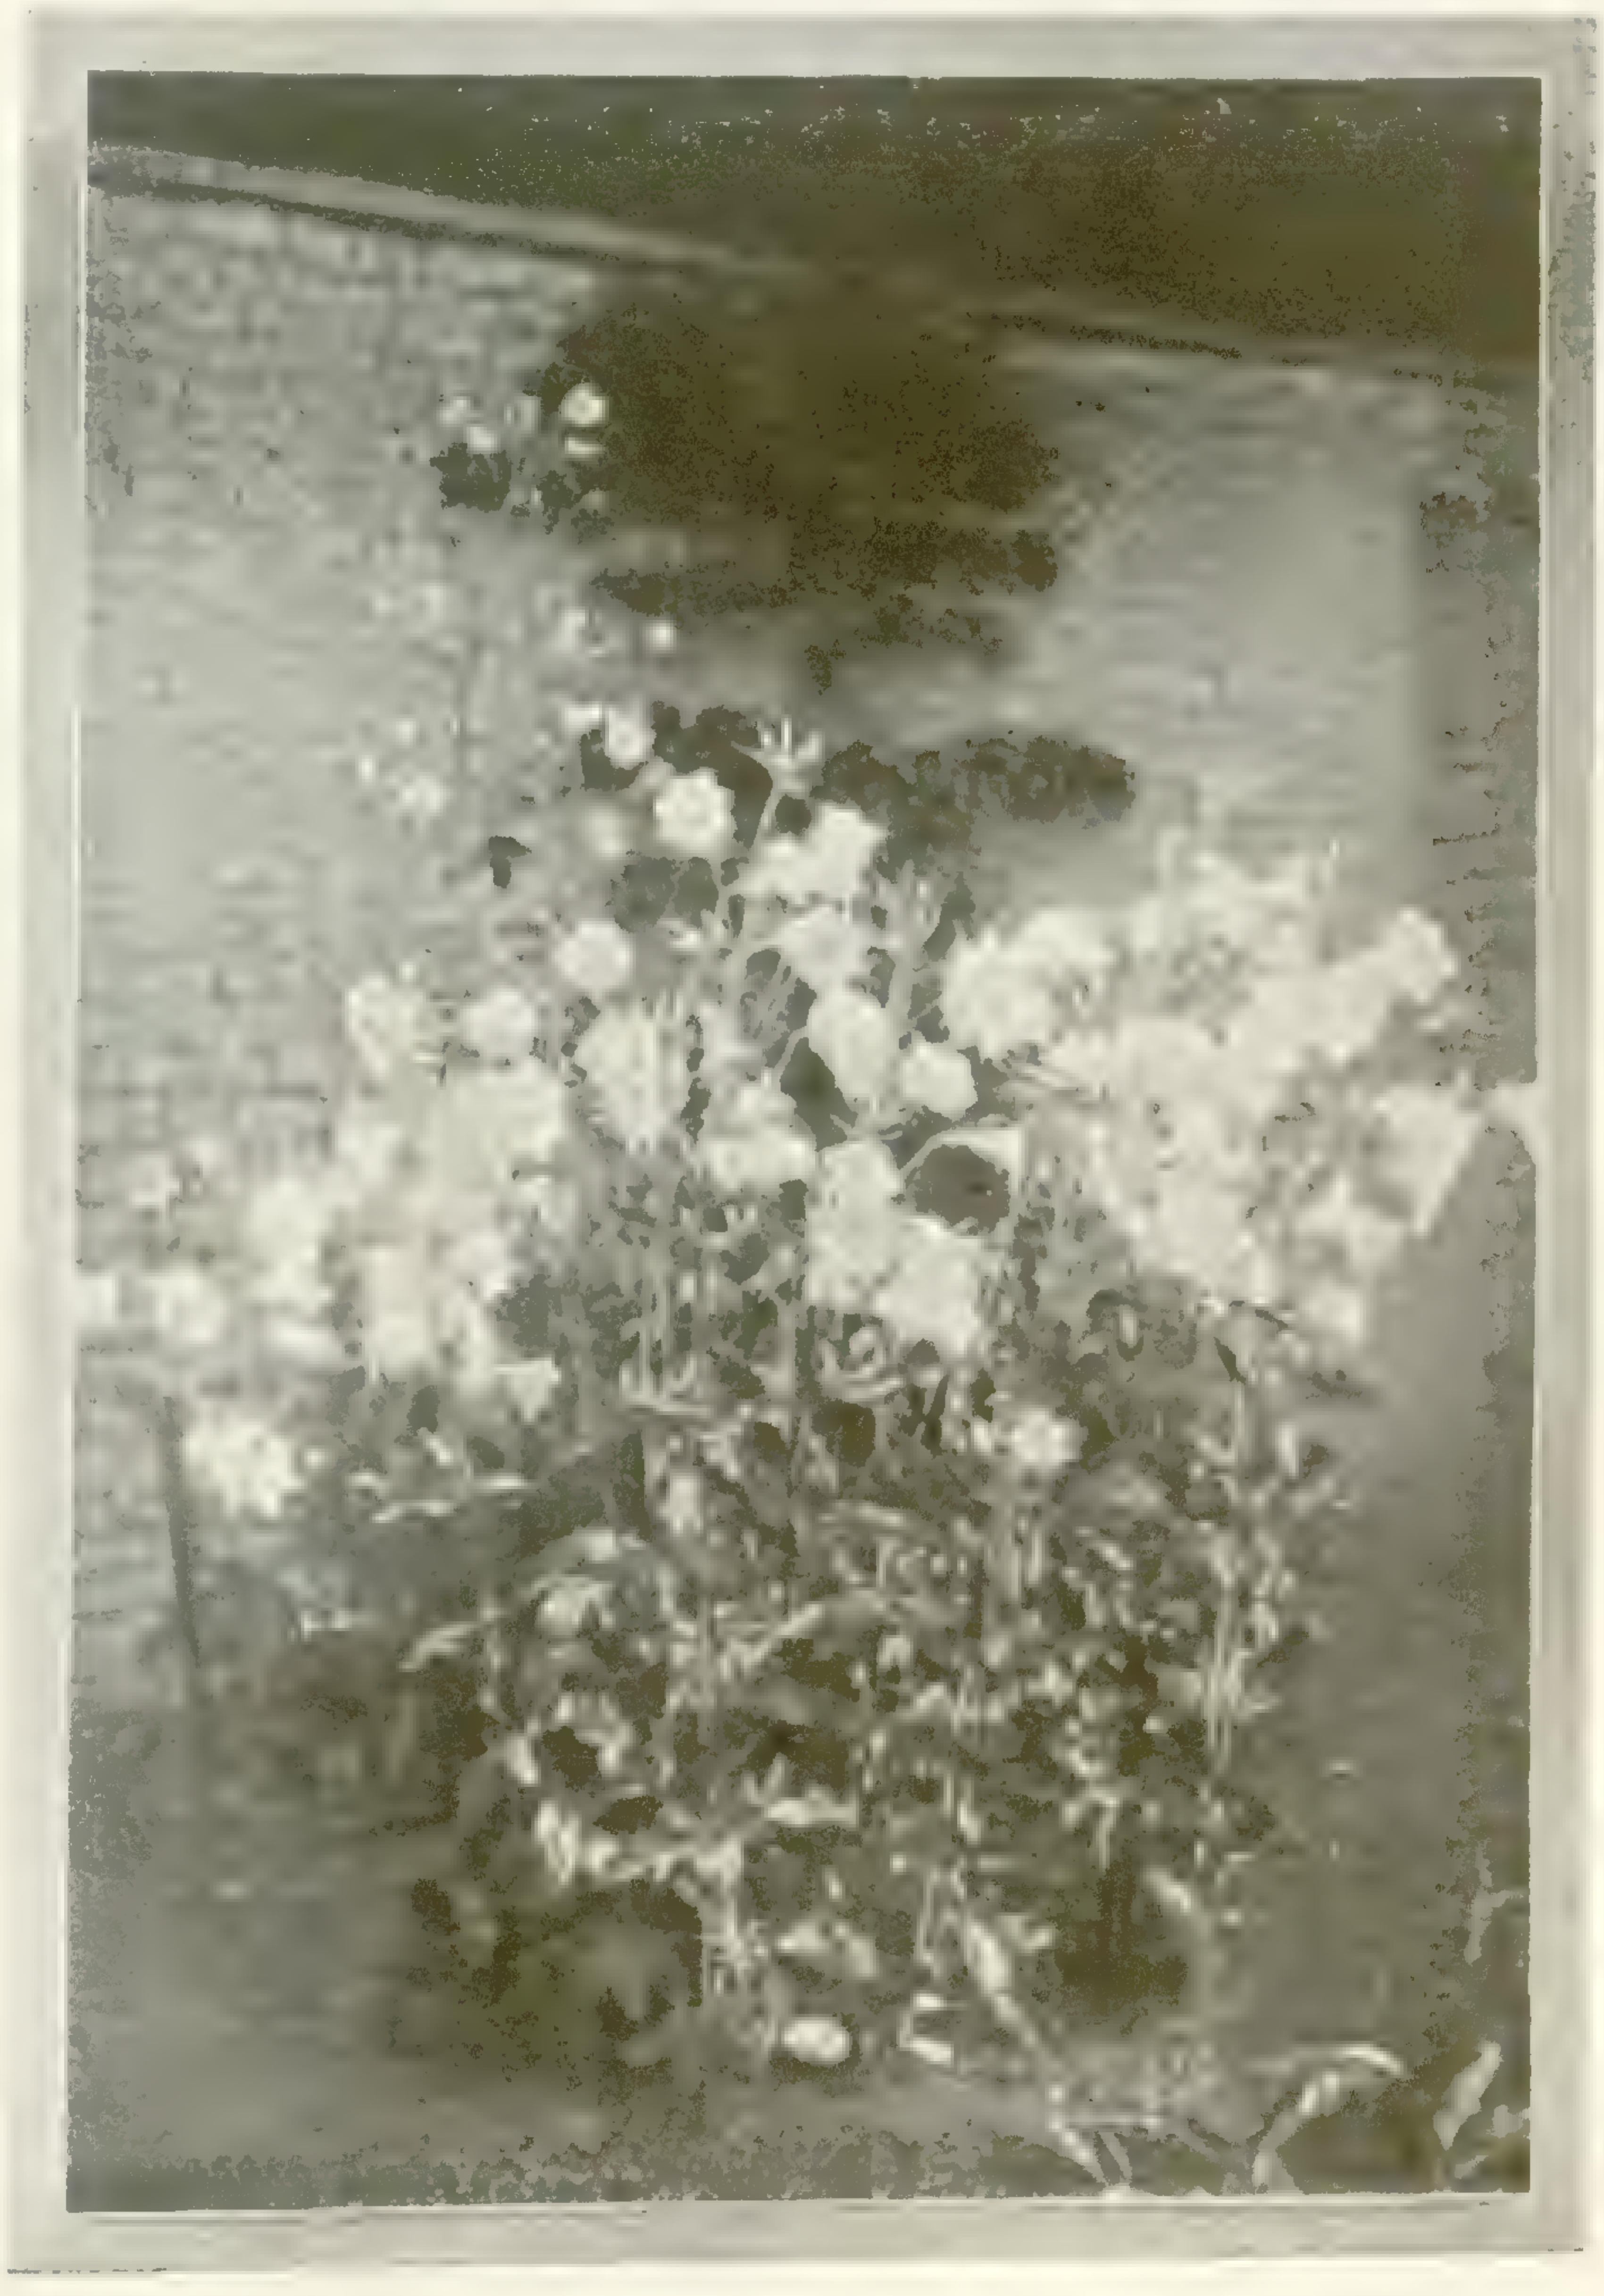
In the south-west plants often die off unaccountably, even when apparently permanently established. This is all the more surprising as the subject comes from a cold climate, and should be perfectly hardy. Opinions as to its winter treatment vary considerably. It has been asserted by some that it commences its root growth in November, and that it is therefore expedient that from that date it should be fully exposed to the winter's rains. This is, however, absolutely opposed to the conditions it experiences in its native land, if I can credit the statement of a friend, that there it is covered with several feet of snow, when it must be perfectly dry. Others advocate its protection during the whole winter under a glass light, until its young shoots break the ground in the spring. Some years since Mr. Archer-Hind had a fine plant of the white variety, about five feet in height, which was protected by a handlight every winter. One year this protection was forgotten, with the result that the plant died, and, consequently, did not appear in the spring. This disastrous effect of the lack of winter protection leads one to infer that it is wiser to keep the plants dry during that season, and, certainly, by so doing the conditions prevalent in the plant's native habitat are more nearly reproduced.

There are, however, many who scout the idea of protecting the ostrowskia, and aver that it is perfectly hardy, and absolutely indifferent to the severest frosts or the most torrential downpours, so that considerable difference of opinion exists as to its correct treatment. In making a bed for the ostrowskia this should be fully three feet deep, as its roots descend a great distance. Heavy soil mixed with old mortar rubble should be used, and frequent waterings given during the season of growth

Perhaps the best method of establishing the ostrowskia is to raise seedlings, and to plant these out when they are about six inches in height. The plants, when in bloom, are marvellously beautiful, the great lavender blossoms, fully six inches across, shining like satin, and remaining fresh in water, if cut, for well over a week. There is also a white variety, which is even more beautiful than the type.

S. W. Fitzherbert.

Silene laciniata Purpusi is, without doubt, one of the finest introductions of recent years. A very rare species, and, not being very well known, there appears to be a doubt as to whether this is a true hardy perennial alpine. The plant is quite hardy, except requiring a little protection, such as given below, and this is only necessary in very exposed positions in the north. It was found by Mr. Purpus growing on the high mountain ranges of Mexico, at an elevation of 11,000 feet. The plant has narrow green leaves, somewhat woolly, is of very graceful spreading dwarf habit, and the flower stems range from about six to eight inches high. The flowers are very freely produced, and of a rich fiery candinal-red, and produced nearly the whole of the summer. It was, as stated in your report, well shown by Messrs. W. Artindale and Son, Sheffield, at Shrewsbury. This variety requires rather a dry position, the roots growing rather deep, and having a liking for stony positions or deep crevices between rock stones. Do not disturb them after once planting if possible; in cultivation one should consider its natural position. A safeguard during winter is a little protection with small branches of dead spruce or shrub.—J. Edginton, Nether Green, Sheffield.



A FINE SPECIMEN OF OSTROWSKIA MAGNIFICA
In the gardens of Lilford Hall, Oundle.

WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

THE COOL HOUSE.—Where the general repotting has not been done it is advisable that it should now be finished without delay. The weather has been particularly favourable for odontoglossums, masdevallias, oncidiums, etc., that were potted at the end of August and beginning of September. I find that our plants are now rooting freely into the fresh compost, and there is little shrivelling of the pseudo-bulbs or other distress, which is usually more or less apparent after repotting. There is nothing more favourable to cool house orchids than damp and mild outside conditions, and every advantage should be taken of these favourable conditions to provide sufficient ventilation to keep the atmosphere freely circulating, both by day and by night. There will be a tendency to stagnation in the atmosphere of the house if this is not carefully seen to, and I consider a good deal of unsightly spotting and dead tips of the leaves may be traced directly to unfavourable atmospheric conditions.

SHADING.—There are numerous prominent orchid growers who advocate northern aspects for the cultivation of odontoglossums, while others are prepared to condemn such an aspect. We have both span roof and lean-to houses with a northern aspect here in which our odontoglossums are grown, and I have no preference for either structure, as we find little difficulty in growing odontoglossums. But there is one great advantage I find from lean-to houses with a north aspect, and that is the blinds are not required so early in the morning during the summer months, and from the present time until well into the month of March shading is dispensed with altogether. There can be no doubt but this is a considerable advantage, for with the thinnest possible autumn blinds there must, of necessity, be a considerable obstruction of light. We need ample light from now throughout the winter, when a large portion of the plants are in their fullest growth and developing their pseudo-bulbs. Do not bring the blinds into use unless it is absolutely necessary.

AUTUMN AND WINTER TEMPERATURE.—A great deal of the success in the cultivation of odontoglossums during late years may be traced to the winter treatment of the plants. The writer who would now advocate 40 degrees as a suitable night temperature for odontoglossums would, I think, be thought somewhat behind the times at least. I have long held that at a season when the plants are in the most vigorous stage of growth every encouragement is needed, and if cold treatment is afforded we may look to find the dwarfed effect upon plants growing under such conditions. I do not care to see our temperature fall below 50 degrees, in fact 53 to 55 degrees is our minimum at night, with normal outside conditions.—H. J. Chapman, Oakwood Gardens.

STOVE PLANTS.

SELAGINELLAS.—These plants, when well cultivated, are extremely serviceable as decorative subjects: either interspersed with flowering plants, or as an edging plant for the intermediate stove, they have but few equals. They will succeed in almost any kind of soil, providing it is porous, and their propagation is effected by division of the stems. These root very freely, and if from four to six pieces are put into small pans or pots, and kept in a warm, moist position, a most useful plant is quickly obtained. Some of the kinds thrive well in a cool house not subject to draughts, but with very few exceptions a warm intermediate stove is the ideal position in which to grow a batch of these useful plants; they ought to be always well shaded from the hot sun. S. cæsia, if exposed to the sun during the latter part of the summer, will attain a beautiful autumn-tint colour which is much appreciated when it is used for dinner table decoration or associated with white flowers. S. cæsia arborea has a somewhat distinctive character, and is a most useful plant for grouping, or arranging amongst other dwarf subjects.

CALADIUMS.—The corms that have already been thoroughly ripened should be placed in a dry position where the temperature does not fall below 60 degrees.

POINSETTIAS ought now to be placed in the intermediate house, where they may still receive alternate applications of weak farmyard liquid and clear soot water. An occasional top-dressing of some approved chemical fertiliser is also most beneficial to the plants in assisting the development of the bracts. The plants should not be crowded or the foliage at the base will suffer, and the value of the plants for winter decoration will be much reduced.

BOUVARDIAS.—These are now producing a plentiful supply of bloom, and if kept in a genial atmosphere, and steadily growing, a later display of flowers will come in at a time when it will be much appreciated.

GLOXINIAS.—The autumn-sown batch of these useful plants is now ready to be pricked off into shallow pans and placed in a light position near the glass, where the seedlings may remain until ready for potting singly into 60's. Bulbs that are already ripened off may be placed in a dry position, where the temperature does not fall below 50 degrees; they will not require much further attention until they are required for starting into growth again.—John Donoghue, Bardon Hill Gardens.

FRUITS UNDER GLASS.

FIGS in pots will be ready for potting on, or reducing, as the case may be. Soil for this purpose should consist of good loam, half-inch bones, and lime rubble or charcoal. No manure should be added to the soil. Figs do not require to be potted every season, but some grow stronger than others. Small oak tubs are perhaps the best receptacles, especially if they are not to be plunged, as they generally burst the pot when they become root-bound, and this is when they carry good fruit. After overhauling the batch they may be plunged back in ashes until required for forcing. See that they are all clean, and take care not to bruise the young fruits that are forming on the young wood.

CUCUMBERS.—The winter batch will now be making good growth and showing fruit. On the first appearance of spider sponge the leaves. If too many fruits are showing thin them out to enable the plants to be regularly productive. The past few weeks of mild weather has enabled them to grow away strongly without the aid of overmuch fire-heat; keep a night temperature of 70 degrees, rising to 75 by day, with the usual damping down, taking into consideration the weather outside. Where they are restricted for root room, as they are grown here on the stage, in a long box, fourteen inches wide, and of the same depth, cucumbers require top-dressing every few weeks, with the addition of diluted farmyard manure. A few more seeds or cuttings may be put in.

MELONS that are ripening their fruits will require a brisk heat, with a little ventilation at all times, and as they show signs of ripening reduce the water supply. Later melons will require constant attention in the way of heat and moisture to get them to mature their fruit satisfactorily; at this time of the year three or four fruits on a plant are sufficient, and these should be swelling fast now, or they will not have much flavour late in the season. Keep water away from the stem of the plant, and be guided to some extent by the weather in the amount of moisture put down in the house. If a great amount of fire-heat has to be used, red spider will make its appearance, and must be sponged off.

PEACHES AND NECTARINES.—Trees that are unhealthy, and have not carried their proper crop of fruit, perhaps through bad drainage, gross wood, or the roots rambling into strong, clayey soil, should be taken in hand. This means partial lifting. If the trees are old half the work should be done in one season. Start as far away as the border will allow, and proceed to undermine the roots, keeping these pegged up out of the way so that one may work more freely with the spade, but the roots should be covered with a wet mat. Tie the tree up to the wall or woodwork of the house, so that it does not sink too low; the new soil can then be better rammed down and the drainage made good; concrete or chalk are the best for a good foundation, but with old trees it is difficult to put a substantial base in the border. The soil should consist of good turfy loam, mortar rubble, or charcoal; if the loam is too heavy some old potting soil should be added, but avoid manure. Ram this well under the tree, and proceed to lay the roots out, keeping them well up to the surface, and damp them if they are at all dry. Cut all the torn, bruised roots off with a sharp knife. Water if necessary, and syringe the tree overhead for a time to prevent the wood shrivelling.—A. B. Wadds, Paddockhurst Gardens.

THE KITCHEN GARDEN.

CAULIFLOWERS.—The young plants from seed sown last month will now be ready for pricking out into hand lights, or planted out into cold frames. By this method they will be well away from the frost, and come in a little before spring-sown ones. Slugs must be guarded against in frames, for they would soon devour these tender seedlings. Autumn cauliflowers that are now turning in, should have the leaves bent over the heads to prevent the frost from reaching them. Those plants that have reached their full size should be pulled up and hung head down in a cool shed having a north aspect. The heads will keep quite fresh in this way for over a week.

CELERY.—This useful vegetable will now require a good deal of attention, but by giving it small applications of soil almost weekly well-blanched sticks may be secured. The earliest batch of plants will now be ready for using, and the latest rows should have their side growths removed and be tied up with raffia, ready for the first lot of soil to be placed round each plant. If the rows are dry a good watering, followed by liquid manure before earthing, will be highly beneficial. It is not wise to feed late celery too much in its earlier stages, for this causes a sappy growth, which will not stand severe and changeable weather.

WINTER ONIONS.—The seeds seem to have germinated very well, and if the hoe is run occasionally through the rows it will assist them considerably, and strengthen the young growths.

WINTER SPINACH.—This crop should now be freely thinned out to about six inches from plant to plant, and the soil between the rows loosened, so that good succulent leaves may be had.

GLOBE ARTICHOKES may now be protected by placing some long litter around their crowns, and if the stock is limited it is a safe plan to pot up a number of offsets in case a severe winter should destroy the old plants; seven inch and eight inch pots are suitable for this purpose. Place them in a cold frame until the following April, when they can be planted out into permanent beds. They will produce nice heads the same year, but probably a little later than the parent plants, which will be all the better, as a succession of useful heads may then be cut.

CHINESE ARTICHOKE (STACHYS TUBERIFERA).—These should now be lifted and stored away in clamps until wanted. They are in season from now till Christmas, but after then the roots become too sweet. This has not become a popular vegetable, perhaps because of its small size, and also the time it takes to prepare it for cooking, but it makes a very agreeable change, and is always liked in the dining-room. Select the largest tubers and store them in sand, which will keep them in a plump condition without shrivelling. A north shed should be chosen and a place that is just out of the reach of frost, for it kept too close they will soon start to grow again.

OUTDOOR TOMATOES have, in this locality, been of fine quality this season. Any fruits that are not quite ripe may be gathered and brought into the houses, where they will finish.

HERBS.—Should there not be a good supply of these gathered no time should be lost in making good the deficiency. Cut the growths when they are perfectly dry, and expose them to the air before storing.—T. W. Birkinshaw, Hatley Park Gardens.

Rose sinica Anemone.—If I had space for but one rose on a south or south-west wall, well exposed to sun, my choice would rest with Rose sinica Anemone. It's beauty is of that kind which will never become commonplace, for whatever amount of pleasure we derive from it in one season, it always appears to be eclipsed as we hail its return in each succeeding year. The flowers, when in bud, are long and pointed, and as they open they reveal petals coloured a soft flesh pink, deepening with age to an exquisite shade of clear shell pink; individual flowers frequently measure four inches in diameter, and for a single rose they remain in perfection longer than any other. The foliage is bright glossy green, and the wood of the stems is of a ruddy purple colour; the combination of so many distinct features cannot fail to commend this rose to amateurs as a gain to their collections at this planting season.—Thomas Smith, Walmsgate Gardens.

CULTIVATION OF GLADIOLI.

The following paper was recently read by Mr. Arthur Cowee, of Berlin, N.Y., before the Philadelphia Florists' Club:—

"I address you this evening upon a subject which, in spite of other business cares and responsibilities, has been uppermost in my ambition and desire to excel; that is, the cultivation of Gladioli."

Doubtless some, if not all, of you are familiar with the exceptionally rapid development and improvement of these flowers during the last ten years or so. Especially I refer to the artistic forms and colouring of enormous flowers, properly arranged on a gracefully bending spike.

The time was not long ago when practically the only gladiolus bulbs commercially offered were of one type, the Gandavensis, with stiff, straight spikes, comparatively small flowers arranged closely together, all of the buds developing at about the same time. The variety of colours also was limited, and it is a wonder to me that, except for massive decorations, the average florist has been slow to take up the growing of this flower.

Our Debt to Groff and Lemoine.

To such hybridisers as Groff and Lemoine we are indebted for the many types of beautiful and artistic flowers which have been recently introduced, and upon which, although it may seem impossible, improvement is constantly being made. These modern hybrids, from their cheapness and adaptability to any kind of decoration, either large or small, are yearly tempting more and more the artistic, critical and exacting florist. I do not wish to appear in the light of condemning the entire Gandavensis family. Such is not my intention, for among the hosts of named varieties of this class are many which I value highly on account of some particular attribute or attributes which render them invaluable for certain purposes. For instance, I have found the varieties Shakespeare, May, Augusta, and Brenchleyensis the most reliable for forcing purposes, one year with another. With a succession of plantings, also, this type can be used with splendid results in masses on extensive lawns, where the contrast in colours is most pleasing.

As my task has been principally in the direction of collecting, selecting, classifying and growing commercially these flowers, my talk will be on this issue rather than from the scientific or hybridiser's standpoint, although I have had considerable experience with hybridising in my early work.

Early Experiences.

Ever since I knew anything about flowers the gladiolus has been my favourite, the growing of which I called a fad up to a few years ago, when, realising the possibilities in the development and consequent demand for these modern types, I concluded, if possible, to make a business of the growing of these bulbs. I was convinced, also, that the soil and climatic conditions of my section of the country were especially adapted to the development of a strong, vigorous bulb, which in the gardens of the amateur and professional growers would give most satisfactory results. How well I have succeeded is indicated by the harvest in 1907 of about [illegible] bushels of bulbs, bulblets, and cormels, all of which stock has been disposed of during the season of 1908-1909, with the exception of such as we were obliged to retain for further growing. This stock is made up of selections from unnamed seedlings and named varieties placed in mixtures and collections, also named varieties of recent introduction, as well as novelties not yet introduced, and, of course, some old varieties, which by reason of some particular attributes are still in demand, are retained.

Comparing the wild species with the modern hybrids, one could hardly believe that the latter were offsprings of the former. Of the wild species referred to, there have so far been discovered 140 or more, a few being natives of Europe and Western Asia, a few from the mountains of tropical Africa. Most of them, however, are from South Africa (Cape Colony and Natal). The leading parents of garden sorts are the species psittacinus, cardinalis, Saundersi, purpureoauratus, Papilio, dracocephalus, Cooperii, Adlami and cruentus. But few of them are of value to the garden, and then only as curiosities. In addition to the use of wild species, many domestic species have been produced which have been of incalculable value in securing new types and colours, as far as the general habits and constitution are concerned.

History of the Gladiolus.

The gladiolus is quite an old flower, for we find that as far back as 1596 Gladiolus segetum was cultivated, and in 1629 Gladiolus Byzantinus was quite popular. Also during the last half of the eighteenth century many species were introduced, causing a great deal of interest in this flower.

At one time Gladiolus segetum and G. communis were highly prized for their medicinal properties, but for what ailments I have been unable to ascertain. The starchy bulbs of some African species were also used by the natives as food. In 1823 Mr. Colvill, of Chelsea, brought to notice the variety Colvillei, a cross between cardinalis and tristis, and this later breeding has shown some beautiful hybrids, especially adapted for early forcing, although the flowers are quite small.

It seems, however, to have been left to Van Houtte to start the ball rolling, when in 1841 he introduced to the trade the Gandavensis type, said by some authorities to be a cross between psittacinus and cardinalis, while others claim it is the result of crossing psittacinus and oppositiflorus. I am inclined to the former theory, although in some so-called Gandavensis hybrids the blood of oppositiflorus is recognised. Especially is it prominent in that old variety, Ceres.

The Lemoinei type, a hybrid of purpureo-auratus and Gandavensis, was first introduced in 1878 by Victor Lemoine, and the Nanceianus, a hybrid of Lemoinei and Saundersi, was introduced in 1889 by the same hybridiser. About this time, or perhaps a little earlier, a cross between Gandavensis and Saundersi was obtained by Max Leichtlin, of Germany, which strain came to America and was named Childsi.

About the year 1887 I happened to see a small planting of gladioli in the garden of a personal friend, which, on comparing quality, vitality, and multiplying functions, were a revelation to me. I found, upon inquiring, that they were hybrids from the trial grounds of H. H. Groff, of Canada, and immediately I made it my business to stock up as rapidly as possible from that source, so that to-day I have between 15,000 and 20,000 seedlings of exceptional merit, the result of crosses made by that hybridiser.

Culture in the Field.

The methods employed in the successful cultivation of the gladioli are too well known to all of you for me to go into full details; hence, I will touch lightly upon this subject. One of the principal points is to select proper soil, for although they will bloom in almost any kind of soil and under adverse conditions, still, like most flowers, it has its choice of soils. Sandy loam is preferable, but if this cannot be supplied, heavy soil may be much lightened by the application of sand. The soil also should be well drained, for the gladiolus will not thrive where there is excessive moisture.

The soil should be well manured in the autumn and thoroughly ploughed, and again in the spring should be well pulverised, at which time the lightening process with sand should take place if required. The planting can be made in rows or in masses, according to the uses which are to be made of the flowers. If space is limited the rows may be as close as eighteen inches apart. Such planting, of course, is intended for cut flowers.

Four inches is shallow enough to plant in any soil for the bulbs to take strong root and to permit of sufficient space for the new bulb or bulbs to form on top of the one planted. By planting this depth, and even a little deeper in especially light soil, the spike from the old corm to the top of the ground is a help toward supporting the mass of flowers which are sure to follow proper cultivation, and, as a general rule, no stakes are required except under extreme conditions, such as continued high winds, sometimes accompanied by driving rains.

Gladiolus bulbs may be carried through the winter year after year in good condition, if stored in a dry place, with as low a temperature as possible above the freezing point.

Propagation.

The multiplication of the same variety is accomplished in two ways: First, by division; the old bulb producing from two to as high as ten new blooming bulbs. Secondly, by offsets or cormels, which are formed among the roots between the old bulb planted and the new bulb or bulbs, which form on the top. A large percentage of these cormels require two years' growth in order to secure blooming bulbs, and the first year may be sowed in rows one inch deep and about twelve inches apart.

New varieties are secured only from seed, and there is no argument which would convince the modern grower that chance seedlings, by bees, butterflies, and other insects, are as good as those produced by hand hybridisation, especially when hybridised by one whose experience and knowledge of the habits and constitution of the parent plants, as well as the proper methods to secure colour results, have taught him when and how to make such crosses. Sports now and then appear in my fields, but, so far, I have been unable to establish and reproduce them.

General Usefulness.

The blooming of the gladiolus, coming as it does at the time of the year when there is comparatively a dearth of other flowers, is a boon to the florists. With its new forms and colouring, there is no decoration for which it is not eminently adapted, and the absence of perfume, as well as the odour from decomposition, which takes place with many other flowers, places it in the lead for table decoration. Beautiful and artistic wedding, funeral, and other designs can be made with the individual flowers, while the spikes can be arranged with green foliage in sprays and other forms, lasting much better than roses or carnations, or, in fact, any other flower, which, by reason of such use, must remain some time without water.

No florist, whether growing for the general or local market, should neglect to force each year at least a few gladioli. Very few are so fortunate as to have their carnation houses entirely free from stem-rot, and consequent bare spaces, in which the gladiolus may be planted with excellent results, and generally with a reasonable profit for the space occupied. Then, too, there are other house crops, among which are chrysanthemums, which can be economically and profitably followed by the planting of gladioli.

Planting in the Bench.

The temperature in which the best results can be secured is that under which the carnation thrives. Corms, after being harvested from the fields in the fall, should be given a reasonable resting period, after which they may be planted in the bench midway between the surface and the bottom of the soil. Sufficient root depth is thereby given and the necessity of staking is also avoided.

The gladiolus is well called the "People's Flower," and I hope that, by careful selection and combination of those varieties best adapted to the use of the craft, the day will not be far distant when it will be a necessary asset to florists in general, and will in due time receive the additional title of the "Florists' Flower."

Spring-flowering Plants. — If there are any surplus plants of either violets or myosotis, after autumn planting is completed, these should be placed in the shrubberies or wild garden; all who saw the splendid effect of myosotis and shrubs at Kew last season must have been impressed with its beauty. Myosotis palustris should be given the damp places.—E. F. H.

CROYDON CHRYSANTHEMUM SOCIETY.
21st ANNUAL SHOW, PUBLIC HALLS, CROYDON, TUESDAY and WEDNESDAY, Oct. 27th and 28th.
Challenge Cups, £35, with £25 money. Total Prizes over £120. Entries close Oct. 22nd.
W. B. BECKETT, "Woodcote," Purley.

KENT COUNTY CHRYSANTHEMUM and HORTICULTURAL SOCIETY.—The TWENTY-FIRST GRAND ANNUAL EXHIBITION will be held in the RINK HALL, BLACKHEATH, opposite Blackheath Railway Station, S.E. and C.R., on Oct. 28th and 29th, 1908. Schedules and all particulars of the Hon. Sec., F. FOX, The Gardens, The Cedars, Lee, S.E.

VICTORIA HALL, EXETER.
DEVON AND EXETER HORT. SOCIETY'S FLOWER, FRUIT, ETC., SHOW.
FRIDAY and SATURDAY, 23 and 24 October.
SILVER CHALLENGE CUP value £30, FOR CUT BLOOMS.
Schedules, etc., from G. W. JACKSON, Hon. Sec., 15a, Bedford Circus, Exeter.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

National Chrysanthemum Society.

OCTOBER 7 and 8.

The first of this society's exhibitions for the present year was held on the above dates at the Crystal Palace. The weather was very favourable, and the flowers were good. On the whole, the competition was also brisk, and the show was a very pretty one. There was one unpleasant circumstance in connection with the show, and that was the disqualification of several competitors, chiefly Scottish growers, who had set up bunches of blooms that were more than the stipulated eighteen inches wide. No doubt the flowers spread a little after they were set up, but as one of the chief offenders had barely finished when judging commenced he could hardly urge this in defence. The regulation, "Not exceeding eighteen inches in diameter," may be a good one or a bad one, but that matters little when it is the regulation under which a competitor enters, and we have no sympathy for anyone, "Jew or Gentile, bond or free," who fails to act according to the regulations, and then feels aggrieved because he is disqualified. We think, however, that as the disqualified exhibits were so fine, some special award should have been made them outside the competition.

OPEN CLASSES.

Two groups of flowers and flowering plants of chrysanthemums were staged, and Messrs. J. Peed and Son, West Norwood, and Mr. F. Brazier, Caterham Valley, were the exhibitors, and they won awards as placed. Each used foliage plants freely in the arrangement, and showed large blooms as well as early-flowering chrysanthemums.

Mr. Parr, gardener to F. A. Bevan, Esq., Trent Park, Barnet, was the only exhibitor of twenty-four Japanese blooms, in vases, eight varieties, and he was awarded first prize for good specimens of Lady Henderson, Valerie Greenham, Mrs. A. T. Miller, G. Mileham, Miss P. Chittenden, Mr. R. Hooper Pearson, Sapho, and Formality. Premier award for a dozen large Japanese blooms, distinct, was won by Mr. Martin Silsbury, Shanklin, Isle of Wight, with handsome examples of some yellow seedlings, Algernon Davis, Mrs. L. Thorn, Mrs. A. T. Miller, Mrs. G. F. Foster, and Bessie Godfrey; Mr. G. Halsey, gardener to Mr. J. Lyon, Riddings Court, Caterham Valley, second; and Mr. H. Parr, gardener to F. A. Bevan, Esq., Trent Park, Barnet, third. For six large blooms the awards were made in favour of Mr. A. C. Horton, gardener to T. L. Boyd, Esq., North Frith, Tonbridge; Mr. F. Blackett, gardener to Mrs. Ford, Park Side, Ravenscourt Park; and Mr. T. J. Broom, gardener to Miss Langworthy, Guy's House, Holyport, in the order of mention.

First prize for twelve bunches of early-flowering pompon varieties was won by Mr. J. Smellie, Pansy Gardens, Busby, Glasgow, who won with Canari, Blushing Bride, Flora, Fred Peale, Scarlet Gem, Piercy's Seedling, Mr. Selby, Alice Butcher, Filberta, St. Croutts, and Mignon. Mr. G. Halsey led for two vases of large blooms, nine flowers in each, and he had bold arrangements of yellow and chestnut coloured varieties, fern fronds, and croton leaves.

Some grand exhibits were put up in the class for a dozen bunches of undisbudded chrysanthemums, from Mr. Smellie and Mr. G. Bowness, who both showed grandly, but they had exceeded the limit of eighteen inches width in their bunches, and so were disqualified, and the awards were made in favour of Mr. A. Hawkins, Gordon Road, Ealing; and Mr. H. Parr, Trent Park Gardens, Barnet, who both showed fairly well, but were a long way behind the disqualified sets. Mr. A. W. Thorpe, South View, Lichfield, was also a disqualified competitor. Polly, Horace Martin, Roi des Blancs, Goacher's Crimson, Galatea, Caledonia, Elstob Yellow, Firefly, Market White, Col. Bernard, Maggie, and Maxim were a few of the best varieties. Mr. Hawkins was awarded first prize for twelve bunches of undisbudded blooms.

Out of ten entries in the open class for table decorations, Mr. T. W. Stevens, gardener to W. H. Stone, Esq., Donnington, Laurie Park, Sydenham, led the way with a pleasing design in yellow and bronze-red flowers and croton leaves. Mrs. H. L. Sell, Kempton Villa, Luton, second, with yellow and orange flowers, prettily disposed; Mr. P. Edwards, gardener to C. A. Morris, Esq., Beechy Lees, Sevenoaks, third. First prize for three epergnes fell to Mr. Trossell, Sydenham, who had small yellow flowers and light maidenhair fern fronds; Miss C. B. Cole, Feltham, second, with a slightly heavier arrangement; and Mrs. G. Knights third.

AMATEURS.

Mr. A. W. Trossell, 12, The Parade, Beckenham, secured the chief award for a table decoration with a pleasing design in soft yellow flowers and ampelopsis leaves; Mr. J. W. Harrison, gardener to R. Girvin, Esq., Ashbourne, Laurie Park, Sydenham, second, with yellow and cream flowers; and Miss E. H. Ekins, Rushden, St. Albans, third, with yellow and orange flowers. For six bunches of disbudded early chrysanthemums Mr. W. H. Chalk, 224, High Street, Slough, led with beautiful flowers of Mrs. T.W. Scott, Nellie Blake, Miss B. Miller, Harvest Home, Perle Rose, and Le Pactole; Mr. R. Sutherland, Auld Aisle, Kirkintilloch, N.B., second.

Mr. A. Hoggan, Strathyre, Busby, Glasgow, led for a dozen bunches of early-flowering pompon chrysanthemums, with a handsome lot that included Filberta, Scarlet Gem, Piercy's Seedling, and Mignon. Mr. A. Hoggan, Busby, scored for three vases of undisbudded early varieties, with Roi des Blancs, Perle Chatillonaise, and James Bateman, all very fine; Mr. C. Fox, Richmond Lodge, Eridge Road, Tunbridge Wells, second; and Mr. W. Webb, third. Seven entries. For three vases of early-flowering varieties, disbudded, Mr. W. H. Chalk led with Le Pactole, Mrs. J. W. Scott, and a seedling; Mr. A. Hoggan, Busby, second; and Mr. W. Webb, third.

OPEN CUT FLOWER CLASSES.

Mr. J. Smellie was a good first for six bunches of early-flowering pompon varieties, showing splendid bunches of Mignon, La Luxembourg, Filberta, White St. Crouts, Bronze Blushing Bride, and J. B. Duvoir; Mr. J. Emberson second, and Mr. W. J. Cornell, gardener to J. H. Payne, Esq., Chatsworth Road, West Norwood, S.E., third. Premier award for six bunches of early Japanese and decorative varieties was won by Mr. J. Emberson with good flowers of Perle Chatillonaise, Claret, Le Pactole, Goacher's Crimson, Dame Blanche, and Rubis; Mr. G. Bowness, Riverside Nursery, Busby, second, and Mr. J. Smellie third.

Mr. G. Halsey, Ridding's Court, Caterham Valley, led for three yellow Japanese blooms with Mrs. W. Knox; Mr. A. C. Horton, gardener to T. L. Boyd, Esq., North Frith, Tonbridge, second with the same variety, and Mr. T. Aley, Knightons, East Finchley, third. For three white Japanese blooms Mr. H. Parr, Trent Park Gardens, scored with splendid flowers of Mrs. A. T. Miller; Mr. T. Aley was second with Miss A. Byron, and Mr. J. Brown third with Beatrice May.

For three large Japanese blooms of any other colour than white or yellow Mr. A. Horton led with Mrs. G. Mileham, Mr. G. Halsey second with the same variety, and Mr. F. Blackett third with Lady Henderson. Mr. J. Smellie, Busby, Glasgow, was easily first for a vase of early-flowering single varieties, and he had a splendid vase. Mr. F. Brazier, Caterham Valley, second, and Mr. J. Emberson, Walthamstow, third.

Miss C. B. Cole, Feltham, led for a basket of chrysanthemums with a bold and handsome arrangement of yellow, bronze, and orange flowers and Asparagus Sprengeri, Mr. J. Emberson, Grove Road Nursery, Walthamstow, second, and Mrs. G. Knights, Parkfield Stables, Sydenham, third; six extries. Miss C. B. Cole, The Vineyard, Feltham, secured the first prize for a basket of autumn berries and foliage with a beautiful arrangement of honesty, purple plum leaves, clematis sprays, blackberries, bryony berries, snowberries, bracken, etc.; Miss E. H. Ekins second, and Miss J. Martin, Lancaster Road, South Norwood, third.

Mr. J. Stevens, gardener to W. H. Stone, Esq., Donnington, Laurie Park, Sydenham, scored for a vase of chrysanthemums; Mr. W. Webb, gardener to J. Chapman, Esq., Melrose, Laurie Park, Sydenham, second, and Mr. E. Houlton, gardener to J. Gardner, Esq., Croxted House, Dulwich, third. Some vases were disqualified in this class because they were over size.

NON-COMPETITIVE.

Messrs. W. Wells and Co., Merstham, were very large exhibitors of early chrysanthemums, Michaelmas daisies, pentstemons, and pyrethrums. They had a very bold central grouping of tall stands of Carrie, Roi des Blancs, Ethel Slade, Perle Chatillonaise, Mrs. A. Thomas, Polly, and other fine early chrysanthemums, set in a groundwork of the lighter Michaelmas daisies, such as Hon. Edith Gibbs, Delight, Ideal, etc. A few large blooms of chrysanthemums were set in the foreground. On either side there were long tables of vases of these several subjects, so that the whole made up a big and effective display. Mr. T. Williams, Oxford Road, Ealing, set up a very artistic display of table decorations, using his silvered receptacles. Messrs. S. Spooner and Sons, Hounslow, contributed a fine collection of handsome apples and pears, their baskets of Hollandbury, Newton Wonder, Winter Pearmain, Vicar of Beighton, Allington Pippin, Peasgood's Nonsuch, Beauty of Kent, and Rival attracting a great deal of attention. Messrs. T. S. Ware, Lim., Feltham, contributed a bold and bright exhibit of early chrysanthemums and cactus and paeony-flowered dahlias, these latter being very fine for so late a date. The chrysanthemums were put up in tall stands, so as to show a mass of each variety, and the dahlias were arranged in low pyramids below them. It was an instructive exhibit, and a compliment to the fine weather. Mr. F. Brazier, Caterham, set up a big group, composed chiefly of Michaelmas daisies, phloxes, and early chrysanthemums; this occupied the far end of the show area, and the bold masses of Mrs. Frank Brazier, Vimineus, Freedom, and Ideal Michaelmas daisies were very fine.

Mr. H. J. Jones, Ryecroft Nursery, Lewisham, contributed a fine collection of Michaelmas daisies, tastefully set up in large vases and in large sprays. Coombe Fishacre, Mrs. J. Rayner, Mrs. Huson Morris, May Crump, Hon. Edith Gibbs, Lil Fordell, Elaine, Mrs. S. T. Wright, and Sophie Arnold were a few of the best in a good lot. White and yellow early-flowering chrysanthemums were used as a foreground. Messrs. J. Cheal and Sons, Crawley, brought up a handsome collection of the best cactus, pompon, and single dahlias, with a few early chrysanthemums. Roses formed the chief attraction in the exhibit set up by Messrs. Hobbies, Lim., Dereham, and these were charmingly shown, and in quantity, set up in vases of varying height. These were backed by vases of various light Michaelmas daisies, solidago, and a row of tall stands of Glenton, High Sheriff, Duke Henry, Queen Emma, King Leopold, Nicholas II., and Germania pæony-flowered dahlias. The fragrance of Betty, Medea, Madame Hoste, Countess of Gosford, Joseph Hill, G. Nabonnand, Lady Roberts, and Madame Abel Chatenay roses was delightful.

One of the prettiest of the several non-competitive displays was the one arranged by Mr. Norman Davis, Framfield, Sussex, who had a charming arrangement of Michaelmas daisies set up in tall bamboo stands. The margin of the group was occupied by bowls of fine varieties of Aster Amellus, notably Framfieldense, Charles Davis (lovely), Perry's Favourite, and the early Amellus grandis, and over these rose the stands of the elegant Hon. Edith Gibbs, and Cordifolius elegans, with a bold central stand of large yellow and white chrysanthemums. Solidagos and bronze chrysanthemums formed a pleasing groundwork for the whole display. Messrs. J. Peed and Sons, West Norwood, showed begonia blooms from the open ground. Mr. G. W. Riley, Herne Hill, and Messrs. Dowel and Co., Hammersmith, contributed summer houses and pottery respectively. Mr. P. Ladds sent some pretty pot plants of Esme Reed chrysanthemum from Bexley, and Mr. W. J. Godfrey, Exmouth, showed a new method of staging blooms, consisting of easily adjustable painted slats, and tin tubes, all light, and easily packed up. Messrs. J. Laing and Sons, Forest Hill, showed a group of crotons and dracænas.

MEDALS.

Gold.—Messrs. Hobbies, Lim., Dereham; Mr. Norman Davis, Framfield; Messrs. T. S. Ware, Feltham; Messrs. W. Wells and Co., Merstham.

Silver-gilt.—Messrs. Spooner and Sons, Hounslow. Mr. H. J. Jones, Lewisham; Messrs. J. Cheal and Sons, Crawley.

Large Silver.—Mr. F. Brazier, Caterham Valley; Messrs. J. Laing and Sons, Forest Hill; Mr. G. W. Riley, Herne Hill.

Silver.—Mr. P. Ladds, Bexley; Mr. T. Williams, Oxford Road, Ealing; Messrs. J. Peed and Sons, West Norwood.

Horticultural Show at the Franco-British Exhibition.

Our readers will remember that we gave a report of the show held at Shepherd's Bush on September 30 and October 1 and 2, in our issue of October 3, and that we were unable then to publish the judge's awards because of the delay in making these known. We now publish a list of the chief awards, and refer our readers to pp. 752, 753, and 754 for comments on the show.

GOLD MEDAL AND GRAND PRIX.

To the Société d'Horticulture de Montreuil, for dessert fruit; Societé d'Agriculture du Gard, fruit; Mr. E. Beckett, gardener to Hon. Vicary Gibbs, Aldenham House, Elstree, for vegetables; Messrs. Vilmorin, Andrieux, and Co., Paris, for vegetables; Messrs. G. Bunyard and Co., Maidstone, for fruits and flowers; Messrs. Sutton and Sons, Reading, for fruits, vegetables, and flowers; Messrs. J. Carter and Co., High Holborn, for fruits, vegetables, and flowers; Messrs. H. B. May and Sons, Edmonton, for ferns; Messrs. T. Rivers and Son, Sawbridgeworth, for fruit and fruit trees; Messrs. Paul and Son, Cheshunt, for roses.

GOLD MEDALS.

Messrs. Vilmorin, Andrieux, and Co., Paris, for plants; Mr. Maron, Brunoy, France, for orchids; Sister Ernstine, Warrenhoe, Hertford, for table decorations; Messrs. W. and J. Brown, Peterborough, for orchids; Messrs. J. Stredwick and Son, St. Leonards, for dahlias; Mr. M. V. Seale, Sevenoaks, for dahlias; Mr. S. Mortimer, Farnham, for show dahlias; Mr. Charles Turner, Slough, for pompon dahlias; Mr. J. H. Goodacre, gardener to the Earl of Harrington, Derby, for fruits; Messrs. Croux and Sons, Chatenay, Seine, for fruits; Messrs. Lecointe and Martin, Seine, for fruits; Mr. Passy, Seine et Oise, for fruits; Messrs. H. Cannell and Sons, Swanley, for hardy fruits; the Syndicate des Maraichers, Paris, for vegetables, etc.; Mr. L. Gravel, Chateau de Bouff, Aix, for grapes; Messrs. W. Wells and Co., Merstham, Surrey, for chrysanthemums; Mr. L. R. Russell, Richmond, for trees and shrubs; Messrs. Wm. Paul and Son, Waltham Cross, for fruit trees and roses; Mr. Bound, gardener to Sir Jeremiah Colman, Gatton Park, Reigate, for orchids; Messrs. Dobbie and Co., Marks Tey, for potatoes and dahlias; Messrs. Clibrans, Altrincham, for vegetables; Mr. Kaeska, Rue St. Martin, Paris, for cut flowers; Mr. W. Poupart, Twickenham, for bottled fruits; Messrs. Toogood and Sons, Southampton, for vegetables.

SILVER GILT MEDALS.

Mr. Guichard, Nantes, for plants; Messrs. Stanley and Co., Southgate, for orchids; Miss Riley, Horticultural College, Studley, for table decorations; Messrs. J. Cheal and Sons, Crawley, for cactus dahlias; Mr. C. Turner, Slough, for show dahlias; Mr. M. V. Seale, for pompon dahlias; Mr. Chevillat, Seine and Marne, for dessert fruit; Mr. Dupont, Montreuil, for dessert fruit; Mr. Lacont, for dessert fruit; Messrs. Millet and Sons, Seine, for dessert fruit; South Australian Government, for dessert fruit; Mr. E. E. Grimston, York House, Sutton, Surrey, for dessert fruit; Mr. Stowes, Whitehall Gardens, Sittingbourne, for hardy fruit; Messrs. John K. King and Sons, Coggeshall, for vegetables; Mr. Ferard, Paris, for vegetables; Mr. Dijit, for vegetables; Misses E. and M. Kippin, Hutton, for alpine plants; Messrs. S. Spooner and Sons, Hounslow, for collection of fruit; Messrs. R. Harkness and Co., Hitchin, for display of roses; Royal Jersey Agricultural and Horticultural Society, for collection of pears; Messrs. Carter Page and Co., London Wall, E.C., for cut flowers; Messrs. G. and A. Clark, Dover, for cut flowers; Messrs. T. S. Ware, Lim., Feltham, for begonias, etc.; Messrs. H. Cannell and Sons, Swanley, for cut flowers.

SILVER MEDALS.

Miss M. Holder, Bengeo, for a basket of autumn foliage and berries; Mr. M. V. Seale, Sevenoaks, for show dahlias; Mr. W. Treseder, Cardiff, for show dahlias; Messrs. Keynes, Williams, and Co., Salisbury, for pompon dahlias; Mr. J. C. Sutton, gardener to the Earl of Stanhope, Chevening Park, Sevenoaks, for hardy fruit; Mr. N. F. Barnes, Eaton Gardens, Chester, for hardy fruit, also for collection of apples; Miss Wilkinson, Horticultural College, Swanley, for hardy fruit; Mr. Ben Ashton, gardener to the Earl of Lathom, Ormskirk (two), for collections of potatoes; Messrs. W. and J. Brown, Peterborough, for fruit and cut flowers; Messrs. G. Yuill and Co., Fenchurch Street, E.C., for collection of Australian fruit; Messrs. G. Massey and Sons, Spalding, for collection of potatoes; Mr. J. C. Fordy, North Ham, for collection of gladioli.

Royal Horticultural Society.

SCIENTIFIC COMMITTEE, September 29.

Present: Mr. E. A. Bowles, M.A., F.L.S., F.E.S. (in the chair); Dr. A. B. Rendle, Rev. W. Wilks, Messrs. G. Gordon, V.M.H., W. Hales, E. M. Holmes, H. T. Güssow, A. Worsley, W. Fawcett, G. S. Saunders, J. T. Bennett-Poë, J. W. Odell, and F. J. Chittenden (secretary), with Mr. G. Paul, V.M.H., visitor.

THE LATE MR. GEORGE NICHOLSON, V.M.H.—The Chairman referred in feeling terms to the great loss the committee had sustained by the death of Mr. George Nicholson, who had been for many years an active member of this committee, and Mr. J. T. Bennett-Poë moved, and Mr. G. S. Saunders seconded a resolution tendering the sincere condolences of the committee to Mr. Nicholson's relatives. The resolution was carried in silence, the members upstanding in their places.

SPORTING IN RETINOSPORA.—Mr. G. Paul, V.M.H., of Cheshunt, showed a specimen of Retinospora squarrosa sulphurea, which was growing into the adult cupressus form known as "plumosa," and which was still retaining the colour of "sulphurea." The adult form of this variety had not before appeared, though the variety alba had produced the plumosa type. Retinospora is the juvenile stage of cupressus, and this being so it is interesting to note that R. leptoclada has produced fruit and seeds which on germination gave rise to typical leptoclada plants. The form known as obtusa compacta has also produced fertile seeds, but the seedlings have not yet reached a size large enough to judge of their precise character.

VIRESCENT GAILLARDIA.—Mr. E. M. Holmes, F.L.S., showed specimens of gaillardia flowers virescent. These were taken by Mr. Saunders for further examination. Mr. Holmes also showed galls on the stem of willow caused by the dipterous gall fly, Cecidiomyia saliciperda.

PROLIFERATION IN PEAR. Dr. A. B. Rendle, M.A., showed a pear from the top of which several leaves were protruding. The fruit had been formed from a late flower, and such proliferation is not very uncommon.

MALFORMATION IN STREPTOCARPUS.—Mr. Odell showed flowers of streptocarpus in which there were petaloid outgrowths external to the corolla, these outgrowths being reversed, i.e., the part coloured like the inner part of the corolla being turned outwards.

DOUBLING IN CARDAMINE PRATENSIS.—Mr. Fraser, F.L.S., remarked upon the various forms of Cardamine pratensis, especially with regard to the doubling, which results from axial proliferation, the calyx and corolla being repeated again and again, and the flowers being therefore infertile. He showed a specimen of the double-flowered form of the variety palustris of that plant.

GALANTHUS OLGÆ.—Mr. E. A. Bowles, F.L.S., showed flowers and foliage of this autumn-flowering snowdrop, which has been described as having no green spots on the inner perianth segments, but in this specimen they were well developed. The plants came from Mount Tagyetas, and had commenced to flower at Waltham early in September. The form differs from G. octobrensis in having a rather longer flower and commencing to flower at an earlier period. They are probably both forms of G. nivalis.

VEGETATIVE GROWTHS ON INFLORESCENCE.—Mr. Bowles also showed a well-developed vegetative growth from an inflorescence of Kniphofia Northiæ seedling. There were three such growths upon the inflorescence, and while all the rest of the inflorescence appeared dead, there was a green strip of living tissue up the stem leading to the vegetative growths.

FASCIATION IN OXALIS CRENATA.—From Messrs. Barr came a remarkable example of fasciation in Oxalis crenata, the stem measuring over 4in. across. This is the first time a fasciated specimen of any species of oxalis has come before the committee.

MULTIGENERIC HYBRIDS.—Mr. Bowles gave notice that at the next meeting the question of the nomenclature of multigeneric hybrids was to be raised.

TRIALS AT WISLEY GARDENS.

A meeting of a sub-committee of the Fruit and Vegetable Committee was held on Tuesday, September 22, 1908, the mid-season and late potatoes and the beet being grown for trial were examined, and it was resolved to recommend an Award of Merit to Potato 64, Devanha Seedling, from Messrs. W. Smith, Aberdeen; to Potato 84, British Champion, from Mr. G. Carter, Cottenham, Cambs., to

Beet 36, Willow-leaved (for ornamental purposes), from Messrs. Dobbie, Rothesay; to Beet 37, Sutton's Blood Red, from Messrs. Sutton, Reading; and to Beet 40, Sutton's Pine Apple, from Messrs. Sutton, Reading.

A report to the above effect was laid before the full committee at Vincent Square on September 29, together with samples of the produce. After due consideration and examination of the produce the committee adopted the report and sent it up to the Council, who confirmed it on the same date.

Croydon Gardeners' Society.

On Tuesday, September 29, at the Sunflower Temperance Hotel, Mr. M. E. Mills, Coombe House Gardens, took for his subject "Flowering Annuals."

He said, unfortunately there appeared to be no real classification of these flowers, for oftentimes what one sees described as annuals are biennials, or perennials, and this misleading description makes it difficult to compile a list.

The cultivation required is rich soil, deeply dug, and pulverised by winter frosts. Soil of a light nature is best. For the hardy kinds, seed may be sown in the open from March to the end of May, and what he particularly emphasised was the advisability of sowing thinly and gradually thinning out the seedlings. They are mostly branching, and if left too thickly together weedy plants will be the result. Seeds should be only slightly covered, especially the small ones. Some of them, such as nemesias, Phlox Drummondi, summer chrysanthemums, etc., are very effective in beds alone, whilst others are useful in the herbaceous border, lending, as they do, bright colours and fragrance. Many of them are useful for cutting, and one he recommended for this purpose is Salpiglossis grandiflora. Of the half-hardy section, asters and stocks came in for much comment. Sweet peas, godetias, and the Shirley poppy should always be grown.

Owing to lack of time the discussion following was rather limited, but a few remarks from several present added interest to the evening.

A very hearty vote of thanks to Mr. Mills concluded an instructive evening.

Four varieties of annuals were shown by Mr. J. C. Lewis. Mr. R. Cleveland staged a dish of onions. Apples were shown by Messrs. A. Edwards and C. Thrower, the latter also exhibiting a vase of scabious, and Mr. Mills brought a splendid group of cactus dahlias, a dish of outdoor figs, and good specimens of Autumn Giant cauliflowers.

Bristol Gardeners' Association.

A largely attended meeting was held on Thursday, September 24, at St. John's Parish Rooms, presided over by Mr. A. O. Shelton. The subject was "Artificial Manures," and two short papers were given, one by Mr. Attwell, and the other by Mr. Curtis. Each reader gave his experience in the use of various manures. The former recommended an application of nitrate of soda for cabbages and strawberries early in the spring; basic slag he advised as a dressing for asparagus in the autumn, and salt in the spring; while for fruit trees he said nothing was better than the ashes from a refuse fire forked in during autumn. Mr. Curtis said he had been very successful in the use of soot, fowl and cow manure, but the objectionable odour and want of uniformity in the strength of these fertilisers was a serious disadvantage. Chemical manures were cleaner and better to handle. Plants, he said, are much like human beings: when in poor health they do not require strong treatment, but when healthy require constant feeding to ensure their keeping in good condition. Mr. Curtis exhibited some phalænopsis grown in marrow bones, for which he was awarded a certificate. Mr. Harper gave a scientific discourse upon manures and their action upon vegetable life. Messrs. House, Garnish, Lee, Wakefield, Binfield, and Holt took part in the discussion, after which the best thanks of the meeting was accorded to the speakers. For a collection of vegetables, Mr. Young was first, Messrs. Binfield and Holt equal seconds. For a vase of hardy flowers (members under 21), Mr. Whiting was first, and Mr. Perry second. A certificate was awarded to Mr. Hayball for tomatoes. It was a pleasing feature to see so many young men present, who are warmly responding to the society's interest in them.

NOTES OF OBSERVATION.

Bulb Dont's. — Replying to Mr. Thomas Smith's "Dont's" to bulb beginners (p. 718), I certainly agree with all he says, particularly the first "don't," about big bulbs not necessarily producing the largest spike of bloom, and the last one of low-priced bulbs not of necessity being the cheapest. I have noticed recently an advertisement of named hyacinths, eight inches round, at 2s. dozen. Such bulbs are certainly large, and appear cheap on paper, but the probability is that a hyacinth 6½in. to 7in. round would throw a spike of bloom which would give more pleasure to the grower than a whole dozen bulbs 8in. round. Large, swollen bulbs are sometimes those that have been flowered in pots the previous year.—Hy. N. Ellison, F.R.H.S.

Œnothera riparia. — Œnotheras have a well-merited reputation as subjects for garden decoration, combining freedom of flowering with elegant and showy blossoms produced over an extended season. The subject of this note is one of the freest and choicest species within the genus. The radical growth is close and tufted, more or less evergreen in character, from which is produced in early summer crowds of brownish wand-like stems, which later become clothed with medium-sized yellow flowers, having all the features common to the evening primrose (œnothera). I have largely employed this fine species for massing upon the rock garden, as its value here is great, furnishing, as it does, a remarkably effective group when the majority of rock plants are over for a season. The stems, which in the early stages of growth are erect, slightly arch over when in full flower, a trait which adds immensely to their picturesque effect. Œnothera riparia is easily propagated by cuttings taken in autumn, and rooted in sandy soil in a cold frame. It succeeds admirably in any well-drained soil, and in quite raised positions, under these conditions, it proves an easy, reliable, and beautiful dwarf perennial, flowering abundantly during July and August, and attaining a height of fifteen to eighteen inches.—T. S., Walmsgate Gardens.

Sobolewskya clavata. — Although I have not this plant in my garden at present, I was reminded of it the other day, and, as it may please some lovers of rock plants, I venture to pen a short note about it as a reminder that there is such a plant in cultivation. One cannot well class it as among the "hundred best rock plants," as this sobolewskya is far from showy, and its habit is not quite beyond reproach, inasmuch as it is somewhat straggly in its growth, and has other imperfections. But there are few plants without some, and there will probably be found a proportion of alpine growers who may wish to possess this species; while there are others who meet with it in lists, but would like to know something about Sobolewskya clavata, which has, I believe, no popular name. In height it grew about nine inches with me, giving a large number of small white flowers in corymbs from May through June. The general character of these small flowers may be gathered from the fact that the plant is one of the crucifers. The kidney or heart-shaped leaves are rather pretty, being deeply veined, and of rather a silvery tone. The plant can be raised from seeds sown under glass in spring. A native of Armenia, whence it was introduced in 1892, S. clavata is hardy in all but the most arctic winters we are likely to have here. — S. Arnott.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

GENTIANA ACAULIS.—H. S. S., Salisbury: The best time of the year to divide and transplant Gentiana acaulis is the end of September, but as the weather has continued warm and the soil is warm and moist, we should not hesitate to divide and replant at once, selecting good soil and planting firmly.

PLANTING DECIDUOUS SHRUBS. — S. T. D., Winchfield: If you have the ground all ready for planting and it is only a question of moving the trees and shrubs from another part of the garden and the home nursery, then you need not wait until the leaves have all fallen. If the leaves have changed colour, i.e., are no longer green, then you may commence planting, although we should hesitate to plant during the hot weather that we are experiencing at the time of writing because of the risk of some of the wood shrivelling. In your case you could take out all the holes in readiness, and also mark every tree and shrub for its position, then planting could proceed with a promptness that would augur well for the future of the plants. Do not omit staking, and give water if necessary. The work should be completed by the end of the present month.

CANKERED TOMATO ROOTS.—R. T., Elginshire: The cankered and swollen roots were due to a severe attack of eelworms. For such an infestation nothing short of an absolute clearance of the contents of the house, and a thorough cleaning of the structure and fixtures would suffice. A totally different kind of crop should be grown in the house for at least a year to come. We regret your letter was overlooked.

BLISTERED APPLE AND PEAR LEAVES.—W. M. C., Thornaby: The leaves sent give evidence of a bad attack of the Blister Moth that attacks pears and also apples; it is Lyonetia Clerckella. Clear away and burn fallen leaves regularly. Take advantage of an early opportunity in the winter for giving the trees a thorough cleaning. Loosen the trees from the walls and burn all old shreds or tying material. December, when the wood is hard, will be a good time to tackle the job. Spray the trees with the caustic soda and potash solution, and see that the whole of the wall surface is also well sprayed. If all crevices on the wall can be filled up with mortar or cement, so much the better. Tie up the branches loosely in bundles, so that wind can do them no harm, and then in January or February give another spraying, making quite sure that every bit of twig and branch is moistened. Tie up the tree shortly afterwards. After the first spraying and cleaning remove and burn the surface soil beneath the trees, and in its place put new material. These proceedings will kill any pupæ that may remain and reduce the possibility of attack next year to a minimum. At the end of next May or early in June, syringe the trees with a soapy mixture to which some quassia extract has been added; this will render the leaves distasteful to the moths, and eggs will not be laid on them. It is at this period that keen attention must be given the trees, and frequent syringings with clear soot-water or weak quassia solution rendered adhesive by soft soap, will prove useful deterrents.

HEATH & SON, CHELTENHAM.

We are Selling our Freehold Nurseries in College Road for Building purposes, and are disposing of the ENTIRE STOCK of Greenhouse Plants, at EXCEPTIONALLY LOW PRICES.

We cordially invite an inspection of our fine **COLLECTION OF ORCHIDS,** including fine varieties of **Cypripedium** insigne and [illegible], **Cattleyas** in great variety. **Dendrobiums** including several hybrids, **Odontoglossums,** etc., etc., **amounting in all to several thousand plants,** all in excellent condition. Full particulars on application. An unrivalled opportunity to procure collections at from 2 guineas upwards, packed free and carriage paid for cash with order.

MALMAISON & WINTER-FLOWERING CARNATIONS, [illegible] best and newest varieties in 5, 6 and 7-inch pots. We have no hesitation in saying that no healthier or more vigorous plants can be procured. **10/-** to **30/-** per [illegible], according to variety and size of plants. GOLD MEDAL three years in [illegible], R.H.S., Dublin. This is a unique opportunity to procure really fine plants [illegible] reduced prices. The Malmaisons are grand stuff in 5-inch pots, with 6 to 8 [illegible], **30/-** per dozen. Also rooted layers of these at **6/-** per doz., **45/-** per 100.

PERPETUAL FLOWERING MALMAISON, Hon. Lady A. NEILD, similar to, but better than Marmion, **2/6** to **10/6** each. **The Carnation of the Century.**

A grand collection of **Hybrid Greenhouse RHODODENDRONS,** including **large exhibition specimen** plants of **Veitchianum,** **Fregrantissima, Sesterianum,** and **Gibsoni,** tall or bushy, 5 and 6 feet high. Also the best of the **Javanico-Jasminiflorum** section in several sizes. Very low prices on application. All these are in perfect health.

Gloriosum superbum, average 3 tubers in an 8-inch pot, trained on canes, **3/6** to **5/-** per pot.

Choice collection of **SCENTED-LEAVED GERANIUMS,** containing **70 varieties,** strong rooted cuttings, **4/-** per doz. Larger plants, **9/-** per doz.

The whole of our magnificent collection of **CHOICE FRENCH PELARGONIUMS** as exhibited at the **TEMPLE SHOW.**

Fine Collection of **BOUVARDIAS,** including the best varieties, double and single, good bushy plants, in 6-inch pots in bud, **15/-** per doz. In 5-inch pots in bud, **10/6** per doz.

Please send me a copy of "THE AMATEUR'S GREENHOUSE," by post, for which I enclose remittance of 5/6.

Name ....

Address ....

COWS AND PIGS.—C. M. F., Rugby: Two very handy little books that will give you the information you are wanting are "Dairy Cows and the Dairy" and "Pigs for Profit." These are each published at 1s. 2d. post free, or at 1s. 9d., post free, if bound in cloth, and can be obtained from the Gardeners' Magazine office., 148, 149, Aldersgate Street, E.C.

EXHIBITING ROSES.—F. P., Plymouth: The subject of new methods of exhibiting roses has been discussed at some length on various occasions, but the ordinary arrangement of flowers in boxes and the more elegant one of setting up the blooms in vases appear to be the best methods for general use. The bamboo stands are not a success, neither are arrangements of tin tubes. The matter was dealt with in these columns last year (pp. 696, 697, Gardeners' Magazine of September 28), and illustrations given of two new methods suggested at the previous July show.

TERRACING.—W. C., Cheshire: The several points must first be marked out on the slope after the turf has been removed. One line of pegs should run 20ft. from the house and parallel with it. The next row should be 10 yards from the 20ft. line and the next 10 yards further out still. Build the wall at the 20ft. line and carry it high enough to hold up the upper terrace. From beyond the 20ft. line throw the soil well back on to the upper portion to bring this to the level of the house steps, and all remaining soil between the 20ft. line and the second row of pegs should be used to raise the ground between the second and third rows of pegs. The middle row of pegs would mark the level for the lower terrace. The wall must be a strong one, and should be buttressed; the spaces between the buttresses could be used for choice plants that are all the better for a little shelter.

LAYERING CLEMATISES.—M. S., Newmarket: It is getting somewhat late to commence layering clematises now, but we may say that many of these useful climbers are readily propagated by layering the growths at the end of summer. It is a good plan to layer the growths in pots, so that, when severed from the parent, the new plantlets may be protected during winter in a cold frame. Follow the same method of tongueing as for carnations.

RIPENING DENDROBIUM GROWTHS.—S. G. W., Cromer: A dendrobium has completed its growth for the season when, at the apex, no new leaves are appearing, and the terminal leaf has fully developed. When this terminal leaf has ceased to increase in size then the resting season should commence, and the first proceeding is a steady reduction of the water supply, and an increase of light and air until presently the plants are placed at the warm end of a vinery, or in an airy house where the night temperature does not fall below 58 deg.

DESSERT PEARS FOR THE MIDLANDS.—H. F. P., Derby: Mr. Woodgate, who has charge of the Rolleston Hall Gardens, has stated in these columns that the best dessert pears forthe Midlands are: Clapp's Favourite, Williams' Bon Chretien, Beurre d'Amanlis, Souv. du Congrès, Emile d'Heyst, Louise Bonne of Jersey, Marie Louise, Thompson's, Beurre Diel, Beurre d'Aremberg, Josephine de Malines, Bergamotte Esperen, and Olivier des Serres.

SWEET PEAS THAT HAVE BEEN SUPERSEDED.—H. M., Trowbridge.—It may be taken for granted that if the National Sweet Pea Society excludes certain of the older varieties of sweet peas from its trials that these varieties have been superseded by others of finer form, size, or colour. We may go a step further and say that these same varieties might well be excluded from all gardens to the great advantage of growers and seedsmen. The excluded varieties are: Admiration, Blanche Burpee, Blanche Ferry, Boreatton, Calypso, Countess Cadogan, Countess of Aberdeen, Countess of Powis, Countess of Radnor, Chancellor, Colonist, Cyril Breadmore, Dorothy Tennant, Duchess of Sutherland, Duchess of York, Emily Eckford, Emily Henderson, Fashion, Firefly, Golden Gate, Gorgeous, Gracie Greenwood, Grey Friar, Her Majesty, Katherine Tracey, Lady Mary Currie, Lady M. Ormesby Gore, Lady Nina Balfour, Lady Penzance, Lady Skelmersdale, Lord Kenyon, Lottie Hutchins, Lovely, Marchioness of Cholmondeley, Mars, Monarch, Mrs. Dugdale, Mrs. Eckford, Mrs. Gladstone, Mrs. H. K. Barnes, Mrs. Joseph Chamberlain, Mrs. Knights Smith, Mrs. Sankey, Oriental, Pink Friar, Prima Donna, Primrose, Princess of Wales, Queen of England, Queen Victoria, Sadie Burpee, Salopian, Sensation, Shahzada, Stella Morse, The Invincible Varieties, Venus, and Waverley.

NAMES OF PLANTS.

W. T. J., St. Mellion.—Escallonia montevidensis.

C. L., Aylesbury.—1, Helianthus decapetalus; 2, Polygonum polystachyum.

J. F., Bowness.—1, Oncidium incurvum; 2, not recognised; 3, probably Selaginella delicatissima.

H. B., Thanet.—We do not recognise the rose; specialists should be consulted in the naming of florists' varieties.

E. E. M., Portmadoc.—1, Androsace sarmentosa; 2 and 3, not recognised; 4, Veronica spicata; 5, Clethra alnifolia.

NAMES OF FRUIT.

Readers who do not find the names of fruit sent in this page will please consult succeeding issues. Sound, full-sized specimens should always be sent, and packed in stout boxes.

F. E. F., Hanwell.—1, Ribston Pippin; 2, Cellini; 3, Alfriston.

H. S., Lincoln.—1, Mere de Menage; 2, Gascoigne's Scarlet; 3, Cox's Orange Pippin.

B. G., Luton.—1, not recognised, a poor specimen; 2, Beurre Diel; 3, Emperor Alexander.

M. E. M., Hythe.—1, Lord Suffield; 2, Beurre Diel; 3, Peasgood's Nonsuch; 4, Beurre Bosc.

L. W. O., Selby.—1, Blenheim Pippin; 2, Waltham Abbey Seedling; 3, not recognised; 4, Court Pendu Plat; 5, Bramley's Seedling; 6, Lane's Prince Albert.

G. S., Ryde.—1, a form of Saponaria officinalis; 2, Spartium junceum; 3, Lithospermum prostratum; 4, Linaria vulgaris; 5, not recognised. The specimens were packed when damp, and hence were in a very bad condition on arrival.

FORTHCOMING ENGAGEMENTS.

THURSDAY, October 15.—Royal Horticultural Society's Fruit Show; two days.

Brighton Horticultural Society meeting.

FRIDAY, October 16.—Royal Horticultural Society; Conference on "Spraying." Morning session, 11 a.m. to 1 p.m., chair to be taken by Colonel Warde, M.P., and lectures given by Mr. G. Massee, V.M.H., and Mr. H. F. Getting; afternoon session, 2.30 p.m. to 4.30 p.m., chair to be taken by Colonel Long, M.P., and lectures given by Professor F. V. Theobald, M.A., and Mr. G. Hammond.

KELWAY GARDENS,
Greenock,
26th August, 1908.

Messrs. Kelway and Son.
Langport, Somerset.

Dear Sirs,—You will be pleased to hear that the £10 or so which I have sent you in the last few years have made my garden (¼ acre) one beautiful mass of colour all the year round.

This year especially the place has been a perfect picture—quite as fine as any of the pictures in Walter Wright's "Perfect Garden."

I am,
Yours faithfully,

GOLD MEDAL,
FRANCO-BRITISH EXHIBITION.
KELWAY AND SON have pleasure in stating that their House has been honoured with the above Award at the Franco-British International Exhibition (in addition to the Silver Medal awarded to their exhibit at the Horticultural Show in the summer).
KELWAY and SON, Langport, Somerset.

For full advertisement see page facing 790.

TO-DAY! AND FOR YEARS AND YEARS PAST the XL ALL Specialities are and have been the best on the market. Where is the Gardener who does not pin his faith to one or the other of these celebrated Insecticides or Fertilisers? XL ALL FERTILISER has pleased all who have used it this season. The Sales of XL ALL FUMIGATOR prove that it is more popular than ever. XL ALL LIQUID NICOTINE INSECTICIDE is always spoken of by gardeners and growers as the most deadly to Mealy Bug, Thrip, etc. XL ALL WINTER WASH for dormant Trees acts like magic, clearing the Trees and Bushes of all Insects' Eggs, Moss, and Fungoid Growths. XL ALL LAWN SAND, a weed eradicator and fertiliser for weedy and poor lawns. XL ALL WEED KILLER used once a year "No weeds can live." Please ask your Nurseryman, Seedsman, or Florist for a copy of my small pink list, giving particulars of these and many other XL ALL Preparations, which can be obtained from the Horticultural Trade throughout the World. G. H. RICHARDS, Manufacturer and Patentee, 234, Borough High Street, London, S.E.

£5 BONUS for information leading to Advertiser obtaining SITUATION as HEAD GARDENER in good establishment, where several men are kept. Advertiser has extensive knowledge in all departments of gardening. Highest credentials. Apply in first instance to R. C., Office of this Paper.

GARDENER (Single-handed or otherwise); willing to be useful; 5 years' good reference from last place; life abstainer; age 26; married when suited. A. S., Tranmere, Sunbury-on-Thames.

GARDENER (Single-handed or with help), one year and seven months' character; eight years previous; age 33. Total abstainer. H. H., 78, Queen's Road, Brentwood, Essex.

GARDENER (Second, where three or four are kept); Inside and Outside; life experience; 6½ years' character from last place; single; age 32. G. EUSTON, Shrubbs Hill, Sunningdale, Ascot, Berks.

GARDENER (Under), age 19, seeks SITUATION; five years' experience Inside and Out; three years' good character. A. WORSFOLD, Benenden, Cranbrook, Kent.

GARDENER seeks SITUATION as good KITCHEN GARDENER; good knowledge of Rose Trees and Carnations, all Hardy Annuals, etc.; also good knowledge of Poultry; good character. **THOMAS RUSSELL, 25, Stockwell Road, Sunnyside,** East Grinstead, Sussex.

GARDENER, life's practical all-round experience, seeks SITUATION, where the services of a competent, trustworthy man would be appreciated; age 32; 2 children; good character. Please state wages. GARDENER, 66, Sandholme Road, Brislington, Bristol.

HANDY MAN seeks SITUATION, Carpentering, Painting, Glazing, all kinds of repairs; would fill up time in garden; age 34; married, no family; 10 years' good reference; or Caretaker in any place of trust. E. CORNFORD, 8, Nye Road, Burgess Hill, Sussex.

STOKER, 10 years' experience in leadi London Market Nurseries; age 34; marr Apply STOKER, 48, Fifth Avenue, Bush Hill Park, N

IMPROVER, in Gentleman's Garden, ag nearly 17; won Essex County Horticultural Sc larship, 1907; also Second-class Certificate R.H.S.; has had one year's training at Horticultural Gardens, Chelmsford; now disengaged. H. BRANSDEN, St ford Lodge Cottage, near Grays, Essex.

TRADESMAN'S SON, tall (20), educated, 3 years' experience in Gardening, requires situation in Nursery, Retail or otherwise, with seed and Bulbs; capable of assisting generally; Suburban or West preferred; excellent references. PERRY VINCENT, 74, St. Stephen's Avenue, Shepherd's Bush, W

YOUNG LADY, age 24, requires SITUATION as an ASSISTANT in first-class Florist Shop, or have the Management of a small Branch Shop; good experience in Flowers and Fruit; good references. Apply D. C., 30, Buckingham Street, Grandpont, Oxford.

YOUNG MAN, age 18, requires SITUATION as Under Gardener; 4 years' experience (Inside and Out). Apply T. JESS, Estate Office, Parmoor, Henley-on-Thames.

YOUNG MAN (21) seeks SITUATION as Second, or Second of three; seven years' experience, Inside and Out. S. WALKER, 86, Hatherley Road, Reading.

Trade.

AS WORKING MANAGER or FOREMAN A. WILLIAMS, who for over seven years has had entire charge of Messrs. Lane and Sons' Vines, Figs, etc., etc., at Berkhamsted Nurseries, is open to a **RE-ENGAGEMENT; good knowledge of General** Nursery Stock and Grower of Peaches, Strawberries, Tomatoes, Melons, Cucumbers, Chrysanthemums, etc.; can be well recommended as such. WILLIAMS, Park Street, Berkhamsted, Herts.

Situations Vacant.

WANTED, MARRIED MAN as UNDER-GARDENER, for Pleasure Grounds; must have good reference from last situation; preference given to man with no family. Wages £1 week, house, milk, vegetables. Apply D. TURNER, The Gardens, Wargrave Hill, Wargrave, Berks.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Dead Leaves.

Although we are accustomed to regard each separate plant, whether tree or shrub or smaller vegetation, as an individual, it is in point of fact a colony of individuals, the leaf being the individual proper, which during its brief period of existence, as compared with that of the plant itself, other than an annual, is busily occupied in collecting and elaborating the material necessary for increasing the size and strengthening the structure, and also for the formation of the seed for an independent generation of plants, and of the buds for a succeeding generation of working leaves of the following year. In deciduous trees and plants generally, the active life of the leaf endures but for part of a year, from the bursting of the buds in the spring to the season of perfected fruit in the autumn. Its task is then completed, and as it is now of no economical use to the tree it has helped to fashion, and would indeed be a source of danger under the stress of wintry gales and heavy snowfalls if retained upon the branches, Nature has contrived that its hitherto firm attachment shall be loosened; a definite line of demarcation is drawn between the dead tissue of the spent leaf-stalk and the living tissue adjacent to the bud at its base, and at this point the shrinkage of the dead cells ensures separation, and the useless appendage falls to the ground. Nature, however, knows no waste, the leaf is still a more or less elaborate network of woody matter plus a certain residue of cellular tissue, and the fall of the leaf to the ground consequently returns this to the soil as a contribution to the future nourishment of the root system. The busy earthworm may seize it and bury it, fungi may attack it, a myriad of tiny insects may devour it, but nevertheless, whatever be its immediate fate, its constituents are sooner or later restored to the soil, and not an atom is lost. The brilliant colours which most arboreal leaves exhibit in the late autumn are due to changes in the normally green chlorophyll, which has been the active agent during the growing period. All the summer through it has been greedily absorbing the vital sunbeams, and under their genial impulse has fashioned the juices within the cells and transmitted them throughout the entire system of the tree, here contributing their contents to build up the annual ring of wood in trunk and branch and twig, and there transforming them into luscious fruits or armour-plated nuts or other infinitely diverse forms of seed as final phases of that reproductive scheme which is the prime end and aim of Nature. In the autumn, all its duties fulfilled, its work done, it ceases to absorb all but the green rays of the spectrum, and now breaks up the sunbeam into all its rainbow components, one and the same leaf often passing through the whole gamut of brilliant tints ere it assumes the brown and dusky hue of death. Evergreen trees and shrubs, as a rule, simply retain their foliage longer, shedding it subsequently to the new growth of the following season, but the life history of the individual, i.e., of the leaf, is practically the same. In this country and others similarly situated as regards climatal conditions, the deciduous or leaf dropping character of trees and shrubs is determined by the alternating seasons of heat and cold, but in tropical countries, where such extremes do not occur, it is determined by alternating periods of drought and moisture. In every environment in point of fact the plant world seems subject to an ebb and flow of vitality, traceable in most cases to climatal fluctuations, but where these are fairly equipoised, to an inherent need for a period of rest. At first sight, the autumnal aspect of the landscape when the brilliancy of colour of the dying foliage has faded, and the bare boughs are beginning to assert themselves as a presage of winter, is apt to induce a feeling of sadness; but when we reflect that every scar those dropped leaves have left marks the birthplace of a vigorous bud, which, after a few months' sleep will redrape the prospect with all the fresh verdure of the spring, we should be easily able to comfort ourselves with the consoling thought that Nature is but temporarily dormant and by no means dead, and possess our souls in patience.

MR. ALEX. MALCOLM.

Mr. Alex. Malcolm is well known by name and repute to every lover of sweet peas who takes more than a passing interest in his or her flowers. His home is at Duns, in Berwickshire, and here for many years past he has made the culture of sweet peas a hobby, growing them extensively and well, and he has been eminently successful as a prize-winner at Edinburgh and Shrewsbury. He is acknowledged to be the chief sweet pea expert across the border, and there are probably very few in the southern counties of England who know the varieties and their capabilities so well as he does. At present Mr. Malcolm is turning his attention to the raising of new varieties, and he is working along strictly scientific lines that are already leading him to a reward for the trouble taken. Mr. Malcolm's enthusiasm leads him to place his expert knowledge at the service of the National Sweet Pea Society, and, as a member of that body's Floral Committee, he annually makes the journey from Duns to Reading for the purpose of adjudicating upon the new varieties that are being tested in the gardens of the University College. Mr. Malcolm is also a great lover of daffodils, of which he has a small but choice collection. Pictures and old china are other hobbies, consequently Mr. Malcom's home and garden are both of a very interesting character.

Fruits and Fruit Culture.—Our next issue will be of special interest to those who are concerned with the all-important question of fruit production. We shall give a freely-illustrated report of the great exhibition of British grown fruit that is being held by the Royal Horticultural Society as we are going to press. We shall also give a report of the Conference on the Spraying of Fruit Trees held at the Horticultural Hall on the 16th inst. The contents of the issue will include several articles dealing with fruits and fruit culture.

Retirement of Sir Daniel Morris.—We learn that Sir Daniel Morris, K.C.M.G., has resigned his post of Imperial Commissioner of Agriculture for the West Indies, a post he has held with great credit to himself and value to the Empire. Educated at Cheltenham and Dublin, and gaining a gold medal for natural science, he became Assistant Director of the Ceylon Botanic Gardens in 1877, where his investigation of the coffee disease brought him public thanks. He became Director of the Jamaica Botanical Department in 1879 and Assistant Director of the Royal Gardens, Kew, in 1886, where his wide knowledge of tropical economic plants was of the greatest value to the establishment and to the Empire. He was appointed scientific adviser to the West India Royal Commission of 1896-7, and appointed to the post he is now resigning in 1898. He was created C.M.G. in 1893, and K.C.M.G. in 1903. Sir Daniel Morris has done more than any other man to improve agriculture in the West Indies; to him is due the revival of the sugar industry, and the improvement of the banana business, while under his care cotton, rubber, cocoa, arrowroot, orange, and lime cultivation has been extended and improved throughout the West Indies. It is safe to say that agriculture has been so systematised, and so much enthusiasm and enterprise have been brought into it as a result of Sir Daniel's generalship, that the industry is certain to progress for long years to come.

National Rose Society.—The Metropolitan exhibition of the National Rose Society will in 1909 be held in the gardens of the Royal Botanic Society on Friday, July 2. The provincial show will be held at Luton on a date yet to be fixed, and the autumn show will be held on September 16 at the Horticultural Hall, Westminster. The society continues to extend its list of members at a rapid rate, 350 having joined during the past five months.

Foreign Fruits were imported in considerable quantities during September, such fruits as bananas, lemons, oranges, and nuts being especially plentiful. With the exception of apples, cherries, and strawberries, the fruits which can be successfully grown in this country were imported in smaller quantities than in the corresponding month of last year. Of apples the imports aggregated 178,532 cwt., of the value of £98,810, or an increase in quantity of 92,549 cwt., and in value of £48,638. The imports of apricots and peaches amounted to 220 cwt., of the value of £382, a decrease of about 50 per cent. Of bananas 682,276 bunches were imported, or an increase in number of 69,486 bunches and in value of £13,482. The cherry imports were 132 cwt., of the value of £209, and these are of interest from the fact that in the corresponding month of 1906 and 1907 no cherries were received from abroad. The imports of currants dropped from 201 cwts. of the value of £203 in September, 1907, to 54 cwts. of the value of £66 last month. In the imports of grapes there was a decrease in quantity of 41,338 cwt., and in value of £21,006, the total having been 110,091 cwt. of the value of £106,652. Pear imports also show a material decrease, both in quantity and value; the aggregate having been 134,847 cwt., of the value of £119,268. The imports of plums amounted to 43,844 cwt., of the value of £31,128, or a decrease in quantity of 3,590 cwt., and in value of £1,652. Strawberries made their appearance for the first time in the September returns, and of these fruits the imports were 6 cwt., of the value of £6. The imports of unenumerated fruits are of interest from the fact that while there was a decrease of 21,753 cwt., there was an increase in value of £5,255. The total value of the imports for the month was £701,706, or an increase of £19,866.

National Dahlia Society and Dahlia Union.—Meetings of the committees of these societies were held on Tuesday for the purpose of considering the question of the amalgamation of these two organisations. At the meeting of each committee, it was decided that the fusion of the two bodies was desirable. A sub-committee consisting of equal numbers of members of the two committees has been formed for the purpose of preparing a scheme of amalgamation, and there is now justification for the belief that this desirable end will be satisfactorily accomplished.

Messrs. Charlesworth and Co., who have for many years been growing and raising orchids at Heaton, Bradford, have now removed from Yorkshire to Sussex, where they have constructed very fine ranges of houses, connected by covered corridors. The new address, to which all communications should now be sent, is Hayward's Heath, Sussex. We wish the firm every success in its new premises, a success we feel they deserve because the new nursery is as up-to-date as experience and skill can make it.

Vegetables of Foreign Growth were less plentiful in British markets during September than usual. The principal decrease was in the imports of potatoes, the abundant yield in this country and the comparatively low prices now ruling having imposed a severe check upon importations of these tubers. The aggregate imports of potatoes during the month were 167,250 cwt., of the value of £27,791, against 259,942 cwt., of the value of £52,929 in the corresponding month of last year. Of onions the imports were 819,719 cwt., of the value of £97,219, or a decrease in quantity of 103,032 cwt., and in value of £5,962. Tomatoes, on the other hand, show an increase in quantity of 18,662 cwt., and in value of £8,332, the cold, wet weather of September having hindered the maturation of the outdoor crop in this country.

The Gardeners' Royal Benevolent Institution.—The Rev. W. Wilks, M.A., secretary of the Royal Horticultural Society, has forwarded a cheque for £10 to the funds of this institution, being the proceeds of the harvest thanksgiving offertories at Shirley Church, Croydon, of which he is the vicar.

Flower Sellers in Oxford Circus.—An effort has been made to prevent the continuance of flower selling by women in Oxford Circus. A resolution before the Marylebone Borough Council to the effect that no one should occupy the position for business purposes after September 29, 1909, was defeated by an amendment that no newcomers should be allowed to sell flowers without permission from the Council, but this amendment, on becoming a substantive motion, was defeated by another that no action be taken in the matter. So the flower sellers continue unmolested at present, and as Mr. Leveson Gower has said he has no wish that the women be removed, they are likely to remain unless some breach of the peace is made.

Extension of Putney and Wimbledon Commons.—A strong effort is being made to secure by public subscription the vacant lands that lie between Putney and Wimbledon Commons and Richmond Park. Richmond, Putney, Wandsworth, Merton, Wimbledon, Coombe, Malden, Roehampton are all directly interested in the movement, and leading ladies and gentlemen from these places have joined the provisional committee formed at the instance of the John Evelyn Club. The Commons Preservation Society and the Public Gardens Association associate themselves with the scheme, and several members of the Surrey County Council are interesting themselves in the matter. We do not know the full area of the land it is proposed to secure, but there are thirteen acres in the strip that runs from Robin Hood Bridge to the Robin Hood Gate of Richmond Park, and this certainly should be secured if possible. The scheme is a commendable one.

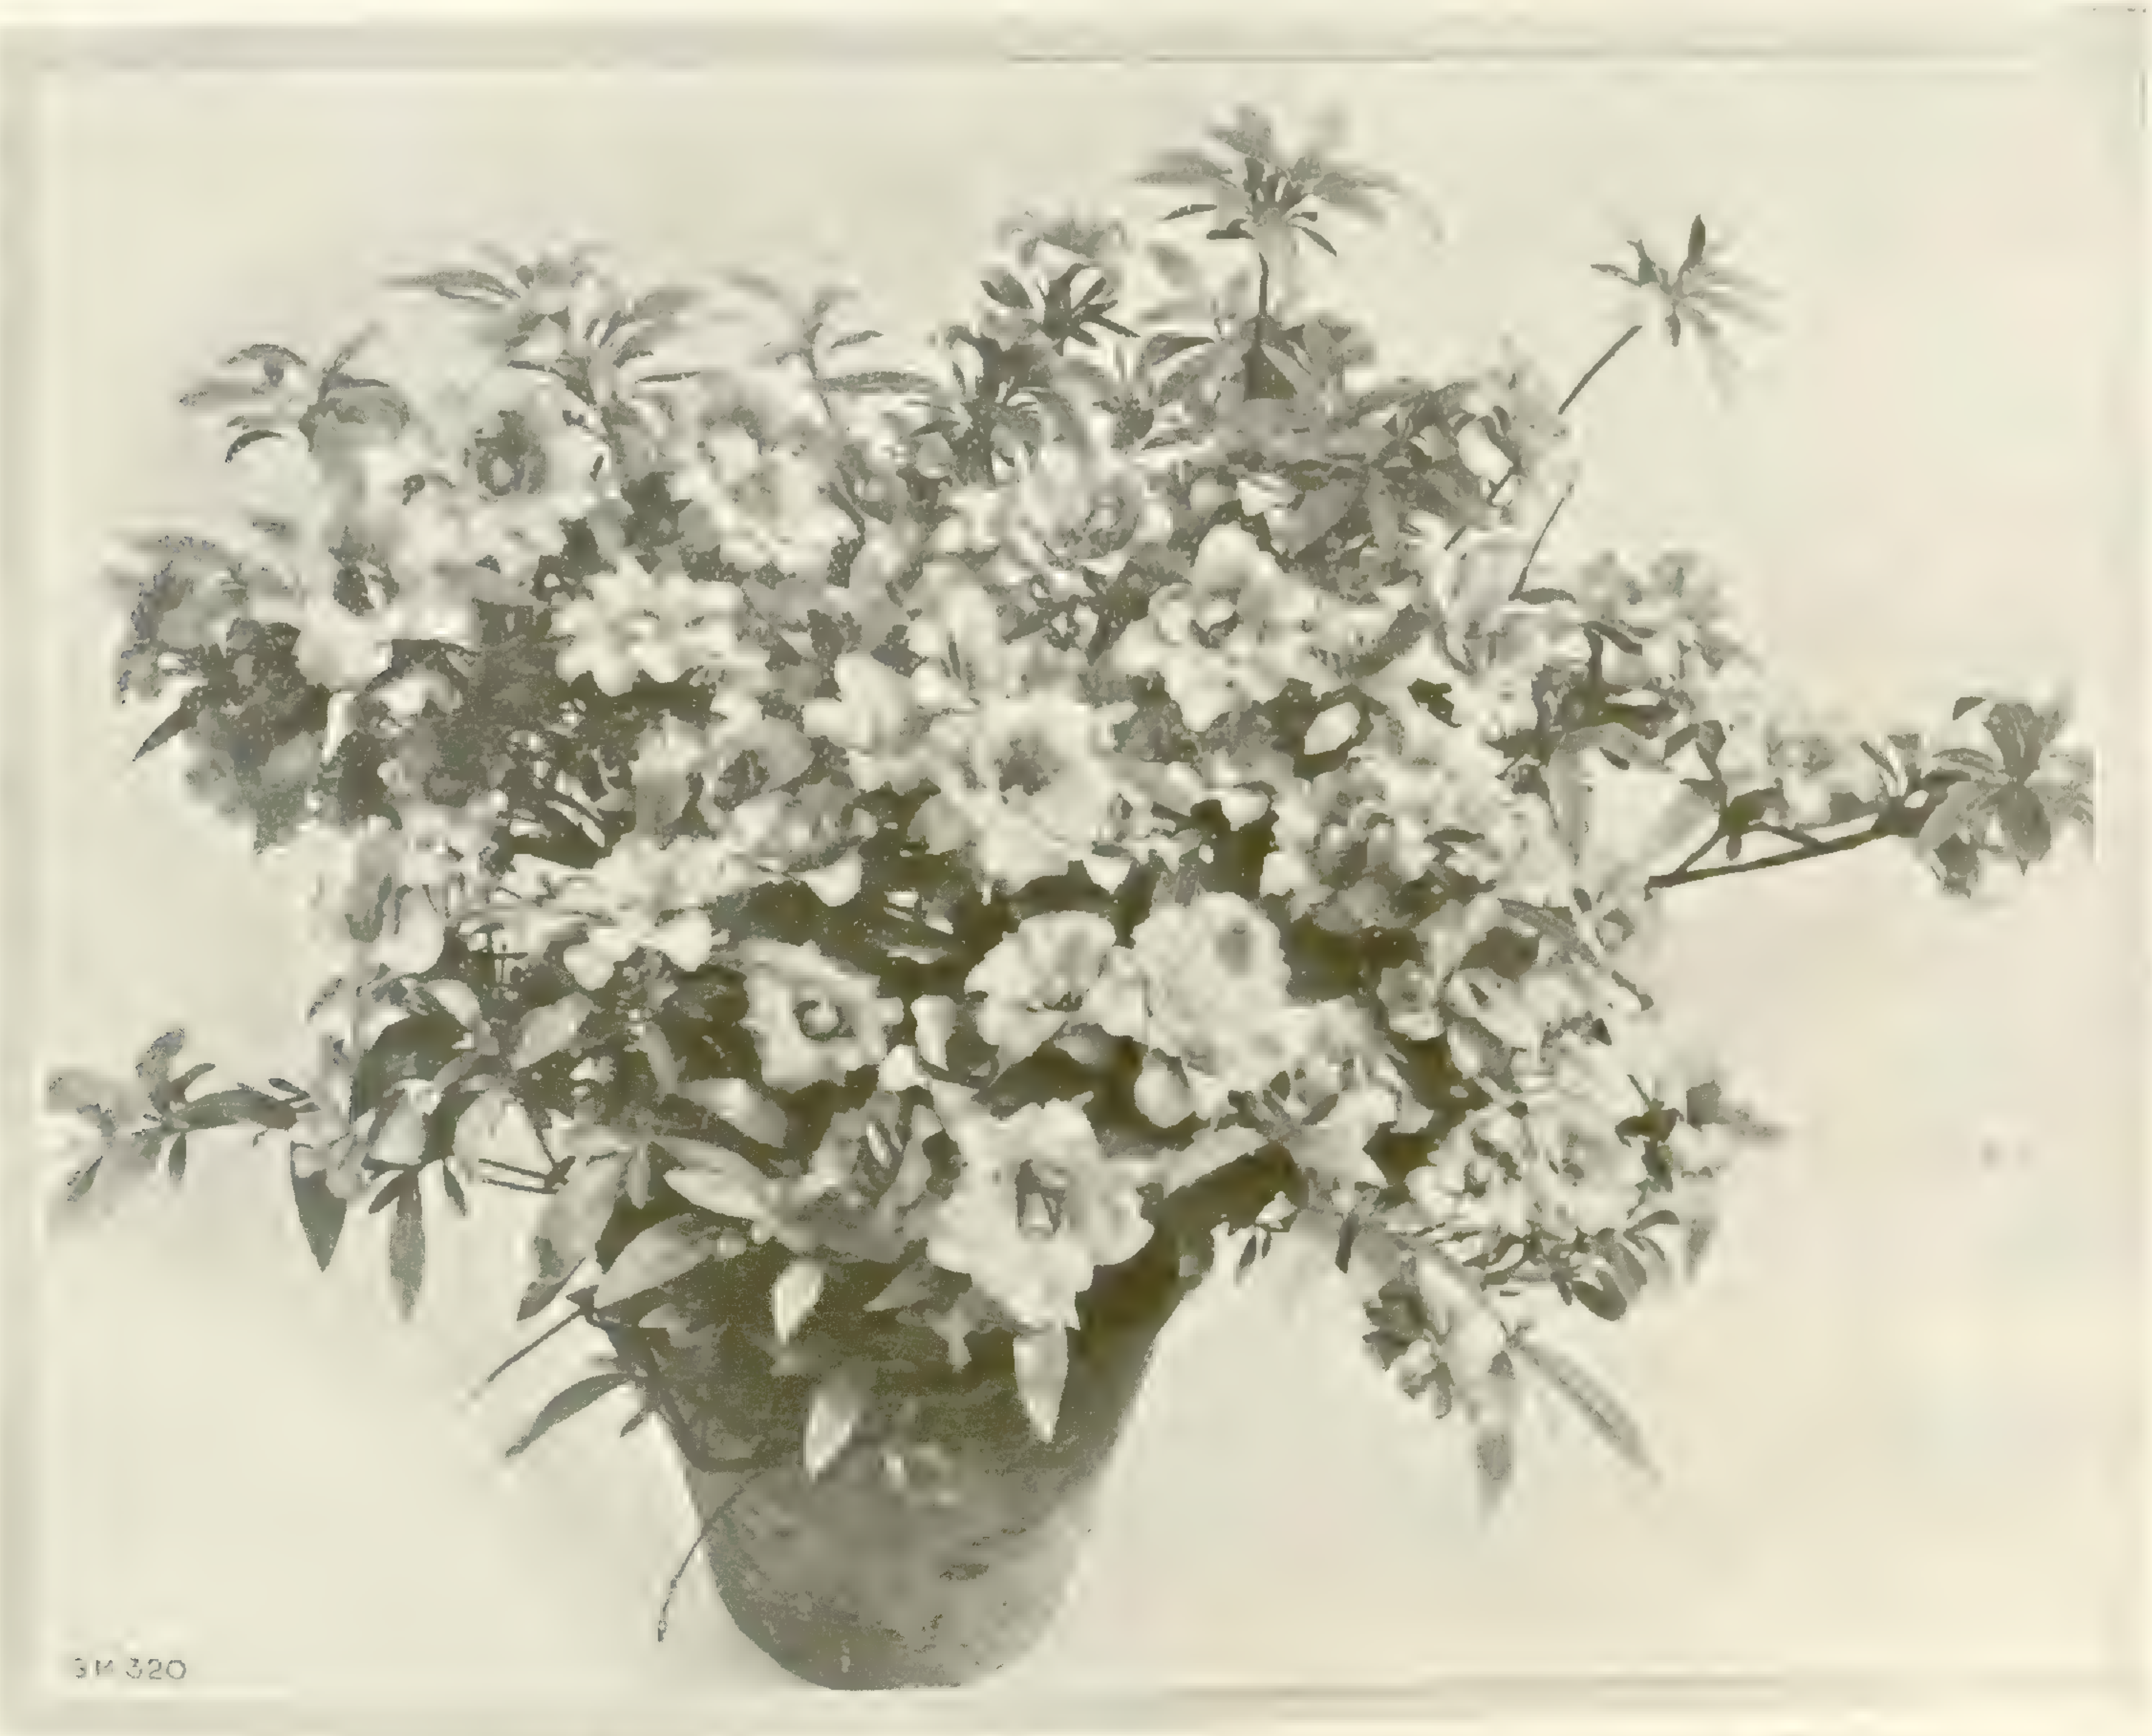
Barren Strawberry Plants.—Among the commonplace notes in the current issue of the R.H.S. "Journal," is one on the causes of barrenness in strawberry plants, and as the matter is one of much interest to a very large number of our readers we herewith reproduce it. "Every year we have complaints about the non-fruiting of strawberry plants, but this year the complaints are more numerous than usual. We think there are two principal causes—(1) propagating from barren plants and (2) a want of fresh stock. It is well known that barren plants produce the earliest and strongest runners, and the man sent to layer or take runners usually selects the strongest and best he can get, irrespective of whether the parent plant was fruitful or not. These are planted in beds or rows, and a greater number of plants are unfruitful than usual. Runners are again taken, the best being selected, until the majority of the plants in the beds bear no fruit. Some years ago we carefully chose runners from barren plants, giving them special attention, but not one runner developed into a fruitful plant. We again took runners for two years following, but in every case the result was the same. We all know how essential it is to change our seed of corn, potatoes, and other crops, and unless we can give a change of soil it is equally necessary to occasionally introduce fresh stocks of strawberries, if we desire to maintain vigour and fertility. Some varieties, like Royal Sovereign, will go on bearing very satisfactory crops for much longer periods than others, but we think the quality suffers. Another cause of failure, or partial failure, is the planting of strawberries where strawberries were grown before. No good gardener permits this to happen, but we find it occurring sometimes, and if the result is disappointing the blame is entirely the planter's."

A Redeemed Apple Tree.—We have received from Mr. J. Melville, superintendent of Finsbury Park, a photograph of a heavily-laden apple tree, which is growing in the garden of Lieutenant Tuckwell, of Beckenham. The tree is of the variety Stirling Castle, and was planted in 1903. Other trees planted at the same time did well from the first, but Stirling Castle languished, and Lieutenant Tuckwell considered it to be dying. Fortunately, Mr. Melville visited the garden in October, 1904, and promptly advised that the tree should be lifted and replanted, but not so deeply as before. This was done, with the result that during 1905 the tree regained health, but bore no fruit. The following year a fair crop was produced, and in 1907 and this year apples were produced in plenty. Indeed, the photograph (which we regret is unsuitable for reproduction) shows that, in the words of Lieutenant Tuckwell, "the tree is all apples." Readers who have [illegible] fruit trees which appear to be unhappy will do well to take a hint from this circumstance.

A Venerable Italian Larch.—A correspondent of "The Scotsman" tells of a venerable larch tree situated in Italy, on the northern flank of Mont Chetif, in the direction of the huts of Pian Veni above Courmayeur, a few steps from the [illegible] that skirts the limit of the meadowland. Due allowance being made for the extreme slowness with which the larch grows, for the altitude above sea level ([illegible] metres) at which it is rooted, and for its northerly exposure in the near neighbourhood of the glacier, where the cycle of its development is barely five months every year, this venerable larch, untouched alike by woodman's axe and thunderbolt, cannot be less than 2,000 years old.

Bees in the Orchard.—In the course of an address given before the Ontario Beekeepers' Association, on "Bees in Relation to Horticulture," Professor H. A. Surface, of Harrisburg, declared that bees are not injured by proper spraying methods. With reference to Bordeaux mixture, he said: Emphasis should be made of the fact that this preparation is not an insecticide, would not kill bees nor other insects, and is used only as a fungicide or preventive of certain plant diseases. If, however, Paris green or some other arsenical poison, such as London purple or arsenate of lead, were added to the Bordeaux mixture, or used as a spray, and the bees could be induced to sip the liquid through its falling into widely-opened nectar-yielding blossoms, or through excessive thirst of the bees, sipping it from the leaves where it temporarily remains, it is possible that these beneficial insects might be killed by such means and at such times. However, it is Professor Surface's opinion that if water be placed in the apiary regularly, as it should be, the bees will learn to go to it, and will not seek the drops of poisoned spray liquid that may remain temporarily on the leaves in spraying for the codling moth. Finally, on this particular point, it may be said that the codling moth is the only pest for which arsenical sprays are recommended as a regular annual practice, and for it the spraying should be done soon after the petals fall, and again within a week or ten days. But few bees are flying in the tree tops at such time.

Southampton Chrysanthemum Show.—We are informed by the secretary of the Southampton Royal Horticultural Society that owing to unexpected circumstances connected with the hall, it has been found necessary to alter the date of the chrysanthemum show from November 2 and 3 to October 28, 29, and 30.



THE BALSAM-FLOWERED AZALEA (AZALEA INDICA BALSAMINÆFLORA).
One of many fine plants shown earlier in the year by Messrs. H. Low and Co.

THE BALSAM-FLOWERED AZALEA.

There are several very beautiful and useful azaleas that once received specific rank, but which now are regarded as well-marked varieties of Azalea indica, though even this latter type, if we would be quite up-to-date, we must now call Rhododendron indicum. One of the distinct varieties of the Indian azalea is A. indica balsaminæflora. This was formerly regarded as a true species, and as such was figured in the "Revue Horticole" in 1882. It has also been known as Azalea Rollisoni because the late firm of Rollisons, of Tooting, brought the plant into prominent notice, and, indeed, introduced it to general cultivation. The late Mr. William Bull was also much attracted by this Japanese azalea, and a large illustration of a plant figured in his catalogue of many years ago. Another name, and one that is still quite commonly used for this azalea is A. rosæflora.

The two names—balsaminæflora and rosæflora are both descriptive of the double, compact blooms that the plant under notice so freely produces. The flowers are of medium size, finely doubled, and the margins of the petals recurve a little, so that each bloom has a very neat appearance. The colour is bright salmon-red. In the matter of habit of growth this azalea is very bushy and gracefully spreading, as a glance at the accompanying illustration will show. Although it is as a pot plant for conservatory and greenhouse decoration that the balsam-flowered azalea is best known and most valuable, it is, like A. indica, hardy in many parts of the country. It is a beautiful plant and one that ought to be better known. B.

APPLES AT GOODRICH COURT.

The soil and climate of the West of England are well known to be generally suit-suitable to the culture of hardy fruits, and among the counties no other is more noted for apples and pears than is Herefordshire, while probably in no private garden in that fruitful shire are these fruits to be found better cultivated, or in greater variety, than at Goodrich Court, Ross, the seat of H. C. Moffatt, Esq. The truth of this opinion will appeal to those readers who have seen the exhibits that have from time to time been staged by Mr. Spencer.

I have for many years had the pleasure of paying Mr. Spencer an annual visit at the end of August, when the character of his crops of apples and pears could be fairly estimated, and this season I made one more visit. Pears at Goodrich, both grown on walls and as pyramids in open quarters, have many times been seen carrying better crops of fruit than they do this season, and this defect may be rightly attributed to the dull, wet weather experienced last summer, together with the cold of last spring.

The orchards were not visited, and my remarks are therefore confined to the garden crops. By far the greatest number of trees are in their prime, and they were planted upon maiden soil when the garden was formed. The garden is extensive, and it is intersected by walks, by the sides of which the trees, moderately-sized pyramids and bushes are placed in single lines. This method of culture affords every facility for the trees being conveniently attended to, and, moreover, the wood down to their base, as well as the fruit, reaps the fullest benefit from sun and air. Mr. Spencer evidently fully appreciates the influence of these elements, for he has been very careful to well thin the branches of his trees. This, I fear, is a necessary detail in the management of the apple that some of us do not sufficiently pay attention to. Winter spraying for the destruction of injurious insects and lichen is never neglected. Summer and winter pruning and thinning of spurs is carried out in the ordinary manner, with the result that the branches their entire length are properly furnished with fruitful spurs.

The trees are worked upon the paradise stock, and consequently it has not been found, except in a very few instances, necessary to root-prune the trees. That this operation is not needful is plainly apparent by the general satisfactory condition of the trees, though their size is moderately limited. As a fertiliser, supehphosphate of lime is used, because the soil is deficient of lime, and a dressing of bonemeal is given early each spring, these being lightly pointed in. The trees are mulched with stable litter early in summer, once the soil has become warmed by the sun, and watered when necessary, if time can be spared to attend to it. This season, however, it has not been even once done, though we in the West of England have, perhaps, had less rain than have most other folks in these isles, and yet, neither the trees nor their crops gave the least indication of having suffered in any way.

There are about fifty varieties of apples cultivated, and each of them is represented by several trees. Of dessert kinds there are most of Cox's Orange Pippin (fifteen trees), and of kitchen varieties there is the greatest number of Lane's Prince Albert, viz., twenty trees. Newton Wonder, Stirling Castle, Ribston Pippin, Allington Pippin, and come next in point of numbers. Of the newer varieties, Charless Ross, James Grieve, The Houblon, Rival, and Norfolk Beauty are each represented by a few trees. With but few exceptions the trees were all heavily cropped, with remarkably fine clean fruit, which in most cases had been considerably thinned. Especially fine fruits of Cox's Orange and Ribston Pippin, with some others, were observed growing upon trees trained against walls.

T. Coomber.

Hendre Gardens.

THE ORIGIN OF THE CULTIVATED POTATO.

The familiar potato must certainly rank among the most remarkable plants known as regards the immense variety of form and colour into which its tubers have sported. The foliage and the flowers also vary, but by no means to the same extent as the tuber, as no attention has been paid to these by the selective cultivator. So far as can be ascertained, all these varieties belong to one and the same species, since, although there are a number of other tuber-forming solanums, to which genus the potato of commerce belongs, none of these, apparently, have responded to the cultivator's attempts to render the tuber of economical value.

Curiously enough, however, the particular species which has yielded such marvellous results has remained undetermined until quite recently, and it is the object of this paper to relate how the mystery has at last been solved. Early in the last century the potato disease suddenly asserted itself to such a devastating extent as to cause terrible privation and suffering to those whose main support was thus destroyed. On the reasonable assumption that this scourge was not solely due to abnormal weather conditions, but was probably also due to feebleness of constitution engendered by long cultivation, the idea was conceived that a cross with the original wild species might impart renewed vigour and thus check the ravages of the pest. To this end a considerable number of wild species of solanum were obtained through collectors abroad, and Mr. A. W. Sutton, V.M.H., F.L.S., of Reading, with the aid of these, made a number of experiments in the way of hybridisation, but attained no results of value; nor among these wild species were any which agreed closely enough in specific character with the potato of commerce to be regarded as the original type.

As a consequence of the negative results obtained the experiments ceased, but a controversy arose a few years ago regarding an alleged "sport" from one of the wild types (S. Commersoni) in France, which "sport" possessed all the characteristics of the potato of commerce, the tubers being of a marketable size and equal in every respect to many well-known varieties. Mr. Sutton thereupon resumed his investigations, one result of which was to prove to the satisfaction of every practical potato grower and expert that the "sport" in question was really due to the accidental presence of an ordinary potato in the soil. Another result, however, was far more satisfactory. Among the wild potato plants to which attention was thus recalled was one named Solanum etuberosum, or the non-tuber-bearing solanum, a name which, as we shall presently see, is entirely inappropriate. This species differs from the cultivated potato in having somewhat hairy foliage, which is also of different habit. Mr. Sutton received tubers of it from Edinburgh some 20 years ago, when the tubers it produced were no larger than marbles, but were white and edible when cooked, but in the course of 19 years' cultivation the tubers have greatly increased in size. During the whole of this period no seed berries had been observed, but in 1906 a solitary one was noticed, carefully protected, and the contents were sown in 1907. It may here be remarked that previously when seed from the various wild species was sown, the seedlings were perfectly true to the parental type, and Mr. Sutton's surprise may therefore be imagined, when the 20 plants resulting not only widely varied among themselves, but could not be distinguished from a batch of plants such as would result from a seed berry of the common potato. The tubers also displayed equal diversity, and among them were some of quite marketable size. The common potato, it may be mentioned, gives equally and similarly diverse offspring from its seed, and can only be propagated truly from the tuber.

This result naturally led to the idea that the seed berry in question had been fertilised by pollen from one of the ordinary potato blooms in the vicinity, a possibility, however, which Mr. Sutton doubted, as the wild seedlings previously raised had been subjected to the same risk, and cross-fertilisation, moreover, in his experience did not occur. To test the question, however, flowers of S. etuberosum were carefully self-fertilised in 1907 by hand and protected from alien pollen, the result being several more berries, the seeds of which have this year, 1908, yielded similarly diverse seedlings to those of the suspected berry, the batch being again indistinguishable from one raised from common potato seed. It was then suggested that S. etuberosum, as introduced, might really not be a wild species at all, but an escape from cultivation in its native country, but here, however, the botanist steps in to determine the question. All the wild species of solanum which have been examined have pollen grains of equal size and of symmetrical long, oval, or elliptical form, while those of the common potato in all cases examined are of very unequal size, very irregular shapes, and symmetrically oval or elliptical ones cannot be found. S. etuberosum pollen is purely of the wild elliptical form, as is the case in two of the seedlings from it which have white flowers, while that of all the lilac-coloured flowers examined exhibits, curiously enough, precisely the same irregular types as the common potato. The true specific character of S. etuberosum is thus fairly established, while that it is the original progenitor of the potato of commerce can, in face of such results, hardly be contested. Finally, a most important economical fact emerges from these data.

For the 20 years S. etuberosum has been cultivated at Reading there has never been a trace of disease on haulm or tuber, though year after year it has been subject to the risk of infection from closely associated diseased plants of the ordinary varieties. This immunity, coupled with the fact that by self-fertilisation it will yield marketable potatoes, implies an even better result than was aimed at originally, since the need of a cross with the enfeebled potato is eliminated, and perfectly pure blood is transmitted from the start. We may therefore regard it as a fact that not merely has the question of origin been definitely settled, but that a really disease-proof, or at any rate, disease-resisting potato has at last been attained.

Chas. T. Druery, V.M.H., F.L.S.

FRUIT AND VEGETABLE PRODUCTION IN FRANCE.

In view of the large quantities of fruits and vegetables that come to this country from France, any information respecting their cultivation and despatch is of interest to British growers, and particularly now that a good deal is being said and written in many quarters concerning French gardening. Accordingly we extract the following account from the reports of the several Consuls as these have appeared in the "Journal of the Board of Agriculture."

DUNKIRK.

According to a report received from H.M. Consul at Dunkirk (Hon. R. Walsh), the export trade from that port to the United Kingdom of fresh fruit locally grown, which was at no time an important trade, has declined very much of late years, as the gardeners find a more profitable market for their produce in their own country and in Belgium. At one time there was a considerable cultivation of gooseberries, currants, pears and apples, all along the coast between Dunkirk and Gravelines, and much of the produce found its way to the English market, but this industry has now practically disappeared, and the ground has been cleared for the cultivation of beetroot and chicory.

The only district where market gardening is still carried on to any extent is that of Rosendaël, where some 600 to 700 acres have been cut up into small gardens and are devoted to the cultivation of cherries, gooseberries, plums, and vegetables. The gardeners of Rosendaël have formed an association with one of their number as president, who undertakes all the organisation of the supply, the fixing of prices, and various other details connected with the trade. It is proposed to establish a bureau, with a paid staff, whose business it will be to find new markets for all garden produce, and to collect information affecting the trade. Mr. Walsh understands that hopes are entertained of establishing a regular export trade to the United Kingdom, particularly in vegetables. The present shipping arrangements, however, would not admit of the British market's being served at fixed times by the existing routes, and the cost of carriage to Calais or Boulogne and thence to the United Kingdom would probably be too high to leave a margin of profit.

CALAIS AND BOULOGNE.

Mr. C. A. Payton, H.M. Consul at Calais, reports that very little fruit or vegetables of local production are exported to England; the large exportation, which takes place in summer, by special cargo boats belonging to the South Eastern and Chatham Railway, arranged so that the consignments reach London early in the morning, comes from the neighbourhood of Paris and the south and centre of France. The principal periods of shipments are for cherries, strawberries, and green peas from May 31 to June 26, and for plums, peaches, apricots, melons, French beans, etc., from July 22 to August 16.

In the same way the large shipments from the port are not of local production. Mr. Vice-Consul Farmer reports that [illegible] are practically the only local vegetables exported. The climate enables these to be placed on the British markets, via [illegible], London, and Goole, some three weeks earlier than the home produce. It is an ephemeral traffic, lasting about four weeks, and ceasing when prices fall below 2d. per dozen bunches.

DIEPPE AND CAEN.

Mr. Vice-Consul Lee-Jortin reports that cider apples are chiefly grown in the Dieppe district, but after these plums are perhaps the most grown. A certain quantity of the ordinary kinds of plums are exported to the United Kingdom, chiefly in September, the better sorts being either consumed locally or sent to Paris. Table apples are exported in small quantities in October. Fairly large quantities of potatoes, grown in the neighbourhood of Le Mans and Orleans, are also sent away.

Mr. Vice-Consul Hettier reports that cherries, gooseberries, plums, and other small fruits are not produced in the Caen district in large quantities, but the local authorities are making a great effort to promote small associations to encourage the growth of these small fruits and also of pears. The cultivation of vegetables is practised only on a narrow strip of land bordering the sea coast from Ouistreham to Courseulles. Potatoes are very early there, but the exports are small, and only amounted to 130 tons in 1906. Carrots and onions are also successfully grown, but are chiefly consumed locally.

HONFLEUR.

Horticulture is one of the principal resources of this part of Normandy, and Mr. Charlesson, the British Vice-Consul, reports that all the farms in this part of France are divided into plots surrounded with thick hedges, and planted with cider apple, plum, cherry, and pear trees. The land is grazed by cattle and regularly manured every spring. In properly-managed orchards, apple trees over 15 years old have the bark scraped off with a special tool in January or February, and are then lime-washed to destroy insects and fungi. The soil chosen for the cultivation of both cider and table apples is generally of inferior quality, dry and stony slopes being favoured, but those facing south and south-west are preferred.

The varieties of cider apples mostly cultivated are Bedan, Bouteille, Joïy, Cimeterre, Belle fille, Sorte à Renoult, Taureau, and Peau de vache. The apples are made into cider locally, but several thousand tons are sent annually to Germany. Table apples are chiefly consumed in the country, though a few are sent to England. The varieties grown are Eclat, Reinette de Caux, Reinette d'Angleterre, Reinette de Bretagne, Pigeonnet, and Calville Blanc.

Several varieties of small pears are grown, such as St. Clair, Liberge, Mouy, Rozé, Beurré gris, Rousselet doré, Souris, Fontaine, and Catillac, the two latter being stewing pears. The fruit is packed loose in boxes and sent to London and Birmingham.

Cherry and plum trees are abundant. The fruit is packed in baskets holding 17lb. and sent to the North of England, Birmingham, Liverpool, Manchester, Hull, etc. Better soil is selected for cherries and plums than for apples and pears, and valleys are preferred. The varieties of plums grown are Orleans, Egg plum, Cherry plum, Gaillon, and Greengages, and the varieties of cherry are Angers, Collet, Guigne dure, Red and White Hearts.

Table pears are grown in gardens which are surrounded with brick or stone walls, or sometimes by clay walls, which, in fact, are considered the best. Espaliers are planted 10ft. apart and trained on the Leverrier system; these are called "candelabres," or chandelier shape, and yield the finest fruit; while another method is the "Palmette" or palm-leaf shape. The latter are planted 13 feet apart, as they cover more space. The "Leverrier" takes about three years to yield fruit in any quantity, while the "Palmette" requires at least five years. This latter system is much practised, as the trees last longer than the "Leverrier," and attain a greater development on the walls, some covering 30ft. and yielding between 250 and 300 fine pears. The varieties cultivated on walls are Williams' Duchesse, Louise Bonne, Doyenné du Comice, Beurré Hardy, Beurré Clairgeau, Beurré Superfin, Beurré d'Aremberg, Doyenné d'Hiver, Olivier de Serres, Crassane, Passe Crassane, General Totleben, and Pitmaston Duchess. The same varieties are grown in the open part of the gardens as pyramids, being planted 13ft. apart each way. Those grafted on quince are preferred. The grafting is always level with the ground, and the young pear trees are allowed to grow gradually, being pruned every autumn. A tree planted three years after grafting takes 12 years to come into full bearing, and it may then produce 200 pears. The fruit, of course, varies in size, but when there are signs of an abundant crop, part of the fruit is plucked off when about the size of a nut.

Packing is a very important point with table pears, and the greatest care is exercised. The fruit is put in layers in boxes with wood fibre, from 36 to 70 Williams' pears being put in a box, according to size.

The cultivation of gooseberries has been almost abandoned, but red and white currants are largely grown.

COTE D'OR.

In this Department agricultural produce is extremely varied according to the nature of the soil and climate. In the valley of the Saône, where the soil is light and permeable, market gardening is extensively carried on. The Côte, which gives its name to the Department, is a narrow stretch of country mostly planted with the vine from which the renowned wines of Burgundy are derived, but a portion of the district is devoted to fruit growing. Cherries, peaches, and currants are cultivated on an extensive scale. The area under potatoes is estimated at about 55,000 acres, and hops occupy about 2,300 acres. Local breweries absorb about one-fiftieth of the production, the remainder being exported to various centres in France and to London. The hops of Burgundy form a third of the French production, and are held to be of first-rate quality.

Fruit production in this Department gives rise to an extensive trade with Paris and England, the fruit exported being chiefly cherries, black currants, and raspberries. An improvement is said to be noticeable in the varieties of cherry selected for cultivation. Peaches and apricots are mostly consumed locally. Peas, haricot beans, asparagus, and onions are grown on a large scale.

OISE.

In several districts vegetable growing, chiefly dried haricot beans, French beans, and artichokes, is conducted on an extensive scale for the supply of the Paris market and for export to England. About 2,000cwt. of cherries, known as "Guignes," are sent to Paris and England in June and July, and about 500cwt. of black currants. Peas are also exported to some extent.

SEINE-ET-MARNE.

Near Coulommiers and beyond Crécy on the slopes of the hills bordering the valley of the Grand Morin, fruit growing is extensively carried on; in good years in this district the sales of the blue plum to agents who forward to Paris and to England amount to 4,000cwt., of other varieties some 1,000 cwt., of the Reine Claude 1,400 cwt., of small early peas 1,000 cwt., and some 800 to 1,000 cwt. of currants and raspberries. The fruit is packed in round baskets containing about 22lb. net. In 1902 some of the growers, in view of the large profits reaped by the middlemen, formed an association, and as the result of this co-operative movement succeeded in obtaining double the amount previously received for the early Carrière pear and for blue plums. In 1903 another association was formed near Crécy with similar results. In the sandy soil about Melun the potato is largely cultivated, the output of the district amounting to 7,000 or 8,000 tons. The potatoes are exported from the end of August to February or March, and a portion of the supply comes to England.

SEINE-ET-OISE.

This Department encircles the Department of the Seine, and provides the bulk of the vegetables and forage required for the supply of Paris. Potatoes, tomatoes, and asparagus are forwarded to London. In several communes special attention is paid to the cultivation of table pears, the favourite varieties being Duchesse d'Angoulême, Louise Bonne, Beurré Diel, Williams' Bon Chrétien, Beurré Hardy, and Doyenné du Comice. The fruit is sold by auction at Paris, or to buyers on the spot, who send it to England and to Russia. An association has been formed at Groslay which makes consignments to England.

LOIR-ET-CHER.

This Department is almost entirely agricultural. The cultivation of haricots and peas is increasing every year. Peas are grown principally on the hillsides bordering the valley of the Loire, and the potato is cultivated throughout the Department; a large portion is consumed locally, and the remainder goes to Paris and London. Owing to the facilities for communication with Paris and other centres, vegetable growing is carried on in most districts. The cultivation of the asparagus, only recently introduced, now occupies some 3,200 acres, with an annual output valued at £40,000.

Bulbs in Grass.—Planting should also now be proceeded with on as bold a scale as possible, but never in formal clumps. If desirable to have as long display as possible two or three varieties may be used. First decide on the outline of the group, then prepare all the holes, and if the soil is impoverished place a shovelful of better soil in each hole, then take the earliest variety and plant one-half of the holes in the entire clump, replacing the turf as planting proceeds; then act in the same way with the other one or more varieties. Tulips and narcissus are most suitable for planting in grass, as are snowdrops, aconites, and anemones.—E. F. H.

LILIES AT LEONARDSLEE.

During the past four or five weeks nothing has been more lovely or interesting than the lilies growing in outside borders. I mention this fact because these plants are not so generally grown as their beauties merit. They are perfectly hardy, and will grow almost anywhere; they should, however, be accorded liberal treatment, but not be subjected to what may be described as coddling.

It is an easy matter to give them a good supply of the soil they best thrive in, should the staple of the district not be suitable. They will do well in rhododendron beds, herbaceous borders, or even may be given a border to themselves, as their flowering extends over a long period, but it is during August and September that they are of special value for brightening up the lawns and shrubberies.

[Photo: J. E. Tyler.

FORTUNE'S TIGER LILY (LILIUM TIGRINUM FORTUNEI).

A handsome form of the strong-growing and free-blooming tiger lily, with large, rich orange-red flowers.

Lilium auratum and its varieties rubrovittatum and platyphyllum are most lovely when seen carrying large quantities of flowers on stems rising from 6ft. to 8ft. in height, and they are much admired. L. speciosum and its varieties rubrum, Kraetzeri, Melpomene, and album appear, when grown well in the open, to produce larger flowers than when grown in pots, and are most attractive.

Lilium longiflorum is also very fine, and grows well. L. tigrinum and its fine variety L.t. Fortunei (see figure), are most beautiful, and when planted in groups of 6 to 10 bulbs each they are highly effective; L.t. flora plena is also very fine.

Lilium Browni, with its large trumpet-shaped flowers, is attractive, and of much interest. L. chalcedonicum (Turk's Cap) is very showy in its season, especially when arranged in bold groups. L. giganteum, one of the most stately of the lilies, thrives here, and produces tall, finely-developed spikes of its large white flowers. L. Henryi, the beautiful golden yellow, is a valuable addition to the flowering lilies, and grows vigorously and blooms profusely here. L. pardalinum, bright scarlet and apricot, is one of the most attractive of lilies. The spikes often reach 9ft. This species does remarkably well by the side of the water, and succeeds admirably in soil which has had a little peat added to it.

All the liliums delight in deeply cultivated soil, to which has been added plenty of well-rotted cow manure. The manure should, however, not be put so that the bulbs will rest upon it, but lower down, so that the roots will reach it after they have become established, and are busily engaged in search of food. When the ground has been prepared, and the bulbs are ready for planting, take out holes to the depth of 8 or 10in., and put in a little fine material, such as leaf-soil and peat. Also add a little sharp silver sand, and a sprinkling of flowers of sulphur. That latter will help to keep bulbs free from fungoid diseases. Plant the bulbs as soon as received, as it is an advantage to keep them sound and plump, and put them quite six inches deep. During the winter they may have ashes (coal) or a little peat spread over them to keep them safe from frost. Watch the growths in the spring, and then a little more soil may be placed around the growths, or taken away if need be. But it is a wise thing to do to add more, as the material prevents the slugs attacking the succulent shoots. The lilies must be looked to occasionally to see that they are kept free from aphis, which is a troublesome enemy to the new growths. When sufficiently advanced they should be supported by sprays or small sticks, and eventually have some good stout stakes, and be tied with soft string.

Lilies under such conditions as here suggested will be satisfactory for several years. It is necessary to top-dress annually, and supply liquid manure or fork in a little bone-meal occasionally during the summer.

Renewing the bulbs must have attention as soon as the growths show the least signs of weakness. They should be lifted and the ground trenched quite two feet deep, and all roots of trees or shrubs in the vicinity be removed. The soil should be partially renewed with material such as was advised at the initial planting. The bulbs will probably be lower than when planted, but on being replanted they should be given the depth of six inches as previously advised. The largest bulbs should be selected for planting where they are required to flower, but the smaller ones should be put in a nursery bed to gain strength. The planting should be done as soon as the stems have ripened, and some ashes, cocoanut fibre, or peat be placed over the surface.

The usefulness of lilies cannot be over-estimated, as they are most valuable when cut with long stems for the embellishment of the drawing-room or for other home decorations. To those starting lily growing I would strongly advise procuring the best sized bulbs, as small, cheap bulbs often produce unsatisfactory results, which means loss of time and a great disappointment.

W. A. Cook.

THE CAUCASIAN POPPY.

Under the name of Papaver arenarium I received some seedling poppies, which have proved to be different from Papaver arenarium as described in Nicholson's "Dictionary of Gardening," and have turned out to be P. caucasicum, as I once grew it several years ago. The former plants came to me from the late Rev. C. Wolley Dod, and I have no reason to doubt that he was right in sending me these plants as P. caucasicum. That there is some confusion is not to be surprised at, seeing that both P. arenarium and P. caucasicum come from the Caucasus and adjacent regions, and that P. arenarium was described as P. caucasicum by Henning in 1823. But the flowers of P. arenarium are purple, with dark spots, while those of P. caucasicum, as I have it, are of a brick red, deeper than the salmon or terra cotta of P. rupifragum and P. pilosum.

It is, however, a very distinct and beautiful poppy, although my previous experience leads me to consider it biennial, and the inflorescence is so great, and so numerous are the flowers, that one can hardly imagine that such a small plant could bear the strain of flower and seed production to such a degree without injury to its life.

Of my few plants only one has flowered this year. This is on the top of a low wall, and it has thrown out a great stem, some two feet or more long, which has been allowed to hang down, and whose side branches have been thrown up in an erect position. On the branches there are many flowers, but only a few open at a time, so that the flowering period is prolonged. The flowers open out flat, and are about three inches across, and, as already said, are of a brick-red, a somewhat pale brick, it is true.

The foliage and the stems are quite beautiful in their colouring, reminding one, so far as regards hue, of the Horned Poppy, Glaucium luteum, but more of a sea green. The leaves, however, are exceedingly prettily cut, and are highly ornamental in form, as well as delightful in the sea green tone of the leaves and stems, which look like some carved and frosted work.

As already indicated, this poppy is probably biennial or annual, but, as it seeds freely, there ought to be no difficulty experienced in keeping up a succession of plants. It should have a light soil, and, even if it never bloomed, the effect of the leafage is remarkably beautiful.

S. Arnott.

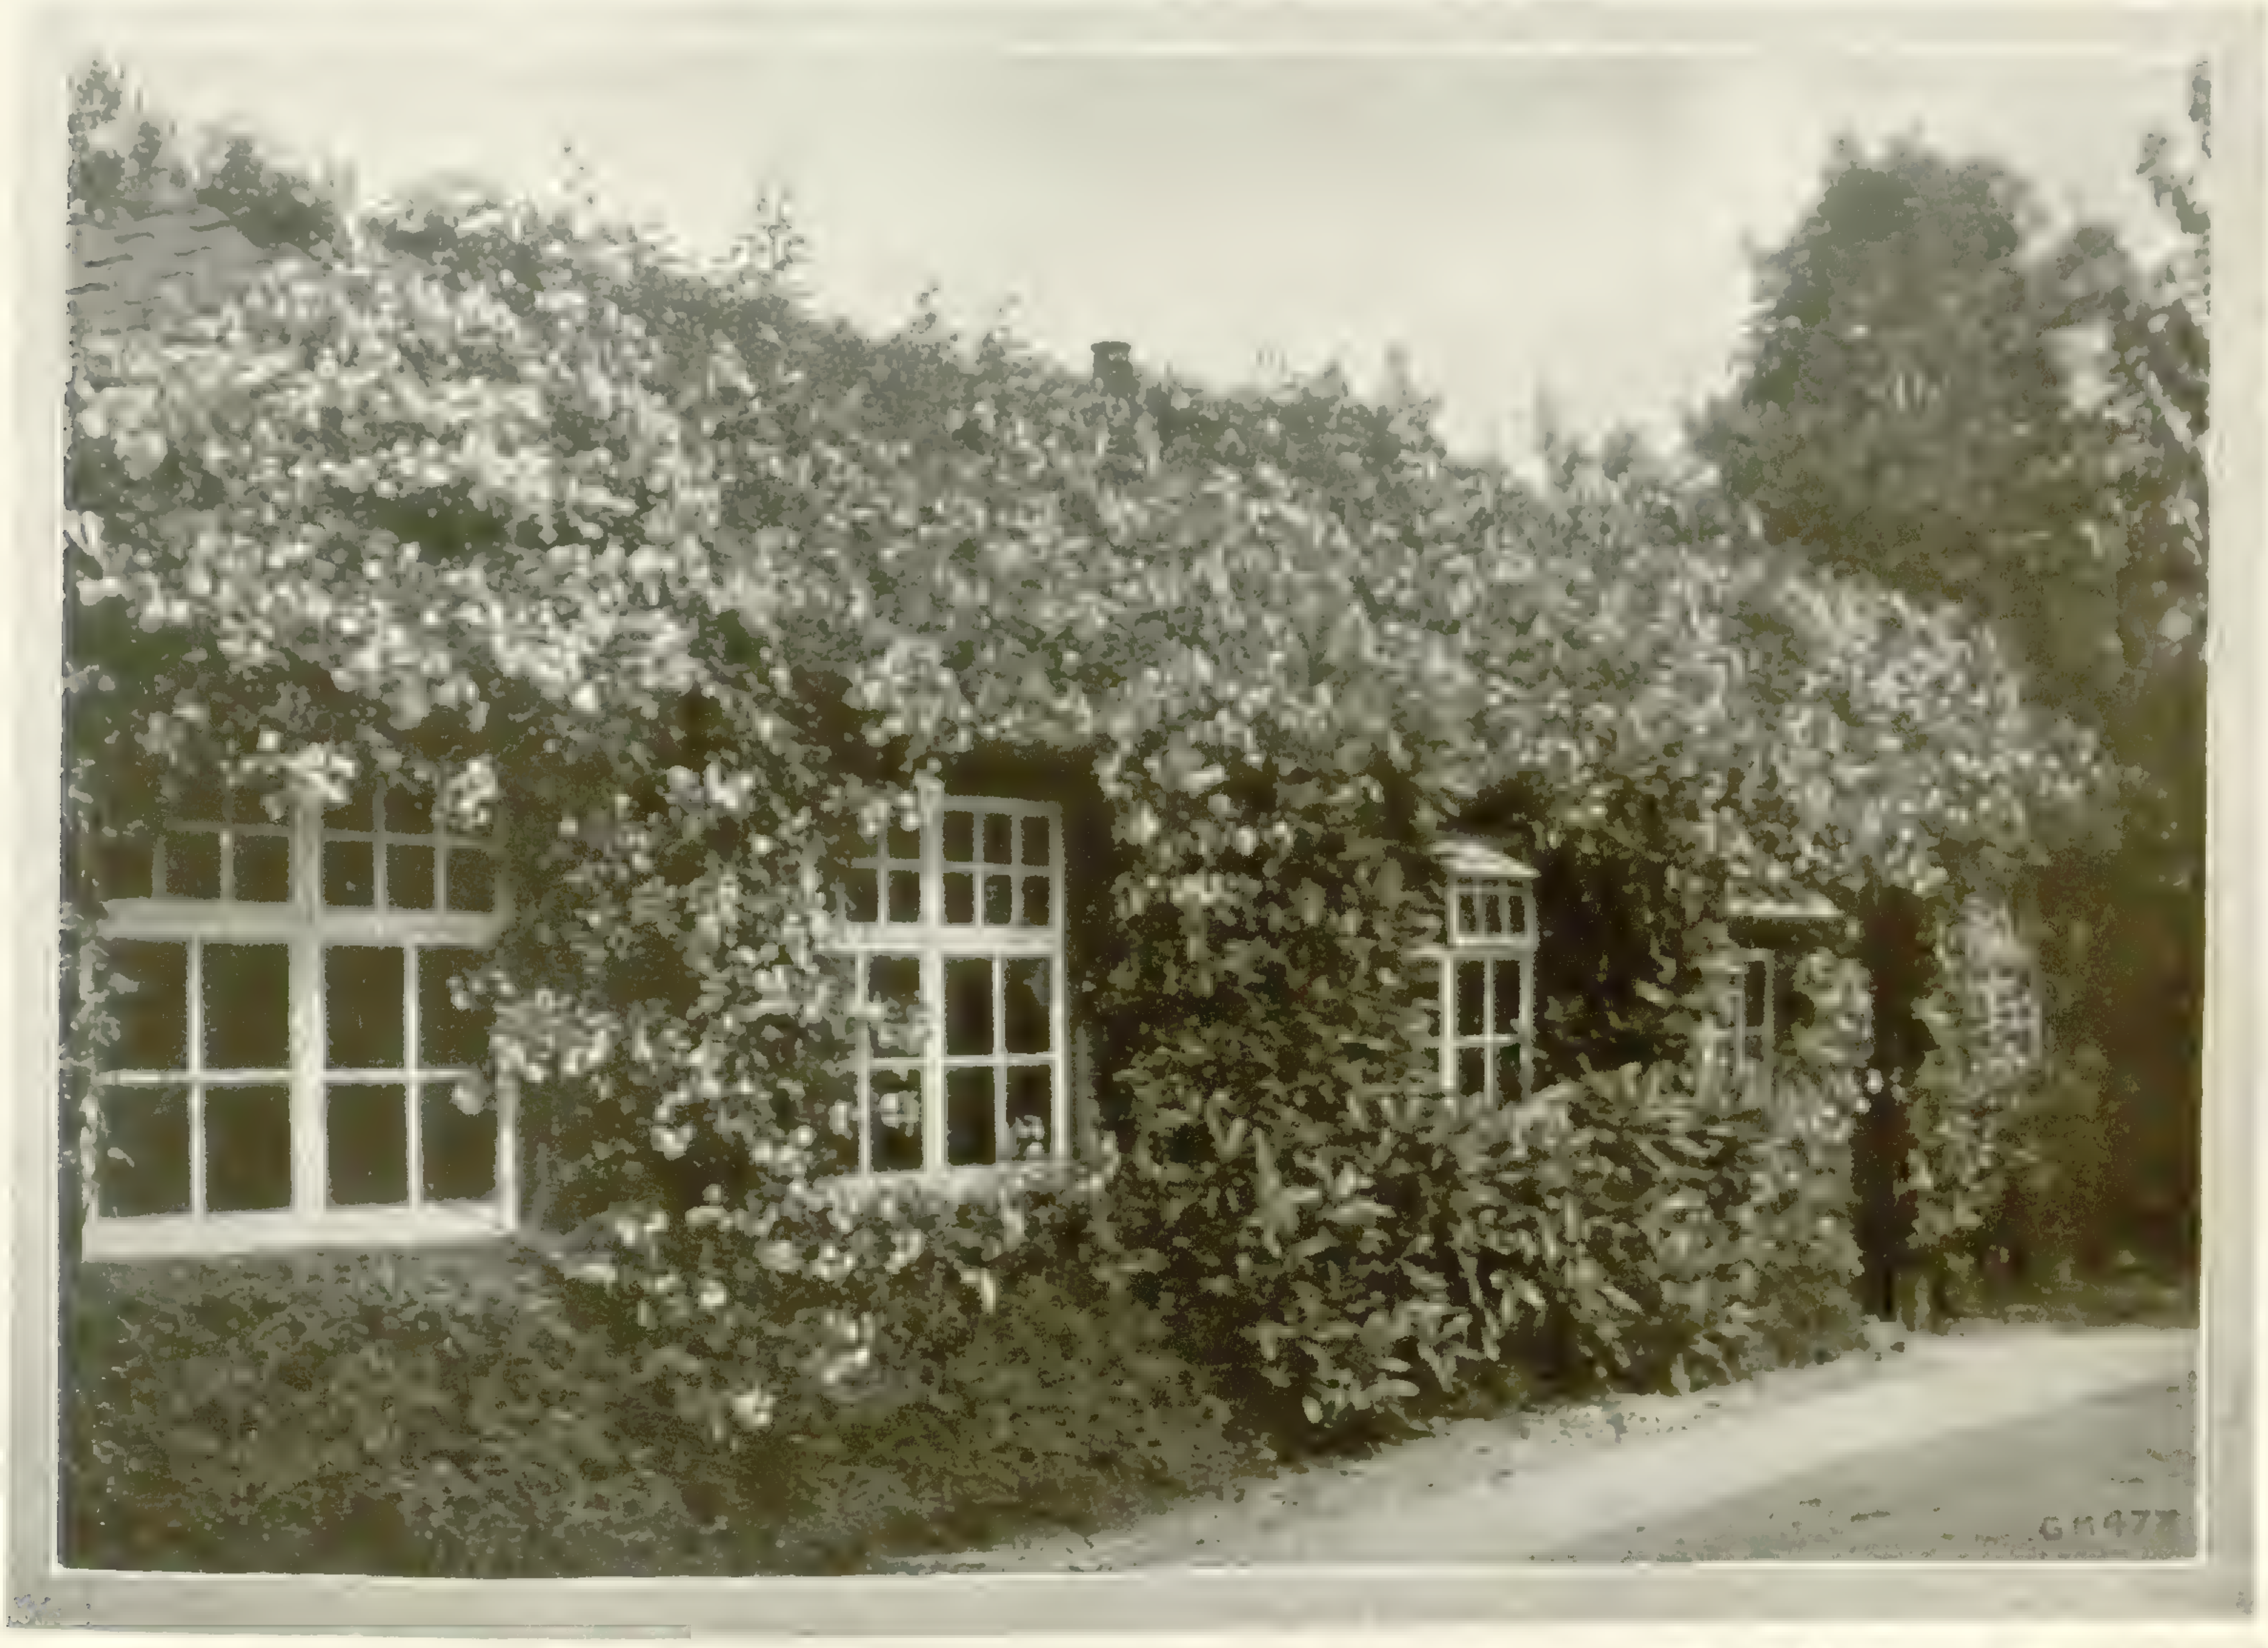
DUNDEE RAMBLER ROSE AT OVERSTRAND.

The attractions of the delightful gardens of The Pleasaunce, Overstrand, are many and varied, and it would be difficult to visit them at any season of the year without finding some feature possessing much interest. The late Lord Battersea had a strong affection for roses, and this affection was shared to the full by Lady Battersea. Consequently when the gardens were being furnished these exquisitely beautiful and fragrant flowers were planted in a lavish manner. Beds and borders were filled with roses, in dwarf and standard form; hedges were formed with them, and pergolas erected for the display of their charms. With so full a representation of the several classes the feast of roses during the summer season is such that one hesitates to refer to it lest it be thought that he is indulging in the use of extravagant language.

With a view to avoid the suggestion of exaggeration I will not do more than say that the display of roses in the gardens of Lady Battersea's marine residence is surpassingly beautiful, and of so varied a character as to afford excellent examples of the various methods by which the several sections can be the most successfully cultivated. I have had the pleasure of enjoying the display of roses on several occasions, and of the various forms in which the roses are grown none have been more interesting to me than the fine examples of Dundee Rambler that have for their support the carpenter's shop, which occupies a position in one of the nooks on the outskirts of the Tudor garden. It must be twelve years since Lord Battersea directed my attention to it as an example of the facility with which a building somewhat unsightly may be converted into an object of beauty, and since then my interest has been in no way abated in the use to which this fine rambling rose has been so successfully put.

There is no occasion to describe the manner in which the building is clothed or to refer to cultural matters. The illustration is a reproduction of a photograph that I had the pleasure of taking at the beginning of July, and from this it will be seen that some of the spaces are filled with Magnolia grandiflora, and that the other parts of the walls and the roof are covered with the growth and flowers of this fine old rose. As a matter of course a certain amount of old wood is removed annually to make way for the new growths in accordance with the practice adopted by the most successful rose growers.

George Gordon.



DUNDEE RAMBLER ROSE TRAINED OVER CARPENTER'S SHOP AT THE PLEASAUNCE, OVERSTRAND.

Rose Madame Eugenie Boullet.—This variety has again been very good this season. It is not a show rose, but one very useful for garden decoration and the supply of cut flowers. Blooms are fairly large, cup-shaped, beautiful in the bud, and when half-expanded the colour is especially attractive. It is described as bright yellow, shaded rose and carmine, but it also shows other shades, and, therefore, is variable in colour. A good grower, with clean, healthy foliage, making it one of the best.—T. H. Slade.

GARDENERS' WAGES.

"Wanted a gardener, married, age about 30; must understand pruning and the growing of fruit and vegetables; nine men kept; wages, 18s., and cottage."

The above advertisement recently appeared in the columns of a weekly paper, and it would appear from the reading of it that the successful applicant for the situation will have the charge and responsibility of an establishment in which nine men are employed, and in return for his labours he will be rewarded with the magnificent stipend of eighteen shilling a week, with a cottage thrown in. Just think of it! Three shillings a day for looking after a place big enough to employ nine men. I wonder if the latter are paid on the same scale.

One may well ask what things are coming to. And what has a man got to do in order to qualify himself for a charge like the above? He begins, we will say, as a garden boy, pot crocking, and the rest, and then goes through the journeyman stage, perhaps serving in several different establishments during this period, and learning the routine of his business. He may have risen to the dignity of a foreman, and at 30 be on the look-out for a head place. What a reward after long years of probationship—eighteen shillings a week and a cottage. Fortunately, instances of such beggarly wages as the stipend offered in the above advertisement are the exception rather than the rule, but the fact nevertheless remains that gardeners are lamentably underpaid, and this, added to the uncertainty of the occupation, prevents parents who have due regard for the welfare of their children putting the latter into it.

Take those gardeners who may be termed fortunate, inasmuch as they are fixed in comfortable situations; generally speaking, they do not bring up their sons in their own occupation if they have any choice in the matter, because they know the uncertainties of the calling and the low remuneration which gardeners are offered. Despite the latter fact, however, gardening is overcrowded, though it is said that really good gardeners are none too plentiful. If this is the case, then the overcrowded state of gardening, and the comparative scarcity of first-class men must be the result of poor prospects and low wages. In these days private gardening does not appeal to parents who are anxious to give their sons a fair start in life, because the prospects are not good enough, but the door is nevertheless open wide, and all sorts and conditions pass through. In other words, there is a good deal of drift in the process of gardener-making, and lads who go into gardens merely for the sake of earning a living, and with no particular ideas about the future, roll on with the stream, and in due course help to swell the overcrowded ranks of gardeners.

By this loose process of gardener-making the standard is lowered, and men who set out early in life to become gardeners, and are fully qualified both as regards capabilities and intellect, are put on a level with the rest, and have to accept the same standard of wages. There are scores of youths today working in gardens who would serve a useful purpose in the world if they remained as labourers, but it is no kindness to them to push them on and make so-called gardeners of them, because they have no particular inclination and little capacity. In short, they are gardeners through sheer force of circumstances, and if the low wage they command is as much as they are worth, infinitely better men are remunerated according to the same standard. It is hoped that the B.G.A. will be the means of altering this state of affairs, but so long as the present loose and unsystematic method of making gardeners continues, overcrowding and low wages are inevitable. H.

PLANTS AND THE DROUGHT

In this locality the present summer has been exceptionally dry, less rain having fallen for the first seven months of the year than in any season except 1902, when the fall was about an inch below that of the present year. Up to the present the fall has been: January, 1.70 inches; February, 2.29 inches; March, 3.48 inches; April, 3.12 inches; May, 2.11 inches; June, .90 of an inch; July, 1.90 inches. In June .58 of an inch out of the total fall of .90 fell on the 2nd, so that for the remainder of the month only about a quarter of an inch fell, and from June 17 to July 10, a period of twenty-three days, not a drop of rain fell. In July rain fell on the 10th, 11th, 12th, 13th, 14th, 16th, 17th, 18th, 19th, and 20th, but mostly in small quantities, and from the 20th until the date of writing, August 20, a period of thirty-one days, there has been practically no rain, only a shower, in which .02 was measured, having fallen. In all probability there will be a drenching September, a contrast to last season, when September was the finest month in the year, absolutely dry and sunny, after a dark and damp summer.

The plants have suffered intensely from the long-continued droughts, many perfectly hardy ones having perished. In this dry and stony soil, with its very steep slope, heavy rain is needed at least once a week to keep the soil in good condition. Aster grandiflorus died in the July drought, as did all the plants of the Foam Flower, Tiarella cordifolia. In the drought that we are at present experiencing Campanula abietina has succumbed, and many other plants are in wretched condition. The mossy saxifrages, such as S. Wallacei and others, are brown tufts; the double arabis has its entire foliage wilted, and hanging limp, and even the hartstongue ferns in the hedgerow are flaccid.

In periods of prolonged drought a thorough watering of every plant in the garden is the ideal one would wish to attain, but this is, of course, impossible, and a sprinkling of water is worse than none at all. Where water is given at all it must be a thorough soaking. In most gardens systematic watering has to be confined to a few plants, and that is the case here. A large specimen of Veronica Hulkeana against a wall is well syringed every evening, as is the clianthus, both red and white; Lonicera Hildebrandiana, which is flowering finely; Berberidopsis corallina, Mutisia decurrens, Brachysema acuminata, Sollya heterophylla, and lapagerias. The Shamrock Pea, Parochetus communis, and Ourisia coccinea are well watered every other night. Among shrubs and plants that have shown the effect of the lasting drought are Clethra arborea, Callistemon salignus, and Salvia azurea grandiflora, better known as S. Pitcheri. South African plants, as a rule, do not appear the least distressed by the weather conditions, Bowkeria Gerardiana and Leonotis Leonurus being in the best of health. However much trouble is taken in watering, it has not the effect of rain, and it is to be hoped that a good downpour is not far off.

[Publication unavoidably delayed.—Ed.]

PROFIT FROM VACANT LAND.

Generous provision of land for ornamental purposes and recreation is now ensured in most large cities, and the Metropolis is particularly fortunate in having several public bodies concerned in this important work, which they perform in an admirable manner. To a limited extent land is also provided for cultivation around London as allotments, but this is mainly for those in full employment or who can afford to bear the expenses of rent, cultivation, and cropping.

Beyond these there is a considerable section of the community—the partially employed—for whom, hitherto, there has been no cultivable land available within their means and opportunities. A large proportion of such men deserve both sympathy and aid; they are often struggling bravely against adverse circumstances caused by ill-health, advancing age, or other difficulties; and every help rendered in these cases is a service to the community, assisting to maintain the independence of worthy members and reducing the demand upon ratepayers.

Here is, indeed, a great and important sphere of work, and it is the purpose of the Vacant Land Cultivation Society to render substantial help in the direction indicated. This society is being developed upon the plan initiated in the United States where highly gratifying success has been achieved in Philadelphia, New York, Cleveland, and other large cities. The loan of vacant land is secured from private owners or public bodies, and this is divided into plots which are let free of rent, rates, and taxes, to men in partial employment. These are required to cultivate and crop the land with vegetables to the best advantage, and they are assisted by the society in attaining that object. The whole of the produce is the property of the men for home use or sale, and no contribution is exacted from them in any way.

With industry, and under expert direction, very satisfactory results can be obtained, and the advantages to the cultivators are threefold. First, physical, as the men are greatly benefited by working in the open air, especially those suffering from lung troubles. Secondly, moral, for the men are encouraged to find pleasure in useful work, and learn the advantage of performing it thoroughly. This means a decrease of street-corner loafers and a lessening of wasted time in other ways on unoccupied days. Thirdly, there is a material benefit. A well-cropped plot of 20 square rods, or, say, one-eighth of an acre, can be made to yield a useful supply of vegetables over a great part of the year, thus reducing home expenses and ensuring that fresh, wholesome garden produce forms an essential part of the daily diet--a benefit to the whole family.

By the sale of the produce, from £3 to £5 has been had from a plot of the size named. This is no fanciful estimate, it has been repeatedly accomplished and even greatly exceeded in some places. The amount is not large, but only those who have experienced the hardships of life can realise what it means to a poorly-paid man with a family.

It will be gathered from the foregoing that the Vacant Land Cultivation Society has undertaken a work that must prove helpful to thousands in and around the Metropolis. It should also prove a public good, and assist in preventing the pauperising of many deserving men and their families. The society therefore earnestly appeals for support to all who are anxious to better the conditions of the less fortunate members of society who are really striving to help themselves in a legitimate way. The funds required are moderate in amount, as the expenses are reduced to a minimum. In the laying out of public ornamental gardens from £200 to £300 per acre has been expended in London, and the cost of maintenance is in some instances as much as £100 per acre per annum. The expense of the work performed by the Vacant Land Cultivation Society, even when dealing with most unfavourable land, would not exceed £15 per acre, and in most cases it will be under £10, for the preparation, manuring, and stocking of the land, while the annual expense per acre will be almost nominal when the whole scheme is fully developed.

If funds permitted it might be possible to include the unemployed who were fitted for the work within the scope of the society, as payment could be made for labour expended upon cultivating portions of the land commercially, the society selling the produce to reimburse it for the outlay.

At present the land held by the society comprises about two acres at High Street, Fulham, lent by the London County Council; seven acres at Townmead Road, Fulham; and 17 acres at Canning Town, the two latter being lent by the Gas Light and Coke Company. Upon these tracts some 200 plots have been marked out and the whole are already in course of cultivation, while other offers of land are receiving consideration.

Applications for further information, offers of land, seeds, or plants, and contributions to the funds (which are much needed), should be addressed to the office of the society, 39, Wilson Street, E.C.

R. Lewis Castle.

CAMPANULA PUNCTATA.

This campanula has a wide range, being a native of Siberia, and being also found in China, Japan, and Corea. It is an old inhabitant of our gardens, but is seldom met with, a rather surprising fact when its ornamental properties are considered. When in good health it is a vigorous perennial, about 2ft. in height, with large, hairy, cordate-ovate leaves. Its flowers are bell-shaped and drooping, and fully 2in. in length. As a rule the blossoms are white, and are spotted internally with minute purple dots. In some cases, however, the flowers are of a delicate rose-tint, and in others violet. The white form is, however, the commonest, and is, perhaps, the handsomest, for large clumps, over 3ft. across, such as that depicted in the accompanying illustration, when covered with hundreds of their large pendent white bells, are as attractive border plants as can well be imagined. In the shape of its flowers it bears a strong resemblance to the hybrids C. Burghalti and C. Van Houttei. If it shows signs of failing health it should be lifted and replanted in rich porous compost. The colony here shown, however, has been in its present position for three years, and shows no sign of loss of vigour. S. W. Fitzherbert.

Root Pruning of Fruit Trees.—No amount of summer or winter pruning of fruit trees is of any avail in correcting unfruitfulness unless root pruning is systematically attended to. Planted out trees in the orchard house should receive first attention, continuing the operation with early and midseason varieties in the open, leaving late varieties to be treated in November. Where the work is carefully ordered only a percentage will require root pruning in any one season.—Thomas Smith, Walmsgate Gardens.

THE SPOTTED BELL FLOWER (CAMPANULA PUNCTATA).

Flowers white or rose colour, spotted on the inner side with purple.

DRAINAGE AND WATER SUPPLY.

The draining of surplus water from the land may be considered the very foundation of good cultivation. It will avail little to have at command a plentiful supply of skilled labour and an abundance of manure if the land be wet and cold through imperfect drainage. Better crops may be obtained than if the supply of labour and manure were less, but nothing like an adequate return from this two-fold expenditure can be obtained while this first operation of good tillage is neglected.

It cannot be too often stated that air and warmth are essential to the life of a plant, and must be regulated to the roots as well as to the top. If the soil be loaded with water there will be a water monopoly, and air, with its attendant warmth, becomes excluded, the process of converting food into a usable form is stopped, and the growth of the plant is brought to a standstill. Some soils have sufficient natural drainage, and expense is thereby spared.

If the subsoil be of a heavy clay texture water cannot freely pass through, and it therefore remains in the upper layer of soil. If, on the other hand, the subsoil be gravelly, the water will pass through and leave the top soil amenable to the beneficial influences of air and warmth.

There are many methods of drainage, but no one method can be pointed out as being the best under all circumstances, for the class of soil material at hand, declivity, amount of capital and labour at command have all to be taken into consideration.

Once the contour of the land is found the position and direction of the main drain can be decided on. This, of course, must be larger than the others, just as a river is larger than its tributaries. A splendid object lesson in drainage is the study of a river as shown on a map, or, when possible, on the land, itself. The water will be found always to follow the line of least resistance, and take the lowest path. Ponds, rivulets, streams, brooks, and rivers are valuable means of draining the land in a natural manner. But they only partly do the work. Ours is to further feed these streams and rivers.

The main drains having been duly mapped out, there arises a question relative to the depth and distance apart of the secondary drains. If the subsoil be of a close, impervious texture, it is evident that the drains will need to be nearer the surface and nearer to each other. In a light sandy soil they could be 2½ft. deep and 20 to 30ft. apart. The figures for a clayey soil would be 1½ft.—2ft. deep, and 10 to 15ft. apart. The main drain may, with advantage, be somewhat deeper than its tributaries.

Earthworms play a part in the drainage of the soil. By their repeated excavations the water passes more readily through the soil. It is a mistake to regard these creatures as garden enemies, for, besides this method of drainage, there stands to their credit the conversion of mould into available plant food. That they are a nuisance in pot plants and on lawns is undeniable, but in the latter case their castings can easily be scattered with a birch broom.

The tile drain is the most common form, and should, preferably, be egg-shaped, with the smaller end downwards, and, of course, it should be level and quite straight. Two and three-inch pipes will be found sufficiently large for ordinary drainage, with the main somewhat larger. The tributaries should be so arranged that they strike the main at an angle less than a right angle.

Other forms of drains are stone drains,

brick drains, rubble drains, sand drains, and open ditches. The open drain may be dismissed from our consideration as being obsolete. Unless ample material is at hand stone drains are very expensive. They may be made in the form of a square, or of a triangle. Bricks may be formed into a box drain, but the question of expense usually debars their use. Rubble drains need not be despised by small cultivators. Brickbats and clinkers are eminently suitable for the purpose. There should be six inches of rubble, and this should be covered over with turf to prevent the fine soil from filtering into it and proving an obstruction. Sand drains have been recommended, and would probably prove useful. An implement has been made that will take out the trench for a drain and deposit several inches of sand at the bottom. It is an interesting experiment, but has not been sufficiently tried to merit confident recommendation. Badly-built drains will certainly not prove economical. Either they will have to be relaid or the effect will be seen on the crops.

The question of water supply is so intimately associated with tillage that I need not apologise for coupling it with drainage. Wherever there is a garden a plentiful supply of water becomes a necessity. Success in growing cannot be maintained unless there is a plentiful supply of water available during times of drought. Many plants will continue to grow during a drought, and even be useful afterwards, but such a check is one from which they seldom wholly recover. The water supply is before all things a local question. A few general hints may, however, be advantageously given. Where the garden is on a slope there is no difficulty in distributing the water once it can be got to the highest point, for we have but to take advantage of the law of gravitation. To get it to the highest point a ram or a wind pump may be needed. In such a case a large store tank should form the basis of distribution by gravitation. The larger the tank the greater the supply that may be had in reserve.

A well-watered garden is one every part of which can be supplied with water at a minimum expenditure of power and labour. If by mechanical means a sufficiency of water can be conveyed to the land there should be no great difficulty in distributing it. The expenditure of capital in this respect will bear considerably interest in the saving of labour, and the better health of the crops. To have a plentiful supply and an inadequate distribution betrays a misconception of the true meaning of economy. By the free arrangemen of tubs and taps, and the means of fastening to the taps lengths of hose piping, there need be no difficulty in conveying water readily to all parts of the garden. Where an adequate supply cannot be arranged the crops should be so regulated that those standing in most need of much water are nearest the supply, and those able to shift for themselves farthest away. When we consider the quantity of rain water which goes to waste during heavy showers it is sad to think that so little effort is made to collect it for use during a dry season. Wherever there are buildings a splendid opportunity presents itself of catching many hundreds of gallons of water by running along the eaves a length of house piping, and arranging, by means of tubs and tanks, for a large supply during a drought. By the use of a few pipes much of the water so saved can be distributed to various parts of the garden by the accommodating power of gravitation. WILLIAM F. ROWLES.

INSECTIVOROUS PLANTS.

By Charles Darwin, M.A., F.R.S. Revised by Francis Darwin, M.A., F.R.S.

Although this important work by the late Charles Darwin was published thirty-three years ago, it has lost none of its freshness or interest, and the revision by Mr. Francis Darwin places the reader in possession of the results of the investigations that have been made by other scientists since the author concluded his experiments and inquiries. Hence the publication of a cheap edition that leaves nothing to be desired as regards paper, printing, and binding is a matter of considerable moment to those who take an active interest in plant physiology and cannot well afford the work in its more expensive form.

In the course of the summer of 1860, or some fifteen years before the publication of the original work, Charles Darwin was much surprised to find how large was the number of insects that were caught by the leaves of the common Sundew (Drosera rotundifolia) growing on a heath in Sussex. He had heard that insects were thus caught, but knew nothing further on the subject. He gathered by chance a dozen plants, bearing fifty-six fully-expanded leaves, and to thirty-one of these dead insects or remnants of leaves adhered. On one plant all six leaves had caught their prey, and on several plants the largest leaves had caught more than a single insect, one had the remains of thirteen insects adhering to it. The largest insect that Darwin had seen caught was a small butterfly, but a correspondent informed him that he found a living dragon fly with its body firmly held by two leaves. It soon became evident that drosera was well adapted for the special purpose; the subject greatly interested the author, and during the next thirteen or fourteen years he devoted a large share of his attention to its investigation. The results, as well known, were highly remarkable, those of special importance being—the great sensitiveness of the glands to slight pressure and to minute doses of certain nitrogenous fluids, as shown by the movements of the so-called hairs, or tentacles; the power possessed by the leaves of rendering soluble or digesting nitrogenous substances, and of afterwards absorbing them; and the changes in the cells of the tentacles when the glands are excited in various ways. Mr. Darwin also investigated several other species of drosera, namely D. anglica, D. intermedia, D. capenses, D. spathulata, D. filiformis, and D. binata, and the description of his experiments with the several species extends over twelve chapters, which occupy 230 pages.

The other plants that were investigated with a view to determine their powers of movement, their capability for catching insects, and their digestive powers,included the Venus' Fly-trap (Dionæa muscipula), which from the rapidity and force of its movements is described by Darwin as one of the most wonderful plants in the world; Aldrovanda vesciculosa, which may be called a miniature dionæa; Drosophyllum lusitanicum, a rare plant growing freely in Portugal and Morocco, and so attractive to flies that it is known among the villagers near Oporto as "the fly-catcher," and is suspended in the cottages for this purpose. Pinguicula vulgaris, a native plant, with attractive flowers, and several species of Utricularia, a genus of aquatics furnished with bladders that serve the purpose of capturing small aquatic animals which are utilised in the nutrition of the plants.

We need not say that this, like other of Darwin's works,is written in an entertaining style, but we would suggest that young gardeners and others who are desirous of becoming acquainted with the methods by which insectivorous plants capture their prey and assimilate their nutrient properties should take advantage of the publication of this cheap issue to study Darwin's investigations first hand.

BULBS AND THEIR CULTIVATION.

By T. W. Sanders, F.L.S. (W. H. and L. Collingridge, 148 and 149, Aldersgate Street, E.C.) Price, 2s. 6d.

An admirable book, at once comprehensive and inexpensive, on the cultivation of bulbous and tuberous-rooted plants. Hardy, half-hardy, and tender bulbs and tubers receive a full share of attention, and the various methods by which the several kinds can be utilised in beautifying the home, the conservatory, and the garden are fully described. The description of the several kinds is ample, the cultural directions are full and explicit, and the selections given will save the reader from perplexity when making purchases.

THE FRENCH GARDEN.

By C. D. McKay, F.R.H.S. ("Daily Mail," London, E.C.). Price 6d.

For some years past Mr. McKay has taken special interest in the question of intensive culture as represented in the French market gardens, and towards the end of 1904 he urged upon the market gardeners in the Evesham district to visit the market gardens around Paris, with a view to the introduction to this country of the methods of culture adopted therein. He was so far successful that in the following year a party of market gardeners visited France, and, it may be added, were much impressed with what they saw. With a view to further assist in disseminating a knowledge of the practice that obtains among French cultivators, Mr. McKay has written this book, and issued it in an inexpensive form. The information given is clear and concise, and free from exaggerated statements with regard to profits.

ALPINE PLANTS

By W. A. Clark, F.R.H.S. (L. Upcott Gill, Bazaar Buildings, Drury Lane, London.) Price, 3s. 6d. net.

An admirably arranged and clearly written book on the cultivation of alpines which has attained to a high degree of popularity, as evidenced by the fact that it has passed through two editions. The cultivation of several hundred of the finest of the rock plants is fully described, and there are selections arranged according to the positions for which they are specially adapted. There is also a chapter on small rock gardens, which is especially deserving of the attention of those desirous of entering on the cultivation of alpine plants in gardens of limited dimensions.

THE BOOK OF FERN CULTURE.

By Alfred Hemsley, F.R.H.S. (John Lane, The Bodley Head, London.) Price, 2s. 6d.

As in the case of the other handbooks on gardening published by Mr. John Lane, this is essentially practical, and is wholly devoted to such matters as the cultivator who would achieve success must give his closest attention. The author is well known for his knowledge of ferns and fern culture, and those who take him for their guide will have good reason to be satisfied with their choice. More space should have been devoted to British ferns, and we hope this will be done in a second edition.

ELEMENTARY BOTANY

By M. A. Liversidge. (Blackie and Son, 50, Old Bailey, London.) Price, 1s. 6d.

An excellent class-book of elementary botany, specially adapted to the requirements of the middle and lower forms of secondary schools. It covers the syllabus of work for the Oxford and Cambridge Junior Local Examinations, the subject matter is clear and well arranged, and the illustrations are numerous and of excellent quality, and well adapted to the elucidation of the text.

THE GENUS CISTUS.

Thanks to the increased attention that is being devoted to hardy subjects, these beautiful shrubs have of late years become a prominent feature in many gardens. The numerous records of failure, loss in winter, and complaint that the plants were tender and not fit subjects to withstand our trying climate, in years gone by, could often be traced to their being transferred to permanent quarters late in the autumn, or to their having been placed in a shady position for some weeks or months. We now recognise the fact that excessive moisture about the roots and in the atmosphere does infinitely more harm than a very low temperature, and since care has been exercised to select suitable sites, the losses are few indeed.

One of the principal points that demand attention in their cultivation is the selection of a site in which they will receive the fullest possible exposure to the sun. Another point is to guard against planting in a soil that is retentive of moisture in winter. There is really no excuse for failing to provide the situation and soil essential to their free development, as no great amount of labour is necessary to secure ample drainage for heavy ground and adding a fair amount of porous and sandy soil.

The dwarf kinds are not, in my opinion, half so beautiful, or appear to be so much at home as when luxuriating on the most sunny and exposed positions in the rock garden. Therefore, amateurs generally cannot do better than utilise them in this way, and some of the species of tall growth may be arranged to furnish the background. Previous to planting the various kinds, some consideration must be given to the growth of the plants that will be their near neighbours for the purpose of guarding against their being overcrowded.

Probably C. laurifolius may claim to possess the most robust constitution, and to be the hardiest of the genus, and it has been known to our gardens since the 17th century.

C. maculatus is very beautiful and distinct.

C. ladaniferus is known as the Gum Cistus, and more frequently met with than any other species, and is a handsome shrub of comparatively strong growth.

C. ladaniferus maculatus has white petals, with crimson spots at the base.

C. obtusifolius has white petals, with yellow base.

C. villosus has reddish-purple petals, and is synomymous with incanus and undulatus, while C. albidus is a very attractive species with purple flowers, the petals yellow at the base.

Much better plants are obtained from seeds than from cuttings, and the seeds germinate freely enough in an unheated frame, and seedlings may be expected to make their appearance in about five weeks from the date of sowing, and require careful treatment in their young stages. A good practice is to put them in [illegible] pots, and later shifted into 48's, when they may be plunged in the open, or reserve garden until November. During the winter they should have the protection of a frame. It is unadvisable to place them in their permanent quarters until the following spring. Cuttings may be rooted in a propagating case placed in a warm house or under a bell-glass in the greenhouse. Early in the spring and the beginning of the autumn are good times for proceeding with the work of rooting cut-

Walter H. Aggett.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

SUMMER - FLOWERING CYPRIPEDIUMS.—The plants of C. Lawrenceanum, C. L. Hyeanum, C. Curtisi, C. callosum, C. c. Sanderæ, and other kinds, which flower in the late spring and summer months, that have not already been attended to in the matter of repotting, should now be seen to without delay. They are both growing and rooting freely at the present season, and are thus in the best condition for repotting. When they can be induced to become re-established with the least possibly delay there is little danger of their receiving a check from the effects of disturbance at the roots. Practically all the above-mentioned kinds and allied species are what may be termed surface or shallow rooting kinds, and it is advisable to provide drainage in the pots accordingly. The pots should be clean and filled at least from one-half to two-thirds of their depth with clean drainage. The potting compost we find suitable consists of about equal portions of peat and fibrous turfy loam, some chopped sphagnum, and sand or finely broken crocks may be added in sufficient proportion to render the compost porous. This compost should be made firm, but not hard. It is a good plan to water them, using rain water, immediately repotting is completed. Sufficient water should be given to wet the compost through. Shade from excessive sunlight for a few days after repotting, and maintain a humid atmosphere.

INCREASING THE STOCK, whether of choicer varieties or the ordinary forms, should have attention. It is desirable to produce more stock where necessary, and to increase the size of the specimens when possible. If we examine any of the above-mentioned kinds when they first reach this country in an imported state, we find that there is distinct tracings of a long succession of annual growths, with no attempt whatever to produce back breaks, unless some injury has befallen the leading growth. Then we have nature inducing one or more lateral growths to break from the base, and make good the deficiency. Plants under cultivation do not always behave the same as those growing naturally, as the attention they receive has a tendency to increase the normal vigour of the plants, and two or more growths may be found advancing together from the same leads. But even the back growths of some years standing, that have retained their foliage, are quite capable of producing breaks, or new growths from their base, but they rarely do so unless the rhizome connecting the growths has been severed. It is not a bad plan to examine the plants some time previously to their being repotted, and to cut through the rhizomes between the growths with a sharp knife. If done in this way any active roots that may still be attached to the severed growths will naturally be of some assistance to aid the development of new growth, and where such growths appear they may be either removed to make stock, or retained to increase the size of the specimen at the potting season. The back growths I consider are of no advantage to the plants, and should be removed at the potting time if there are no good roots attached. Where they are taken off in this way they may be potted up in small pots, using plenty of chopped sphagnum moss and sand in the potting compost, and placing the plants in a warm, moist position.—H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

HERBACEOUS CALCEOLARIAS.—Many of these are still in small pots, and they should now be examined, and any becoming pot-bound should be potted. A fairly rich soil suits them well, such as good sound loam with plenty of silver sand, and about one-sixth of the bulk should consist of dry cow manure rubbed through a sieve. Where the latter is not at hand decayed horse droppings form a good substitute. The shift should not be a large one at this time of the year, and the plants should be potted firmly. Calceolarias abhor fire-heat, so where it is possible keep them in cold frames all the winter, matting them up when the weather is severe. They like moist surroundings, and never do better than when the leaves have beads of moisture on them when the frame is opened for the day.

TUBEROSES.—The African bulbs are now coming to hand, and may be potted singly in 4½ inch pots, or three in a 6 inch pot. They do best in a compost of fibrous loam and leaf-soil, with sufficient sand to keep the soil porous. The compost should be used in a moist condition, and no water will be necessary at present. Plunge the pots in cocoanut-fibre refuse with a bottom heat of about 65 degrees or 70 degrees, and cover the bulbs with flower pots. The American tuberoses come to hand in December and January.

NERINES.—The flower spikes are now

HOARY-LEAVED ROCK ROSE (CISTUS ALBIDUS).

Flowers pale purple with yellow centre.

showing themselves, and a light feeding should be given. Give water with great care or disaster will soon follow. When in full flower nerines are among the most beautiful of greenhouse bulbous plants, and flowering as they do during autumn and winter, they deserve to be more largely grown. Nerine Fothergilli and Fothergilli major are the most useful.

FERNS.—At this season less atmospheric moisture must be given, and all dead and decaying fronds be regularly removed. Allow plenty of space between the plants, as this will keep damping of the fronds in check. Plants that have been growing all the season, and have their pots well filled with roots, should be given a stimulant.

CHRYSANTHEMUMS.—Plants cultivated to produce large flowers will now be full of interest, and each bud and bloom will be watched with keenest anxiety. No insect pest must be allowed to lurk among the blooms. Green-fly is perhaps about the most troublesome of all when once allowed to establish itself among the petals, as when it obtains a foothold it is difficult to eradicate, and, not only so, but seldom is the flower worth much, as it will lack colour and freshness. Thrips are also responsible for many badly-finished flowers, but these little creatures, being so minute, are often overlooked. Frequent light fumigations must be persisted in.

SHADING MATERIALS.—Sunshine is not now sufficiently strong to injure plant life under glass, and the removal of shading should at once be undertaken. Select a day when the material is quite dry, and store the blinds in proper order; this will save time and confusion when they are again in request.

ROMAN HYACINTHS.—The ease with which these can be brought into flower, well in advance of any other forced bulbous plant, makes them of great value. An essential point to success in their cultivation is that the bulbs shall have been potted up sufficiently long to have practically filled their pots with roots before they are removed from under the ashes or other material with which they have been covered, and taken into heat. Given this, the rest is easy, and there is no fear but what good flowers may be had at an early date, but to remove and attempt to force them before strong root action has been set up will result in failure. Bulbs potted in August have already formed a network of roots round the pots, and these may at once be started. After removing them from the ashes it is best to give them a day or two in a cold frame until the crowns become green, then they may be taken into a house or pit with an intermediate temperature. Stronger heat may be given when the flowers commence to open, if it is thought desirable to draw the spikes out. The lower temperature will produce shorter spikes, with flowers of greater substance and lasting power. Very little water will be needed to begin with, but the syringe may be freely used with advantage until the flowers develop.—T. B. FIELD, Ashwellthorpe Gardens.

THE FLOWER GARDEN.

CLEARING AND REPLANTING BEDS.—Continue to remove summer bedders, and refill or prepare the beds for winter. The sooner this is now completed the better will be the results in winter and spring. Probably if the weather continues mild a few things may still be bright, yet it is but waning glory, and, all things considered, it is best not to wait until every flower has disappeared before replanting.

LAWNS.—The recent warm weather has given grass quite an impetus after the previous heavy rains and low temperature, and the mowing of lawns must be attended to. It may be advisable to mow grass much later than usual. Grass left unduly long gives an untidy appearance to the lawns throughout the winter. Defects in lawns will be noticeable, and this is a good time to remove them. In many cases a dressing of basic slag may be applied with advantage.

COLLECTING LEAVES.—As leaves fall have them collected and carted away. If allowed to remain either as they fall or in heaps, they will soon weaken or disfigure the grass, especially if shade has been at all dense. Continue to sweep and collect leaves from all walks and drives; if allowed to remain they not only become unsightly, but are trodden or pressed into the gravel, and if there is a considerable amount of traffic they discolour and spoil the appearance of the surface.

AUTUMN PLANTING of trees and shrubs should now be proceeded with. If a screen of trees or shrubs is at once wanted, permanent ones should be first arranged at suitable distances apart, and the intervening spaces be filled with cheaper or common subjects, to be afterwards removed as required. With the wealth of beautiful foliage and flowering shrubs at command none but those really good should be planted. Far too many shrubberies consist of the commonest and least beautiful kinds only. Due consideration should be paid to autumn effects.

EARLY CHRYSANTHEMUMS.—As these pass out of bloom old stems should be removed. Also decide what varieties to retain and what fresh ones to add next season. In most cases old chrysanthemums will live outside throughout the winter, but where it is known that they suffer, either protect them where they are growing or lift them and store close together in a quite cold frame.

DAHLIAS.—Should frost disfigure these they should be cut quite down, and, on a fine bright day, be lifted and left on the ground a few hours to dry before taking them into store for winter. If the tubers are turned bottom upwards they will dry better, and also allow any moisture in the hollow stems to drain away. Cannas that are still out can be treated in a similar way. In storing roots a little quite dry soil should be placed round them, unless the store is unduly damp, when they are best without it; almost any cool, dry, frost-proof place, not necessarily dark, is suitable for the storage of dahlias and cannas.

PAMPAS GRASS.—Where the plumes of the pampas grass and arundo are used for decoration during winter they should now be cut and taken indoors. If not already fully open they will soon expand if held a short distance from a gentle fire, of course, guarding against too close a contact. The stems of Physalis Franchetti and P. Alkekengi are also useful for winter decoration if cut when the outer envelope of the fruits is of a good colour, and hung up in a light airy place to dry.—E. F. HAZELTON, Knowsley Gardens.

HARDY FRUITS.

APPLES.—The time for planting fruit trees will soon be at hand, so that no time should be lost in making a careful selection of the most suitable varieties. Apples are very numerous, and amongst them are kinds which, if carefully planted, will be suitable, and seldom fail to crop in the more unfavourable climates. With regard to standards, the following will be found good varieties to plant: Dessert.—Irish Peach, Worcester Pearmain, Lady Sudeley, James Grieve, Ribston Pippin, Summer Golden Pippin, Cox's Orange Pippin, King of the Pippins, Baumann's Red Winter Reinette, Allington Pippin, Cox's Pomona, Scarlet Nonpareil, Duke of Devonshire, and Sturmer Pippin. Kitchen apples of special excellence comprise Lord Grosvenor, Lord Derby, Golden Noble, Warner's King, Bismarck, Blenheim Pippin, Lane's Prince Albert, Tower of Glamis, Bramley's Seedling, Dumelow's, Northern Greening, Newton Wonder. There are many other varieties good for the different purposes, and in certain districts yield heavy crops of excellent fruits. Where planting has to be done on a large scale the land ought to be in readiness for the trees so soon as they arrive from the nursery, remembering that with most large firms the orders are executed in rotation, hence the necessity for early ordering. All planting if possible, ought to be taken in hand and finished before frosty weather sets in, as the early autumn-planted trees usually start away freely the following spring, and make rapid progress the first season. On the other hand, those planted late in spring make but little growth, and especially should the weather prove very dry, and watering be neglected, which sometimes is the case when other work is very pressing.

PREPARING FOR PLANTING.—If the land to be planted is under grass (where the fruits generally attain better colour), remove from six to eight feet square of the turf where the trees are to be planted. Throw out the top spit, and break up the subsoil to the depth of two and a-half to three feet. If the soil is poor and unsuitable it should be carted away, and replaced with a better and more suitable compost; otherwise the bottom soil may be ameliorated by mixing road scrapings, wood ashes, and well-decayed manure. When planting trees it is most essential to have the drainage good, so that the water may pass away freely. A layer of brickbats, stone, or old lime rubble will also be favourable to the future growth. It should be made firm before placing turves over it and filling up the stations. Some prefer trenching the whole of the land before planting, which is probably a very good practice if the plot is not extensive, but the cost and labour would be too heavy when planting on a large scale.

DISTANCE AT WHICH TO PLANT.—The larger-growing and spreading varieties of apple should stand at from 30 to 40 feet apart; plums, 20 feet, and less for damsons if planted to form a shelter to the apples and more tender mixed fruits. Between the apples might be planted bush or half-standard trees, if desirable, and these may remain for some years. When becoming crowded the latter may be cut out, so that the permanent trees can more fully develop. Orchard land should be, if possible, sloping to the north, and the trees should be in lines running north to south.

PEARS.—Although some varieties do well planted as standards, there are others which are not at all suitable to plant. Good stewing pears, I believe, such as Catillac, Black Beurre, Beurre Clairgeau, Vicar of Winkfield, etc., might be more largely planted with a view to profit. Good stewing pears from about Christmas onwards are usually in demand, and not so plentiful as they should be.

PLUMS.—In some districts plums are not found doing well as standards, and producing the best quality fruits. In the south and Midlands they may be profitably planted, and in the majority of orchards good fruits in most seasons will be the rule. Victoria, Pond's Seedling, Pershore, Kirke's, Bush Plum, River's Early Prolific, Sultan, Jefferson's, and Monarch are excellent free-bearing varieties to grow.

CHERRIES.—Bigarreau Napoleon, Elton Heart, Black Tartarian, Black Cluster, May Duke, Early Rivers, and Noble should be selected for planting, although there may probably be others equal to them.—H. MARKHAM, Wrotham Park, Barnet.

Hardy Ferns in Pots.—Some of the commonest of our hardy ferns are very useful when potted and grown either for the greenhouse, or for positions in the dwelling house where it is not possible to have flowering plants owing to insufficient light. One of the prettiest is the Lady Fern (Athyrium filix fœmina), but the Hartstongue, as well as many others, should now be procured, potted, and placed in cold frames until the spring, when, brought into gentle heat, they soon unfold their fronds. I have often wondered why hardy sorts, like the Hartstongue, for example, are not oftener grown in the greenhouse: I like to see them under the stages and on the margins of the pathways; they add variety to the greenhouse in spring. Now is the best time to procure plants for this purpose, just before the foliage dies away.—T. B. FIELD.

DEVIZES CHRYSANTHEMUM SHOW will be held in the CORN EXCHANGE, DEVIZES, on TUESDAY, Nov. 10th, 1908.
For 36 Blooms, Incurved (not less than 18 varieties), prizes, 140s., 100s., and 60s.
For 36 Blooms, Japanese (not less than 18 varieties), prizes, Cup, 70s., and 40s.
For Schedules, apply to A. J. RANDELL, Hon. Secretary, Exchange Place, Devizes.

HUDDERSFIELD and DISTRICT CHRYSANTHEMUM SOCIETY.—The SEVENTEENTH EXHIBITION of the above Society will be held in the TOWN HALL, HUDDERSFIELD, on FRIDAY and SATURDAY, November 13th and 14th, 1908. Schedules and Entry Forms may be obtained on application to JOHN BELL, Hon. Sec., Marsh, Huddersfield.

KENT COUNTY CHRYSANTHEMUM and HORTICULTURAL SOCIETY.—The TWENTY-FIRST GRAND ANNUAL EXHIBITION will be held in the RINK HALL, BLACKHEATH, opposite Blackheath Railway Station, S.E. and C.R., Oct. 28th and 29th, 1908. Schedules and all particulars of the Hon. Sec., F. FOX, The Gardens, The [illegible], Lee, S.E.

VICTORIA HALL, EXETER.

DEVON AND EXETER HORT. SOCIETY'S FLOWER, FRUIT, ETC., SHOW.

FRIDAY and SATURDAY, 23 and 24 October.

SILVER CHALLENGE CUP (value £30) FOR CUT BLOOMS.

Schedules, etc., from G. W. JACKSON, Hon. Sec., 15a, Bedford Circus, Exeter.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Royal Horticultural Society.

OCTOBER 13.

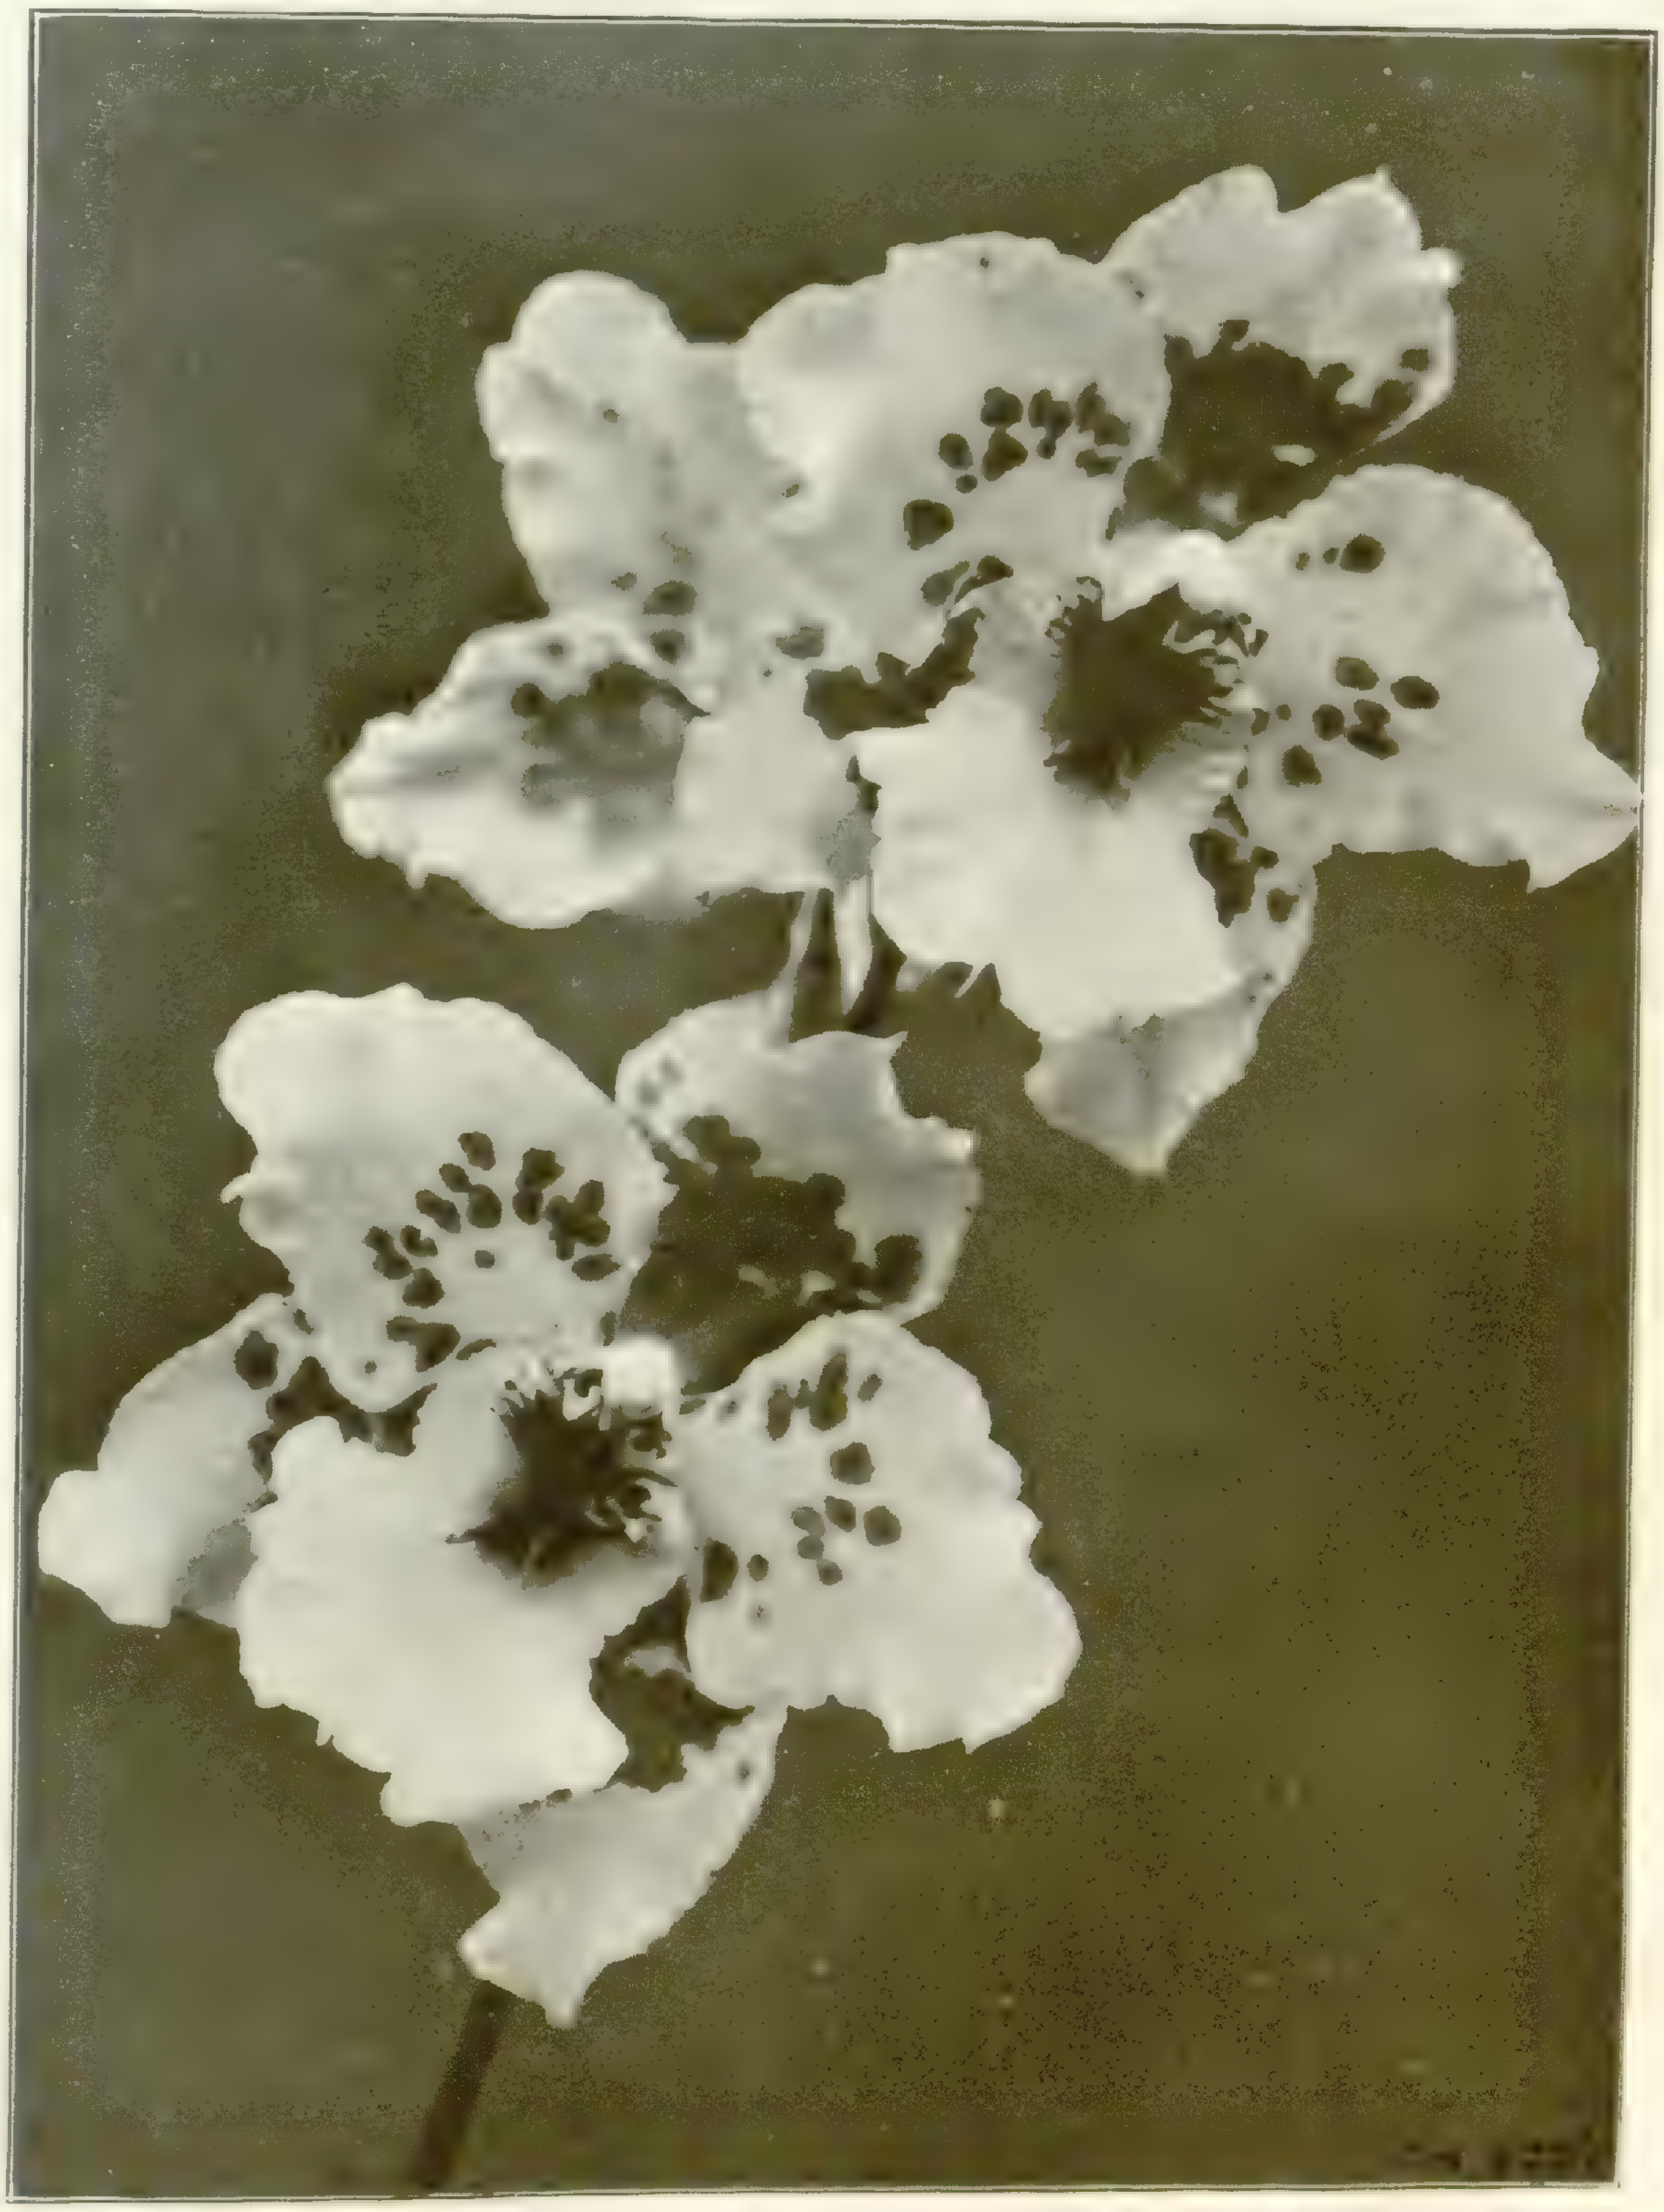
It was a difficult matter to believe that we had reached mid-October on Tuesday last, when the R.H.S. Hall was crowded with bright exhibits and well filled with visitors. Early chrysanthemums and Michaelmas daisies, dahlias and carnations, orchids and apples, choice conifers and roses, were all present in quantities, and made up a very attractive exhibition.

FLORAL COMMITTEE.

Messrs. H. B. May and Sons, Edmonton, brought up a group of the choicer hardy ferns, and these included a great variety of frilled and crested Hartstongues, Lomaria magellanicus, plumose and tasselled Lady Ferns, broad and elegant Male Ferns, the beautiful Polypodium Schneideri, that is hardy in and below the London district, P. vulgare cambricum, and osmundas. A few standards and bushes of varieties of Veronica Andersoni were also shown by the Messrs. May. Hardy flowers were largely exhibited by Messrs. G. Bunyard and Co., Maidstone, who, among many other good things, had Stokesia cyanea, Aster cordifolius elegans, Lilium tigrinum Fortunei, a few late poppies, Polygonum filiforme variegatum, Cimicifuga simplex, and a selection of kniphofias. Messrs. W. Wells and Co., Merstham, put up a very fine group of early chrysanthemums and pentstemons, the former predominating. Some large Japanese blooms of newer varieties occupied a central position, and all along the back were tall stands filled with Mrs. A. Thomson, October Snow, Edith Blades, Mrs. J. W. Scott, etc. Below these were the groups of pentstemons and vases of varying size filled with Marvel, Blue Boy, Perle Chatillonaise, a scarlet seedling, Spitfire, and other good early chrysanthemums.

The white-berried Pernettya mucronata alba, and pyramids and bushes of Citrus sinensis, or Otaheite oranges, freely fruited, made up the bulk of a bright exhibit set up by Messrs. William Cutbush and Son, Highgate. The Highgate firm had, in another group, a charming lot of perpetual carnations set up in vases of varying heights. Of Enchantress, the new pink Winona, Robert Craig, The President, Victory, Mrs. Burnett, Harlowarden, and Mrs. T. W. Lawson, there were fine vases of blooms, and in addition there were several good seedlings, including a deep purple. Mr. L. R. Russell, Richmond, contributed hardy variegated and berried shrubs. The Misses Hopkins, Shepperton, showed a few Michaelmas daisies and alpines.

A very large, attractive, and instructive group of coniferous trees and shrubs was arranged by Messrs. James Veitch and Sons, Chelsea, and it included handsome specimens of Sciadopitys verticillata, Abies pungens glauca, Cedrus atlantica glauca, and C. a. aurea, the bright Cupressus Lawsoniana Stewarti, and still brighter Retinospora obtusa aurea Crippsi, the rare Libocedrus macrolepis, the bold Abies magnifica, Retinospora filicoides, Cupressus nootkatensis argentea nova, Pinus Armandi, and the very graceful Retinospora filifera aurea. The Chelsea firm had also a brilliant group of winter-flowering begonias, all of Begonia Elatior, very freely bloomed and bright. Messrs. Harkness and Co., Hitchin, Herts, submitted a large group of delightful roses that admirably demonstrated the value of those varieties that bloom freely in the autumn; they had a bright and fragrant exhibit.



ODONTOGLOSSUM PESCATOREI SANDERÆ.
Exhibited by Messrs. Sander and Sons at R.H.S. meeting on the 13th inst., when it received an Award of Merit. Flowers white with pale brown markings.

Roses in mid-October are not usually numerous, but Messrs. Frank Cant and Co., Colchester, showed that this season the autumnal bloom is wonderful by staging delightful bunches of clean, fresh flowers of La Tosca, Gustave Regis, Irish Elegance, White Maman Cochet, Mrs. E. Mawley, Madame Antoine Marie, Antoine Rivoire, Papa Gontier, etc. Messrs. McGredy and Co., Portadown, Ireland, sent over three beautiful new roses, i.e., Mrs. E. J. Holland (A.M.), Mrs. Alfred Tate (A.M.), very lovely, bright copper-red; and Mrs. Wakefield Cristie Miller (A.M.). Messrs. J. Jefferies and Son, Cirencester, displayed coniferous trees and shrubs largely, and in their extensive exhibit they had Abies pungens glauca, Cedrus atlantica glauca, golden cupressus, and retinosporas, golden yews, and other choice and beautiful subjects.

Cactus dahlias were very charmingly arranged by Mr. M. V. Seale, Sevenoaks, who put up large stands, but set the flowers up lightly with grasses, sprays of Michaelmas daisies, and set bowls of ceanothuses among and below them, making up a very attractive display. Messrs. G. and A. Clarke, Dover, showed their large form of Cimicifuga simplex, a beautiful autumn-flowering plant, and around this grouped gaillardias, delphiniums, anemones, Michaelmas daisies, liliums, etc. Messrs. Dobbie and Co., Rothesay, showed some delightful dahlias, setting these up in the orthodox bunches, and displaying the best cactus varieties. Messrs. Barr and Sons, Covent Garden, contributed a group of hardy flowers, that included Cimicifuga simplex, kniphofias, pampas grasses, and Michaelmas daisies. Messrs. Paul and Son, Cheshunt, exhibited sprays of trees and shrubs; this was a most interesting collection, and contained Calycanthus occidentalis, cratægus in variety, crabs, cornuses, liquidamber, various bright-leaved oaks, and other useful trees and shrubs.

A splendid collection of Michaelmas daisies was put up in a most attractive manner by Mr. Edwin Beckett, V.M.H., gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree. The fine sprays of elegant blooms were put up in large stands, and they were a great feature of the show. Amellus, Maia, Osprey, Climax (A.M.), very large soft blue flowers; Hon. Edith Gibbs, Wm. Marshall, cordifolius elegans, Mrs. J. T. Rayner, White Diana, Silvery Star, Triumph, Maidenhood (A.M.), small, white, very free; Jessie Crum, and Brightness were among the best, but the collection contained many fine seedlings, and the two varieties that gained awards were raised at Aldenham. Messrs. T. S. Ware, Lim., Feltham, submitted a collection of alpines, Michaelmas daisies, phloxes, etc. Messrs. J. Cheal and Sons, Crawley, set up a bright lot of single and cactus dahlias, very fine for mid-October. Messrs. Eggett and Son, Thames Ditton, showed choice hardy ferns in a small rockery.

Messrs. Heath and Son, Cheltenham, showed a collection of scented-leaved pelargoniums and a new perpetual carnation named Lady Audley Need, that is very like Marmion, but is said to be a better grower. Nerine Countess of Altamont (A.M.), bright carmine-pink, was shown by Mr. T. D. Godman, South Lodge, Horsham; it is a distinct and handsome variety. Messrs. Hugh Low and Co., Bush Hill Park, Enfield, showed cut perpetual carnations and Otaheite oranges.

Michaelmas daisies were largely shown by Mr. H. J. Jones, Ryecroft Nursery, Lewisham, who again set up these charming flowers in a very pleasing manner, and, besides the best varieties in commerce, he had several new seedlings of merit; Calliope and Flora were conspicuously good. Mr. G. Reuthe, Keston, had Tropæolum tuberosum, Desfontainea spinosa, Abelia floribunda, Berberidopsis corallina, Gloriosa superba, nerines, colchicums, and other interesting plants. A very bold group of Michaelmas daisies and early chrysanthemums was well arranged in the lower annexe by Mr. F. Brazier, Caterham Valley. Phloxes were also well shown, and the whole group was very effective.

ORCHID COMMITTEE.

A bright group of orchids was set up by Messrs. Cypher and Sons, Cheltenham, and this contained a good batch of Cypripedium Fairrieanum, C. Niobe superbum, C. Maudiæ, Cattleya labiata, the graceful Oncidium incurvum album, Dendrobium Phalænopsis in variety, the bright Phaio-cymbidium Chardwarensis, and the bold Cypripedium gigas Corndean variety. Mr. G. Day, gardener to H. S. Goodson, Esq., West Hill, Putney, put up a large and bright group of orchids, in which Cypripedium insigne Sanderæ figured largely and well. Other good things were Cattleya Iris, the fine Laelio-cattleya St. Gothard (F.C.C.), Odontoglossum crispum in variety, Brasso-cattleya Digbyano-Warneri, and Miltonia Bleuana.

Vanda cærulea was splendidly shown by Messrs. Sander and Sons, St. Albans, the spikes being not only of fine size but of fine colour. Several laelio-cattleyas, the fine Cattleya Venus Sander's var., Cypripedium Lord Ossulston Sander's var. (A.M.), and Odontoglossum Pescatorei Sanderæ (A.M.), white, with soft brownish markings, were also good. This latter is very distinct, the lower half of each sepal being almost wholly of the pale red-brown colour. Mr. Maurice Mertens, Mont St. Amand, Ghent, brought over a few choice odontoglossums, including a richly-coloured seedling form of O. crispum. Mr. Morgan, gardener to H. J. Bromilow, Esq., sent Cypripedium Charlesworthi Bromilowianum (F.C.C.), a very pretty form, with transparent white, green-based dorsal sepal, and pale translucent green petals and lip.

Messrs. Charlesworth and Co., Heaton, Bradford, brought up Lælio-cattleya Golden Oriole, Sophro-cattleya Leda, Phaius flavus—with no yellow in it; Vanda Kimballiana, Zygocolax Wiganianus, Miltonia spectabilis Moreliana, L.-c. Luminosa, and several fine new hybrids, and a beautiful form of Odontoglossum Lambeauianum. Messrs. Stanley and Co., Southgate, were responsible for a small group of orchids, in which some pretty forms of Cattleya labiata were conspicuous, together with C. Minucia, C. Miss Williams, and Lælio-cattleya elegans Harrisi. Messrs. J. and A. McBean, Cooksbridge, Sussex, showed some fine examples of Cypripedium insigne Sanderæ, C. i. Harefield Hall var., C. Rossetti, the very bright C. Albertianum, and a few odontoglossums. Two other fine things were plants of Cattleya Bowringiana and C. fulvescens, each of which gained a cultural commendation.

Cypripedium Melba, Cattleya Iris, Cypripedium Fairrieanum, and Cattleya Patrocini figured well in the group from Messrs. Moore, Lim., Rawdon, Leeds. Messrs. Heath and Son, Cheltenham, sent up Dendrobium formosum giganteum, D. Phalænopsis, Cattleya Harrisoni, and cypripediums, and showed these largely. Vanda Kimballiana, Lælio-cattleya Firefly, Dendrobium formosum giganteum, Cypripedium Thalia gigantea, C. Maudiæ, and Cymbidium erythrostylum were the features of Messrs. Hugh Low and Co.'s group of orchids.

Mr. H. Alexander, orchid grower to Lieut.-Colonel Holford, showed Lælio-cattleya Cornelia (A.M.), Brasso-cattleya Heatonense delicata, and Sophro-lælio-cattleya Danæ aurea. Mr. Howard, gardener to H. Little, Esq., Baronshalt, Twickenham, had a large exhibit of Cattleya Bowringiana, C. Mantini inversa, C. Portia, C. labiata, Vanda cœrulea, and numerous oncidiums and cypripediums.

Miss M. Walters Anson, Streatham, showed a collection of orchid paintings, representing dendrobiums, odontoglossums, lycastes, and cypripediums; the paintings were good, but the backgrounds to the flowers were not pleasing.

FRUIT AND VEGETABLE COMMITTEE.

Some wonderfully fine apples were shown by Mr. James Whittle, gardener to Lieut.-Colonel Borton, Cheveney, Hunton. The collection was a large one, and the fruits were put up in neat baskets. Conspicuous varieties were Bismarck, Blenheim Pippin, Charles Ross, Gascoigne's Scarlet, The Queen, Peasgood's Nonsuch, Lord Derby, Allington Pippin, Mere de Menage, Annie Elizabeth, Emperor Alexander, James Grieve, Ribston Pippin, Warner's King, and Newtown Wonder. This was one of the finest collections of apples we have seen, and for a private establishment it was a splendid effort, and one that reflected great credit upon gardener and employer.

Some excellent examples of Bramley's Seedling, Allington Pippin, Court Pendu Plat, Bismarck, King of the Pippins, Tyler's Kernel, and Blenheim Pippin apples were shown by Messrs. Hugh Low and Co., Enfield. Mr. J. Leakey, Newland's Park, Sydenham, showed a box of small bunches of the Brandt grape grown out of doors at Sydenham.

CERTIFICATES AND AWARDS.

First Class Certificate.—To Lælio-cattleya St. Gothard, from H. S. Goodson, Esq., West Hill, Putney; Cypripedium Charlesworthi Bromilow's var., from Mr. H. J. Bromilow.

Award of Merit.—To Lælio-cattleya Cornelia, from Mr. Alexander, orchid grower to Lieut.-Colonel Holford, Westonbirt, Gloucester; Cypripedium Lord Ossulston Sander's var., from Messrs. Sander and Sons, St. Albans; Odontoglossum Pescatorei Sanderæ, from Messrs. Sander and Sons, St. Albans; Dracæna Bruanti variegata, from Messrs. William Cutbush and Son, Highgate; to H.T. roses Mrs. E. J. Holland, Mrs. Alfred Tate, and Mrs. Wakefield Cristie Miller, from Messrs. McGredy and Son, Portadown, Ireland; Asters Climax and Maidenhood, from Mr. E. Beckett, Aldenham House Gardens, Elstree; and Nerine Countess of Altamont, from Mr. F. D. Godman, South Lodge, Horsham.

MEDALS.

Silver-gilt Hogg Medal.—Mr. Whittle, gardener to Lieut.-Colonel Borton, Cheveney, Hunton.

Silver-gilt Flora.—Mr. E. Beckett, V.M.H., gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree.

Silver-gilt Banksian.—Messrs. Harkness and Co., Hitchin, Herts; Messrs. James Veitch and Sons, Chelsea; Messrs. W. Wells and Co., Merstham.

Silver Flora.—Messrs. William Cutbush and Son, Highgate; Messrs. J. Jefferies and Co., Cirencester; Messrs. H. B. May and Sons, Edmonton; Mr. Howard, gardener to H. Little, Esq., Baronshalt, Twickenham; Messrs. Charlesworth and Co., Bradford; Messrs. Cypher and Sons, Cheltenham; Messrs. Sander and Sons, St. Albans.

Silver Banksian.—Mr. H. J. Jones, Lewisham; Mr. F. Brazier, Caterham; Mr. M. V. Seale, Sevenoaks; Messrs. Hugh Low and Co., Enfield (one for orchids and one for fruits); Messrs. Stanley and Co., Southgate; Messrs. Moore, Lim., Rawdon, Leeds; Mr. Maurice Mertens, Mont St. Amand, Ghent; Messrs. J. and A. McBean, Cooksbridge, Sussex.

Ideal Home Exhibition at Olympia.

There is ample room for a wide difference of opinion as to what constitutes an ideal home or an ideal garden, and whether either has been realised in the exhibition that is now being held at the Olympia might well be regarded as an open question. There can, however, be no doubt as to the exhibition containing much to interest those concerned with the home and its surroundings, or that an hour or two can be spent in inspecting the large display of manufactures employed in the furnishing and decoration of the dwelling-house, and the features of the garden, which extends over an acre or so of the floor space of the huge building.

With the model rooms, the articles of furniture, and the materials for decorations we are not immediately concerned, and we need only say that they fully illustrate the prevailing taste in house furnishing, and are well arranged for inspection. The garden, which forms a distinct and refreshing feature of the exhibition, comprises a large expanse of turf, intersected by broad, gracefully-curved walks, and furnished with numerous beds and borders containing flowering plants, and trees and shrubs of various descriptions. The garden was designed by Mr. Edward White, of the firm of Messrs. Milner, Son, and White, landscape architects, of Victoria Street, S.W. There are two geometric schemes and several flower beds, placed singly on the lawn, and the whole of these have been arranged with suitable plants by Mr. Henry Eckford, of Wem, Shropshire. In the scheme on the eastern side of the garden Mr. Eckford has employed pink and scarlet bouvardias, rose, red, and pink carnations, with good effect. On the other side of the garden there is a group of beds contiguous to the bungalow erected by Messrs. Boulton and Paul, Rose Lane Works, Norwich, and these are filled with dwarf scarlet salvias and orange and yellow chrysanthemums, and present a highly attractive appearance. Not far distant from these beds is a long border of considerable breadth, and in this Mr. Eckford has arranged a rich display of golden chrysanthemums.

The spacious borders that occupy a prominent position in the general scheme have been planted by Messrs. J. Veitch and Sons, of Chelsea, and in these there is an excellent representation of tree and shrub life. The coniferous trees include well-developed specimens of Cupressus Lawsoniana in variety, Cedrus atlantica glauca, golden yews, and among the evergreens are fine examples of the choicer green and variegated hollies, and of elæganus, osmanthus, olearias, veronicas, and aucubas.

The bungalow which Messrs. Boulton and Paul have erected and furnished is an excellent model of what such a structure should be, for it is elegant in design, substantial in construction, and conveniently arranged. It has also the advantage of being inexpensive. Messrs. Boulton and Paul exhibit in association with their bungalow specimens of the garden trellises, to which they devote special attention, and also chairs and other garden furniture.

Contiguous to the bungalow mentioned in the preceding paragraph Messrs. Messenger and Co., Lim., of Loughborough, Leicestershire, and 122, Victoria Street, S.W., have erected a span-roof conservatory or plant house, which is of interest as illustrative of the success of the firm in combining elegance of design with substantial workmanship. On the same side of the garden Messrs. Pulham and Son, of 71, Newman Street, Oxford Street, and Broxbourne, have, in the comparatively large space allotted them, arranged a large pool, with a charming cascade and surrounding rock work. The pool, which holds about 3,000 gallons of water, is spanned by a stone bridge, and this is in the style of many Welsh stone bridges. On the bold rockwork which flanks the cascade are arranged evergreen shrubs of various sizes.

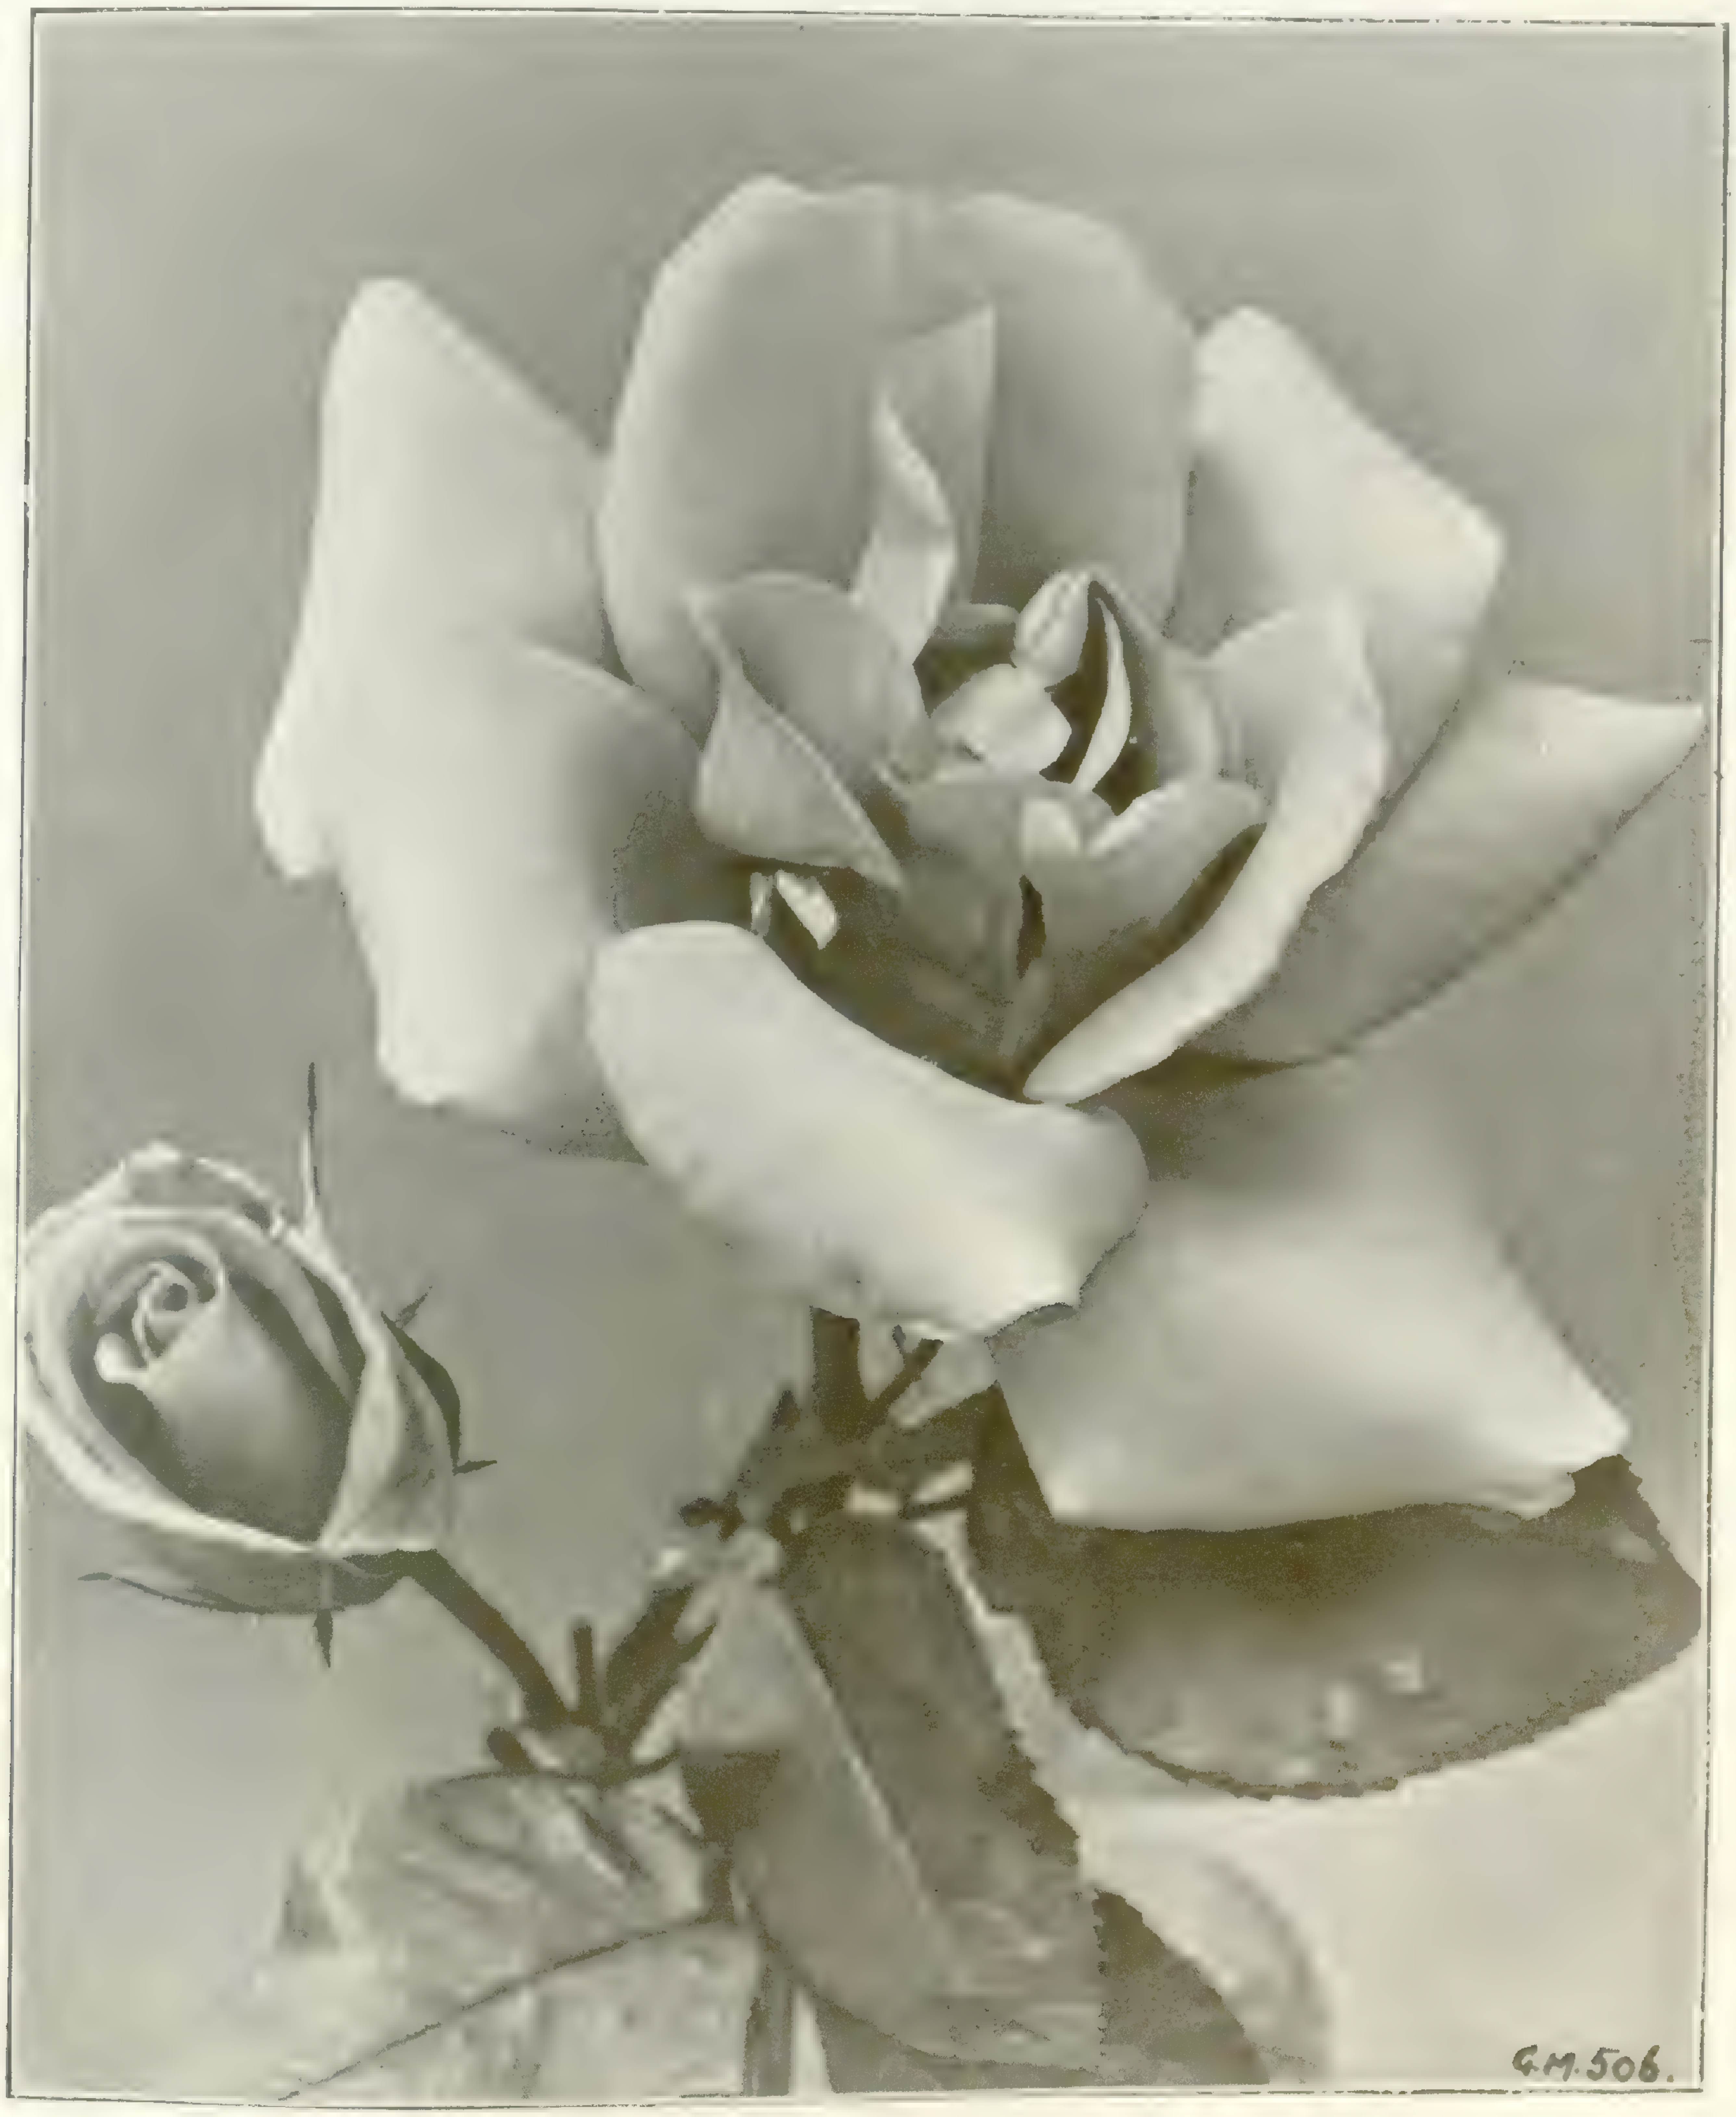
The King's Acre Nursery Company, Hereford, contribute a collection of fruit trees in pots, which are carrying heavy crops of splendidly developed fruit, and also baskets of richly-coloured fruits; Messrs. J. Veitch and Sons exhibit a collection of finely-fruited apple trees, and gathered apples of high quality.

Messrs. Sutton and Sons, of Reading, are represented by a collection of vegetables that is equally remarkable for the high development of the individual specimens, and the taste evinced in the arrangements. Included in the magnificent display are beet, carrots, cauliflowers, cucumbers, onions, parsnips, and potatoes, representing the finest types of those kinds. The melons associated with the vegetables are also noteworthy for their high quality, and the flowers tastefully arranged among the several products materially enhance the general effect.

Mr. Henry Eckford, of Wem, who is responsible for the flower garden to which we have alluded, has an exhibit of sweet pea and other perfumes.

A small French garden has been arranged by Messrs. Watkins and Simpson, of Tavistock Street, Covent Garden, W.C., but the space is not sufficient to adequately represent the methods of cropping adopted by the French market gardeners, and the results obtained therefrom.

Messrs. Ransomes, Sims, and Jefferies, Lim., Ipswich, exhibit hand and other lawn mowers; Messrs. Walter Voss and Co., Lim., Millwall Road, E., exhibit their chemical preparations for the destruction of insect pests, etc.; the Studley Horticultural College for Women, Studley Castle, Warwickshire, exhibit fruits, vegetables, etc.



NEW HYBRID TEA ROSE (MRS. ALFRED TATE).
Exhibited by Messrs. McGredy and Son, at the R.H.S. meeting on the 13th inst., when it received an Award of Merit. Flowers, coppery red.

Mr. John Walker's Onion and Carrot Show.

OCTOBER 6.

For nearly a quarter of a century Mr. John Walker, Thame, Oxon, has arranged a competition among his customers of agricultural roots and other produce, usually about the tenth month. It was found, however, more convenient to the farmers generally to compete at the Oxon Agricultural Exhibition in September, hence it has happened that carrots and onions have been the only products in competition at the October show.

Liberal prizes are offered, and for a dozen bulbs of Walker's Exhibition onion twenty-two lots were staged. The type is a useful form of white Spanish, originally somewhat concave at the base, but during the past few seasons there has developed a more convex outline, which must be regarded as an improvement. Mr. W. Turnham, gardener to W. W. Barber, Esq., Culham Court, Henley, headed the list with bulbs eighteen inches in circumference; Mr. C. Marcham, gardener to G. W. Bennett, Esq., Tiddington House, second, whose bulbs were slightly less in diameter; Mr. Geo. Neal, Bampton, was third with very uniform, shapely bulbs; Mr. J. Holton, gardener to Rev. the Provost of Worcester College, Oxford, and Mr. Adams, Tiddington, being placed equal fourth. The carrots, an old-fashioned type of Intermediate, were presented by fifteen competitors, many of the best specimens for size and colour being marred by insect blemishes; the premier award going to Mr. James Broadfoot, gardener to Colonel J. Miller, Shotover Park; Mr. A. Briscowe, Haddenham, second; Mr. T. Anstiss, Brill, third; and Mr. C. Marcham, fourth.

There were quite a number of extra productions, including some fine collections of vegetables, notably excellent turnips and celery, and grand dishes of Up-to-Date, The Factor, Walker's Reliable, and Covent Garden white potatoes, from Mr. Moses Brown; Mr. C. Marcham adding five dozen onions (much on a par with his prize set); Mr. Turnham also staging two dozen onions of exceptional merit. Mr. A. Briscoe sent Globe mangold (very shapely), and fine Intermediate carrots; Mr. W. James made a brave show with Long Red and Globe mangolds, Intermediate, and Short Horn carrots (both types bulky), Edgecote Purple, Reading Russet, and Up-to-date potatoes, Autocrat peas, red cabbage, marrows, turnips, and celery. From Mr. J. Walker's trial grounds came large quantities of Intermediate carrots, dishes of Reliance and The Factor potatoes; Mr. Anstiss, Brill, sent Intermediate carrots; and Mr. Amos Oliver, carrots, onions, and Up-to-Date potatoes.

The plenitude of apples in the district was demonstrated by baskets of Emperor Alexander, Bismarck, Blenheim Pippin, Cox's Pomona, Cox's Orange Pippin, Newtown Wonder, Duchess's Favourite, and Peasgood's Nonsuch, all very large and richly coloured, some examples of Peasgood's from Dr. Lee, Haddenham, turning the scale at eighteen ounces. Some dishes of very showy Devonshire and John Downie crabs were noticeable for their glorious colouring. Mr. Briscoe exhibited an orange-coloured gourd weighing 63lb.

The exhibits were arranged on tables with a back line of nearly six dozen vases filled with dahlias in variety, viz., singles, twelve flowers each; cactus, six to eight blooms each; and pompons, fourteen to sixteen flowers each. Mr. Walker also displayed his trophies, viz., four silver cups, five gold, thirty-three silver, and ten bronze medals.

Reading Gardeners' Society.

The opening meeting of the autumn session of the above flourishing society was held in the Abbey Hall, Reading, on Monday, October 5, the president of the association (Mr. Alderman F. B. Parfitt) occupying the chair. About one hundred members assembled to listen to the paper announced to be given by Mr. T. Tunbridge, F.R.H.S., the subject being "Perennials." To illustrate his lecture, Mr. Tunbridge had staged a splendid collection of flowers, which were greatly admired by all present. The lecturer, in the most able and lucid manner, took his hearers through a large number of examples, giving many valuable hints on colour combination, grouping, cultivation, etc. At the close of his remarks, discussion was invited, and a very animated and instructive debate ensued, among those taking part may be mentioned the president, Messrs. T. J. Powell, G. Hinton, F. W. Exler, W. J. Townsend, T. Judd, W. Turnham, D. Harris, and others.

A group of seedling Cryptomeria gracilis was staged by Mr. A. F. Bailey, and awarded a certificate; a collection of fruit exhibited by Mr. G. Tovey was highly commended. Mr. F. W. Exler had on view a nice batch of Primula obconica (raised from Messrs. Sutton's seed), and Mr. Timms brought a basket of very fine Up-to-Date potatoes. Several new members were elected, and the meeting terminated with a vote of thanks to Mr. Tunbridge and the chairman.

Haywards Heath Gardeners' Society.

At the October meeting of the Haywards Heath Gardeners' Association a most interesting discussion took place on a paper entitled, "Vegetables for Exhibition," which was read by Mr. George Porter, gardener to Lieut.-Colonel Dudley Sampson, of Buxshalls, Lindfield. Mr. Porter, who is a successful grower and exhibitor, spoke on ten kinds of vegetables suitable for exhibition, and invited questions after each kind had been referred to—a novel but successful way of raising a discussion. After the paper the Rev. T. G. Wyatt, who is a keen vegetable grower and exhibitor, raised the question of having a fixed standard for judging, and pointed out what a help it would be to exhibitors if all judges acted on the same principles. Exhibitors, he said, should know beforehand what standard they had to work to, and by what standard they would be judged. What was required was a common standard to bind both exhibitors and judges. This was provided by the Royal Horticultural Society in their book on judging, which he thought should be strictly followed, and accepted as the rule for all. He advised associations and societies to press this forward continually, and secretaries of shows should state, when obtaining judges, that the R.H.S. code book was to be followed. Putting it merely in the schedule of a show was insufficient; it should be made a condition of judging. If this was done generally it would greatly help and encourage all exhibitors, as they would then know beforehand the principles which would guide the judges in making their awards.

Bristol Gardeners' Association.

The first fortnightly meeting for the current session was held on Thursday, October 8, at St. John's Parish Rooms, and Dr. Barclay Baron presided over a large attendance. Mr. Cooling, of Bath, read an interesting and instructive paper upon "Autumn-flowering Roses." The lecturer, in the course of his paper, said that beds of one variety produced the best effect upon lawns, and grouping the varieties in borders was preferable to indiscriminate planting. Mulching the beds twice in the year was recommended, and spring and autumn were mentioned as the best times for applying mulching materials. Spent hops were suggested as the best for spring dressing. The term hybrid perpetual was, in Mr. Cooling's opinion, somewhat of a misnomer, as most of those known as such were only so in name. The new varieties of hybrid teas, now so popular, were more worthy to be described as such, as they come into bloom in June, and continue till late in the autumn. What are required now are autumn-flowering pillar roses of the Dorothy Perkins type. Raisers are working in that direction, and he believed they would soon be successful in obtaining such varieties. Trier, a new German climbing rose, was recommended as useful for autumn flowering. A few varieties that Mr. Cooling had found mildew-proof included Souv. de Pierre Notting, Dainty, Queen Mab, Rainbow, Papa Gontier, and Grus an Teplitz. Mr. Cooling staged a lovely lot of the newer varieties of hybrid teas, including Earl of Warwick, Dean Hole, Souv. de Marie Zayas, Lady Rossmore, Richmond, Betty, and Pharisaer, and was awarded a special certificate. For three bunches of hardy flowers Mr. Binfield was first, and Mr. Holt second.

Cardiff Gardeners' Association.

The opening meeting of the current session of this society was held at St. John's Schools, Queen Street, on the 6th inst., Mr. H. R. Farmer presiding. An address was given by Mr. F. G. Treseder on "Seed Culture, and the Countries which produce the Greatest Quantities." The lecturer considered that California and Germany were the two largest seed producing countries in the world, and from them seedsmen in this country obtained large supplies. The lecture was most interesting, and many of the members took part in the discussion which followed. A hearty vote of thanks to Mr. F. G. Treseder was proposed by Mr. T. Malpass, and seconded by Mr. C. Cossam, and carried unanimously.

EARLY-FLOWERING CHRYSANTHEMUMS.

In your report of the show of early-flowering chrysanthemums held by the National Chrysanthemum Society, in your issue of the 10th inst. (page 768), your reporter says, "no doubt the flowers spread a little after being set up, but as one of the chief offenders had barely finished when the judging commenced he could hardly urge that in his favour." As I am that chief offender, will you kindly allow me space in your valuable paper to defend myself. As it takes two hours' good work to set up twelve bunches correctly, if the last one has no time to spread, the first one has certainly plenty. The bunches set up were no larger than those staged in previous years, and they were not disqualified, therefore what reason had the judges (or committee) for enforcing the rules so strictly on this occasion. I had a vase to finish at eleven o'clock, and asked the superintendent for a few minutes' grace, and was told I may as well leave it, as I would be disqualified anyhow. So it appears to me that the committee had the whole thing planned beforehand. I am an old competitor, and do not, as a rule, grumble at judges' decisions, but I consider it rather hard on an exhibitor, after travelling 500 miles to a show, to be used in such a manner.

John Smellie.

Pansy Gardens, Busby.

ONE PENNY WEEKLY, by post 1½d.

FARM AND GARDEN

THE DAIRY—POULTRY—PIGS—LIVE STOCK—ALLOTMENTS—MARKET GARDENING, etc.

This week's issue (Oct. 17) contains the following:

THE DAIRY SHOW—FULL ILLUSTRATED REPORT.
MILK TESTS IN LANCASHIRE.
EARLY WINTER SEEDS FOR COWS.
CHURNING.
THE QUALITY OF MILK.
THE PIG TRADE.
HAY FOR STORE CALVES.
DIRECT TRADING.
FOOD VALUE OF POULTRY.
SEASONABLE NOTES ON POULTRY.
LIFTING AND STORING BEETROOT.
FRUIT PLANTATIONS.
SELECTING EWES.
SEASONABLE NOTES ON MARKET GARDENING.
THE HOUSEHOLD.

SOLD BY ALL NEWSAGENTS.

OFFICES: 148 and 149, ALDERSGATE STREET, London.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

FUNGUS ON CHERRY ROOT.—J. T., Feltham: We have had the roots carefully examined, and find that the fungus on them is Didymium farinaceum, one of the Myxogastres. But as this is merely a saprophite growing on the dead wood, and not a parasite growing in the wood, it follows that it is not the cause of the death of the cherry tree. You must look in another direction for the cause. If you let us know the circumstances connected with the death of the tree, and give us some idea of its position and treatment, we may be able to help you.

SHELTER FOR A GARDEN.—H. S., Wellingborough: So much depends upon the elevation of the site, and the prevailing winds, that it is not an easy matter to advise you in the absence of information on these matters. We believe a stout, close fence would be far better than a hedge, and it would provide further opportunities for fruit culture. Beech or hornbeam make good shelter hedges. If the wall faces east some of the early peaches might succeed against it, provided the rising ground, trees or houses, give some shelter from east winds, without obstructing light. Peaches so grown need to be protected with blinds or fish netting during the time the flowers are opening. Any of the best pears that do well in the district could be grown satisfactorily on the wall facing west, notably Jargonelle, Williams' Bon Chretien, Louise Bonne of Jersey, Beurré d'Amanlis, Thompson's, Doyenné du Comice, Beurré Diel, Marie Louise, and Duchess d'Angoulême.

SHANKED GRAPES.—G. G., Hants: The specimens sent show that the grapes are shanking badly, and shanking may be caused by over-cropping, excess of moisture, and unripened growth the previous year. If you have not over-cropped the vines it is desirable that the border be tested to find out the condition of the soil and roots. Write us again.

STONELESS PLUM.—S. B. J., Faversham: There is a variety of plum known as Stoneless, and it is so named because it has no hard stone surrounding the kernel, and only a thin membrane to take its place. We do not know where the variety is in cultivation now, but as it is small-fruited, and by no means a good bearer, we imagine it has now quite gone out of cultivation. The variety is a very old one, and was probably introduced from France by London, who was at one time at Versailles. The fruits are purple-black with a blue bloom.

EXAMINATION IN HORTICULTURAL PRACTICE.—S. L. F., Epsom: The following syllabus of horticultural operations and practice is issued by the Royal Horticultural Society, and shows what is expected of the student, or, at least, what he may be examined in: (1) Surveying and landscape gardening. Elements of. (2) Choice of site for garden. (3) Description and use of implements under each head. (4) Operations connected with the cultivation of the land, with explanations and illustrations of good and bad methods, digging and trenching; draining, hoeing, stirring the soil and weeding; watering; preparation of seed beds; rolling and raking, sowing, transplanting and thinning, potting, planting, aspects, positions, and shelter, staking; earthing and blanching, etc. (5) Propagation, elementary principles, cuttings, buddings, and grafting, stocks used, layering, division, branch pruning, root pruning, old and young trees and bushes, training. (6) Fruit culture—open-air and under glass; small fruits; apples and pears; stone fruits; gathering and storing; packing, marketing; selection of varieties, etc. (7) Vegetable culture, open air and under glass; tubers and roots; green vegetables; fruits and seeds; rotation of crops and selection of varieties. (8) Flower culture, outside and under glass. (9) Manures and their application. (10) Improvement of plants by cross-breeding, hybridisation, and selection. (11) Arboriculture: Trees and shrubs and their culture. (12) Insect and fungus pests; prevention and treatment.

WHITE INSECTS ON FERN ROOTS.—A. B., Reynoldston: The insects belong to the aphis family, and are not so troublesome as some members of it. Clear soot-water will make things uncomfortable for them, but perhaps the best method of dealing with them will be to stand the pots in water for twenty-four hours. The pots must be put well under water, and the water must be at the same temperature as the house. Lay the plants on their sides for an hour or two after immersion, and then allow them a little extra fire heat and increased ventilation for a few days. Small plants may be washed out, and potted in sterilised soil. Examine the staging, and any material that is used on the staging to hold moisture, as there may be insects on or in these. We have found the method of suffocating insects on plant roots by immersion in water to be an excellent one.

BLISTERED APPLE AND PEAR LEAVES.—W. M. C., Thornaby: You will find the answer to your question on p. 770 of our issue of October 10.

HIDALGOA WERCKLEI.—R. C. D., Ryde: This pretty free-growing composite loves the sunshine, and will not flower well unless it has plenty of light. It is not so free flowering as one could wish, but its brilliant scarlet, dahlia-like flowers are very effective. It is readily propagated from cuttings, and thrives best in an airy conservatory or greenhouse. The young growths die back a good way each year, but the plant does not die down annually, as in the case of the garden dahlia. Overwatering is often the cause of trouble with this climber. Good loam and some coarse sand form a suitable rooting medium.

NAMES OF PLANTS.

W. H., Yeovil.—1, Should have been sent earlier; 2, Caryopteris mastacantha.

J. T., Feltham.—Send us a flower and leaf at some other time; the specimen was insufficient for identification.

W. P., Shenley.—1, Spiræa Douglasi; 2, apparently a Weigela growth; 3, probably Ligustrum chinensis; 4, Escallonia macrantha; 5, Spiræa prunifolia; 6, not recognised. Nos. 2, 3, and 6 should be sent again when in flower.

NAMES OF FRUIT.

W. H., Guildhall.—Gloria Mundi.

A. S., Christchurch.—Duchess' Favourite.

W. C., Worcester Park.—Scarlet Nonpareil.

J. G., Norfolk.—1, Fearn's Pippin; 2, Histon Favourite; 3, Nouvelle Fulvie.

A. P., Over.—1, Belle Julie; 3, Beurre Capiaumont; 5, Hawthornden; others not recognised.

J. B., Seaforth.—Hill's Seedling is probably correct, but the colouring is not up to the usual standard.

R. N., Stoke Newington.—1, Lord Suffield; 2 and 4, not recognised; 3, Madame Treyve; 5, Adams' Pearmain.

E. S., Belvedere.—1, Withington Fillbasket; 2, Northern Greening; 3, Catshead; 4, not recognised; 5, Emile d'Heyst.

H. H., Godstone.—1, Bedfordshire Foundling; 2, Claygate Pearmain; 3, Yorkshire Beauty; 4, not recognised; 5, Sops in Wine; 6, Round Winter Nonsuch.

T., Barnet.—1, Gloria Mundi; 2, Grenadier; 3, Lord Suffield; 4, Morgan's Sweet; 5, fruit badly crushed, probably Souv. du Congrès; 6, Round Winter Nonsuch.

Why should Pests Plunder your Plants?

Whether your gardening merely consists of the care of a window box or potted plants—whether you have charge of large gardens or cultivate a farm, you know the way plants suffer from the ravages of insects, slugs and snails, beetles, woodlice, wireworms, etc. We wish to day to tell you of a way by which insect pests can be banished for ever.

Science has perfected an economical preparation called "KILOGRUB" which, sprinkled, distributed, and worked well into the soil will exterminate the wireworms, grubs, etc., that ruin fruit, vegetable and flower productions.

Two or three ounces worked into each square yard of soil is all that is necessary. Nor does it lose its efficiency at once, retaining its qualities for as long a period as 6 months. Try "KILOGRUB" now—most dealers stock it, and if you have any difficulty in obtaining a supply, write us for a sample tin, 9d., post paid; or, larger quantities at the following prices, cash with order, carriage paid;

[illegible] lbs. ... 2/-
[illegible] cwt. ... 5/-
[illegible] cwt. ... 7/-
[illegible] cwt. ... 11/6
Carriage Paid.

Write us for FREE BOOKLET, telling the story of this wonderful help to successful gardening. Address:—

OBITUARY.

Dr. Douglas Law Freeland.

Mr. Horace J. Wright sends us the following: I was delighted to read your generous appreciation, and see the life-like portrait of my greatly respected friend, Dr. Freeland, in your issue dated September 19. Now, full of grief, I take up my pen to tell the many readers of the Gardeners' Magazine who knew and respected him, if by name alone, that he has passed to his rest. Truly are the ways of the Almighty beyond understanding. Here has been taken from us one whose whole serious life, alas, all too short, was devoted unceasingly and uncomplainingly to alleviating the pains and sympathising with the troubles of others. His was a life of real value and help to others, but the call has come to him, and he, perforce, has had to respond. For myself, I knew Dr. Freeland as a husband, a master, a doctor, a rosarian, a horticulturist, and, above them all, I knew him as a man, straight, true, ever ready to do his duty by himself and by all the world. I recall many happy hours in the rose garden at Delamere, Snodland, in which he found his delight and recreation, where we talked of roses and sweet peas, of men and matters, of manners and customs, and times without number I have enjoyed the "abundant hospitality" of Dr. and Mrs. Freeland. Dr. Freeland passed away at 2 a.m. on Saturday, the 10th inst., and the interment took place at Snodland on Wednesday, 14th inst., at 3 p.m. I am sure that every reader of the Gardeners' Magazine will unite with me in offering to Mrs. Freeland most sincere condolences in the terrible and irreparable loss which she has sustained.

TRADE NOTE.

Mr. Amos Perry, Hardy Plant Farms, Enfield, has secured the whole of the collection of hardy ferns formed by W. L. Buster, Esq., of St. Mary's Cray. The collection comprises some 400 varieties, and over 30,000 plants, and includes the finest varieties in cultivation, many of which are not yet in commerce.

FORTHCOMING ENGAGEMENTS.

WEDNESDAY, October 21.—Royal Society of Arts.

TUESDAY, October 27.—Royal Horticultural Society; Committees meet at 12 o'clock; lecture on "Garden Design," by Mr. T. H. Mawson; Scientific Committee at 4 o'clock
Croydon Chrysanthemum Society; two days.

WEDNESDAY, October 28.—Royal Society of Arts.
Lindfield Chrysanthemum Society; two days.
Southampton Royal Horticultural Society; three days.

Rose Antoine Rivoire.—In colouring somewhat resembling Prince de Bulgarie, but the blooms are not quite so broad-petalled; this is a medium-sized rose of very attractive shape, and clean, vigorous growth; apparently a good rose for autumn, as we have some nice blooms at the present time. During August we had between two and three inches of rain, and with good weather through September, not only the variety under notice, but other roses have made a good autumn display.—T. H. Slade.

The Public Parks and Gardens of the United Kingdom form a very interesting feature of our national horticultural life, and as the editor of the "Gardening Year Book" for 1909 is anxious to record the correct title and area of these parks and open spaces, he will be very greatly obliged if the superintendents will send him these particulars, as well as their own name and address. Secretaries of horticultural and gardening societies are also requested to furnish him with particulars of their societies, with dates of exhibitions, etc. The information should be sent as early as possible to the Editor, "Gardening Year Book," 148 and 149, Aldersgate Street, E.C.

CATALOGUES RECEIVED.

CHARLES TURNER, SLOUGH.—Two catalogues, one of bulbs and one of auriculas, carnations, picotees, cloves, and pinks.

GEMEN AND BOURG, LUXEMBURG.—An illustrated list of Dutch bulbs and dahlias.

GEO. MASSEY AND SONS, SPALDING.—A concise bulb list.

MISS HEMUS, UPTON-ON-SEVERN.—An advance list of new and exhibition sweet peas.

JAS. MURRAY AND SONS, DEPTFORD, S.E.—A catalogue devoted to liliums, Dutch bulbs, azaleas, and roses.

DANIELS BROTHERS, NORWICH.—Cultural notes for the various bulbs, fruit trees, roses, etc., listed, is one of the features of this catalogue.

DICKSONS, CHESTER.—A freely illustrated [illegible] catalogue, concluding with a comprehensive list of garden sundries.

FRANK DICKS AND CO., DEANSGATE, MANCHESTER.—A well arranged list of bulbs, roses, and sundries.

DOBBIE AND CO., ROTHESAY.—An autumn catalogue in which pansies, violas, and roses occupy as much space as the bulbs.

HORACE J. WRIGHT, 32, DAULT ROAD, WANDSWORTH.—A very handy and quite unique catalogue of sweet peas, together with cultural details, and an announcement of a Sweet Pea Information Bureau.

JOHN PEED AND SON, WEST NORWOOD.—A useful list of bulbs, gloxinias, plants for forcing, etc.

THE COWPER AND NEWTON MUSEUM, OLNEY, BUCKS

AN APPEAL FOR ENDOWMENT.

EIGHT years ago, on the occasion of the Centenary of the death of the Poet Cowper, the house in which he lived at Olney was presented to the town to form a memorial and museum. The Trustees have, with a number of gentlemen resident in the district, formed an Endowment Committee, of which the Bishop of Durham is the chairman. The [illegible] in view is clearly stated in the following [illegible] from a letter signed by the Bishop:—

"At present the Institution has an income of only eighteen pounds a year, and this is insufficient for its due maintenance. The front of the Museum has recently been restored, but the two rooms now used for exhibits are overcrowded, and we think that the whole of the house should be devoted to the public, who would then be admitted to the "John Gilpin" room and other rooms now occupied by the Curator. For this purpose it will be necessary to form a small endowment; and it has been calculated that the sum of £2,200 is required. We sincerely trust that the public will respond generously to this appeal.

HANDLEY DUNELM,
Chairman of the Committee.

The Hon. Treasurer is Mr. Frank Littleboy, of Newport Pagnell, Bucks, to whom contributions should be addressed.

Mr. A. Mitchell, Corrour R.S.O., writes us Mar. 5th, 1908:—

"Kindly send on another pair of your splendid Boots. The last pair has worn me over two years, and when I mention my house stands **1,350 feet above Sea level,** you can imagine the awful weather, we have nothing but snow and slush the greater part of the year. When I state I never had a wet foot it speaks well for your Boots. Enclosed P.O. 16/-.

KELWAY GARDENS,
Greenock,
26th August, 1908.

Messrs. Kelway and Son,
Langport, Somerset.

Dear Sirs,—You will be pleased to hear that the £10 or so which I have sent you in the last few years have made my garden (½ acre) one beautiful mass of colour all the year round.

This year especially the place has been a perfect picture—quite as fine as any of the pictures in Walter Wright's "Perfect Garden."

I am,
Yours faithfully,

GOLD MEDAL,
FRANCO-BRITISH EXHIBITION.
KELWAY AND SON have pleasure in stating that their House has been honoured with the above Award by the International Jury at the Franco-British International Exhibition (in addition to the Silver Medal awarded to their exhibit at the Horticultural Show in the summer).
KELWAY and SON, Langport, Somerset.

FOR AUTUMN PLANTING.

PLANTERS of FRUIT TREES should write for our fully descriptive catalogue and supplement, 6d., post free; and gratis to customers.

Well-ripened trees of all kinds, and our large, developed specimens of Vines, Figs, Peaches, and Nectarines, are especially good.

An inspection solicited.

GEORGE BUNYARD and CO., Ltd.,
The Royal Nurseries, MAIDSTONE.

TO-DAY! AND FOR YEARS AND YEARS PAST the XL ALL Specialities are and have been the best on the market. Where is the Gardener who does not pin his faith to one or the other of these celebrated Insecticides or Fertilisers? XL ALL FERTILISER has pleased all who have used it this season. The Sales of XL ALL FUMIGATOR prove that it is more popular than ever. XL ALL LIQUID NICOTINE INSECTICIDE is always spoken of by gardeners and growers as the most deadly to Mealy Bug, Thrip, etc. XL ALL WINTER WASH for dormant Trees acts like magic, clearing the Trees and Bushes of all Insects' Eggs, Moss, and Fungoid Growths. XL ALL LAWN SAND, a weed eradicator and fertiliser for weedy and poor lawns. XL ALL WEED KILLER used once a year "No weeds can live." Please ask your Nurseryman, Seedsman, or Florist for a copy of my small pink list, giving particulars of these and many other XL ALL Preparations, which can be obtained from the Horticultural Trade throughout the World. G. H. RICHARDS, Manufacturer and Patentee, 234, Borough High Street, London, S.E.

r "lead"—York Roses.

Start the planting season right. Lead off with York Roses. Take a hand NOW in the production of the most beautiful garden subjects. Here are reasons why you should.

Hardy York Roses will flourish anywhere in any garden, yours included. They do not quarrel with the weather, and are too big and strong to require any "nursing." Their one object in life is to provide you with more and better blooms than ever before—and they do it.

Dwarf Hybrid Perpetuals for Beds or Borders. Colours: white, rose, red, scarlet, or velvety black. 12 for 6s. 50 ,, 22s. 6d.

Fragrant Dwarf Hybrid Teas for Beds or Borders. Colours as above, with addition of yellow shades. Bloom continuously till frost. 12 for 8s. 6d. 50 ,, 31s. 6d.

Tea Roses, same price as H.T.'s.

Strong vigorous Climbers for Walls, Arches, Pergolas, etc., in all colours. 12 for 8s. 6d. 50 ,, 31s. 6d.

Leading named varieties in each case. Packed free and carriage paid for cash. Send along your order to-day. Art Catalogue free from

NOTES OF THE WEEK.

Hardy Shrubs for Forcing.

The rapidly increasing popularity of the hardy shrubs that are remarkable for the beauty of their flowers for contributing to the attractions of the conservatory early in the year, is a matter that cannot well fail to give much satisfaction to those who take an active interest in the ornamental aspects of gardening. We have among these shrubs kinds that are distinguished by their elegance of habit, the delightful colouring of their flowers, or some other attribute of beauty; and they are all more or less amenable to the artificial conditions under which it is necessary to place them to ensure the development of their flowers considerably in advance of the usual season of blooming. The best of the kinds are sufficiently numerous to produce a series of the most varied and delightful colour effects, and to add thereby immensely to the charms that a well-furnished and tastefully arranged conservatory possesses. Few among past generations of gardeners could have had other than a vague idea of the possibilities of shrub culture for flower production under glass; for the number who utilised hardy shrubs for indoor decorations was small, and in no case were they used other than in a very sparing manner. Now it is quite common to find conservatories so liberally embellished with them as to afford a series of displays of exquisite beauty. So generally is the value of hardy shrubs for conservatory decoration recognised that it is somewhat surprising to find anyone to raise an objection to their being so employed; but there are some who do not regard with favour the flowering under glass of shrubs that bloom profusely in the open quite early in the spring season, and produce effects at once distinct and beautiful. We confess to a difficulty in understanding the feelings of those who take up this position, because it is possible to fully appreciate the flowers of shrubs growing under natural conditions after having enjoyed the display produced by those which have had their season of flowering accelerated. Much has been accomplished in the improvement and the extension of the culture of shrubs for forcing, but there is something more to be done before it can be said that further progress is unnecessary. There are still gardens in which their value is not fully recognised, and there are instances in which the selection of kinds should be improved.

MR. CHARLES ROSS.

We would suggest to those who have not used the more beautiful of the flowering shrubs for forcing, to put their utility to a practical test during the forthcoming season by forcing a few of them. With regard to the selection, it may with advantage be pointed out that it is not advisable to have a large number of kinds, but to select a few of the very best and have several examples of each. The lilacs are of special value, for they are unsurpassed in charm of colouring, are delightfully fragrant, and their flowers retain their freshness for a considerable period. If but one group is forced, the lilacs should have the preference, and such varieties as Charles X., Dr. Lindley, Madame Lemoine, Marie Legraye, and Michel Buchner be selected. Next in importance are the forms of Azalea mollis, and if there is no objection to the small additional cost, such fine varieties as Anthony Koster should be selected, otherwise good seedlings should be obtained. Of much value is Prunus triloba, which is so largely grown in Germany for conservatory decoration. This beautiful shrub is admirably adapted for association with the lilacs, and the delicate pink hue of the flowers presents a delightful contrast to the soft colours of the lilacs. The double-flowered peaches have much to recommend them, and the double-flowered cherries are of the highest value. The rose and crimson varieties are the most desirable of the varieties of the double-flowered peach, and the best of the cherries are Cerasus pseudo-cerasus fl.-pl., C. pseudo-cerasus J. H. Veitch, and C. avium fl.-pl. The forms of Pyrus malus floribunda differ materially in decorative value, and the best of those obtainable at ordinary rates is Scheideckeri. Magnolia conspicua, M. Soulangeana, and M. stellata are all useful, but they require to be well set with buds to justify their being forced into bloom. The Philadelphus includes several good forms, notably Lemoinei and Boule d'Argent, both of which are of free growth, and profuse in flowering. Deutzia gracilis, which has long enjoyed considerable popularity for flowering under glass, should be included in the smallest selection, and with it should be associated D. Lemoinei, one of the finest of the white-flowered shrubs. A few of the shrubby spiræas should be included, S. confusa, S. arguta, and S. prunifolia fl.-pl., comprising some of the best. In addition, may be mentioned Viburnum opulus sterile and V. plicatum. There are other good shrubs suitable for forcing, but it is not now necessary to refer to them as our object is not to give an exhaustive list, but to mention a few that possess so much merit that they should have the preference in making a small selection. We need hardly state that in the preparation of shrubs for forcing good cultivation is essential to success. The plants must be well furnished with fibrous roots, and, if well established in pots, it will be a great advantage; and they must have stout, short-jointed growths, and large plump buds, and there will be no great difficulty in the production of examples of this description provided a generous course of culture is adopted.

Mr. Charles Ross, the veteran gardener and fruit raiser, has done a great deal to make fruit culture more interesting than it used to be. We have great pleasure in presenting our readers with a portrait of Mr. Ross at this time, because this fine old gardener is now proposing to retire from active participation in professional horticulture, and also because Mr. Ross is now quite famous as a raiser of new apples. Born at Dundas Castle Gardens, Linlithgow, on December 22, 1824, Mr. Ross was early taken to Dalmeny Park, where his father became forester and estate manager. Here, under Cuthbertson and Melville, Mr. Ross commenced his gardening career. In 1846 he went to Fullarton House Gardens, Ayrshire, and then spent several years at Middleton Hall, Blackadder, Berwick, and with Messrs. Dickson and Co., of Leith Walk, Edinburgh. On March 3, 1851, Mr. Ross entered service under Charles McIntosh, at Dalkeith, and he was told that his services would not be retained a moment longer than they gave full satisfaction. Young Ross evidently gave satisfaction, for in August of the same year he gained leave of absence for one week, and in that time he visited the Great Exhibition in Hyde Park, Kew Gardens, Hampton Court, the Royal Botanic Society's Gardens at Regent's Park, and the Royal Coliseum. He also subsequently became general foreman at Dalkeith, and this at a time when McIntosh was writing "The Book of the Garden." In 1854 Mr. Ross became head gardener to Mr. Joseph Ridgeway, at Fairlawn, in Kent, and in 1862 he became head gardener at Welford Park, Newbury, where he has remained until now. Colonel and Lady Archer-Houblon, the owners of Welford Park, have nothing but praise for Mr. Ross, and the several tenants have regarded him as a friend. Besides certificates and cups and medals, Mr. Ross has won about 1,200 prizes, largely for fruit. He has raised numerous good apples, such as Charles Ross, The Houblon, Rival, Encore, Renown, etc., and he has long been held in high estimation as a judge of fruits. Though 83 years of age, Mr. Ross is hale and hearty, and walks as briskly as many men a score of years younger, and he was one of the keenest of pomologists at the R.H.S. fruit show last week. That he may for many years continue to have good health, and thus be able to fully enjoy the well-earned rest of retirement is the heartiest wish of his many friends.

Nomenclature of Orchid Hybrids.—The following resolution was received by the R.H.S. Scientific Committee at its meeting on the 13th inst. from the Orchid Committee: "That the Scientific Committee be asked to consider and advise upon the proper nomenclature of tri-generic, quadi-generic, and other hybrids, as it appears to the Orchid Committee that not more than two generic names can conveniently be combined in defining the origin of the hybrids." Several letters upon the subject were considered, and suggestions were made as to the best methods of forming names for these hybrids. It was finally proposed by Mr. Veitch, and seconded by Mr. Hurst, that a sub-committee should be formed, to consist of five members of the Scientific Committee and five of the Orchid Committee, who should confer together and further consider the subject. This was carried, and Dr. Rendle, Messrs. Bowles, Fawcett, Hurst, and Rolfe were appointed to represent the Scientific Committee.

Improvements at Balmoral.—The King has decided to make several alterations in the grounds and plantations of Balmoral Castle. A considerable number of trees are to be cut down, and many of the newer kinds of trees and shrubs will be planted. The alterations will be made in accordance with plans prepared by Lord Redesdale, and will be carried out during the ensuing winter and spring.

Union of Gardeners' Societies.—On the second day of the Royal Horticultural Society's exhibition of British grown fruit, the first annual meeting of the Gardeners' Mutual Improvement Associations in affiliation with the R.H.S. was held at the Horticultural Hall. The Rev. W. Wilks presided, and there was a large attendance, the No. 1 Committee Room being crowded with delegates. The report presented was satisfactory, both as regards the number of societies in affiliation and the provisions made for meeting the requirements of societies in need of lectures. The business proceedings were of short duration, and within a quarter of an hour of the chair having been taken the meeting proceeded to the consideration of the two subjects that had been arranged for discussion. One of these was the definition of an amateur, and the other, methods of competition at public exhibition. The discussion on the first subject was opened in an admirable manner by the representative of the Radlett Society, and the second with a paper read by Mr. Jay, of St. Barabas, Sutton, which evoked considerable criticism. It is somewhat remarkable that the whole of the meeting should have been occupied by the discussion of questions that more immediately concern horticultural societies holding annual exhibitions, instead of some portion at least being devoted to matters that concern mutual improvement societies. One representative made a vigorous protest against the meeting having been devoted to exhibition questions.

Franco - British Exhibition Awards.—The list of awards made to British exhibitors at the Franco-British Exhibition has been published; and from this we learn that the following awards have been made in the classes for horticultural products and appliances. In Class 46 for trees, shrubs, and ornamental plants and flowers, the awards made were: Diploma for Grand Prize, Messrs. Sutton and Sons, Reading, and Messrs. James Carter and Co., High Holborn, W.C.; Diploma for Gold Medal, Messrs. Kelway and Son, Langport, Messrs. J. Cheal and Sons, Crawley, and Messrs. Carter Page and Co., London Wall, E.C.; Diploma for Silver Medal, Miss Babbington. In Class 48 for horticulture and nursery seeds, the awards were: Diploma for Grand Prize, Messrs. Sutton and Sons and Messrs. J. Carter and Co.; Diploma for Gold Medal, Messrs. Stead and Co.; Diploma for Silver Medal, Mr. J. Osborn. In Class 43 for appliances and processes used in horticulture and arboriculture, the awards were: Diploma for Grand Prize, Mr. Alex. Hamilton, Bromsgrove; Diploma of Honour, Mr. J. Burn; Diploma for Silver Medal, Messrs. J. Carter and Co., Mr. G. W. Riley, and Messrs. H. and J. Cæsar; and Diploma for Honourable Mention, Messrs. F. Reddaway and Co., Lim. In Class 58 for preserved vegetables, fruits, etc., the Horticultural College was awarded the Diploma for Gold Medal.

What Constitutes an Amateur?—This question was discussed at some length, and we hope with considerable profit, at the meeting of Gardeners' Mutual Improvement Associations, which was held at the Horticultural Hall on the 17th inst. The discussion was opened by the representative of the Radlett Society, who described what had been done by his society with a view to place the amateur in his rightful position. Considerable success, it would appear, had been achieved, but the practice that had been adopted seemed rather faulty. Other representatives proceeded to state their views, which were of a most divergent character, and the discussion soon made it evident that many of the difficulties that had arisen had been due to a failure to appreciate the fact that all who take an interest in gardening and do not regularly sell the produce of their gardens are amateurs. Much confusion has arisen from the practice that obtains in some societies of describing certain classes open to gardeners without restriction as to the number of men employed, others to gardeners with one or two assistants, and some to single-handed gardeners. Mr. Wilks, who presided, submitted a scheme for the classification of exhibitors who are not engaged in commercial horticulture, and, as this is based on the proper definition of an amateur, its general adoption would be an immense advantage. Briefly stated, Mr. Wilks divided amateurs into four classes, namely, those who employ a gardener with a considerable number of men under him; those who have a gardener with one or two assistants; those who employ a gardener without assistance, and those who do the work of their garden themselves, with or without occasional assistance. Mr. Wilks directed attention to the importance of great care in the drawing up of regulations relating to the classification of amateurs, so that there may be no ambiguity in the wording. At the close of the discussion Mr. Wilks promised to send a copy of his scheme to the societies in affiliation, so that the several committees may have an opportunity of fully considering it, and adopting it if they should be so disposed.

A Conference of Fruit Growers will be held at the South-Eastern Agricultural College, Wye, Kent, on November 27, under the chairmanship of Mr. C. W. Radcliffe Cooke, president of the National Association of English Cider-makers. "Insecticides" will be discussed by Mr. Spencer Pickering, F.R.S., "Spraying and Spraying Machinery," by Mr. E. S. Salmon, and "Grading and Packing" by a representative from British Columbia.

Purchase of Small Holdings.—It is not yet fully recognised that, in addition to the powers which are given to County Councils by the Acts of 1892 and 1907 for the purchase or hiring of land for small holdings, they are empowered by section 17 of the Act of 1892 to advance money to sitting tenants of small holdings to enable them to purchase their holdings. In this connection it is most interesting to learn that in consequence of the sale of the Penrhyn and Vaynol estates in Carnarvonshire sixty-eight of the tenants applied to the County Council for advances to enable them to purchase their holdings, and sums amounting to £4,436 have been advanced by the Council for the purpose.

SOME REASONS WHY APPLES SELL BADLY.

Speaking generally, there is a fairly plentiful supply of apples this year, and one hears the usual story when crops are up to the average, about glutted markets and low prices. This is the outcry at the moment of writing early in October—and yet I fully expect that a few months hence English apples will be difficult to buy and the markets will be mostly supplied with foreign fruit. It seems incredible that this country produces more apples than its population can consume, and even in a season of plenty one cannot help thinking that there must be something wrong with the methods of distribution when one hears that the prices received by the growers are insufficient to pay expenses, much less show a profit. Let us therefore just look into one or two of the causes of this unsatisfactory state of affairs.

Ungraded Fruit.

The other day we happened to be in a big fruit market in a West of England town where most of the fruit is grown in orchards in the vicinity, and is brought in by the farmers to be sold by auction. We happened to get into conversation with one of the latter, who was complaining about the miserably low price he had received for his fruit. It was barely enough to pay for the picking, and what, asked the man, is the good of spending time and trouble in looking after orchards if that was all the reward one got? On the face of it the argument sounded feasible, and we asked to see the fruit. There it was basket after basket, filled with apples, good, bad, and indifferent, all jumbled up together, even the varieties in some cases being mixed, and no attempt at sorting or grading. It may be added that the fact of the baskets being lined and the fruit covered with half-dirty newspapers did not improve the appearance of the fruit. We ventured a remark about the mixed state of the fruit, which was met with the response that it was no good bothering with it when the market was glutted with fruit, and there was nothing to be got for it. With that the man went on his way grumbling.

In the meantime we got into conversation with the individual who had bought the fruit, who was a dealer, by the way, and was about to remove the apples to a town in the Midlands. Would he sell them as they were? The man smiled, but there was a world of meaning in the smile. "Not quite," he observed drily, and went on to explain that the apples would be removed from the receptacles they were in to his own baskets. The best would be all put together, and he knew where he could place them, while the small and malformed specimens would go for what they would fetch, and if they fetched nothing he would get enough for the best samples to show a good profit. While he, shrewd man, was making this arrangement and seeing money at the end of it, the original owner of the fruit was enlarging on the rotten state of the apple trade to a little crowd of ready listeners who fully agreed with what he said. They were also growers, whom the dealers were quietly making a nice bit of money out of.

Proper Grading and Packing.

Most of the apples in the market were of the same rough and ready order, but we noticed a few baskets that were nicely graded and presented for sale in a pleasing manner. These samples certainly sold better than the rest, but the price was lamentably low, and one seller asked in all sincerity what was the good of going to the trouble of careful packing and grading when the fruit fetched so little more than that which was sold just as it came from the trees. The question was not an easy one to answer, but it can be explained why the really good apples only fetched so little more than the second-rate samples. There was a preponderance of the latter, which set the market in the manner that markets are set, and when the auctioneer came to a really good lot, the bidding became a little brisker, and the price rose a few shillings per cwt., but the average figure being fixed, as it were, the buyers would not go much beyond it, and got good bargains at the expense of the few men who had been careful in selecting and packing. What we contend is that if the whole of the produce in the market had been of the same high order, it would have fetched considerably more than the few lots referred to, and this the grower of good and graded fruit stands to lose when he sells it in a market that is practically made up of second and third-rate produce. In this case, of course, it was the buyers who got the benefit out of the care and trouble bestowed on the fruit by the vendors, and if the latter get discouraged and send in fruit of the same type as most of that in the market one can hardly be surprised. It is experiences of this kind which cause a levelling-down instead of a levelling-up; or, in other words, the value of good fruit is reduced owing to the overwhelming amount of rubbish that is offered for sale.

Selling Varieties in Season.

Just now local markets are glutted with fruit, and largely because growers will not go to the trouble to discriminate between varieties and dispose of the apples when they are in season. The prevailing anxiety seems to be to get rid of the stuff as soon as possible and have done with it. On the occasion referred to, we saw basket after basket of Blenheim Pippin, Bramley's Seedling, Wellington, and other varieties of this type, that would keep for months if carefuly stored, being sold side by side with apples that were ripe and fit for disposal. In regard to this point, it may be added that there are men who eagerly buy up late keeping apples, which are sold by auction as soon as they are picked, and after selecting the best samples they carefully store them and sell them about Christmas time when fruit is less plentiful and prices are better.

The Storage Question.

Thousands of apple trees have been planted in orchards and plantations during the past few years, and amongst them a large proportion of late-keeping varieties; but amongst those who have planted I wonder how many have made provision of any kind for storage. Doubtless this is done to a certain extent amongst those who make fruit growing a business, but in the case of farmers and also others, apple growing is one item, and in too many instances it is not treated seriously enough. There are apples in plenty just now, you can buy them for an old song; and under the trees in orchards may be seen fine specimens that have been allowed to fall, and if they are picked up at all they will go into the cider mill.

This is the state of affairs at the beginning of October; how shall we stand next January? In all probability, the stock of English fruit will consist of small scrubby little specimens that can only be called rubbish, and a certain quantity of picked, well-preserved specimens which are offered by those who do make a point of storing fruit for late sale, but the price then is generally too high for the man in the street. But he gets apples all the same when English crops

R.H.S. FRUIT SHOW—CULINARY APPLE, BEAUTY OF NORFOLK. EXHIBITED BY MESSRS. H. CANNELL AND SONS.

have been disposed of somehow, for in every shop where fruit is sold there is a barrel of foreign apples standing in the corner and the fruit at the bottom is as good as it is at the top. Is there any need to wonder that the foreign fruit grower has got such a firm footing in our markets when we consider the trouble he goes to over the details of cultivation, grading, packing, and shipment? It is said that it does not pay home growers to adopt the methods of the foreigner. This may be, but it would have done so if the former had been quick enough in the past to seize the opportunities which the latter has made the most of.

H.

CLIMBING ROSES UPON TREES.

In the excellent articles upon "Roses for Arches," and "Roses for the Rock Garden and Rootery" (pp. 730 and 732), there are many useful hints; but not a word is said for beautiful roses when used upon old tree stumps.

Pergolas, arches, and masses of roses are very handsome, but there is, after all, a certain amount of formality about them. Recently I was in a garden, part of which used to be an old orchard. Here and there a favourite tree has been left; in short, the trees have been weeded out from time to time until the last few are mere stumps, with just sufficient life left in them to retain a firm root hold. Irregular paths wind among these; and, wherever space admits, there are beds of herbaceous and other subjects in profusion. The owner styles it his "Wild Garden." An appropriate, and yet inappropriate name, for everything receives a little attention at the right time.

To get to my subject a little closer, there is nothing more pleasing than roses and a few other climbers among these old branches. Sometimes a little away from the path, at others almost overhanging it · and a little further on two or three old stumpy trees close together. Even if one wished to train the trees in a formal manner it would be impossible; and I am sure no art could improve upon the effect given by the irregular and invariably graceful forms taken by roses when supported upon such stumps.

Here we can grow our earliest and latest varieties. Even when not in flower they are far from unsightly. Nor is the fruit tree stump unpleasing early in the season, with its few blossoms mingling among growth that will presently be a mass of roses. Very little tying is needed; indeed, the less of this the better, as all we want is one or two stout pieces of cord or string to keep the main branches in order. The lateral growths carrying flowers will always find the most artistic positions for themselves; and the more these are left at random the better the effect.

In the excellent notes from Mr. Molyneux and Mr. Dallimore, most of the strong-growing varieties suitable for this purpose are named, but I miss one of the very best, viz., the Wichuraiana type, a pure white, in flower early, mid-season, and late. This is a picture in itself when growing from old fruit tree stumps. Trails of pure white, with showy golden stamens; the shining green foliage, and almost evergreen leafage are charming; a few stumps covered with this and with Jackman's clematis and the scarlet Flame Flower (Tropæolum speciosum), apparently planted without any idea of effect, yields a combination so good that one could not but admit Nature was the best guide in the matter of artistic beauty.

A. Piper.

FERTILISERS FOR GARDEN VEGETABLES.

There are no crops on which it is more profitable to use artificial manures than on garden vegetables, provided they are used in the right way and in the proper forms. Many failures with these concentrated fertilisers are caused by lack of knowledge of the simple principles of plant food.

Mr. A. D. Hall, director of the Rothamsted Experimental Station, says, in reference to this subject: "Artificial manures are powerful tools by which the development of the plant may be shaped by the gardeners along certain directions, but like all powerful tools they require to be used with knowledge and discretion or they will do as much harm as they can be made to do good." The great value of artificial manures is that they can be used to meet certain special difficulties of soil and climate in a manner that would otherwise be impossible.

Stable and farmyard manure, when used in sufficient quantities, almost invariably produce good results, while the unintelligent use of concentrated fertilisers did not do so well. In this way many gardeners were persuaded that there was nothing equal to farmyard or stable manure, which they continued to use in large quantities, paying in many cases fully twice as much for it as the plant food it contained was worth. There is no doubt but that stable manure is very valuable as a fertiliser, and in many cases is indispensable owing to its liberal supply of humus matter which concentrated fertilisers do not give; but at the same time the quantities necessary to produce the results now obtained could be greatly reduced by using artificial manures to supply the plant food, and only enough farmyard or stable manure to give lightness and friability, and to add humus to the soil.

Use of Fertilisers.

For crops like cabbages, beet, lettuce, turnips, spinach, etc., that it is desirable to force to rapid maturity, the form in which the plant food, and especially nitrogen, is applied is of the greatest importance. Many fertilisers sold for this purpose have all the nitrogen they contain in an insoluble and only slowly available form, so that it requires a considerable time for the plants to derive benefit from it. Another fault is that they do not contain enough nitrogen or ammonia.

Stable manure contains, on the average, in one ton weight, 10lb. of nitrogen, 10lb. of potash, and only 5lb. of phosphoric acid; while the average complete fertiliser, such as guano, contains more than twice as much phosphoric acid and nitrogen. The late Mr. Nesbit, F.C.S., estimated that one ton of nitrogenous guano was equal to 33½ tons of good farmyard manure or 21 tons of horse dung. A fertiliser for quick-growing vegetables should contain as much nitrogen as phosphoric acid, and at least half this nitrogen should be in the form of nitrate, which is the only form in which it is immediately available to plants. When farmyard or stable manure is used in addition to the artificial manures all the nitrogen applied should be in this form, and in most cases it is better to have it all in this form, whether stable manure is used or not.

The best manure for cabbages, cauliflowers, onions, turnips, carrots, etc., is a mixture of equal parts of nitrate soda and superphosphate. A small quantity of sulphate of potash should be added when the land is naturally poor or of a sandy character. The proportion of nitrate to superphosphate can be varied according to the kind of soil and previous manuring of the land. Soils on which farmyard manure has been used in considerable quantities for a number of years, and on peaty land full of decaying vegetable matter, the proportion of nitrate should be smaller than on sandy soil or on land that has not been manured properly, and contains only a small amount of vegetable matter or humus.

Bearing these facts in mind, it is easy to judge about what proportion of each material to use on the different kinds of soil.

Root Crops.

Root crops, such as turnips, onions, carrots, parsnips, etc., are generally manured. It is, however, quite possible to grow very heavy and excellent crops of these vegetables without any manure at all; but it is not, as a rule, desirable to attempt this. The actual food required by the crop can be easily supplied by artificials, but a moderate dressing of manure affects the temperature and moisture-holding powers of the land at a time when these considerations may be very important to the crop, viz., the time between germination of the seed and thinning out the plants. It is then that the plant is most subject to its enemies—whether insect pests or climatic influences; under such trying circumstances a manured area of young roots will sometimes pull through, when an unmanured area would fail.

This fact was well exemplified in the Rothamsted experimental crop of mangolds this year. At the same time it is a mistake to over-manure, simply because it is wasteful. About ten tons of manure per acre is to be regarded, generally speaking, as an average manuring for garden crops of roots. Less will generally suffice. But what is essential, unless we use exceptionally large dressings of manure, is a dressing of phosphoric manure put in with or under the seed. A vast accumulation of experience shows that root crops, and their relations, the cabbage tribe, require a plentiful and early store of phosphates in their young stages of growth.

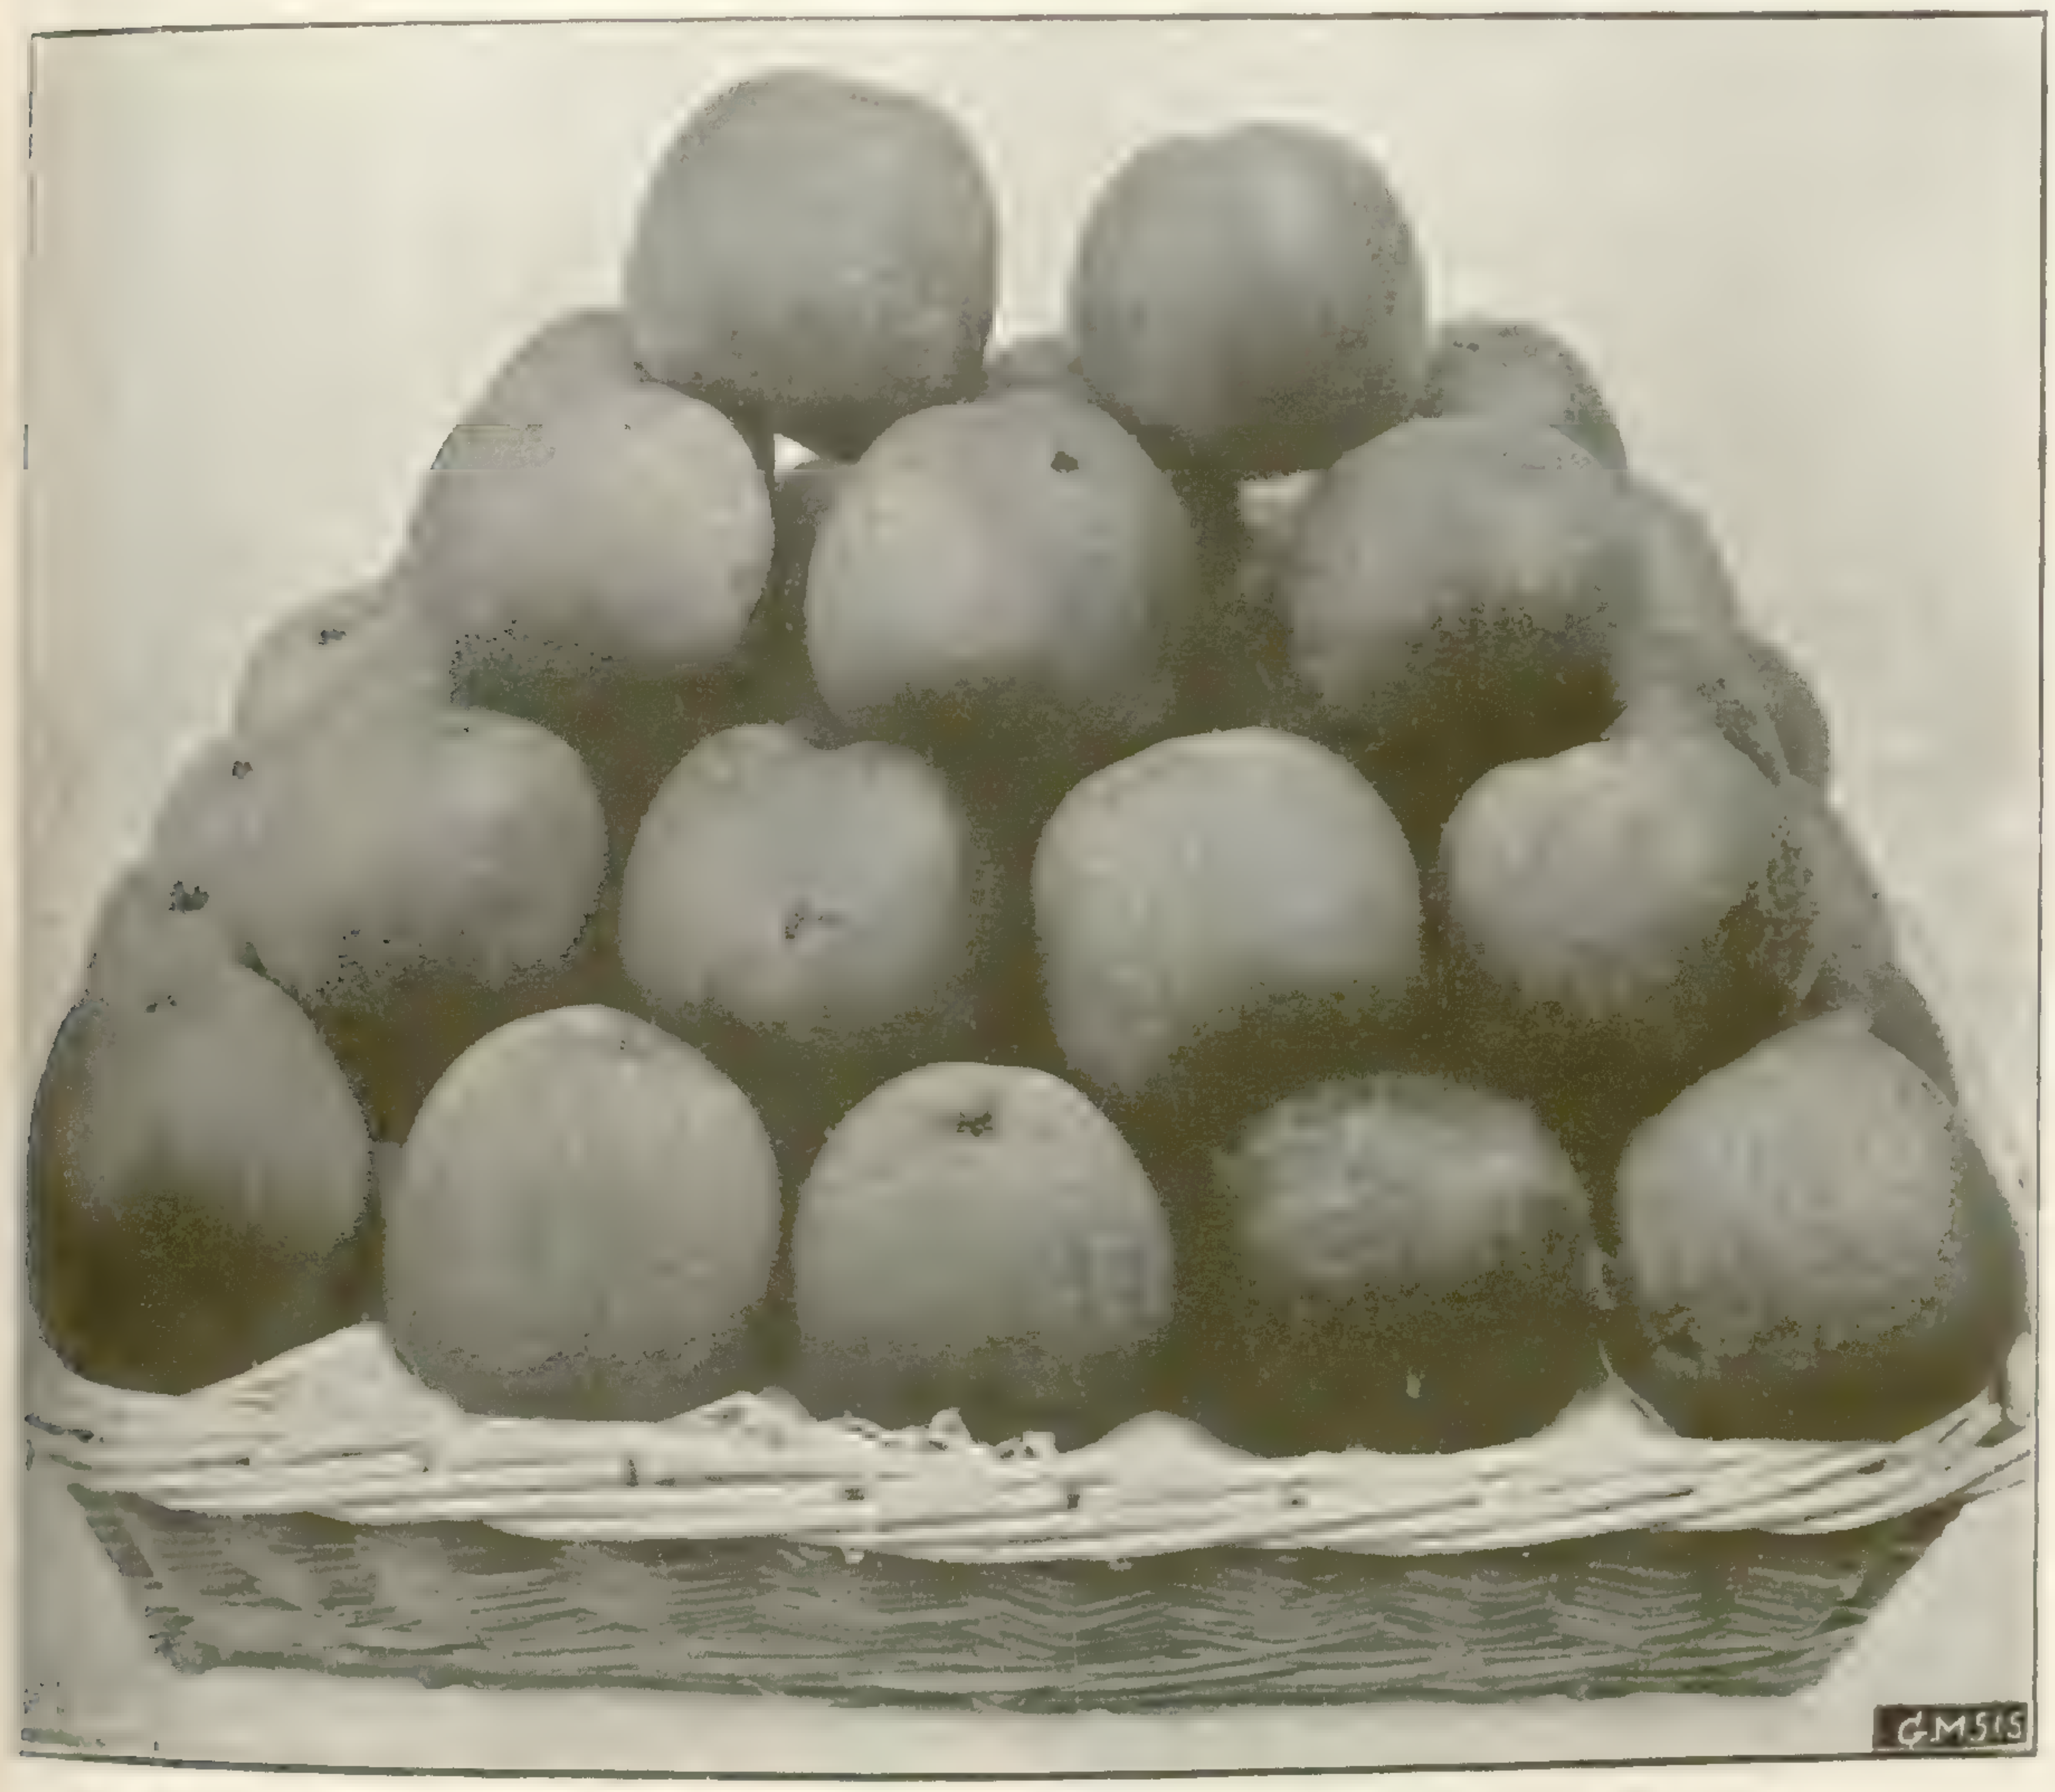
Harpenden. J. J. Willis.

(To be continued.)

Trenching.—Many of the crops will by now have finished, and they should be cleared off the ground. It will be too late to plant others, therefore early opportunity should be taken to trench the ground, with a view of securing an early crop next spring. Trenching is, no doubt, a slow process, especially where labour is somewhat limited, but if it can be done it more than doubly pays for itself. For instance, where peas are grown on deeply trenched soil, the haulm is stronger and grows to a greater height. There is more produce, of much better quality, and the season is more prolonged than on untrenched land. It is advisable to trench early and manure the ground well, so that it is in readiness for cropping in the springtime. Light, sandy soils should have the second and the bottom spits brought to the surface, but if the subsoil is clayey, thoroughly break up the bottom of the trench, and put in plenty of leaf-mould, wood ashes, and anything else that would tend to lighten the soil. Another method of dealing with heavy, retentive soils is to throw it up in ridges as early as possible, so that frost and air may reach it and bring it into better tilth. Spread the necessary amount of manure on the ground and work it in as the work proceeds. Wood ashes, leaf-soil, and road sweepings are excellent for improving strong soils.—T. W. Birkinshaw.

PROMISING NEW APPLES.

Mr. Charles Ross, the veteran raiser of so many new apples, has again been successful in securing the coveted honour of an Award of Merit for another of his numerous seedlings. Renown was exhibited on September 29 last, and is the result of still another seedling from Peasgood's Nonsuch crossed with Cox's Orange Pippin. The fruits are large, and take more after Peasgood's in shape, but are more conical than that variety; the flesh, too, is deeper in colour, and, from fruits tasted, it is of very good quality for dessert, although it is recommended as a kitchen variety. From trees seen growing in the gardens at Welford Park, viz., the parent and two grafted heads, its growth is free and healthy, and as fruitful as may be expected from young, vigorous trees. Mr. Ross has still more seedlings not yet fruited, but has already shown us several excellent varieties that in time will take a high place among the most popular apples to grow for use in quantity.



R.H.S. FRUIT SHOW—CRAWLEY REINETTE APPLE. EXHIBITED BY MESSRS. J. CHEAL AND SONS.

Miller's Red Victoria.

I should predict a far greater future for this apple than the variety known as Victoria, which is really very much like Lord Grosvenor in habit, and also in the fruit. So far as I have seen, however, it is not so large or so prolific as Lord Grosvenor, and has nothing to advance its claims over that variety. Red Victoria is a large, highly-coloured, handsome market apple very similar to large highly-coloured Gascoigne's Scarlet, it is, however, very different in the flesh to that variety, and the apple would be described as an Ecklinville Seedling in texture and earliness, but with its exceptionally fine appearance, it will no doubt be very largely grown, particularly as I understand that it is an extraordinarily free cropping variety. Certainly it should be tried in every district for market use. It has a distinct advantage in appearance over any early cooking variety now grown. When recently submitted to the R.H.S. Fruit Committee by Mr. C. W. Miller, Clarkson Nurseries, Wisbech, an Award of Merit was made in its favour.

Feltham Beauty.

This is a seedling raised by Messrs. James Veitch and Son, and is an early dessert variety of very good quality, ready for use during August, and larger than many of our very early varieties. Its parents, Cox's Orange Pippin and Gladstone are good. The offspring, in appearance, takes after Goodenough's Nonsuch, or good Lady Sudeley, as regards its colouring. It has been awarded an A.M., and ought to be given a trial amongst other of our early dessert fruits.

Langley Pippin.

This is another of the Chelsea firm's early dessert fruits, very sweet and of good quality, certainly much better than some of our older varieties, because it keeps in condition over a longer period.

Hector Macdonald.

This is likely to prove of universal merit. An apple with a very clear skin and bright colouring, with the hardened appearance of Annie Elizabeth. As seen growing and fruiting with the raiser, it has every quality to recommend it as a new, good, and vigorous variety.

Lord Stradbroke.

This is a very old apple, found growing in Suffolk. The tree is a very vigorous grower, and in some seasons an immense cropper. The fruits are large, ribbed, and in some years are black-red in colour. It is a late variety, with greenish flesh; valuable for its keeping qualities, and late market use. This was known formerly as Fenn's Wonder, but received an A.M. under the above name in 1905.

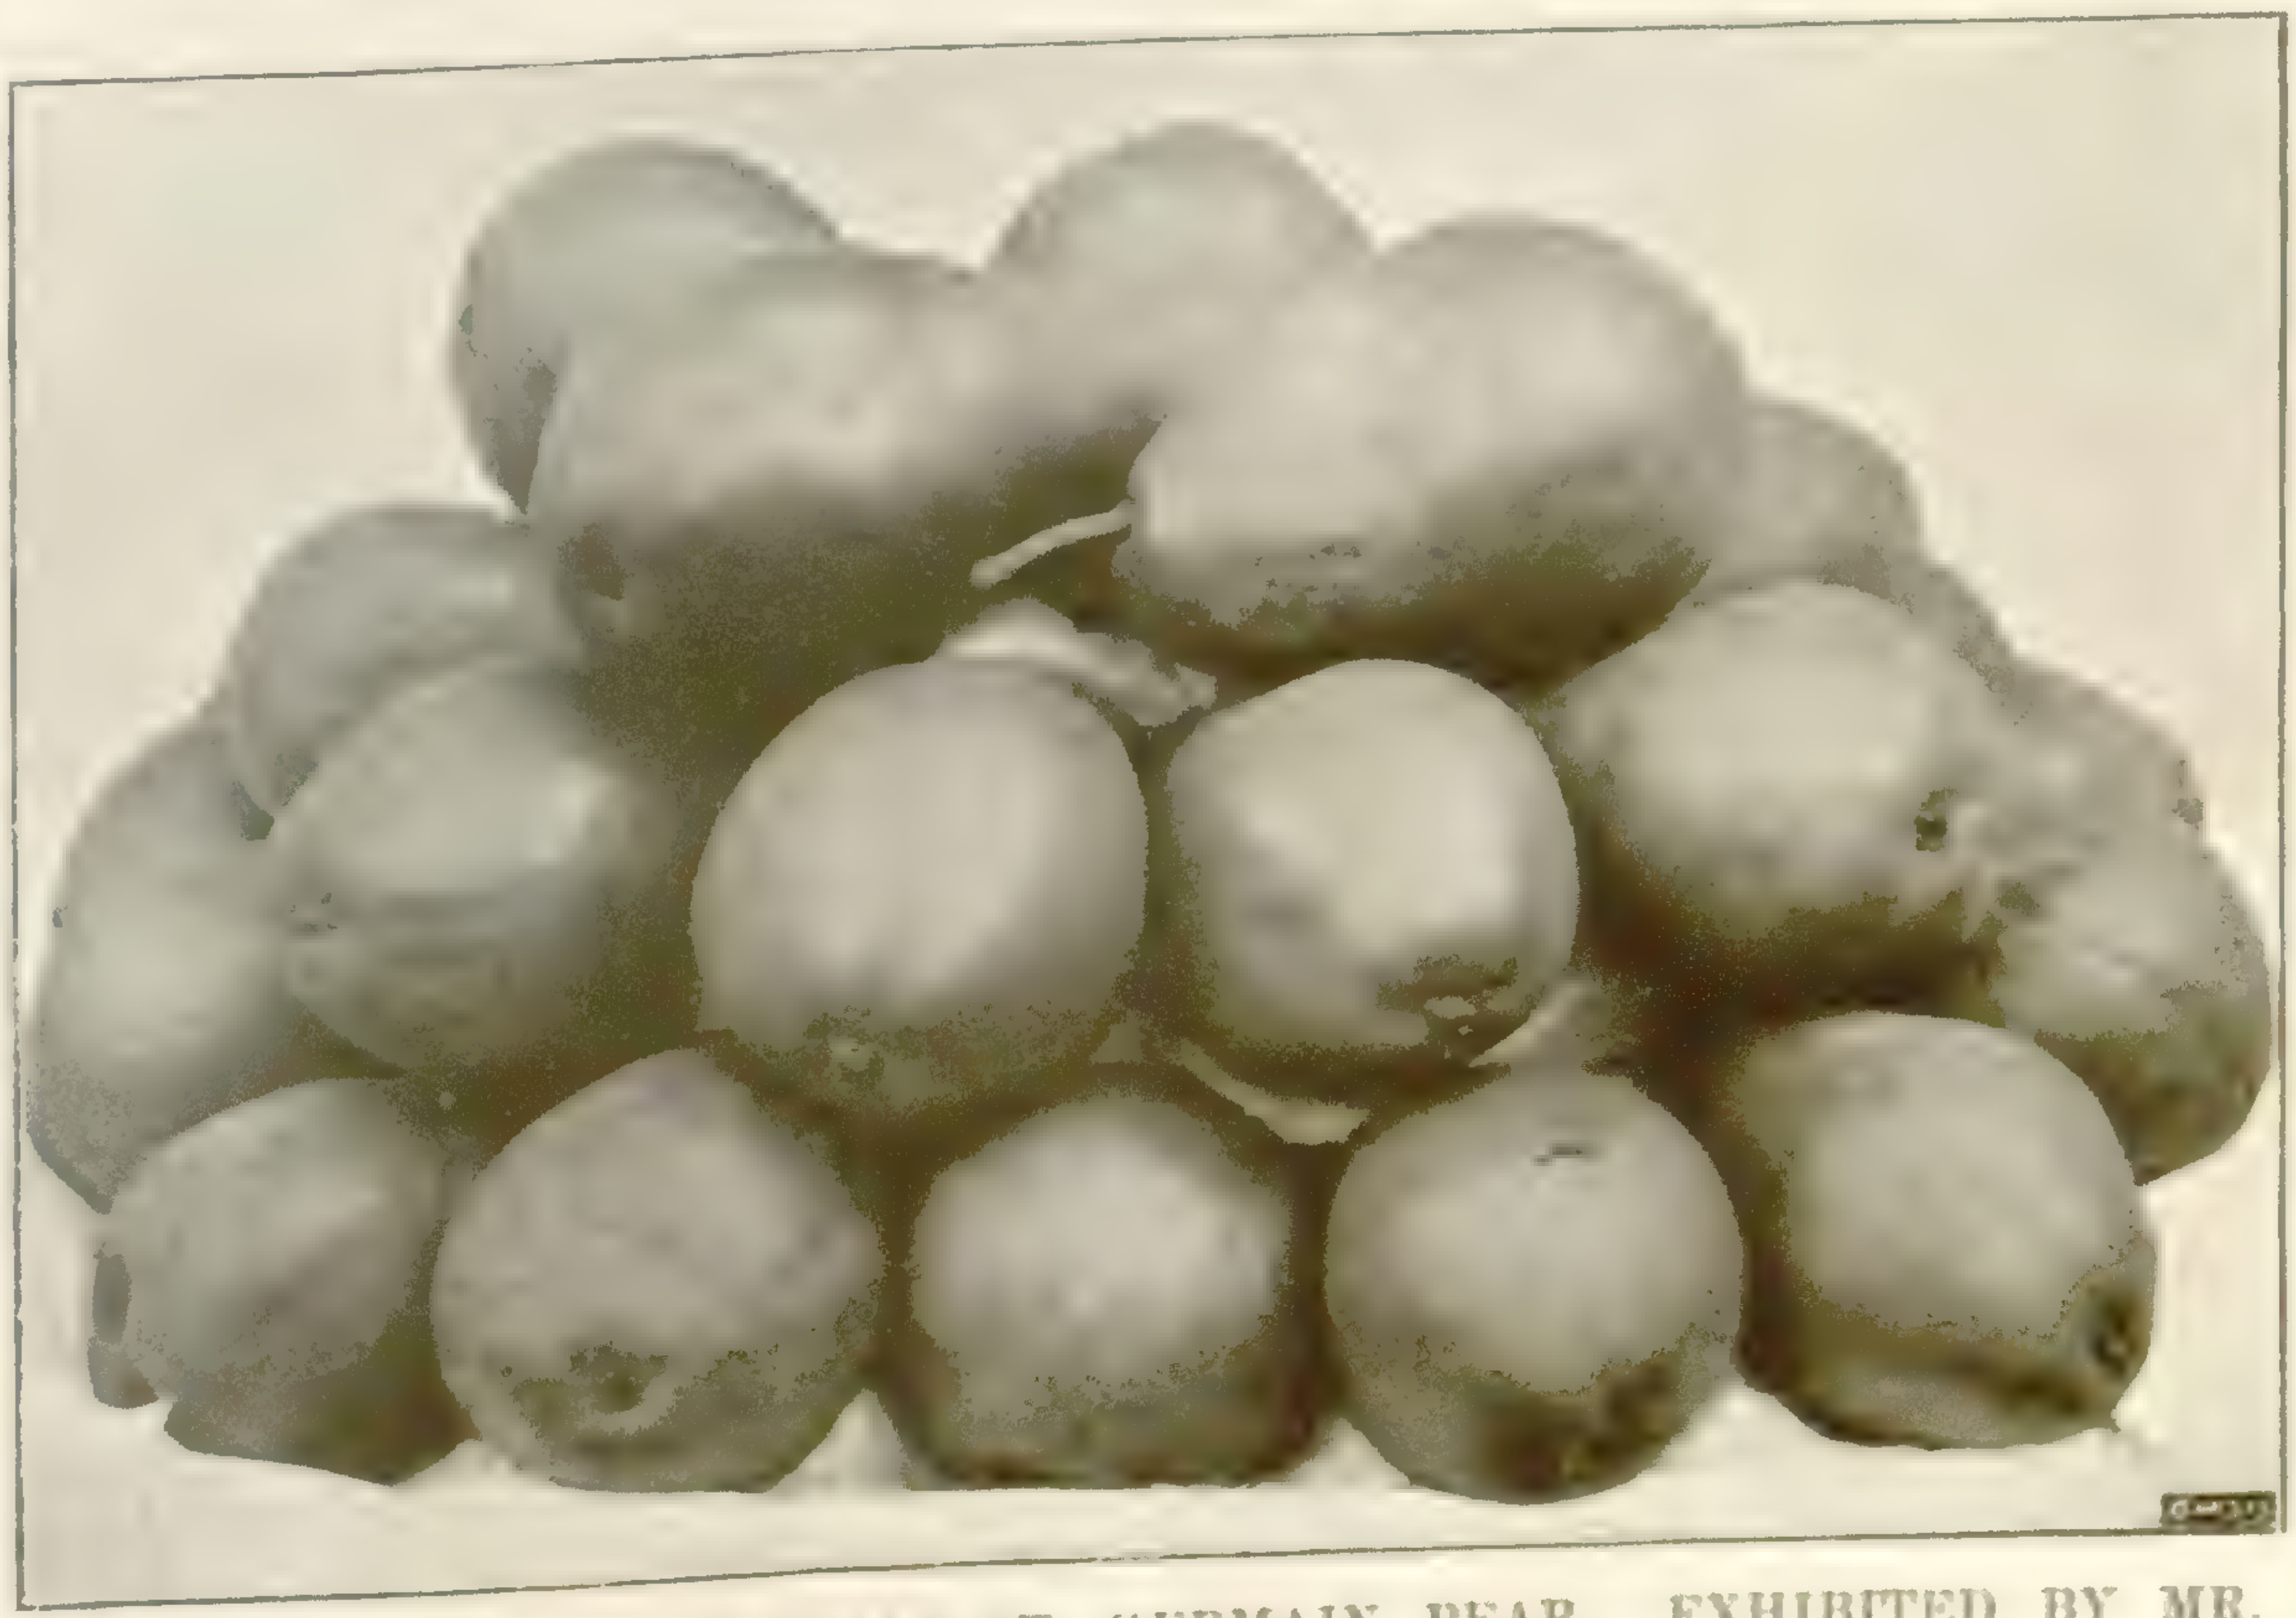
Ruddy.

Ruddy is another of Ross' seedlings, and likely to prove a valuable early market apple. It is the result of a cross between Ecklinville Seedling and Mère de Ménage, and like this latter variety, is very brightly coloured. Mr. Ross thinks a good deal of this apple, and certainly at Welford Park it is grand. The greatest drawback in connection with it is that birds are very fond of the fruit, which is soft. It is an excellent cooking apple.

Excelsior.

Excelsior has not yet left the hands of the raiser. Its appearance appeals to me very much, as it is one of those varieties that fills up well at both ends. The eye is open, set very shallow, and the stalk is very distinct, mostly set on one side of an enlarged base. The parents are Peasgood's Nonsuch and Duke of Devonshire. The variety takes more after Duke of Devonshire in its season, and also in colour, but is in every way superior, giving very fine, large, deep fruits, that were hanging upon the trees as late as October 5. From its appearance one might have expected Waltham Abbey Seedling to be one parent. I think this is a variety everyone will want to grow.

C. Foster.



R.H.S. FRUIT SHOW—UVEDALE ST. GERMAIN PEAR. EXHIBITED BY MR. W. TAYLER, HAMPTON.

RED OR GRIZZLY GRAPES.

In the ordinary course of things red grapes are an abomination, and especially when they ought to be black ones. When an amateur or a professional gardener cannot persuade the grapes they grow to colour up properly, then there is disappointment and sometimes a good deal of trouble also, while if the grower is also a competitor the red colouring proves a very serious handicap. The grower for market also finds that red grapes will not realise the prices that finely finished black berries of the same variety do.

But it is not of red grapes that are such because of some cultural defect that I would write, but of those varieties that are still red, or reddish, when finely finished. Of course, I am seeking after trouble in venturing to suggest that red or grizzly grapes possess any merit, because ninety-nine out of every hundred growers tell me that their employers will not look at red grapes, and, when I was at the old Chiswick Gardens, and discovered that red or grizzly grapes were, in many cases, of unusually high quality, the late Mr. Barron quenched my ardour by declaring most emphatically that it was next to useless recommending these varieties, simply because most folks preferred fine appearance, i.e., black or amber berries, even though they lost something in quality.

Of course, I have no quarrel with Muscat of Alexandria, Madresfield Court, and Black Hamburgh, and Muscat Hamburgh grapes, except it be that they so seldom come my way nowadays; nor do I forget the merits of such delicious grapes as Ascot Citrionelle, Strawberry, etc., but I want to put in a plea for the red grapes in the hope that some may be tempted to try them, and that those who have tried them may be induced to state with what success. It is interesting to remember that Mr. Barron's selection of seven varieties of "grapes of the highest quality" consists of five white and two red varieties—not a black one among them!

One of the finest, perhaps the finest, grapes in the newly-formed collection at the R.H.S. Gardens, Wisley, is Muscat Champion, and yet, I wonder if it is cultivated in more than a dozen or two of gardens. I visit many gardens annually, more than most people, and yet I never hear the praises of Muscat Champion sung. Those who saw the Wisley bunches recently must acknowledge that this red grape is of fine appearance, and those who have tasted it know full well that the quality is exceptionally high. Both in bunch and berry it attains a fine size. The variety was raised by Melville, at Dalmeny Park, and is the result of crossing Mill Hill Muscat with Cannon Hall Muscat. At the exhibition recently held at the Franco-British Exhibition at Shepherd's Bush, I saw and tasted a fine red grape of somewhat similar character to Muscat Champion. It was shown by Mons. Louis Gravel, from Chateau de Bouffar, Aix, and was named Angelino, a name I cannot find in Hogg's or Barron's works. The flavour may be scarcely up to that of Muscat Champion, but Mr. Charles Pearson, of Lowdham, and I agreed that it was a splendid variety, and one well worth testing under glass in this country.

Grizzly Frontignan, judging from the fact that it is seldom met with now, must be fast disappearing from general cultivation, but those who love good things, and believe that the proof lies in the eating rather than in the appearance, need not to be reminded that this is one of the finest of grapes from the point of view of high quality. Dr. Hogg considered the correct name to be Red Frontignan. It is not so red in colour as Muscat Champion, but is a yellowish grape prettily clouded over with red.

Barbarossa, the true Barbarossa—and not the monstrosity so often shown as it, but which is Gros Guillaume, and, in my humble opinion is only fit for making a display at harvest festivals—is another fine red or grizzly grape with Muscadine flavour, only more so. This appears not to be in cultivation in this country, but I feel quite sure it was shown by some of the French growers recently, at Shepherd's Bush, as Uva Barbarossa. It has been described as "the king of dessert grapes."

There is no need to labour the point. All red grapes are not necessarily good, but some of the finest grapes are to be found among the red ones. Other varieties beyond those named are Madeira Frontignan, first imported from France by the Messrs. Rivers, of Sawbridgeworth, and at one time grown in the Chiswick collection; Ahbee, an Indian grape of no special merit beyond its handsome appearance; Chasselas Rouge or Red Chasselas, a sweet water grape suitable for a cool house; Gromier du Cantal, a lightly grizzled variety, large-berried, but a poor keeper; and Lombardy, a very large and handsome grape, but of second rate quality and one that was raised at Wantage from the seed of a dried raisin and exhibited before the R.H.S. as far back as 1812 by Mr. Wilmott, of Isleworth.

Chas. H. Curtis.

ROOT PRUNING AND LIFTING FRUIT TREES.

I do not think that the root pruning and lifting of fruit trees are practised half as much as they should be, seeing how very frequently we meet with trees strong and apparently healthy, but which rarely produce even a moderate supply of fruit. Young trees, if they have only been planted a few years, I prefer to lift bodily and replant them again, believing that by lifting the whole of the roots, pruning them, and then laying them in fresh suitable soil at a nearer distance to the surface, better results follow. Peaches, plums, cherries, pears, and apples all readily respond to this treatment; when the work is carefully done they soon begin to yield heavy crops.

It is not strong coarse growth that is required on fruit trees, but medium, firm, short-jointed, and well matured shoots, and to secure these there is nothing for it but to lift the roots with all care possible, prune them, making clean cuts with a keen-edged knife, and replant them. The immediate effect is a reduction of the supply of nourishment, a less rapid development of shoots, and the formation of flower buds instead of wood buds. I have for many years practised the lifting and replanting of all kinds of fruit trees, bushes, espaliers, cordons, and standards, with first rate results, young trees being quickly brought into a state of bearing, and old ones made to produce clean, good-sized and highly flavoured fruits.

As the best time for lifting and root pruning is at hand, I would strongly advise that there should be no delay in commencing the work and pushing it forward before the soil becomes cold. Though at any time during the autumn and spring root pruning can be satisfactorily practised, the earlier after this date it is proceeded with the better, as it then gives time for the callusing of cuts and the formation of new roots before the end of the season. With regard to wall trees—in fact, all trees—if the roots and soil are dry, it will be advisable to give them a good soaking with water a day or two previous to lifting. Then dig out a trench three to five feet away from the stem, according to the age and size of the tree; let the trench be two feet wide and two feet deep, then work gradually towards the tree, removing the soil from among the roots with great care. All roots which may have penetrated the subsoil should be cut, and trimmed back a little. Work well beneath the ball of roots and then gradually raise the tree. Cleanly cut all jagged wounds and relay the roots in fresh sweet soil at various depths and at different angles. Make the new soil firm as the work proceeds, and should the weather prove dry and the soil be in need of water give a good watering.

The shoots and branches of the trees, having already been unfastened from the walls, should then be carefully secured against damage by wind, but in a way that the whole of the tree may sink with the soil.

When lifting trees early in autumn, and when they are still in full leaf, the heads and stems should be well syringed two or three times daily in bright weather, as this will greatly assist the young wood and enable the leaves to hang much longer than otherwise. I have lifted very large trees in the first week in October, with excellent results; in fact, with the exception of a better growth the following season, no one would ever have imagined they had been taken up and replanted the previous autumn. Lifting should be practised in all cases where trees are apt to break away into coarse wood during the second year, and again probably two seasons after, but when once the growth is checked, and is of a suitable strength to produce fruit no further attention in that direction is needed. I am more than satisfied that in many cases too much attention is paid to the tops of the trees and too little to the roots. A tree with reasonable growth and plenty of healthy fibrous roots as a rule will arrive at a good bearing state in a comparatively short space of time. Hence my advice for keeping the roots fibrous and near the surface where they can in due course be well supplied with suitable food.

Larger trees, which rarely produce fruit satisfactorily, can, if they are good varieties, be vastly improved by taking up the roots and pruning them, but in the case of such large trees it is well to do half the work at each operation so as not to check the top growth too severely the first year. When operating on old trees, every care must be taken to see that no descending roots escape attention, and with such trees that are too large to lift, after cutting a descending root, and to prevent further trouble, it is a good plan to push a piece of tile or slate just below the cut. The drainage should be made good, and all the roots should be trimmed and relaid in good soil. Turfy loam, old brick rubble, burnt earth, and well decayed manure, with a good sprinkling of crushed bones will suit the growth of most fruit trees. After the work has been made complete, mulch well with short manure, rather strawy than otherwise. Standard apples can be treated, if only a few years planted, but, as a rule, if the trees were carefully planted at first, the roots being neatly spread out near the surface, with plenty of room for the extension of the shoots, such trees soon bring themselves into a good bearing state.

H. Markham.

Wrotham Park Gardens.

DAHLIA NOTES.

In the Gardeners' Magazine of October 3 attention is called to the dahlia difficulty, or in other words, to the necessity of holding dahlia trials on the same lines as those adopted with sweet peas by the National Sweet Pea Society, not so much to test the flowers themselves as to select the best varieties for general garden decoration.

The trials that have been carried out at Wisley have not been successful from a dahlia fancier's point of view, neither do I think they have taught us much. Such trials should be carried out in a more accessible place, and in any case the trials should be continuous, for the number of good garden varieties are, to say the least of it, very limited. One has only to walk through a collection of a hundred varieties to observe how few there really are of garden decorative value.

This failure or limitation has undoubtedly been brought about by the craze for size, which has been all too apparent during the last five years. Raisers produce flowers for exhibition purposes only, but I sympathise with them because the so-called garden varieties are never seen by the flower-loving public, consequently, there is little or no demand for them, and it does not pay to produce new varieties that do not sell. I am sure that many good garden varieties are thrown on the rubbish heap annually because they are not large enough for trade or exhibition purposes.

To make the cactus section really popular we shall have to produce a hardier plant, one that will flower earlier in the season, and one that will give flowers that do not collapse so soon when cut for decorative purposes, and this popularity will not be attained until the National Dahlia Society gives encouragement in the right direction.

There is plenty of material to begin with, for we have many varieties with good stiff stems, which could be improved were it in the interest of the raisers to do so; at present the reverse is the case.

It is to be hoped that the valuable suggestions as to a trial ground, made in the issue referred to, will not be lost upon the National Dahlia Society.

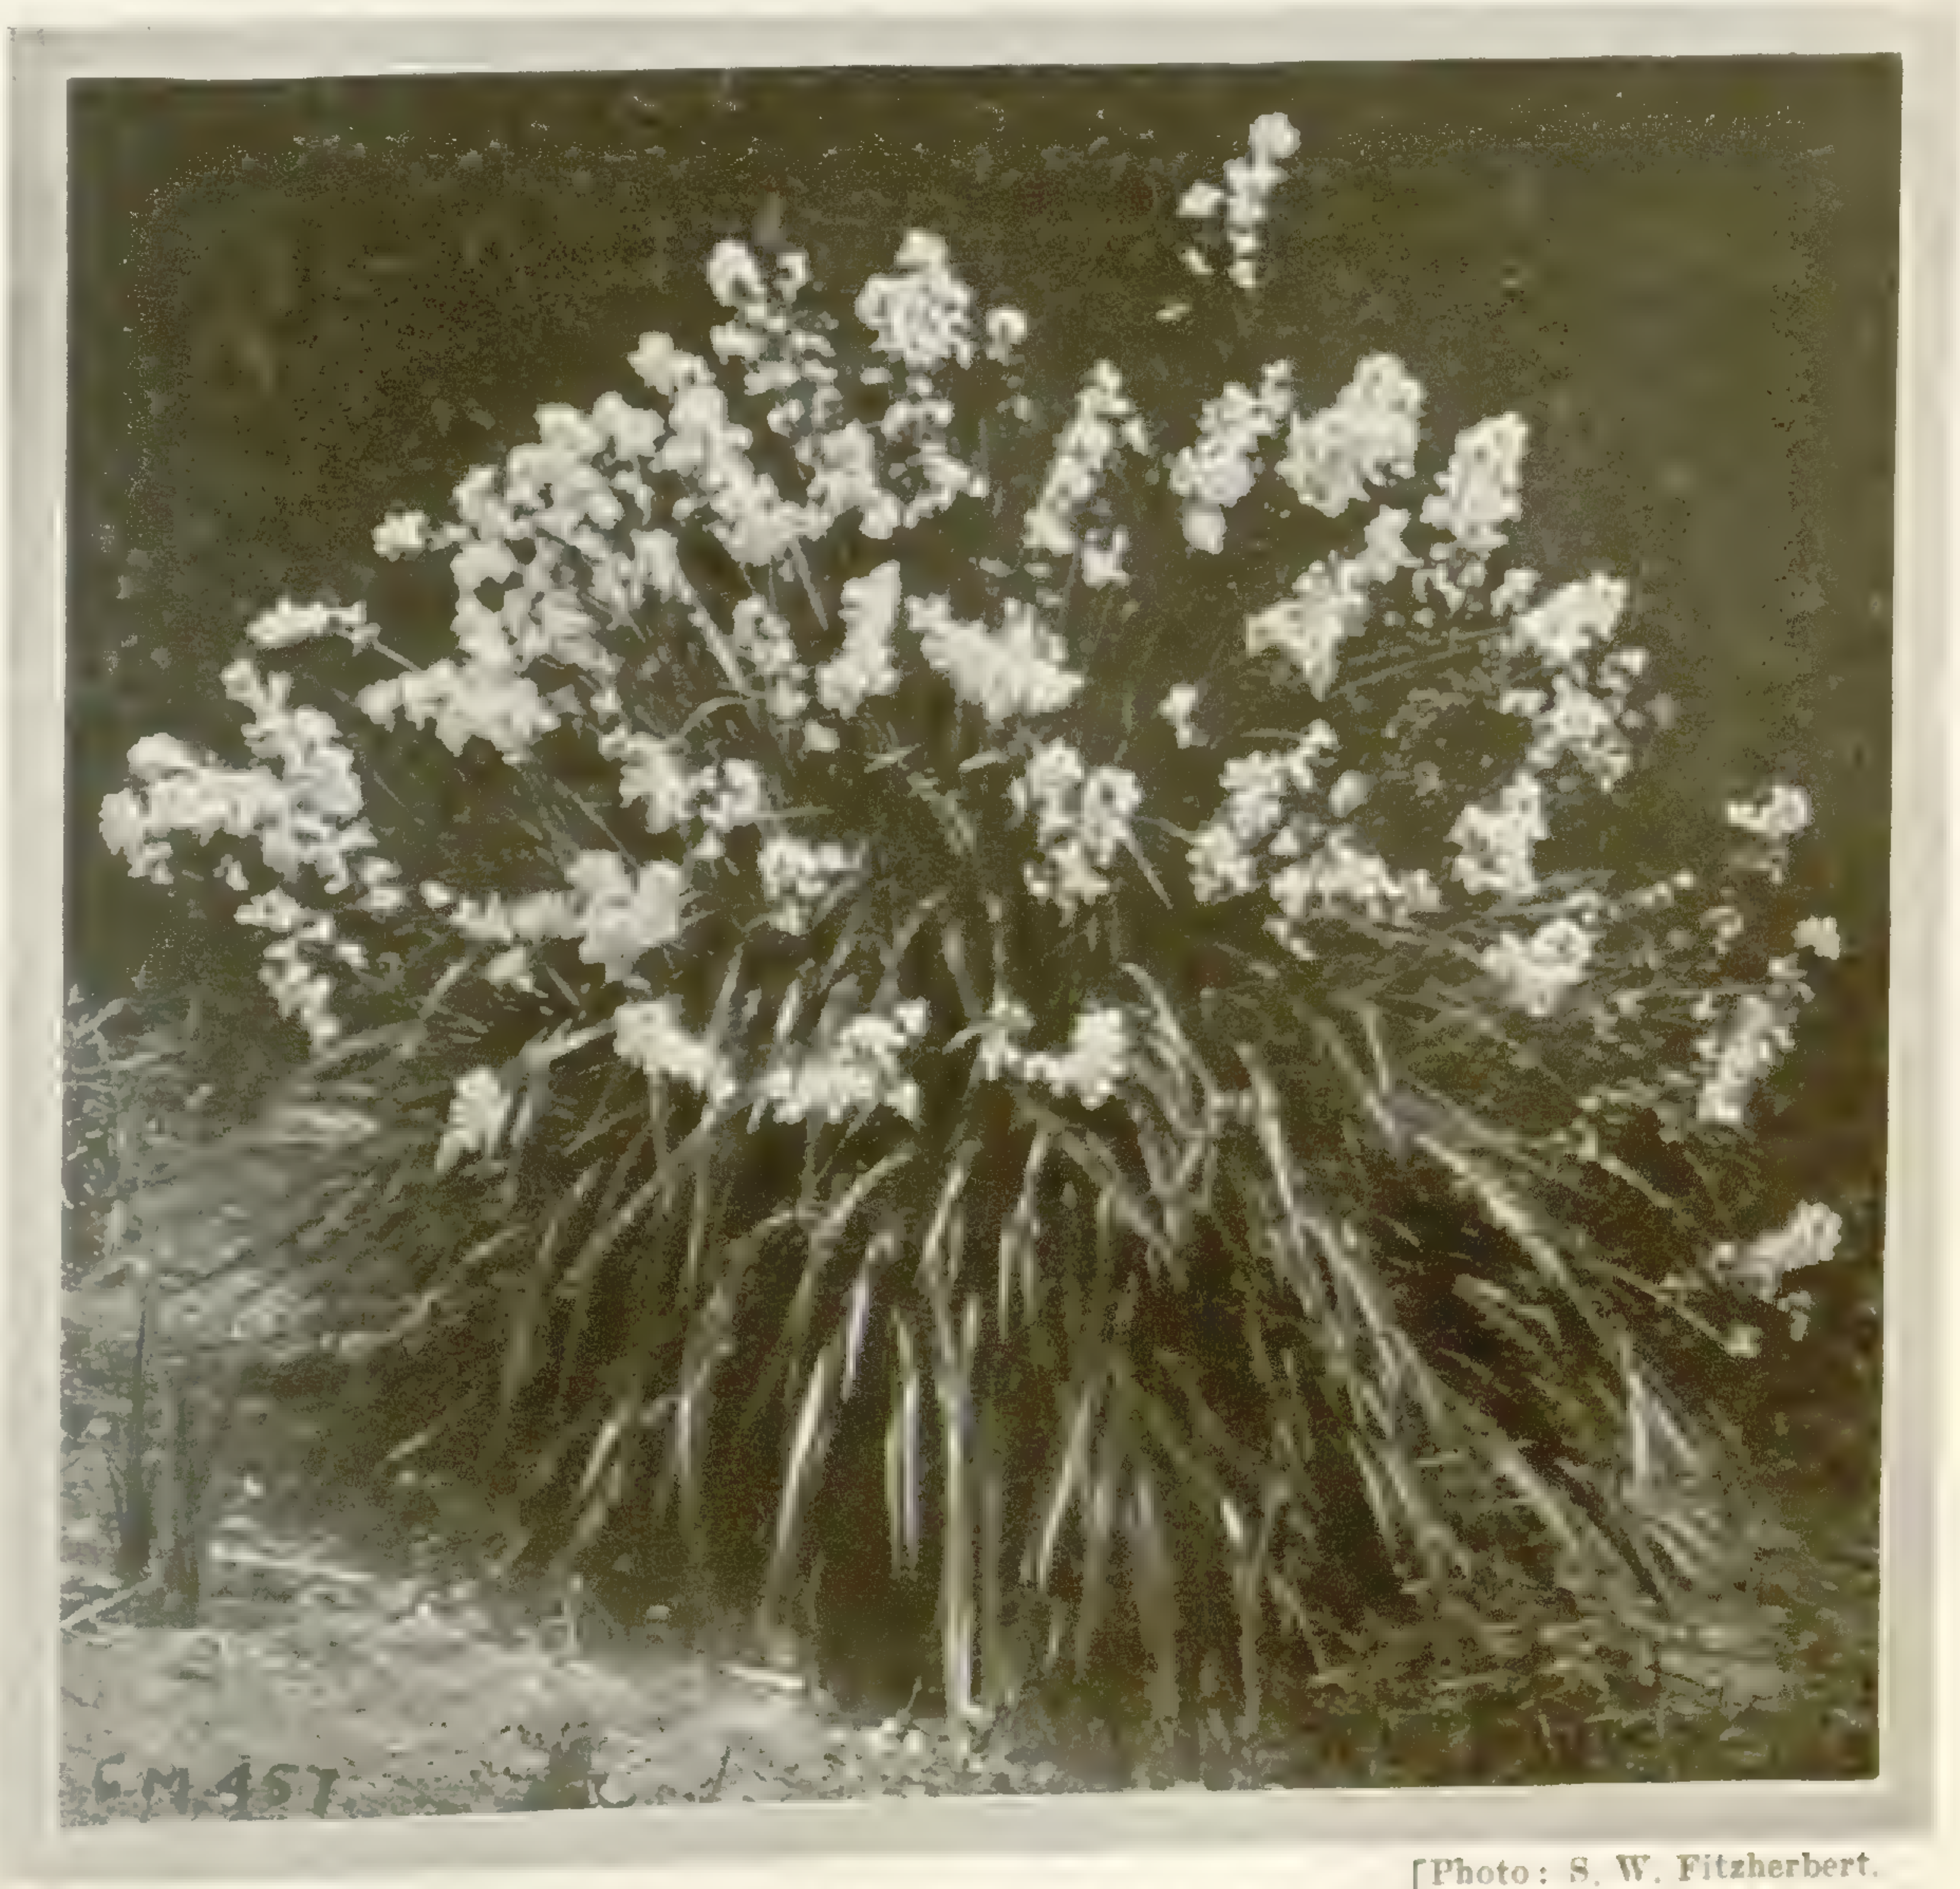
J. B. Riding.

Eremuri and Ostrowskia are among the noblest of perennials, and both have tuberous or fleshy roots. They ought [illegible] planted while some warmth remains in [illegible] ground, and it is advisable to protect [illegible] crowns during the first winter. Select [illegible]ions where the morning sun does not [illegible] them in early spring, as their growth [illegible] developed at a season when frosts are [illegible]alent, and rapid thawing by sunshine is [illegible] to destroy the young shoots and [illegible].—Thomas Smith.

Gruss an Teplitz Rose.—As a [illegible] of your valuable paper I thought it would be interesting to relate that I have growing in my garden a Gruss an Teplitz [illegible] with over a hundred buds on it (October 4), and if we are so fortunate as to be [illegible]ed with a continuance of this delightful weather for another week or two there [illegible] no reason whatever why the rest of the [illegible]s should not properly develop. I suppose [illegible] attribute this to the summer-like [illegible]ther we are experiencing at the present [illegible]ment. But for the webs which the spiders [illegible] assiduously and wondrously weaving [illegible]his period of the year, suggestive of [illegible]tumn, one would imagine that we were [illegible]ring the rose season; I have now about [illegible] dozen blooms on this bush alone. In [illegible]pinion Gruss an Teplitz is one of the [illegible], if not the finest, hybrid tea-scented [illegible] that we have extant.—Rosa, Manor [illegible]k.

LIBERTIA FORMOSA.

This lovely spring-flowering plant is a native of Chili, whence it was introduced in 1831. It appears to be fairly hardy, as it has been recorded as succeeding as far north as Berwickshire, where it was said to grow to a height of between two and three feet, and to flower freely. It will not, however, flourish in all places, and generally fails in heavy retentive soil of a clayey nature, but in warm soil of a porous character it is almost always a success. The individual blossoms are pure white, three-petalled, and rather under an inch across, often covering the end of the flower-spike for the length of a foot. They are borne in May, and remain in beauty for some weeks.



[Photo: S. W. Fitzherbert.

A FINE SPECIMEN OF LIBERTIA FORMOSA IN A DEVONSHIRE GARDEN.
Flowers pure white.

Even when out of bloom the plants are by no means unornamental, their long, tapering leaves, erect in the centre of the clump, and gracefully arching to the ground on the outside, having an elegant effect. It is a very rapid grower, a small root-division attaining a height and spread of three feet in four years, and bearing upwards of two hundred flower-spikes. In the gardens at Abbotsbury Castle, Dorsetshire, it is grown in quantity in the neighbourhood of water, and does remarkably well, and in another garden in Devonshire it is grown on both sides of a streamlet, and has spread over many yards of ground.

That water is not indispensable for its successful culture is, however, shown by the specimen figured in the accompanying illustration, which is growing on a slope in an exceptionally dry garden in hot and stony soil. This example was planted as a small offset eight years ago, and now has a circumference of more than twenty feet. Its leaves are over three feet in length, and its flower-spikes are nearly five feet in height. Some hundreds of bloom-shafts are carried every season, and a beautiful picture is created. Numberless self-sown seedlings have sprung up round this plant, which have been lifted and given away to such as required them.

S. W. Fitzherbert.

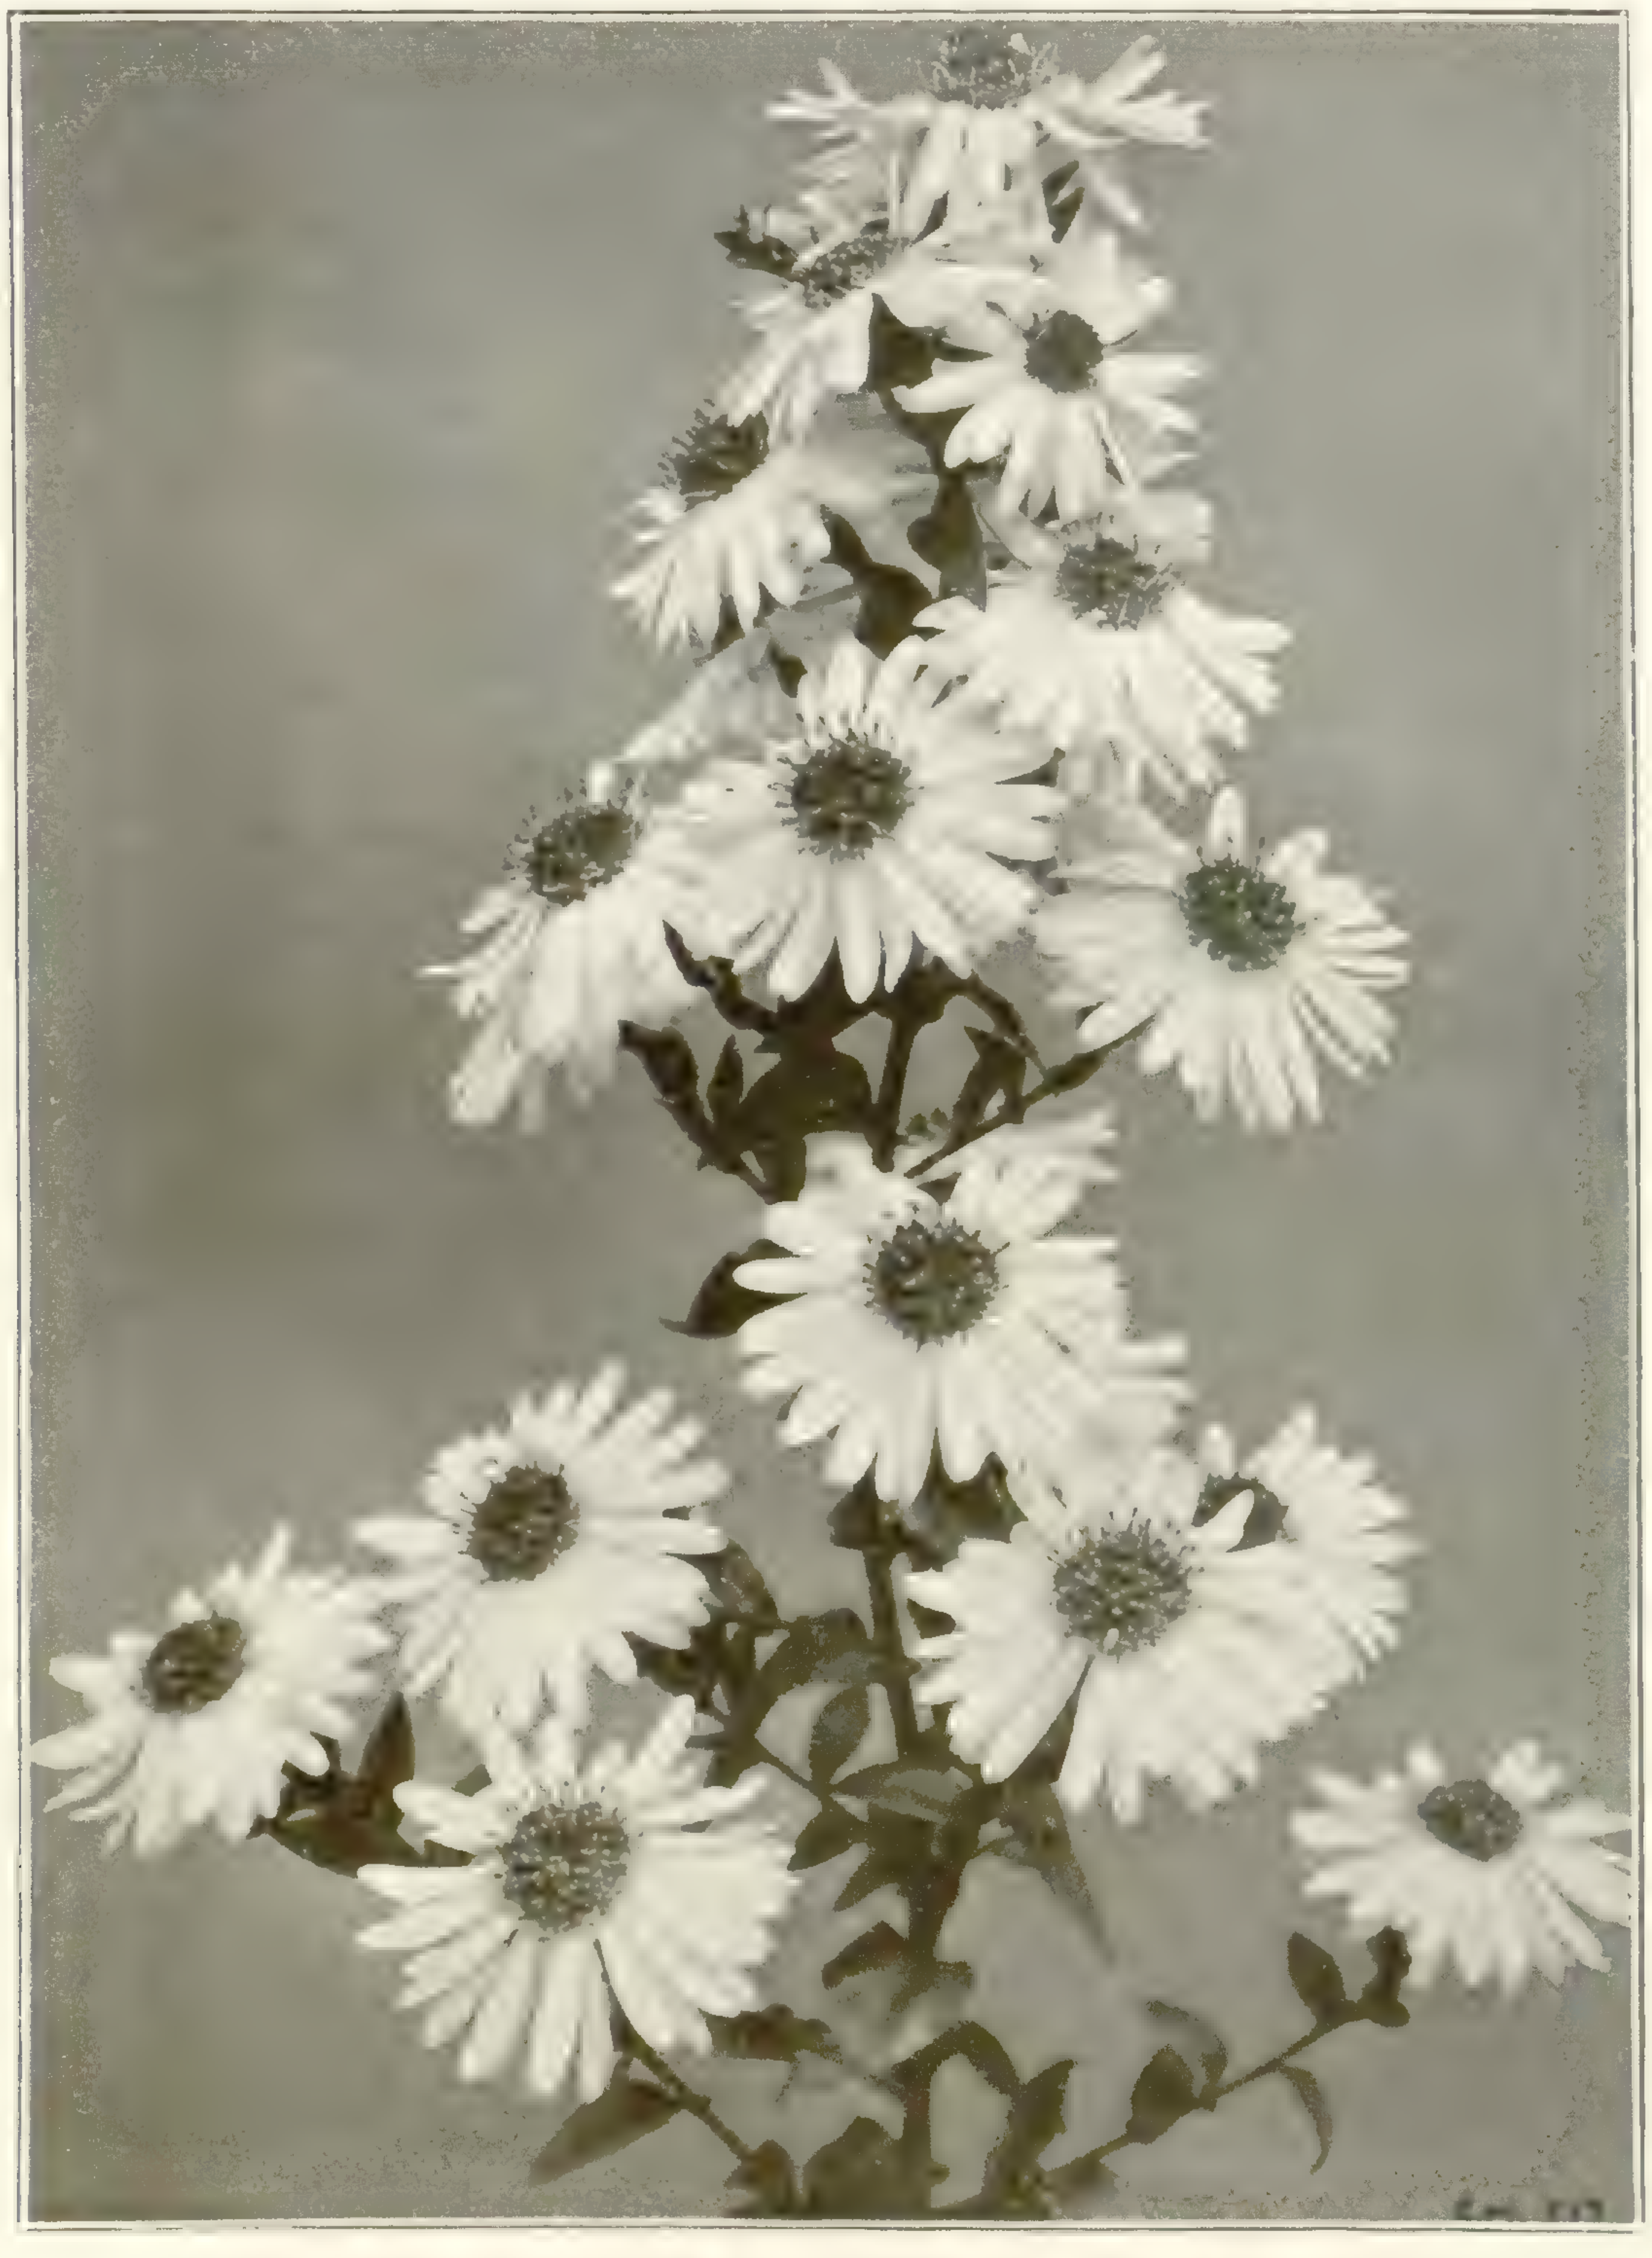
ROSA SERICEA VAR. PTERACANTHA.

Rosa sericea is a very variable species, and recent explorations in China have revealed several very distinct forms, which, in many cases are distinctly attractive. The type is recognised by its four-petalled cream-coloured flowers, which open near London earlier than any other rose, flowers frequently being borne during April. The variety under notice is remarkable by reason of its large, bright red, almost transparent spines. These spines cover the branches thickly, and are interspersed with red bristles. The flowers are hardly so large as those of the type, but they are followed by rich orange berries, which form a pleasing contrast to the red spines. Between this and the type there are many intermediate forms, some of which are worth growing for their attractive fruit alone. Although the type may be grown successfully in comparatively poor soil, the variety pteracantha must have rich food material to bring out the spines to their fullest extent. It is somewhat difficult to propagate from cuttings, but may be grafted or be grown from seed.

Kew. W. D.

FRUIT STORAGE.

The storage of fruit, especially apples and pears, is quite an important detail in fruit production, not only to the private gardener but to those concerned in fruit culture for profit. To the latter the proper storing of apples may make a considerable difference, for it permits the disposal of a quantity of fruit at Christmas, and the price is better than that obtained when the fruits are gathered early in October. For instance, take a large crop of Dumelow's Seedling (Wellington) or Bramley's Seedling, at picking time. In some localities the best price obtainable for such sorts as these is 5s. per bushel of 48lb., whereas in three months hence the price may easily be doubled, especially now that Bramley's Seedling is becoming so well known for its fine quality. The end of September and the first two weeks in October form about the worst season to sell apples in a general way, for usually at that time there is such a quantity of inferior fruit on hand, consequent upon the general ingathering and a thorough overhauling of the better fruit for storing.



NEW MICHAELMAS DAISY (CLIMAX).
Exhibited by Mr. E. Beckett, V.M.H., at the R.H.S. meeting on the 13th inst., when it received an Award of Merit. Flowers very large, soft blue. (See New Plants.)

To the gardener, amateur, or even the cottager, the question of fruit storage is an important item when but a limited quantity of fruit is available, and that is expected to last a considerable time. Seldom is the ordinary garden fitted with what may be termed an up-to-date fruit room, a rustic looking isolated building, with an over-hanging roof thatched with Norfolk reeds for the sake of its coolness and durability. No doubt such a structure is a distinct boon to many, but not many gardeners are fortunate enough to participate in such a luxury. An ordinary shed, situated at the back of a south wall often has to do duty for a fruit room, and right well it serves the purpose when well managed.

The chief points to observe about fruit storage are careful handling of the fruit, gathering it at the right time, and an entire absence of examples that exhibit the smallest sign of decay, as such contaminate perfect samples. The common method of arranging the shelves in an ordinary shed fruit room is that of narrow strips of wood with a space between each so that a current of air is constantly passing about the fruit. This, I am certain, is not a desirable method, as too much air in close contact is liable to produce shrivelling, a loss of flavour, and general deterioration. The floor of a cool cellar is considered to be an ideal place for the storage of fruit, especially apples. If this is so, and I do not think it will be doubted, then the lattice shelves suspended in mid-air cannot be of equal value for the preservation of fruit in the best possible manner. I often notice, too, those who have these lattice-made shelves very often cover them with brown paper, which is an indication that they wish to limit the quantity of air about the fruit. One of the cheapest structures, and certainly one of the best fruit stores that I have seen is at Rookesbury Park. The soil there is of a sandy character, and a site on a bank under some trees and hidden from view by Rhododendron ponticum was selected. The space, 20ft. by 12ft., was dug out, the sand forming the walls. Larch posts were used for uprights, rafters, and stage supports. A thick coat of straw thatch was put on the roof, coming down on to the bank at the sides and end. On each side of the entrance the sand was banked up, making the whole quite air-tight. Ventilation is provided at the top, at each end, with a hit-and-miss shutter, double doors being provided for the entrance. The floor is of sand, and the shelves are erected on each side of a central path. Abundance of room is provided for fruit, which can be kept in an even temperature of 45 degrees without any risk from frost after the first sweating of the fruit has taken place. Clean deal shelves, well seasoned, are provided for the fruit. In this structure, which is quite an inexpensive one, the fruit keeps admirably. The cool and equable temperature maintained so easily by its position, and the fact of the floor being of a cool nature, renders the storage of the fruit quite a success.

When gathering the fruit, apples or pears, they should be at once graded to save further handling, and if the quantity is more than the space at command will accommodate, layers of three thick can be arranged. In this way the fruits will keep as well as those laid out singly. I need hardly say the smallest, bruised, cracked, or otherwise disfigured fruits should be at once removed for use, as they are detrimental to the keeping of the sound ones. Abundance of air should be provided until the first sweating has taken place, but after that darkness should prevail, and an equable temperature, as near 45 degrees as possible, should be regularly maintained. Seldom is it necessary to provide artificial warmth, but if it is so, and hot-water pipes are not available, much may be done to prevent the temperature getting too low about the apples by covering them with several thicknesses of stout brown paper. At no time should hay be used as it is certain to leave a taint behind it.

Apples can be effectively preserved in barrels, keeping them in a darkened site after the sweating of the fruit has taken place. Stand the tubs on the floor of a cellar, as the cool situation is exactly to the liking of the fruit. The colouring of many varieties of apples can be much emphasised by placing them on moss in a shallow box at the time of gathering, and standing them out-of-doors in a sunny site for a month or so. The warmth of the sun, coupled with heavy dews does certainly emphasise the colour.

Swanmore Park. E. Molyneux.

New Asters.—Despite the dry season in this district, asters have been very satisfactory in our heavy soil. There was sufficient rain after the plants were put out to give them a good start. Two novelties I have tried this season are Mammoth Shell Pink and Salmon Pink. The last-named is a new shade in asters, and the plants come fairly true to colour; the flowers are of the Victoria type, of good size, the plants growing about 18 inches in height. The shell pink is correctly described as Mammoth, the blooms being of the largest. The height of the plants is over two feet, the habit branching, and the blooms are borne on long stems, rendering them very suitable for cutting.
T. H. Slade.

THE LOGAN BERRY.

Of the several new soft fruits that have been brought prominently into notice during the past few years the logan berry is undoubtedly the most important from a commercial point of view, and there can be no doubt that it may be grown as a profitable crop in almost every garden. Without going to the extreme of supporting the views of one grower, who, in speaking of its merits, told me last year that it was fast ousting the raspberry in his district, so fast, in fact, that the raspberry seemed doomed as a market grower's berry, one may safely say that it is a very valuable addition to the fruits suitable for cooking and for jellies and preserves. Many people are fond of its peculiar raspberry-blackberry flavour, and its brisk acidity, while as a good hardy grower and heavy cropper, it is perhaps superior to any fruit of its class.

The logan berry has its defects. The crop comes in with a rush and is soon over, and as the berries soon turn mouldy in wet weather, there is a risk of having much of the fruit more or less spoiled if moist conditions coincide with the ripening of the crop. As a dessert fruit I do not consider it a great success, for the berries have to be perfectly ripe to ensure their being highly flavoured and fully appreciated by most people, and this exact stage of ripeness is so fleeting that no fruit I know requires so much care in selecting. On the other hand, it comes in at a very convenient season—after strawberries, and before the raspberries are in full picking.

As regards the growth, the logan berry proves to be as robust as any of our native brambles, making strong shoots up to fifteen and twenty feet in length in heavy or rich soils, with fine foliage to correspond, while it is equally amenable to culture in any aspect, and most valuable as a cover to rough fences or low buildings.

Here we grow most of the stock on a split oak fence facing east, and in heavy cold soil. It appears to enjoy both the soil and position, and grows and crops remarkably well. We plant at fifteen feet apart, and the plants would do with even more room than this. The canes grow so freely and plentifully that up to the time the fruit is gathered, the fruiting canes cut out, and the young ones for the next season tied in position, the plants cover a big space and other crops should not be grown very near. Hence the advisability of utilising for the culture of this fruit any out-of-the-way fence which may have been erected primarily to hide an unsightly portion of the ground.

The main cultural details, when once the plants are established, are to see that the principal young canes are well looked after from the first, and that those that have fruited are cut away directly the crop is over to make room for the young canes, which should then be tied in or otherwise secured in position. About three rows of strong wire running along a fence of, say, eight feet or nine feet high, will be quite sufficient for providing support for the canes. In the spring the canes should be examined, and any damaged tips removed, cutting back into sound wood, but no farther, as the longer the canes the heavier the crop. In dry seasons or in poor soil a good mulch of manure would be useful, though where the soil is heavy and the position rather shaded there is no need for any application of the kind until, perhaps, the plants show some signs of exhaustion. The general treatment is that applied to the raspberry, except that cutting back should not be so severe, and propagation is effected in much the same way, though useful suckers are not so plentifully given. If a large increase of stock is required layering would be a good method of increase. Seedlings, too, may be raised easily, and will prove interesting if their development is watched throughout and selections made.

WELL-GROWN FRUITS OF THE LOGAN BERRY.

Rose Madame Jules Grolez.—The colour of this variety, satiny China rose, appeals to many, and, combined with this is good form and a free-flowering habit. It was described on its introduction as an acquisition, and so far has worthily maintained a high position. Some seasons perhaps it is better than others, but, on the whole, it is a variety to be depended upon. For filling a bed of one colour, or for planting more sparsely, its evenness of growth renders it especially valuable.—T. H. Slade.

ENDIVE.

The endive plant is without exception the most accommodating one we have for winter salading to take the place of the valuable lettuce. It is not sufficiently hardy to stand severe frosts without injury. It is also susceptible to decay from damp during the extreme wet and dull months of the year. Therefore protection of some form is necessary to ensure the plants passing safely through the winter, and giving a satisfactory and unbroken supply until March.

For the production of suitable heads over the above period a sowing of seed should be made about the second week in July, and another about the middle of August. The first sowing will produce plants of a large size, and will be found most serviceable in carrying the supply over the earliest part of the winter. Where appearance is considered the curled varieties are to be preferred, as they certainly give a very inviting and decorative appearance to the salad, and they are usually satisfactory for the first sowing. But I have noticed that invariably these kinds are the first to suffer from damp, and for this reason I prefer the broad leaf Batavian for the August sowing. The plants, if raised from seed sown on a high, sheltered border, will, by the end of October, have grown into medium-sized heads, and will be more suitable for passing through the winter than larger plants, especially if they have been grown hard, by thinning out the plants to eight to ten inches apart in their early growth to allow steady development from the beginning. This latter is one of the most essential points, as when drawn up the soft leafage will succumb to the first extreme of either frost or damp. Plantations of the thinnings of the plants from the rows should be planted out in suitable sheltered places in quantities, and possibly these will be found most acceptable during the scarce time of February. For instance, under south walls growth continues longer during the autumn and the early part of winter, resulting in stocky, medium-sized plants, which will stand unless the winter is very severe and they are required for blanching.

The main stock of plants, after growth is fairly complete, are best lifted carefully with a ball of earth and their roots intact, and planted in pits or frames moderately close together to save space, but sufficiently far apart to allow the air to circulate between them. Wintered in this way they are under control whatever the weather may be. During bright days the lights may be quite drawn off to give full exposure, which is most beneficial, and dispels stagnant moisture. In such weather the lights should be so arranged as to throw off the rain, with a liberal amount of air admitted at the top by tilting them about six inches high. When sharp frosts set in the frames must be closed down and protection given by covering the lights with mats or suitable material, according to the severity of the weather. In cases where it is found that the frost has entered the frames it is much better to allow the plants to thaw before removing the covering; if this is done, no harm whatever will accrue.

There are several methods of blanching endive for use, such as placing a piece of slate over the heart of the plants a week or ten days before cutting them, or placing a six-inch or seven-inch inverted flower pot over them, according to the size of plants, with a covering on the hole to keep out light. There is also the plan of having frames of different sizes to fit the borders, but instead of using glass lights the tops are fitted with shutters. These are simple, but effectual in keeping out light and rain, and are to be recommended for saving time, as they can be quickly arranged and protected as required. At mid-winter the lifting of batches of plants from the store frames and placing them in the mushroom house as required, is to be preferred. The hearts grow what under the influence of heat and darkness, and if kept liberally supplied with water at the roots, and daily syringed over their leaves, they will be crisp and clean for use. This treatment can be given them quite independent of the extreme weather that is usual at this season.

Cholmondeley Castle Gardens.

BULB CULTURE.—A practical treatise on the cultivation of hardy, hothouse and greenhouse bulbous and tuberous rooted plants is "Bulbs and their Cultivation," by T. W. Sanders, price 2s. 6d. net, or by post 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London

THE EIGHT BEST PEARS FOR SMALL GARDENS.

I do not give my opinion of what I consider the best eight pears for small gardens without being aware of the fact that it is a matter of impossibility to make a selection that would prove to be the best under all circumstances. The pear varies considerably, not only when planted in different kinds of soil and positions, but the fruits from one and the same tree cannot always, owing to the changeableness of our climate, be depended upon to be of the same degree of flavour, even for two seasons in succession. My selection will, however, include varieties that have proved, for several years past, to be most generally the best here upon a heavy soil not altogether well suited to pears. The varieties are also selected with a view to giving a supply of fruit over a good length of the time pears are in season, though the limited number must not be expected to cover the time without interruptions.

Williams' Bon Chretien.

This, a well-known old favourite, ripens in August and September. It bears freely upon the quince stock as a pyramid, espalier, or wall tree. Its fruit is large, pyriform in shape, and when ripe, yellow in colour, with streaks of dull red on the sunny side. Its flesh is white, buttery in texture, and of rich, slightly musky flavour. It is a better cropper than Souvenir du Congrès, which ripens at the same time, and is its offspring. In ordinary warm seasons it is better flavoured than in very hot ones.

Beurre d'Amanlis.

This is one of the most certain bearers, either grown as a pyramid, espalier, or cordon, though even on the quince it is a rather robust grower. The trees are hardy, but their blossoms are amongst the first to suffer from frost. The fruits are large, greenish, though slightly bronzed on the sunny side, ripening at the end of September. The flesh is buttery, juicy, and good in flavour.

Louise Bonne of Jersey.

The fruit of this variety is large and handsome, yellow, with bright crimson on the sunny side, buttery, juicy, and very richly flavoured. It ripens in October. The tree does well in any form, though it is not a robust grower. It is a very heavy cropper, and will in that way often exhaust itself, unless its crops are properly thinned. Trees of limited growth should be worked on the quince.

Beurre Hardy.

This gives a successional supply of fruit to the last named. Its fruits are large and handsome, greenish and bronzed where exposed to the sun. Flesh white, melting, and pleasantly flavoured. The tree is robust, and does well in any form, and when covered with its fine foliage and worked on the quince it makes a particularly handsome pyramid. Its fruit ripens at the end of October. This variety has been included in preference to Beurre Superfin, because the latter is rather delicate here.

Marie Louise.

This is one of the very best of pears, and a long supply of its fruits may be obtained by planting trees in different aspects—and it succeeds even on a north wall—and gathering the fruit at intervals. Its fruits are large, pyriform, straw coloured, and russetty. Flesh white, buttery, and very richly flavoured. The tree makes a good cordon, and fine pyramid, espalier, or wall trained specimen, but, except as a cordon, it does not bear freely in a very young state.

Doyenne du Comice.

This is generally considered to be the best of pears. The fruits are large, greenish yellow, and marked with russet. Flesh buttery, juicy, and deliciously flavoured, tree hardy and a good bearer in any form. It does here exceedingly well, compared with many others, and is best as a cordon or pyramid when grown on the quince. It ripens at the end of October and beginning of November, and keeps well after it is ripe.

Olivier des Serres.

This is the smallest pear of my selection, and it is grown here only as a cordon, and trained tree on walls, but it also makes a good pyramid. Fruits medium in size, roundish, cinnamon coloured, and covered with delicate russet. Flesh yellow, and of rich flavour. Ripe in January.

Easter Beurre.

This does best on a wall, except in favourable situations, though near here it succeeds well even as a standard. We grow it as a wall-trained tree, pyramids, and as cordons, and we secure the best fruits from the last-named. In each case it is a free bearer. Fruits large, colour almost green, with brown cheek on sunny side. Flesh white, buttery, and good in flavour. It ripens in January and February.

The Hendre Gardens.

BRITISH v. FOREIGN POTATOES.

The wonderful versatility of the potato as regards the shape, colour, and size of its tubers could not possibly be better exemplified than by the recent exhibits of Messrs. Sutton, of Reading, and Messrs. Dobbie, of Rothesay, at the Franco-British Exhibition. The former firm staged no less than three hundred distinct varieties, each one represented by a dish of typical tubers, round, oval, elongated, smooth, rough, and of all tints— white, yellow, pink, red, and purple, this last tint approaching to black, and even pervading the flesh in some cases, though without in the least affecting the flavour. One curious type resembles roughly a pine cone, the "eyes" being arranged spirally in the axils of bluntly pointed projections, suggesting morphologically an extremely fleshy shoot with axillary buds. An interesting feature of this exhibit was that one-half of it were last season's crop, which, owing to careful storage under cool conditions, could not be discriminated in any way from this season's crop represented by the other half, not a trace of budding or shrivelling being perceptible. A comparison of both exhibits cited with those of French origin showed their superiority to a very surprising degree, the latter, in one of the most prominent exhibits, consisting not only of irregularly-shaped and sized tubers, disfigured by projecting knobs and other defects, but with eyes filled with soil, dirty, scaly skins, and, in short, in such a condition as no firm on this side of the Channel would dream of putting forward competitively. The contrast, indeed, will doubtless involve an instructive lesson for our French friends, and is the less explicable, as the preparation and transport of potatoes present no such difficulties as are experienced with fragile flowers or even large standard fruit trees, such as some of the foremost French nurseries contrived to send over and display to the very best advantage. In point of fact, we have heard so much lately of French high culture of vegetables for the table that this inferiority in the direction of the potato is nothing less than a puzzle.

C. T. D.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

ONCIDIUM CHEIROPHERUM.—There are many less attractive orchids that are more extensively cultivated than this small-growing, yellow-flowered, and winter-blooming plant. Moreover, it is a plant that always appealed to me as one suitable for cultivation in the neighbourhood of large towns, and in fog-affected areas. I have known it to pass through a prolonged period of November fog uninjured in the neighbourhood of London, and it should thus find favour where plants have to be cultivated under unfavourable conditions. It is most effective when several plants are placed together in shallow, well-drained pans, so that they may be suspended near the roof glass. They are best suited in a cool intermediate house, where the temperature does not fall below 55 degrees during the winter months. The flower scapes will now be expanding, and every encouragement must be afforded the plants to properly develop their flowers. Care is particularly necessary to see that the plants do not remain in a dry state at the roots for any length of time while the spikes remain on the plant, but as soon as the flowers have been removed only sufficient moisture is necessary to keep the pseudo-bulbs plump.

O. ORNITHORHYNCHUM is a useful winter-flowering cool house oncidium, that succeeds well when grown under the conditions that prevail in the odontoglossum house. It may be treated in every way similar to odontoglossums, with the exception that repotting is best attended to immediately the plants have passed out of flower. Ample drainage should be afforded, and a good open and porous potting compost is desirable. The white variety, O. o. album, is one of the most charming of winter-flowering orchids, and when grown into a large specimen, such as may produce a dozen or more flower spikes, it becomes a most attractive plant either for exhibition or home decoration. I have found this variety succeed best in a temperature a few degrees higher than that in which the type does well. Although it will do well in the cool house during the warm months of the year, the growth is liable to become dwarf, and the flower scapes stunted, if allowed to remain there during the winter. The conditions found suitable for Miltonia vexillaria I have found suits O. o. album during the winter.

ONCIDIUM INCURVUM and O. i. album are also useful autumn and winter-flowering orchids, and when grown satisfactorily they make a fine display. The flowers are produced on long racemes, and last a long time in perfection. The white variety I have found the more robust growing of the two, and it also flowers later. They both do very well either in the cool house or cool intermediate house, potted and treated in every way the same as odontoglossums, the only exception being that after flowering they may remain practically dry for a few weeks, only sufficient moisture being necessary to prevent shrivelling of the pseudo-bulbs.—H. J. Chapman, Oakwood Gardens.

STOVE PLANTS.

STEPHANOTIS FLORIBUNDA.—As the plants complete their flowering season they ought to be kept somewhat drier at the roots, and syringing must be discontinued throughout the resting season. They may also be allowed more air and a temperature reduced to about 55 or 60 degrees for the winter months. The surplus growths may be thinned out to allow the permanent shoots to become thoroughly ripened. As stephanotis will not require much attention until the new year, it is advisable to thoroughly cleanse them. As time permits the specimens planted out should have their borders examined, with a view to renewing them if necessary.

GESNERAS.—Throughout the autumn and winter these ornamental-leaved plants should be given more air and less water, and with the tuberous-rooted kinds this treatment should be continued until the foliage has ripened up thoroughly. The pots may then be placed in a position secure from drip, at the coolest end of the stove, or where the temperature does not fall below 55 degrees.

BEGONIA GLOIRE DE LORRAINE, and its various sports, are now developing their blooms freely, and the atmosphere of the flowering house may be kept somewhat drier, but a plentiful supply of water should be given to the roots. Ventilation must be given very judiciously, or serious harm may be caused from cold draughts. Light feeding may still be continued, and this will greatly assist in prolonging the flowering season by producing further growth, which eventually develops abundance of bloom. In arranging the plants some taste ought to be displayed, in order to show off the plants to best advantage. A dwarf edging of Panicum variegatum, and the light variety of Fittonia argyoneura are very pretty for association with the pink begonias.

R.H.S. FRUIT SHOW—EMILE D'HEYST PEAR. EXHIBITED BY MESSRS. LAXTON BROTHERS.

LUCULIA GRATISSIMA.—Considering the magnificent display of autumn flowers this will produce I consider it well worthy of more extensive cultivation. As the plants pass out of bloom they should be subjected to a season of rest, but in no case must the foliage be allowed to suffer from excessive dryness, or red spider will be found very troublesome. Luculia gratissima will winter successfully in the intermediate stove, where the temperature does not fall below 55 degrees.

MARANTAS have a very pleasing effect associated with other fine foliage plants, and on account of their distinct markings they usually command their share of attention. They ought not to be allowed to grow throughout the winter months, and so the roots must be kept rather dry.

GENERAL REMARKS.—Most of the occupants of the stove are now approaching their usual season of rest, and syringing is being discontinued, with the few exceptions of those favourable occasions when the operation can be carried out in time to allow the plants to become thoroughly dry before evening. Damping down the floors and stages is done only once before noon, and again towards evening.—John Donoghue, Bardon Hill Gardens.

FRUITS UNDER GLASS.

LATE VINERIES.—Grapes in the late house will be ripe, and every care should be taken to ward off damp. The pipes should be well warmed at night, and also in the day, especially when dull weather prevails. The vines must not become dry at the roots or shrivelling of the berries will commence, but watering must be done on a bright day, and a little extra fire heat given to dry up the moisture: air should be given at all times, and the netting kept over the openings for the admission of air until the bunches are cut. Keep a night temperature, with fire heat, of 45 to 50 degrees, with ventilation. It has been a good time for colouring late grapes, as the recent fine weather has permitted ample ventilation. The variety Ambrose's Seedling or Melton Constable does not colour very freely here yet. Lady Hutt makes a good late grape, but does not colour to perfection, and as the season advances the berries become marked. Prince of Wales will evidently make a good market grape, as it colours up well. Any bunches that show signs of shrivelling may be cut and have their stalks put in bottles containing water, as they keep well so treated; place some charcoal in the bottles, and keep the temperature of the fruit-room at 45 degrees. Examine the bunches carefully every few days for bad berries, as the damp soon spoils the bunches. As soon as the bunches have been cleared examine the borders to see if they are dry; farmyard liquid may be given, diluted if too strong, and well syringe the rods with insecticide or clean water.

TOMATOES.—The sunny weather has well matured these, especially the late crop in unheated pits and houses. Those in pots for a winter crop are swelling away and have set well; Lye's Early Prolific is still grown here for winter and early spring supplies, and I find it has recently come out with honours at the Wisley trials. As soon as the shoots reach the top of the wires they may be stopped, and these top shoots may be made into cuttings to give plants for providing fruit early in the spring. Plants now bearing fruit require to be watered carefully. Keep a night temperature of 60 degrees with plenty of ventilation.

BANANAS.—As the bunches are cut turn out the old stools to make room for young ones. The former will probably throw up a strong sucker, and this is an inducement to keep the old stool, but though these generally make strong stems they fail to throw out their fruits satisfactorily. This is the case with bananas grown in tubs, but when they are planted out it is as well to leave one sucker and cut the old stem right out and fill the hole with new compost. Any plants that require to be potted should receive attention, but do not pot any weak suckers at this time of the year. If possible, this structure should now be cleaned, as great heat and moisture make the glass and woodwork dirty.

EARLY POT VINES.—The house or pit for these should be put in readiness to receive them. Fill the bed with leaves, but at the same time there should be a flow and return pipe as well to keep up the required bottom heat, as any check is detrimental. The leaves will give enough heat for some time. Prune the vines back to a suitable eye, and apply a little styptic to the cuts; the roots should be kept rather dry after pruning to keep the stems from bleeding. The canes should be washed and the roots top-dressed, but nothing is gained by making too early a start.—A. B. WADDS, Paddockhurst Gardens.

THE KITCHEN GARDEN.

LEEKS.—The earliest batch of plants for the main crop will by now have made good growth, the stems being well above the surface of the soil, consequently the earth may be drawn up to these to increase the blanched portion of the stems. Those plants that have paper collars around them should be examined occasionally, for if they have no attention only partially blanched stems will be the result. It is not necessary to feed the plants after this date, and any plants that are inclined to "bolt" should be pulled up and used without further delay.

LATE PEAS.—We are still sending dishes of Autocrat, Webb's Talisman, and Late Queen to the kitchen, and they are very serviceable. These were sown on trenched ground on July 10 and 16. They were watered during the hot, dry weather we had early in the present month, which assisted them very much. Some gardeners keep up the practice of sowing a few rows in the autumn, and where this method still exists now is the time for doing the work. William the First is a good variety for present sowing, as it will stand a good deal of changeable weather, especially if it can be given a position on a warm, sheltered border.

CABBAGES.—Another batch of cabbage should be planted out, choosing an open quarter for the purpose. The cabbages will come in a little later than those already planted on sheltered borders. There will also be fewer run away to seed; plant them very firmly, so that they may make a sturdy growth and be better able to withstand the winter. It is always prudent to prick out a few score of seedlings in a bed, so that if gaps occur in the permanent quarters they may be filled up again. Red cabbage plants will now require to be dealt with in the same way, pricking them out about five inches apart each way. This will enable the plants to grow strongly and thicken at the stems.

PREPARING FOR WINTER.—It is now quite time that the necessary arrangements should be made for the forcing of vegetables, and where a good-sized mushroom house exists a good deal of this work may be carried on satisfactorily. Such a place is most useful for rhubarb, seakale, chicory, and for blanching endive, also for bringing on mustard and cress in boxes. Asparagus is better accommodated in heated pits, or on hotbeds made up with leaves and long litter. And just at the present time there are plenty of good leaves to be had, which will give a lasting and gentle heat suitable for vegetable forcing.—T. W. BIRKINSHAW, Hatley Park Gardens.

EXHIBITIONS AND MEETINGS.

Great Exhibition of British-Grown Fruit.

OCTOBER 15 and 16.

A very fine exhibition of home-grown fruit was held in the Royal Horticultural Hall on the above dates, and some of the fruit, notably apples, have rarely been seen in finer condition. Grapes were good, and there was a fine competition in the smaller of the two classes for a collection of dessert fruits. The pears shown were, on the whole, very good, but the competition was not so keen as one could have wished, due not a little to the rapid ripening of many varieties during the last few weeks.

Spectacularly the show was not a success, and this was due not a little to the absence of fruit trees in pots, but also to an entire lack of plants of any kind on the flat tables. The nurserymen's classes, with their raised dishes, prevented any flatness at the clock end of the hall, but there was nothing at the other end to relieve the monotony. Of course, fine fruits need nothing to enhance their beauty, but a few pot fruit trees or table plants along the centre of the benches would have improved the show greatly.

The attendance was good on the first day, and at both the conferences on spraying there was a large and interested audience.

COLLECTIONS OF DESSERT FRUIT.

There were two competitors in the class for nine dishes of ripe dessert fruit, at least six kinds, and here Mr. J. H. Goodacre, gardener to the Earl of Harrington, Elvaston Castle, Derby, was once more supreme, winning the chief award and silver cup with grand clusters of Muscat of Alexandria and well-finished Madresfield Court grapes, a seedling melon, Princess of Wales and Sea Eagle peaches, Victoria nectarines, Ribston Pippin and Cox's Orange Pippin apples, finely coloured, and a splendid dish of Doyenne du Comice pears; Mr. R. Aldarman, gardener to C. R. Adams, Esq., Babraham, Cambridge, came second, and he had a fine dish of Pitmaston Duchess pears.

In the class for six dishes of ripe dessert fruits, at least four kinds, there were no fewer than eight competitors, and here the leading prize winner was Mr. T. Pateman, gardener to M. W. Price, Esq., The Node, Codicote, Welwyn, who had good examples of Muscat of Alexandria and Alicante grapes, Lady Palmerston peaches, Royalty melon, Cox's Orange Pippin apples, and Louise Bonne of Jersey pears; Mr. J. Vert, gardener to Lord Howard de Walden, Audley End, Saffron Walden, came second with a good collection, and Mr. E. Neal, Tilgate Gardens, Crawley, came third.

GRAPE CLASSES.

The leading grape class was for five distinct varieties, three bunches of each, and in this there were three entries. The prizes were given by the Veitch Memorial Trustees. Mr. J. H. Goodacre led with fine bunches of Muscat of Alexandria and Alicante, and excellent samples of Golden Queen, Madresfield Court, and Gros Maroc, all well coloured and of good size; Mr. J. G. Weston, gardener to H. J. King, Esq., Eastwell Park, Kent, came second with good Muscat of Alexandria, Alicante, Lady Downe's Seedling, and Chasselas Napoleon; Mr. A. B. Wadds, gardener to Sir F. Weetman Pearson, Bart., M.P., Paddockhurst, Sussex, third.

Premier award for a brace of bunches of Black Hamburgh grapes was won by Mr. J. Doe, Rufford Abbey Gardens; Mr. E. Neal, Tilgate, came second, and Mr. H. Prime third, but there was nothing of outstanding merit in the class. There were six entries in the class for a pair of bunches of Mrs. Pince, and here Mr. J. Doe, gardener to Lord Savile, Rufford Abbey, Ollerton, Notts, secured first prize with well-finished, chubby bunches; Mr. C. Earl, gardener to O. E. d'Avigdor Goldsmitt, Esq., Tonbridge, Kent, second with larger, but poorly-coloured bunches, and Mr. J. H. Goodacre third. Alicante was shown by ten competitors, and the best pair of bunches came from Mr. H. H. Brown, gardener to W. G. Raphael, Esq., Castle Hill, Englefield Green; Mr. H. Poulton, gardener to C. T. Cayley, Esq., Tunbridge Wells, Kent, second, and Mr. J. R. Tooley, gardener to Hugh Andrews, Esq., Toddington Manor, Winchcombe, Gloucester, third.

Only four competitors came forward with Madresfield Court grapes, and here Mr. J. Doe was again to the front with long, characteristic clusters of well-finished berries; Mr. Billings, gardener to F. R. Rodd, Esq., Trecartha Hall, Launceston, second, and Mr. H. Prime, gardener to the Marquis of Salisbury, Hatfield, third; the latter had bunches that showed a deposition of sulphur. In the class for two bunches of "any other black" grape, there were fourteen entries, the winning clusters being splendid ones of Gros Maroc, shown by Mr. W. Allan, Gunton Park, Norwich; Prince of Wales, shown by Mr. W. Lintott, gardener to Sir W. Greenwell, Bart., Marden Park, Caterham, was fine; these were scarcely up to their best in colour, the bases of many berries being reddish, but this would have been remedied if the bunches had been hung a little longer. They gained third place, Mr. H. H. Brown coming second with Gros Maroc.

For a pair of bunches of Muscat of Alexandria, Mr. J. H. Goodacre led well with large-berried and richly-coloured clusters, leading from eleven other competitors; Mr. W. Lane, gardener to Sir E. Durning-Lawrence, King's Ride, Ascot, second with long, clean bunches; Mr. H. H. Brown third with heavy clusters that showed a little sign of shrivelling. In the "any other white" class Mr. H. Cornish, gardener to A. Benson, Esq., Merstham, Surrey, scored with Mrs. Pearson, and Mr. A. B. Wadds came second with Lady Hutt.

HARDY FRUITS.

In the class for a collection of hardy fruits, arranged on a space 12ft. by 3ft., and to consist of thirty dishes, distinct, there were three entries, the premier award falling to Mr. J. Whittle, gardener to Lieut.-Colonel Borton, Cheveney, Hunton, Kent, who had magnificent specimens of Mère de Ménage, Emperor Alexander, Peasgood's Nonsuch, Sandringham, and Charles Ross apples; Marie Benoist, Pitmaston Duchess, Beurre Diel, and Doyenne du Comice pears; Golden Drop and Monarch plums, Golden Eagle peaches, nuts, and cherries. Second prize was awarded to Mr. G. M. Bacon, gardener to Sir Marcus Samuel, Bart., Mote Park, Maidstone, who had big apples and pears, but these were not well coloured; he had nuts, peaches, plums, currants, cherries, and quinces. Mr. J. Cornford, gardener to Major Powell Cotton, Quex Park, Isle of Thanet, third.

NURSERYMEN ONLY.

In this division there were three classes, but the one of these that was for orchard house fruit and trees was conspicuous by reason of its non-entries, for one of the things missed from the show was the display of well-grown pot trees.

For a display arranged on a space of 24ft. by 6ft., Messrs. G. Bunyard and Co., Maidstone, secured the premier position and gold medal, for, they state, the twenty-fourth time. They had a very fine exhibit, and had raised their central dishes of fruits on neat stands, so that the group was attractive by reason of its arrangement, as well as by reason of the fine quality of the apples and pears staged. All the fruit had to be out of doors grown, and the Maidstone collection consisted of no fewer than one hundred and seventy-five varieties. Mère de Ménage, Byford Wonder, Lord Grosvenor, Allington Pippin, the new and very handsome Viscount Castlereagh, Bismarck, Lord Derby, Royal Jubilee, King of the Pippins, Peasgood's Nonsuch, and Rival apples were very fine, as also were the dishes of Catillac, Conference, Beurre Alexander Lucas, Doyenne du Comice, and Pitmaston Duchess pears.

Another very fine group was the one from

Messrs. H. Cannell and Sons, Swanley, Kent, which gained second prize. Here, too, the fruits were well set up, and the collection contained King of the Pippins, Norfolk Beauty, Cox's Pomona, Chelmsford Wonder, Hambling's Seedling, Warner's King, Stone's, Allington Pippin, The Queen, and many other apples in perfect condition. Messrs. J. Cheal and Sons, Crawley, were awarded third place, and they had grand samples of Crawley Reinette, King of the Pippins, Jubilee, Bismarck, Chas. Ross, Castle Major, and Allington Pippin among many other good things. Other exhibitors in this class were Messrs. J. Laing and Sons, Forest Hill.

In the section for a display, arranged on a space 16ft. by 6ft., there were nine competitors, and here Mr. Will Tayler, of Hampton, Middlesex, secured first prize, and showed that splendid clean fruit can be grown quite close to London. His finest apples were King of the Pippins, Barnack Beauty, Newton Wonder, Lord Derby, Peasgood's Nonsuch, Jubilee, Lane's Prince Albert, Bismarck, Cox's Orange Pippin, Emperor Alexander, and Blenheim Pippin, while his basket of Uvedale's St. Germain, Beurre Hardy, and Doyenne du Comice pears were of high merit. Messrs. W. Seabrook and Sons, Chelmsford, came second in this competition with a remarkably fine collection, especially meritorious being Peasgood's Nonsuch, Bramley's Seedling, Cox's Pomona, Warner's King, Bismarck, The Queen, Jubilee, Lord Derby, Gascoigne's Scarlet, King of the Pippins, Cox's Orange Pippin, and Dumelow's Seedling apples. Messrs. Laxton Brothers, Bedford, gained third prize with a fine and well set-up display. Other exhibitors in this class were Mr. R. C. Notcutt, Woodbridge, who, among fine apples, had a dish of ripe fruits of Vitis Coignetiae; Messrs. S. Spooner and Sons, Hounslow; Messrs. J. Peed and Son, West Norwood; Messrs. Paul and Son, Cheshunt, who had a very attractive exhibit.

MARKET GROWERS.

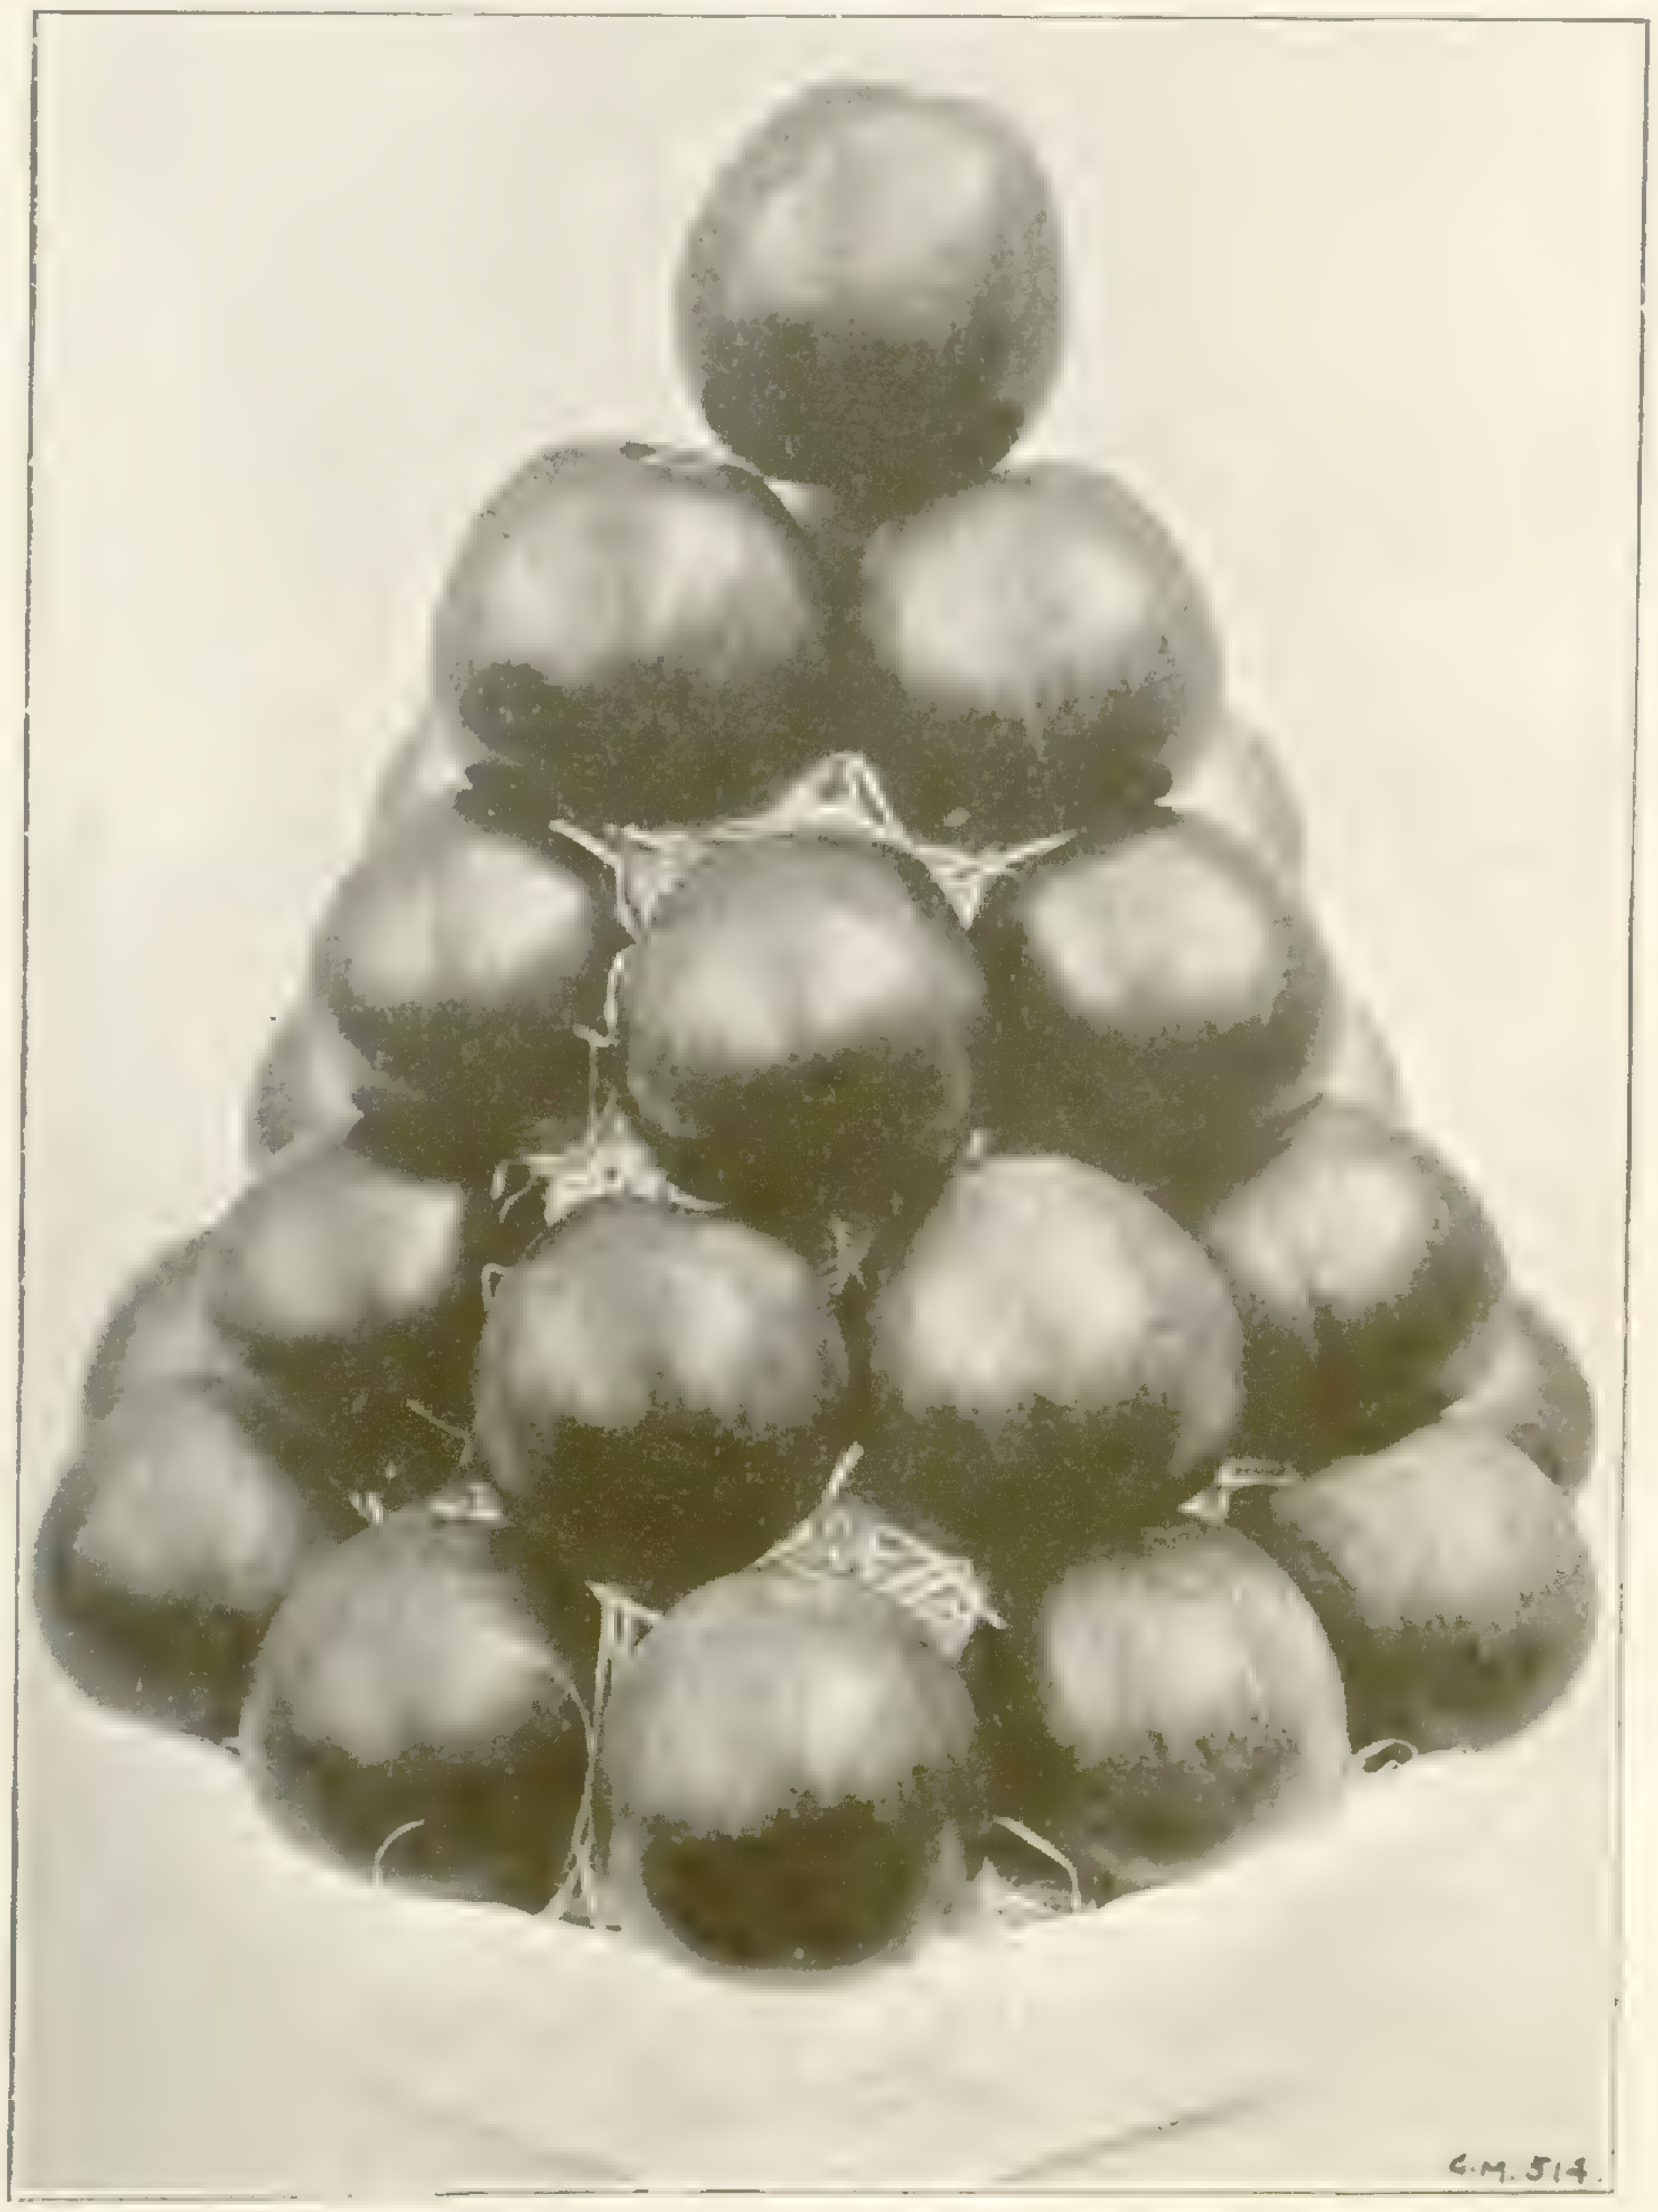
Mr. W. Stowers, Harold Road, Sittingbourne, Kent, was a capital first for a display of outdoor fruit in the market growers' division. On a space 12ft. by 6ft. he had dishes and baskets of wonderfully fine Emperor Alexander, Mère de Ménage, Rambourg Perfection, Allington Pippin, Annie Elizabeth, Peasgood's Nonsuch, Charles Ross, Hambling's Seedling, Rival, and Royal Jubilee apples. Second place was accorded Mr. Owen G. S. Croft, Pomona Fruit Farm, Withington, Hereford, who showed well-packed fruits in boxes ready for market, and some dishes of fine fruit; Messrs. W. [illegible]t and Son, Heston, Middlesex, came third.

For a display on a space 18ft. by 6ft., the Horticultural College, Swanley, gained second award for a good set, but, so far as we could gather, there was no other competitor, and no first prize awarded.

In the same division there was a class for six dishes each of dessert and cooking apples, and here there were three competitors, but the "dishes" were mostly baskets. Mr. H. T. Mason, Hampton Hill, Middlesex, won first prize with wonderfully fine, clean, and bright specimens of Cox's Orange Pippin, Allington Pippin, King of the Pippins, Ribston Pippin, Worcester Pearmain, Dumelow's Seedling, The Queen, Golden Noble, Bismarck, Lady Sudeley, Newton Wonder, and Peasgood's Nonsuch—a grand exhibit; Mr. A. E. Mason, Rectory Farm, Hampton Hill, a good second; and Miss K. M. Courtauld, Knight's Farm, Earl's Colne, Essex, third.

COLLECTIONS OF APPLES.

Seven competitors came forward with twenty-four dishes of apples—sixteen of cooking and eight of dessert varieties. Mr. J. Whittle, Cheveney Gardens, Hunton, led the way with splendid examples of Mère de Ménage, Bismarck, Lady Henniker, Warner's King, Belle Dubois, Emperor Alexander, Peasgood's Nonsuch, Newton Wonder, The Queen, Gascoigne's Scarlet, Belle Pontoise, Bramley's Seedling, Sandringham, Lane's Prince Albert, Lord Derby, Annie Elizabeth, Ribston Pippin, Allington Pippin, The Rival, Christmas Pearmain, American Mother, King of the Pippins, Wealthy, and Cox's Orange Pippin—this was a wonderful display, probably the finest of its kind ever shown in London. Mr. G. W. Bacon, gardener to Sir Marcus Samuel, Bart., Mote Park, Maidstone, was a capital second, and he had grand specimens of popular varieties; Mr. F. J. Gerrish, gardener to J. S. Williams, Esq., Pendley Manor, Tring, was third, and he had probably the best set of eight dishes of culinary varieties, showing Chas. Ross, Cox's Orange Pippin, and Melon Apple grandly. Mr. H. Whiteley, St. Mary Church, Torquay, had a very pleasing and interesting lot of fruits, all grown in a field; these were not over large, but they were very clean and bright, and King Edward VII. and Chas. Ross were the finest dishes.



R.H.S. FRUIT SHOW—NEW APPLE, LORD CASTLEREAGH. SUITABLE FOR COOKING AND DESSERT. EXHIBITED BY MESSRS. G. BUNYARD AND CO.

There were seven entrants in the class for twelve dishes of cooking and six dishes of dessert apples, distinct, and here the winner was Mr. R. Aldenham, gardener to C. R. Adams, Esq., Babraham, Cambridge, who scored with beautifully clean, weighty examples of Lane's Prince Albert, Gascoigne's Scarlet, Bramley's Seedling, Peasgood's Nonsuch, Mère de Ménage, King of the Pippins, Cox's Orange Pippin, etc.; Mr. J. Cornford, gardener to Major Powell Cotton, Quex Park, Isle of Thanet, a good second; and Mr. C. Earl, Tonbridge, Kent, third.

For twelve dishes of apples, eight cooking and four dessert varieties, Mr. A. Basile, gardener to the Rev. T. McMurdie, Woburn Park, Weybridge, was a good first, with excellent fruits of Mère de Ménage, Peasgood's Nonsuch, Gascoigne's Scarlet, Warner's King, Rival, and Christmas Pearmain; Mr. F. H. Skinner, gardener to Lord Arthur Butler, Hunton, Kent, came second.

There were nine competitors in the class for six dishes of cooking apples, distinct, and once again Mr. Whittle came to the front with grand fruits, showing Peasgood's Nonsuch, Mère de Ménage, Emperor Alexander, Warner's King, Bismarck, and Bramley's Seedling; Mr. W. H. Bacon second, and Mr. P. Aldenham, third. Out of eight competitors Mr. Whittle was easily first for six dishes of dessert apples, distinct, winning with clean, very bright, and particularly handsome fruits of Allington Pippin, American Mother, Chas. Ross, King of the Pippins, Cox's Orange Pippin, and Wealthy; Mr. W. H. Bacon a good second.

COLLECTION OF PEARS.

Premier award of Hogg medal for eighteen dishes of dessert pears, distinct, was well won by Mr. W. J. Finch, gardener to F. A. White, Esq., East Grinstead, Sussex, who had wonderfully clean and large specimens of Duchesse d'Angoulême, Beurre Bachelier, Pitmaston Duchess, Doyenne du Comice, Beurre Superfin, Glou Morceau, Beurre d'Anjou, Beurre Diel, Durondeau, Easter Beurre, Beurre Hardy, Doyenne du Comice, Fondante de Thirriott, Princess Conseiller de la Cour, Thompson, Beurre Alexandre Lucas, and Louise Bonne of Jersey. Mr W. H. Bacon second, and Mr. J. Whittle, Hunton, third.

The Silver Medal of the Fruiterers' Company and first prize for twelve dishes of pears, distinct, was won by Mr. A. Basile, Woburn Park Gardens, Weybridge, with a very even set, consisting of Beurre Bachelier, Duchesse d'Angoulême, Charles Ernest, Pitmaston Duchess, Beurre Alexandre Lucas, Beurre Fouqueray, Durondeau, Beurre Baltet Pere, Doyenne du Comice, Glou Morceau, Conseiller de la Cour, and Beurre Hardy; Mr. T. Pateman second, and Mr. F. H. Skinner, third.

The best six dishes of dessert pears came from Mr. G. Mackinlay, gardener to the Hon. Whitelaw Reid, Wrest Park, Beds, who had very brightly coloured dishes of Louise Bonne of Jersey, Marie Louise d'Uccle, Beurre Superfin, Pitmaston Duchess, Beurre Diel, and Marechal de la Cour; Mr. H. Cornish, gardener to A. Benson, Esq., Merstham, Surrey, second.

Mr. J. Cornford was awarded first prize for three dishes of stewing pears,for Uvedale's St. Germain, Catillac, and Gilogil; Mr. F. King, gardener to the Rev. H. A. Bull, Kingston House, Westgate, second. Mr. Davison, gardener to Major Petre, Westwick, Norwich, showed enormous fruits of Catillac, General Todtleben, and Uvedale's St. Germain in this class, but they received no award owing to the fact that a curious regulation excluded Mr. Davison (being a competitor in single dish classes) from competition in this division.

PEACHES AND PLUMS.

Mr. A. R. Searle, gardener to the Marquis of Northampton, Castle Ashby, Northampton, led for a dish of peaches with Sea Eagle; he was first for nectarines with Pineapple, and he also led for three dishes of plums with Jefferson, Coe's Golden Drop, and Late Transparent; Mr. J. Vert, Saffron Walden, second. Mr. Vert led for three dishes of outdoor-grown plums with President, Coe's Golden Drop, and Monarch; Mr. Searle second. For one dish of Coe's Golden Drop plum Mr. Birkinshaw, gardener to Sir C. E. Hamilton, Bart., Hatley Park, Beds, led, and for any other dessert variety Mr. Vert scored with Jefferson. Mr. Gerrish led for Morello cherries, and Mr. J. R. Smith, gardener to F. A. English, Esq., Addington Park, Surrey, had the best basket of outdoor grapes, showing neat little bunches of Alexandria and Chasselas Vibert; Mr. G. E. Cripps, Chelsham Road, Croydon, second with Black Cluster.

COUNTY CLASSES.

As on previous occasions, a division was set apart for county classes, two classes for each county division, one for six cooking and four dessert apples, and one for six dishes of pears, all distinct. The first prize in each case is 30s., and third-class railway fare from the competitor's home; second prize, 15s. and railway fare.

In the Kent class, Mr. J. Bond, gardener to W. E. T. Drax, Esq., Olantigh Towers, Wye, led for apples with heavy fruits of Peasgood's Nonsuch, Hambling's Seedling, Mère de Ménage, The Queen, Allington Pippin, and Worcester Pearmain; Mr. R. Edwards, gardener to C. A. Morris Field, Esq., Beechy Lees, Sevenoaks, second. For pears, Mr. J. Skelton, gardener to the Dowager Lady Hillingdon, Wildernesse Park, Sevenoaks, led with good dishes of Durondeau, Beurre Bosc, Beurre Superfin, Doyenne du Comice, Emile d'Heyst, and Pitmaston Duchess; Mr. R. Edwards second.

In the division formed by Surrey, Sussex, Hants, Dorset, Somerset, Devon, and Cornwall, the prize-winner for apples was Mr. G. Lock, gardener to B. H. Hill, Esq., Newcombes, Crediton, Devon, who was strong with Alfriston, Peasgood's Nonsuch, Emperor Alexander, and Stone's; Mr. W. Turton, gardener to F. J. B. Wingfield Digby, Esq., Sherborne Castle, Dorset, second. For pears Mr. Turton led with splendid fruits, and Mr. W. A. Cook, gardener to Sir Edmund Loder, Bart., Leonardslee, Horsham, second.

Mr. A. Carlisle, gardener to C. Gurney, Esq., Henlow Grange, Biggleswade, scored for apples in the division composed of Wilts, Gloucester, Oxford, Bucks, Berks, Beds, Herts, and Middlesex; his Gascoigne's Scarlet, Peasgood's Nonsuch, and King of the Pippins were very highly coloured; Mr. W. Hutt, gardener to Captain Farwell, The Priory, Burnham, Bucks, second. For pears Mr. C. Page, gardener to J. B. Fortescue, Esq., Dropmore, Maidenhead, was first, and Mr. J. R. Tooley, Winchcombe, second.

Essex, Suffolk, Norfolk, Cambridge, Hunts, and Rutland formed another county group, and in this one Mr. G. D. Davison, gardener to Major Petre, Westwick House, Norwich, led for pears, followed closely by Mr. W. Allan, gardener to Colonel the Hon. C. Harbord, Gunton Park, Norwich; while in the class for apples Mr. J. Lee, Kingscroft, led with Allington Pippin, Mère de Ménage, etc., and was followed by Mr. A. Andrews, gardener to the Hon. W. Lowther, Wickham Market, Suffolk.

Entries were not numerous in the section devoted to growers from Lincoln, Northampton, Warwick, Leicester, Notts, Derby, Staffs, Shropshire, and Cheshire, but some excellent apples were staged by Mr. J. Lee, Kingscroft, Higher Bebington, Cheshire, who had weighty but not highly coloured fruits; Mr. W. H. Divers, gardener to the Duke of Rutland, Belvoir Castle, Grantham, second; the latter was also second to Mr. A. R. Searle, Castle Ashby gardens, for pears, Mr. Searle showing very bright fruits of Souv. de Congrès, Beurre de Mortilett, Marie Louise, etc.

The western counties of Worcester, Hereford, Monmouth, Glamorgan, Carmarthen, and Pembroke, made up another section, but not at all a strong one. First prize for apples was awarded to Mr. Denis Best, Temple Langhern, Worcester, who had a very fine dish of Lane's Prince Albert; Mr. P. Norbury, The Norrest, Malvern, second. For pears, Mr. R. M. Whiting, Credenhill, Hereford, was the only competitor, and he received first prize.

The Welsh growers did not come forward in large numbers, but left Mr. G. Aitkens, gardener to P. Yorke, Esq., Erdigg Park, Wrexham, Denbigh, to secure first prize for apples and first for pears, there being no other competitors. In the group composed of the six northern English counties to the Isle of Man there was but one entry in each class, this being from Mr. J. E. Hathaway, gardener to J. Brennard, Esq., Baldersby Park, Thirsk, Yorks, who was awarded first prize for apples and also for pears, and showed well in each case.

In the Scottish class Mr. James Day, gardener to the Earl of Galloway, Galloway House, Garliestown, Wigtownshire, was the only competitor, and he was awarded first for pears—Beurre Diel, Emile d'Heyst, Conference, Gratioli of Jersey, Marie Louise, and Beurre Bachelier; and second for apples—Warner's King, Washington, Lane's Prince Albert, Bramley's Seedling, Ribston Pippin, and The Queen, all somewhat small. From the Sister Isle there came three competitors—Mrs. Blackmore, of Piltown, co. Kilkenny, who led for apples; Mr. C. B. Broad, Aghern Conna, co. Cork, who was second; and Mr. Murphy, Whitechurch, Carrick-on-Suir, who was unsuccessful. The growers in the Channel Islands did not send any fruits at all, for competition or otherwise.

SINGLE DISHES OF DESSERT APPLES.

A number of classes are provided for single dishes of specified dessert apples, and in these we give the name of the variety and the winner of the first prize in each case: Adams' Pearmain, fifteen entries, Mr. A. R. Allan, gardener to Lord Hillingdon, Hillingdon Court, Uxbridge; Allington Pippin, twenty-two entries, Mr. R. M. White, Hereford; American Mother, twelve entries, Mr. Turton, Sherborne Castle Gardens, Dorset; Ben's Red, two entries, Mr. J. G. Weston, gardener to H. J. King, Esq., Eastwell Park, Kent; Blenheim Pippin, sixteen entries, Mr. T. Beesley, gardener to Earl Nelson, Downton, Salisbury; Charles Ross, eleven entries, Mr. P. Norbury, The Norrest, near Malvern; Christmas Pearmain, five entries, Mr. G. Lock, gardener to B. H. Hill, Esq., Newcombes, Crediton; Claygate Pearmain, nine entries, Mr. W. Barnes, gardener to A. F. Walter, Esq., Bearwood, Wokingham; Cox's Orange Pippin, thirty-five entries, Mr. A. R. Allan, Hillingdon Court, Uxbridge; Egremont Russet, ten entries, Mr. W. Turton; Fearn's Pippin, fifteen entries, Mr. W. Barnes, Bearwood Gardens; Golden Reinette, two entries, Mr. E. Montague, gardener to Colonel Biddulph, Grey Court, Ham, Surrey; Houblon, four entries, Mr. W. Barnes, Bearwood Gardens; James Grieve, eleven entries, Mr. T. Atkinson, Montrose Villa, Caversham, Reading; King of the Pippins, eighteen entries, Mr. A. R. Allan, Hillingdon Court Gardens; King of Tomkins County, eight entries, Mr. A. Tidy, gardener to C. H. Combe, Esq., Cobham Park, Surrey; Lord Hindlip, five entries, Mr. H. Hocking, gardener to Rev. S. Baring Gould, Lew Trenchard, Lew Down, Devon; Margil, eight entries, Mr. G. Lock, Newcombes Gardens; Ribston Pippin, seventeen entries, Mr. J. Vert, gardener to Lord Howard de Walden, Audley End, Saffron Walden; Rival, ten entries, Mr. R. M. Whiting, Credenhill; Roundway Magnum Bonum, five entries, Mr. J. C. Sutton, gardener to Lord Stanhope, Chevening Park, Sevenoaks; Scarlet Nonpareil, nine entries, Mr. G. Lock; St. Edmund's Pippin, five entries, Mr. W. Barnes; Wealthy, fourteen entries, Mr. J. G. Weston, Westwell Park Gardens; any variety not already mentioned, twenty-nine entries, Mr. A. R. Allan winning with an unnamed variety; Mr. A. Tidy second with Gravenstein (?); and Mr. Skelton third with Mabbott's Pearmain.

CHOICE COOKING APPLES.

In this division single dishes were required, and we again name the specified variety and winner of the chief prize: Alfriston, seven entries, Mr. Turton, Sherborne Castle Gardens; Annie Elizabeth, ten entries, Mr. T. Beesley, Salisbury; Beauty of Kent, nine entries, Mr. G. Lock; Bismarck, nine entries, Mr. W. Hutt, gardener to Captain Farwell, The Priory, Burnham, Bucks; Bramley's Seedling, thirteen entries, Mr. W. Barnes, Bearwood Gardens; Dumelow's Seedling, eight entries, Mr. C. Page, Dropmore Gardens, Maidenhead; Ecklinville, seven entries, Mr. T. Beesley; Edward VII., one entry, Mr. R. M. Whiting, Hereford; Emneth Early (syn. Early Victoria), no entries; Emperor Alexander, eleven entries, Mr. Allan Voss, Rayleigh, Essex; Gascoigne's Scarlet, nine entries, Mr. J. Bond, Olantigh Gardens, Wye; Golden Noble, twelve entries, Mr. Turton; Golden Spire, six entries, Mr. J. Lee, Higher Bebington, Hereford; Grenadier, four entries, Mr. C. Page; Hambling's Seedling, ten entries, Mr. J. Bond, Olantigh Gardens; Hector Macdonald (Northern counties), no entries; Hector Macdonald (Southern counties), one entry, Mr. C. Ross, Welford Park Gardens, Newbury (the prizes in the two foregoing classes were offered by Messrs. J. R. Pearson and Sons, Lowdham, Notts); Hormead Pearmain, three entries, Mr. Turton; Lady Henniker, five entries, Mr. G. Lock; Lane's Prince Albert, nineteen entries, Mr. Turton (a fine dish); Lord Derby, fifteen entries, Mr. D. Best, Temple Longherne; Mère de Ménage, ten entries, Mr. G. Lock; Newton Wonder (northern counties), six entries, Mr. Carlisle, gardener to C. Gurney, Esq., Henlow Grange, Biggleswade; Newton Wonder (southern counties), twelve entries, Mr. W. Burnes, Bearwood Gardens (the prizes in the two foregoing classes were given by Messrs. J. R. Pearson and Sons, Chilwell); Norfolk Beauty, one entry, Mr. G. Lock; Peasgood's Nonsuch, sixteen entries, Mr. A. Carlisle, Henlow Grange Gardens (with a magnificent dish weighing 7¾lb.; heaviest fruit, 1lb. 11oz.), Mr. J. Bond second; Potts' Seedling, six entries, Mr. C. Turner, gardener to F. W. Platt, Esq., Ken View, Highgate; Royal Jubilee, six entries, Mr. G. Lock; Royal Late Cooking, no entries; Sandringham, seven entries, Mr. W. Barnes, Bearwood Gardens; Stirling Castle, six entries, Mr. E. W. Caddick, Caradoc, Ross; The Queen, sixteen entries, Mr. J. Vert, Saffron Walden; Tower of Glamis, thirteen entries, Mr. J. G. Weston; Warner's King, thirteen entries, Mr. Denis Best; any other variety than those specified, sixteen entries, Mr. Charles Ross, Welford Park, Newbury, first with a fine new apple, named Encore (F.C.C., R.H.S.); Mr. T. W. Herbert, gardener to J. T. Charlesworth, Nutfield Court, Nutfield, Surrey, second with Chelmsford Wonder.

SINGLE DISHES DESSERT PEARS.

The single dish classes were very interesting, and brought out a fair competition, but it was evident that in many cases intending competitors had had to withdraw because of the rapid ripening of many pears just in season, owing to the continuance of bright warm weather.

SINGLE DISHES OF DESSERT PEARS.

Beurre Alexander Lucas, three entries, Mr. Turton (fine specimens); Beurre d'Amanlis,

BRADFORD CHRYSANTHEMUM SOCIETY.
The 22nd ANNUAL EXHIBITION will be held in ST. GEORGE'S HALL on FRIDAY and SATURDAY, November 13th and 14th, 1908.
£27 for 24 Blooms, Japanese (on Boards).
Prize Money and Classes again increased for Open Competition.
Entries Close November 7th.
Schedules, with Entry Form, post free from
H. SPENCER, Hon. Sec.,
Horton Park, Bradford.

BRISTOL CHRYSANTHEMUM SOCIETY.
The 45th GRAND EXHIBITION at the DRILL HALL, BRISTOL,
NOVEMBER 18th and 19th.
Tickets and Schedules from all Seedsmen and Florists; or of the Secretary,
W. ELLIS GROVES,
Durdham Down Nurseries, Bristol.

BROMLEY and DISTRICT CHRYSANTHEMUM SOCIETY.
27th ANNUAL EXHIBITION,
DRILL HALL,
WEDNESDAY and THURSDAY,
November 4th and 5th.
Hon. Sec., R. S. PATTERSON,
The Gardens, Bromley Palace, Kent.

CORN EXCHANGE CHRYSANTHEMUM AND FRUIT SHOW,
To be held at the
CORN EXCHANGE TAVERN, MARK LANE,
WEDNESDAY, November 11, 1908,
In aid of the Funds of the Corn Exchange Benevolent Society.
TWO SILVER CHALLENGE CUPS, of the net value of £10 10s. each, will be given, the Cups to become the property of the winners after being won [illegible] times.
(Not necessarily in succession.)
ONE CHALLENGE CUP for the best 12 blooms exhibited by a Member of the Corn Trade.
ONE CHALLENGE CUP for the best 12 blooms exhibited by a non-member.
For full particulars of entries, apply to Hon. Secretary,
J. H. MITCHINER,
36, Mark Lane, London.
N.B.—From considerations of space, the Committee reserve the right to limit the number of entries.

NATIONAL CHRYSANTHEMUM SOCIETY.
GREAT AUTUMN COMPETITION AT THE CRYSTAL PALACE,
November 4th, 5th, and 6th.
Apply at once for Schedule and particulars of membership, from the Secretary,
Mr. RICHARD A. WITTY,
St. James's Villa, Swains Lane, Highgate, London, N.

SOUTH SHIELDS and NORTHERN COUNTIES CHRYSANTHEMUM SOCIETY.
ANNUAL EXHIBITION in the ROYAL ASSEMBLY HALL, SOUTH SHIELDS, on WEDNESDAY and THURSDAY, November 11th and 12th.
£150 in prizes, Seven Silver Cups, Medals, etc.
First Prize for 36 Japanese, £10.
Entries close Nov. 6.
Schedules and all particulars from ALLEN PURVIS, 63, King Street, South Shields.

YORK.
The 29th GRAND ANNUAL CHRYSANTHEMUM SHOW will be held on 11th, 12th, and 13th November.
About £220 offered in Prizes. Groups, Cut Flowers, Fruit and Vegetables. (36 Japanese Cut Blooms, £20 10s.) Medals for Trade Exhibits.
Entries due 4 November.
Schedules on application to the Secretary,
GEO. F. W. OMAN, A.S.A.A., 38, Petergate, York.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

three entries, no prize awarded, all fruits semi-rotten; Beurre d'Anjou, no entries; Beurre d'Avalon, no entries; Beurre Bosc, [illegible] entries; Mr. M. Birkinshaw, Hatley Park Gardens, Sandy; Beurre Dumont, two entries, Mr. J. Skelton; Beurre Hardy, three entries, Colonel Archer Houblon, Hallingbury Place, Bishop's Stortford; Beurre Superfin, four entries, Mr. J. Skelton; Charles Ernest, three entries, Mr. Turton; Comte de Lamy, three entries, Mr. J. Skelton; Conference, four entries, Mr. G. D. Davison; Doyenné du Comice, ten entries, Mr. Turton (fine dish); Durondeau, seven entries, Mr. G. D. Davison; Emile d'Heyst, five entries, Mr. F. Blackett, gardener to Mrs. [illegible], 1, Parkside, Ravenscourt Park, W.; Fondante d'Automne, no entries; Fondante de Thiriot, no entries; Glou Morceau, seven entries, Mr. G. D. Davison; Josephine de Malines, thirteen entries, Mr. Turton; Le Lectier, four entries, Mr. J. Vert (fine specimens, very heavy); Louise Bonne of Jersey, two entries, Mr. J. Bond, Olantigh Gardens; Marguerite Marillat, no entries.

Marie Benoist, two entries, Mr. G. Lock; Marie Louise, seven entries, Mr. W. Allan, Gunton Park Gardens; Nouvelle Fulvie, eight entries, Mr. Turton; Pitmaston Duchess, nine entries, Mr. G. D. Davison (huge, clean, but not brightly coloured fruits); President Barabé, three entries, Mr. W. Allan; St. Luke, one entry, Mr. C. Page; Souv. de Congres, no entries; Thompson, four entries, Mr. Turton; Triomphe de Vienne, one entry, Mr. W. Hutt; Winter Nelis, five entries, Mr. G. Lock; any other variety, six entries, Mr. F. King, Westgate, first with Seckle; Mr. Mead, St. Mary's, Teddington, second with Gratioli of Jersey.

The Horticultural Club.

"A HOLIDAY ON THE NILE."

On Tuesday, the 13th inst., at the Hotel Windsor the house dinners of the Horticultural Club were resumed, Mr. Harry J. Veitch, V.M.H., taking the chair, and between forty and fifty members and guests being present to hear the lecture by Mr. A. W. Sutton, V.M.H., on "A Holiday on the Nile." The lecture was illustrated by a large number of beautifully coloured lantern slides from photographs taken by Mr. Sutton during his travels. His previous lecture on "A Camping Tour from Damascus to Petra in Arabia," illustrated in like fashion, had evoked great expectations, which were in every way realised, the brilliancy, sharpness, and artistic effect of many of the photographs evoking intense admiration, coupled with surprise when Mr. Sutton explained that many of them were snapshots taken from horse, donkey, or camel back. The interest of the lecture however was largely enhanced by the lecturer's descriptions embracing allusions to the political, historical, and artistic lore of Egypt past and present. A splendid view of Cairo, for instance, gave occasion for an allusion to its conquest by a small body of exhausted British soldiers, barely 150 in number, under the command of Major Watson, who, leaving his men outside the walls, coolly walked in, demanded that the sleeping Commandant of the 8,000 soldiers should be awakened and told to surrender, which he accordingly did, handing over the keys with profuse apologies for the delay involved by his nap, his men then retiring to make room for the British handful.

A previous set of slides gave a series of charming pictures of the Suez Canal, starting from Port Said, particular allusion being made to the admirable service established by Messrs. Cook for oriental trips and exploring parties. Views of the Pyramids followed, including the oldest of all, the Step Pyramid at Sakkara, supposed to have been built about B.C. 4300, i.e., about 6,200 years ago. The largest Pyramid is estimated as having originally been about seventy feet higher than St. Paul's Cathedral, with a base as large as Lincoln's Inn Fields, comparisons which clearly bring home to the Londoner's mind the stupendous nature of the edifice, while baffling all comprehension of how it was constructed, especially as the immense blocks of stone composing it had to be conveyed some 600 miles from the far away quarries at Assouan. Both the art and the architecture of old Egypt as exemplified by and in existing monuments, involve much of the mysterious. The Tombs of the Kings, for instance, although of later date, being estimated at only some 3,000 years, are remarkable for being entirely excavated in a hillside. Externally nothing is seen but small cave-like apertures in the soil, and yet penetrating these a series of spacious halls is reached after passing through a long and spacious corridor to match. The marvel here is that every inch of the surface of the walls and the ceilings is occupied by brilliantly coloured mural paintings of the most ornate hieroglyphic and pictorial character, the colours being evidently as bright to-day as when first applied. By means of flash lights a number of photographs were obtained, but the puzzle is what system of lighting was used by the artists, since nowhere is there a trace of smoke such as primitive torches or other illuminants would presumably produce. These pictures, as do most of the carvings covering the gigantic columns and walls of the ancient cities of Thebes, Memphis, and Karnac, views of all of which were given and explained, are practically records of contemporary history, and possess, therefore, additional interest to the antiquarian apart from their merely artistic merits. Several views were given of the great dam at Assouan, designed to control the water supply of the Nile, and so reduce the risks of periodical famine to which ancient Egypt, both by biblical records and their confirmation by the mural ones aforesaid, was as subject as the Egypt of later date. The slides illustrating this magnificent specimen of engineering design and skill formed a fitting conclusion to the lecture, and proved at any rate that the engineer of the present day can not merely vie with the Egyptians of old in vastness of construction, but can infuse immensely more practical value into the work achieved for the benefit of humanity, since after all is said and done, the great bulk of these ancient monuments were mere temples of vanity erected by tyrannical monarchs solely for their own honour and glory.

A very hearty vote of thanks to Mr. Sutton concluded the meeting.

Dutch Bulb Growers' Society.

The following awards were made at recent meetings of the Floral Committee:—

First-class Certificates.—To pæony-flowered dahlia, Andrew Carnegie, light rose; cactus dahlias, Cecilia, Dorothy, Elsa Ellrich, Eureka, Hamlet, Harold Peerman, Ivernia, Kathleen Bryant, Rev. Arthur Bridge, and Rosa Starr; Montbretia Prometheus; Watsonia Ardernei; Anemone japonica Autumn Queen, a large flowering semi-double variety, clear rose; Anemone japonica Geant des Blanches, a very large flowering semi-double variety; flowers pure white.

Awards of Merit.—To Acidanthera bicolor, a rare species from Abyssinia, allied to gladiolus, flowers creamy white, with brownish-red blotches; cactus dahlias Apricot, Crespy, Charles H. Curtis, Elysian, Flame, Gazelle, Spanish Prince, and C. E. Wilkins; Gladiolus gandavensis America; Gloriosa Leopoldi, a little-known hothouse climbing plant, with elegant pure yellow flowers; Lupinus polyphyllus roseus; Phlox decussata Gruppenkönigin, large trusses of deep rose coloured flowers, centre dark violet; Aster Novæ-angliæ Ryecroft Pink, a very free-flowering variety with large magenta rose, copper centred flowers, Aster puniceus pulcherrimus, with large white flowers, shaded with light blue; Aster ibericus Ultramarine, large deep blue flowers, Aster cordifolius Sprühlicht, with small soft blue flowers, a very free-flowering variety; Helleborus niger præcox, flowers white, smaller than those of the common Christmas rose, and opening out of doors from September till February.

United Horticultural Benefit and Provident Society.

The monthly meeting of this society was held at the Horticultural Hall, Vincent Square, Westminster, on Monday, October 12. Mr. C. H. Curtis presided. Eleven new members were elected, making a total of 63 this year so far. Sick pay was much lighter during the last month, the amount being £25 10s., against £39 13s. the previous month. Mr. A. C. Hill, of West Kensington, was co-opted on to the committee to fill the vacancy caused by the resignation of Mr. A. Hemsley. The usual quarterly payments were passed for old members on the benevolent fund.

CONFERENCE ON SPRAYING FRUIT TREES.

With the hearty concurrence of the National Fruit Growers' Federation, the Royal Horticultural Society organised a conference on spraying for the second day of the fruit show. There were two sessions, one at from eleven to one a.m., and the other from 2.30 to 4.30 p.m. There was a very good attendance at each session.

Morning Session.

At the morning session Colonel Warde, M.P., presided, and opened the proceedings by briefly thanking the Council of the Royal Horticultural Society for organising a conference upon a matter of very vital importance to the fruit-growing industry.

MR. G. MASSEE, V.M.H.

Mr. Massee did not read a paper, but, with a few notes to assist him, he talked easily about fungi and fungicides, and at once pointed out that it was with fungi and fungicides he proposed to deal, and not with insects and insecticides. From the fruit-grower's point of view, Mr. Massee's remarks were eminently depressing, as he stated very emphatically that too much was expected of fungicides, that spraying machines did not yet permit the complete covering of affected leaves, that a month after spraying with Bordeaux mixture fungi spores would germinate on the leaf surface, that the mixture does not always prevent the spread of fungus, and that it was a fallacy to believe that even if Bordeaux mixture covered the leaf it would kill or prevent the spread of apple scab. He had noticed that spores developed at the same rate on sprayed as on unsprayed trees, thus showing that spraying was not to be so much depended upon as was generally supposed. What was needed were proper tests with control plants to show exactly the value of spraying. Spraying as a preventive was of some value, and he urged that the spraying mixtures, notably Bordeaux, should be made at home. Changes of weather often served to reduce the value of spraying as a preventive, either by inducing chemical changes or by diluting the mixture and rendering it ineffective. At its best Bordeaux mixture is not a perfect spray mixture, and it is most ineffective when the fungi are most in evidence.

Mr. Massee urged that summer spraying was not specially useful because a fungicide strong enough to kill the fungi would usually scorch the tender leaves, and would be practically useless on old hard, uninfectable leaves; moreover, coating a green leaf with a fungicide reduced its usefulness to the plant because it excluded some light, and hence reduced the amount of starch manufactured. No amount of spraying, said the lecturer, would atone for uncleanliness. Good work in the orchard, good cultivation and cleanliness would do the most good. He urged the thorough examination of fruit trees in winter, the removal and burning of dead and all infected branches, and so remove the cause of the disease, instead of attempting to prevent or cure it when it had commenced to grow and produce spores. Winter work tells best, said Mr. Massee, and is the most effectual method of combating fungi. He pointed out that so many people now went into the fruit industry to make money for themselves and retire, and not with a view of gaining a livelihood and providing a business for their sons, hence insufficient care was taken in the matter of culture and cleanliness, and there was neglect until the fungus attacked the fruit itself, and thus affected the pockets of the proprietors.

Mr. Massee stated that in a Mortlake orchard, careful pruning and removal of dead and diseased branches and shoots, followed by two sprayings in the winter, did far more good than spraying the trees when the foliage was young and soft. There was not yet a spraying machine that gives the fineness of division (water vapour) that was needed for successful spraying; what was wanted was an enveloping vapour after the nature of a London fog, from which the moisture would soon evaporate, leaving the effective part of the mixture on the leaf to do its work. The lecturer then showed a few lantern slides that portrayed good and bad spraying and numerous fungi that attack fruit crops.

MR. H. F. GETTINGS.

Following immediately upon Mr. Massee's lecture came the paper contributed by Mr. H. F. Gettings, of Glewston Court, Ross, which was read, in his absence, by the Rev. W. Wilks, M.A.

Mr. Gettings urged spraying as a preventive of insect and fungus attacks, and strongly advocated regular spraying because it was almost impossible to continually examine the trees to find whether there was an attack. Further, when an attack was discovered it was usually too far advanced to be satisfactorily dealt with. Spraying for aphides should take place just before the bloom buds opened. For the apple sucker spraying should be left as late as possible, and should be done at the hatching period, as nothing would kill the eggs of this pest. Mr. Gettings dealt with the expense of spraying and the need for mixing effective materials in the right proportions. He deplored the lack of expert advice such as could be obtained for the asking in the United States. Mr. Spencer Pickering and the Duke of Bedford had done a good deal, but what was needed was a sub-department of the Board of Agriculture to deal with the whole subject of insect and fungi attacks on fruit crops, their prevention and cure, and the need of a properly equipped experimental station for its use. He also thought that a body of growers might be induced to visit the United States, and report for the benefit of their fellows at home upon the methods there adopted. He wished some of the fairy tales advertised respecting washes for fruit trees were fact, and he thought the cure-all advertisement defeated the end of the advertiser. Washes should all be very carefully tested before use. Proper spraying depended largely upon the operator, and should not be condemned merely because it had sometimes been ineffective. Bordeaux mixture he regarded as the best spraying mixture, though, possibly because of the nature of the lime used, it often did a great deal of harm to the foliage. Liver of sulphur, he said, was an insecticide (for aphis) as well as fungicide. He advocated nicotine and tobacco mixtures, and hoped that these might be cheapened by the removal of duty from tobacco juice. He cautioned growers against the use of paraffin with caustic soda, as he believed the harm done by paraffin was not noticeable for some time after its use. Mr. Gettings concluded with some remarks concerning the fruit spraying outfit at Glewston, and the need of keeping down the cost of labour and material to secure a reasonable profit on the undertaking.

DISCUSSION.

Dr. Guthergood, of Wisbech, expressed the disappointment he felt at the pessimistic tone of the papers read. He had spent thousands of pounds on spraying, and if spraying was useless it was impossible to stop the ravages of insects and fungi, and therefore impossible to grow fruit successfully. He pleaded for practical examples of success or failure in dealing with individual pests. He had cleared his orchards of the apple sucker by the use of petroleum in the winter dressing of caustic soda and potash, and gave as his formula 3lbs. of soda, 3lbs. of potash, and one gallon of petroleum to 30 gallons of water.

Professor Salmon, of Wye College, advertised a fruit conference at Wye on November 27. and went on to say that fine spraying, i.e., the deposition of the mixture in dust-like particles was the cardinal point of successful spraying, and he urged that there were machines capable of giving this fineness of spray. He emphasised Mr. Massee's advice as to the benefit of making Bordeaux mixture at home, but he traversed numerous statements made by the eminent mycologist, notably observing that it was impossible to combat apple scab without summer spraying. Mr. Salmon suggested self-boiled lime mixture for spraying peach trees, peach leaves being so tender and liable to scorch if treated with Bordeaux mixture. He also urged the formation of a sub-department of the Board of Agriculture, and instanced as the passing of the Destructive Insects and Pests Act what fruit growers could do if they combined and organised.

Mr. Baker spoke at some length, but not very pointedly, on insecticides. He said it was essential the lime solution should be c[illegible] before being added to the copper sulphate solution in the manufacture of Bordeaux mixture. Good lime was difficult to secure, and he had used common soda instead of lime with success.

Mr. Percy Bunyard referred to the value of nicotine preparations and their expensiveness at present. Mr. Meamé said that apple scab had been almost cleared by the use of Bordeaux mixture directly before and directly after flowering. Rev. G. H. Engleheart, wanted a remedy for apple leaf spot on Cox's Orange Pippin; he had tried every remedy recommended, and had cultivated thoroughly well, but the leaf spot was still a terrible plague in the Salisbury district. Professor Collinge said that upwards of twenty advertised washes tested had proved absolutely useless. He thought there should be a small committee of chemists and growers to standardise Bordeaux mixture; they also needed a mixture that would give the greatest amount of "wettability." Mr. Crook advocated early spraying as being the most effective.

Afternoon Session.

Colonel Long, M.P., presided over the afternoon session, and started the proceedings promptly. There was again an excellent attendance, the Lecture Hall being comfortably filled.

PROF. THEOBALD.

The paper contributed by Prof. Theobald dealt with insect pests, insecticides, and their use. It was a paper that will, doubtless, prove far more valuable as a contribution to the subject of "Spraying," when we can read it in the Royal Horticultural Society's Journal. Professor Theobald did not read his paper, but addressed the meeting using his marginal notes; hence, owing chiefly to the time limit, much had to be passed over, and possibly owing to these facts, a wrong construction may have been placed upon his remarks. He said that at present we knew very little about spraying. At present they had arsenical washes to poison the food of biting insects, and emulsions to kill other insects, like aphides, by contact. He hoped, however, that—as Mr. Spencer Pickering had suggested it might be—it would become possible to make one wash that would do for both kinds of insect pests. Professor Theobald is no friend of wash manufacturers, for all through his address he deplored the widespread use of spraying mixtures, averring that huge sums were wasted upon them, and with little advantage, any advantage gained in the reduction of insect pests not outweighing the damage done to the trees. He appeared to be strongly opposed to the use of mineral washes, to spraying in general, and to winter spraying in particular. He said no wash was a preventive, but it might be a remedy. But he made two exceptions in favour of quassia and nicotine preparations, both of vegetable origin, useful to ward off attacks of aphis, etc., and harmless to the trees sprayed.

It was desirable to keep fruit trees clean, and hence winter spraying with caustic preparations did some good by removing the hibernating quarters of many insects, it would not kill the eggs of the apple sucker, and he believed that where it was supposed that a large proportion of eggs had been killed, it was usually the fact that [illegible] per cent. of the eggs were unfertile. Regular spraying with a caustic wash would, he said, prove injurious to the trees, reducing their vitality after six or seven years of regular application. Spraying when young insects emerged, and before they could do any harm, appeared to be the only sensible method, but it was a waste of time and money to spray because insects might come—the insects or their eggs would be there or not there. Spraying, after all, could only do some good. He advocated cutting down the bill for spraying, and said that almost any wash would suffice for winter dressing, and, curiously enough, he suggested the [illegible] wash as a good one—this is the addition of paraffin and soft soap to the soda and potash. A mixture of lime and salt [illegible] settle about the leaf scars and prevent the young apple suckers, or most of them, from reaching the buds. The self-boiling lime and sulphur wash he suggested as good for the pear blister mite, but he condemned [illegible] purple and Paris green. Arsenate of lead needed to be properly mixed, and should be left to the chemists to prepare, and the mixture should be of guaranteed strength. Referring to emulsions of paraffin, he suggested that the best mineral oils [illegible] were Solar Distilled Oil and Tea Rose [illegible] suggested that a basic sulphate was [illegible] than soft soap for emulsing paraffin. [illegible] thought there was as much likelihood of ever getting one preparation to cure all the ills of fruit trees as one pill to cure all the ills of humanity.

MR. G. HAMMOND.

Mr. Hammond was inclined to let his paper stand over to permit of lengthy discussion of Professor Theobald's views, but the meeting would not allow this. Mr. Hammond's [illegible], written by his son, and combining the results of good culture, observation, and experiment conducted by father and son at [illegible]ntwood, was an eminently practical one. [illegible] straight from the orchard itself, [illegible] brought with it the fragrance of fruit, [illegible] good fruit too. There was no denying the absence of Governmental aid. [illegible]demnation of spraying, but a good, [illegible] lecture that told of good culture, [illegible] tests, preventive measures, useful [illegible]dies and good crops. After the pessi[illegible] the other papers it was quite a treat [illegible] to the plain tale of a successful grower; indeed we might sum up Mr. Hammond's remarks in his own advice, to keep the trees in good condition and they will throw off attacks of insects and fungi. Cli[illegible] vagaries, he admitted, were the cause of much trouble, as they reduced vitality, [illegible] the same time provided conditions [illegible] to fungi and insect attacks. [illegible] he regarded as a regrettable neces[illegible], but without it there was no remedy [illegible] loss of fruit crops. Mr. Hammond's [illegible] and advice were identical with [illegible] given from time to time in these [illegible] acknowledged masters of fruit [illegible] experience and advice that has done [illegible] to put the fruit growing industry [illegible] and profitable basis. What is [illegible] that all fruit growers should act [illegible] that the average of quality may [illegible] all round. The use of a sulphur compound, such as copper sulphate and [illegible] of sulphur, was advocated by Mr. Hammond as a preventive of fungi attacks. He pointed out the need of two or three sprayings, the difficulty of late spraying when soft fruits were grown under hard fruits, and also the difficulty of securing men who would do the work of spraying properly—he urged that the proprietors or their sons should give close attention to the matter. He suggested that remedies should not be adopted wholesale too quickly, and urged that the Board of Agriculture should be perfectly certain of the efficacy of a course of procedure before advocating it, or the fruit growers might suffer very greatly. Winter spraying he advocated, though he said that it was doubtful whether the eggs of many pests were killed by the caustic dressing. He found hot lime wash, 1½ bushels of lime in forty gallons of water, self boiled for ten minutes, and then applied hot as a thick mixture, very efficacious as a winter dressing, and satisfactory if used during the first fortnight in April, against the apple sucker, though not wholly successful against apple scab. Iron sulphate made a good emulsion with paraffin, and this was a good wash for apple sucker, but it left a rusty deposit that might reduce the value of the crop if not washed off by rains. He suggested liver of sulphur for red spider on gooseberries, and hellebore powder for the gooseberry sawfly.

A fine spray, a suitable mixture, a pressure of 60 to 100 lbs. per square inch, calm weather, and an intelligent operator, were points that Mr. Hammond emphasised as essential to proper, effective, and economical spraying. Mr. Hammond also suggested that many of the mixtures were best obtained from chemical manufacturers, in guaranteed form, rather than made up at home. Mr. Hammond was listened to with close attention, and was loudly applauded when he had finished. Hope seemed to have returned after the scientists had bid it depart.

Mr. F.W. Moore, V.M.H.,Glasnevin, livened things up also by asserting that the scientists had discounted the intelligence of the grower. They had heard diametrically opposed views; one said spray by all means; another said spraying was useless—who was to decide? For himself he was convinced, as a result of experiments conducted in Ireland, that spraying was of the utmost value, and he urged growers not to give up winter spraying, and he did not believe this did any harm to the trees, but was convinced that clean limbs and clean surroundings were of as great importance to fruit trees as to human beings. He urged that there was a great need of a standardisation of washes, and it was essential that growers should know the right percentage of purity needed in the various ingredients used in the washes, and he said that of the specimens of damaged leaves of fruit trees sent to the Department of Agriculture in Ireland for inspection, 30 per cent. were damaged by the use of over strong or badly mixed washes. Several other gentlemen spoke, and the meeting then concluded with a vote of thanks to Colonel Long and those who had contributed papers.

NEW PLANTS, ETC.

◆

MICHAELMAS DAISIES.

Climax.—A splendid Michaelmas daisy, and one that grows about five feet high, producing branched growths, and an abundance of large soft blue flowers. In size, form, and colour, and habit this variety is a great advance upon known varieties. A.M., R.H.S., October 13. Mr. E. Beckett, gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree, Herts.

Maidenhood.—This is a particularly graceful and beautiful variety, evidently derived more or less directly from Aster ericoides. It has small, starry, white flowers, that are abundantly produced on arching and much-branched spikes. A beautiful variety. A.M., R.H.S., October 13. Mr. E. Beckett.

LÆLIO-CATTLEYA ST. GOTHARD.

A very fine orchid, derived from L.-c. Gottoiana and C. Hardyana. It has good size, shape, and colour, and appears to be a fine grower. The sepals and petals are bright rose-purple, and the broad apex of the lip is deep rich crimson-purple. F.C.C., R.H.S., October 13. Mr. Day, gardener to H. S. Goodson, Esq., West Hill, Putney.

CYPRIPEDIUM CHARLESWORTHI BROMILOWIANUM.

This is a distinct and beautiful orchid, but there are some doubts as to its being a variety of C. Charlesworthi, the leafage and the shape of the dorsal sepal being somewhat different from those of this species. For purposes of description it may be regarded as an albino of C. Charlesworthi, the pure whiteness of the dorsal sepal and staminode contrasting finely with the pale green of the petals and lip. F.C.C., R.H.S., October 13. Mr. Morgan, gardener to H. J. Bromilow, Esq., Rann Lea, Rainhill, Lancashire.

ODONTOGLOSSUM PESCATOREI SANDERÆ.

An unusually distinct and very pretty variety of a species that does not vary much. The ground colouring is pure white, but the base of each sepal is marked with a blotch, formed of confluent spots of soft brown, with one or two other spots separated from the blotch. On each petal, towards the base, there are a few free spots of the same colour. A very good idea of the arrangement of the colour markings can be obtained from the illustration, from a photograph, on p. 785. A.M., R.H.S., October 13. Messrs. Sander and Sons, St. Albans.

CYPRIPEDIUM LORD OSSULSTON, SANDER'S VAR.

A fine cypripedium, obtained by crossing C. Leeanum Clinkaberryanum with C. Charlesworthi. It has green petals and lip, and a green base to the very broad, large, and rounded white dorsal sepal. A.M., R.H.S., October 13. Messrs. Sander and Sons, St. Albans.

PAUL & SON'S
SPECIALITY OF
STANDARD APPLES.
STOCK THIS SEASON, 20,000 FINE TREES.

PAUL & SON grade their Standard Apples into three sizes. The £5 size are 4-year-old trees; the £6 trees 4 years selected and 5 years; the £12 size is a special size, especially adapted for permanent orchards that are grazed. They are magnificent trees, many thousands of which are retailed at from 3s. to 5s. each.

Fine Standards, 5 to 6 ft. stems ... ... 20s. per doz., £7 10s. per 100
" " extra selected, girth 3 in. average ... ... 24s. " £9 "
" special orchard size, girth 3½ in. to 5 in. average ... 36s. to 60s. per doz.

All Leading Kinds Grown in Large Quantities. Catalogue Post Free of
THE OLD NURSERIES, CHESHUNT, N.

ANSWERS TO CORRESPONDENTS.

CORRECTION RE CERTIFICATED DAHLIAS.—Messrs. J. Burrell and Co., of House Nurseries, Cambridge, write that in our issue of October 3, p. 752, we credit Messrs. Stredwick and Son with having gained an Award of Merit for dahlia Monarch at the Royal Horticultural Society, whereas this variety was raised by the Messrs. Burrell, and the award was made in their favour. We gladly publish this correction. The error was due to the fact that we gave the award as it appeared on the official list, and also because the dahlia was arranged with other flowers from other exhibitors in the annexe of the hall, and there was no card attached denoting ownership.

FORCING ROSES.—T. S., Gloucester: We have read your letter with a great deal of interest, and not a little amazement. It is quite impossible to properly force a rose into flower during the winter if the plants are dug up early in November, potted and placed in heat. They would most likely die if so treated, and in any case would be miserable specimens. We have no hesitation whatever in stating that the advice of the Continental nurseryman, that November lifted roses would stand early forcing, is utterly at fault, and likely to cause a vast amount of trouble and disappointment. If the advice were followed, with the unhappy results indicated, and the blame was laid upon the shoulders of the Continental nurseryman who gave it and supplied the plants, then the case would not be so very bad. But, unfortunately, the blame is not always rightly distributed, and in such a case as this, the gardener would probably receive it instead of the tradesman, even though he knew full well what the results of such advice, given to the employer, would be. We cannot too severely condemn such advice and methods as those you have indicated.

AMATEUR CHRYSANTHEMUM GROWERS.—S. C., Bridgwater: We have many times given our advice upon this matter. Your society might adopt the definition of an amateur prepared by the National Chrysanthemum Society. It is as follows. Definitions of the term, amateur. — The society recognises two sections of amateur cultivators of the chrysanthemum: (a) For those who mainly, if not entirely, personally cultivate their chrysanthemums, and employ but one assistant regularly, and do not grow for sale. Single-handed gardeners who grow for their employers, can also exhibit in this section, but in all cases of entry the name and address of the employer in full must be given. (b) For those who employ no paid assistance whatever in the culture of their chrysanthemums, and are the bona fide growers of their plants. No person who is employed in a nursery, or public or private garden, can compete in this section, and any act of selling cuttings, plants, or blooms will disqualify. Note: A single-handed gardener is defined as one who is alone constantly employed in the garden, though he may have occasional help. The committee reserve to themselves the right to apply to the employer of any single-handed gardener for verification of his qualification to exhibit, and to require proofs of the bona fides of any person entering as an amateur.

RIDDLED ROSE LEAVES.—M. F. B., Oxford. The cause of the trouble is the Rose Slugworm (Eriocampa rosæ), a pest that appears about May, deposits its eggs on the leaves, and these hatch out and the grubs or slugworms devour the upper leaf surface, and the leaf-substance, but curiously enough they do not eat the lower epidermis, and so, though the leaves present a riddled appearance at a slight distance, they are not really riddled through. Two or more broods may appear in a year, hence the necessity for keeping a close watch upon bushes that have been once attacked. Hellebore powder, or a hellebore wash made by mixing 1oz. of freshly ground hellebore powder and 2oz. of flour, with three gallons of water, will kill the slugworms. If not killed these grubs mature, fall to the ground and pupate in cocoons in the soil. The removal of surface soil from beneath rose bushes that have been infested is recommended, and the work should be done in winter, the removed material being burned or deeply buried, and new rich material substituted.

PLANTS CATS WILL AVOID.—We shall be glad if some of our suburban readers will give us their experiences concerning plants that cats will avoid in answer to the plaint of a reader who writes as follows from Surbiton: "Is there any plant, easy and convenient to grow in a small garden, which cats will avoid? I find that in one part of my garden nothing will grow well. I have had failures there from January to October. Coreopsis, anemones, poppies, and asters that do well elsewhere are no good in this particular place, and I can only account for the failure by the fact that a cat is in the habit of frequenting the spot, hence I should like to know whether there are plants the cat would avoid, or whether there is anything I could strew over the ground that would keep the cat away and not injure the plants." We may say that while we shall be glad to hear of suitable plants that cats avoid, we think the remedy lies rather in making things unpleasant for the cat. A free distribution of cayenne pepper over the spot, applied when the soil is dry, and just before the time the cat usually arrives on the scene will cause the beast to find another resting place, and if cayenne, or even common strong black pepper is used occasionally the cat will not stay. Sprays of some thorny plants, such as hawthorn, placed among the plants, will make the place uncomfortable for pussy. A hose is also a useful instrument, and if it is trained upon the favoured spot, and the water is turned on whenever the cat attempts to settle down, the animal will soon seek less exciting quarters.

NAMES OF PLANTS.

S. L. J., Exeter.—1, Aster vimineus; 2, Cupressus macrocarpa.

F. C. H., Skipton.—1, Quercus cerris; 2, Pelargonium quercifolium.

M. E. M., Colchester.—1, Polygonum Baldschuanicum; 2, Aster sinensis, 3, Buddleia globosa; 4, Garrya elliptica.

T. H. B., Plympton.—1, Begonia Pres. Carnot; 2, Calceolaria Burbidgei; 3, Helxine Solieroli; 4, Euonymus radicans; 5, Hedera helix dentata.

NAMES OF FRUITS.

R. R., Summerscales.—1, Claygate Pearmain; 2, Beurre Diel; 3, Catillac.

M. C., Faversham.—1, Ribston Pippin; 2, not recognised, poor specimen.

T. R. E., Dorking.—1, Duchess' Favourite; 2, Norfolk Beefing; 3, Annie Elizabeth.

S. H. L., Horsham.—1, Lane's Prince Albert; 2, Betty Geeson; 3, Adam's Pearmain.

N. S. L., Rottingdean.—1, Court Pendu Plat; 2, Waltham Abbey Seedling; 3, Dumelow's Seedling.

C. L. L., Rugby.—1, Cellini; 2, King of Tompkins County; 3, King of the Pippins; 4, Alfriston; 5, Golden Noble.

GARDENING APPOINTMENTS.

Mr. S. W. Wyatt, for three and a-quarter years inside foreman at Leonardslee, Horsham, has been appointed head gardener to J. Stuart, Esq., Stonehurst, Ardingley, Somerset.

Mr. A. Bennett, for the past three and a-half years' gardener at Newton Kyme Hall, Tadcaster, and formerly seven and a-half years' gardener to H. Stanton, Esq., at Byford Court, Hereford, has been appointed gardener to this gentleman at Snelston Hall, Ashbourne, Derbyshire, and enters on his new duties on October 26.

FORTHCOMING ENGAGEMENTS.

MONDAY, October 26.—National Chrysanthemum Society; Floral Committee at Essex Hall, at 3 p.m.

TUESDAY, October 27.—Royal Horticultural Society. Committees meet at 12 o'clock; lecture at 3 p.m. on "Modification of Leaves and Stipules for Special Purposes," by the Rev. Prof. G. Henslow V.M.H.; Scientific Committee at 4 o'clock.

Croydon Chrysanthemum Show; two days.

WEDNESDAY, October 28.—Royal Society of Arts. Lindfield Chrysanthemum Show; two days.

Kent County Chrysanthemum Society; two days.

Southampton Royal Horticultural Society; three days.

Sale of Botanical Books.—The important library which will be sold by Messrs. Hodgson and Co. at their rooms, 115, Chancery Lane, W.C., on Wednesday, November 4 and two following days, is rich in botanical works. Among others of special interest are the "Index Kewensis" with the first and second supplements; Paxton's "Magazine of Botany," Loddige's "Botanical Cabinet," and Redouté's "Les Liliacees." The botanical books will be included in the first day's sale.

V1 FLUID

THE WINTER SPRAY FLUID.

V1 FLUID CLEARS THE TREES OF MOSSES, FUNGI, AND LICHENS.

Easy to Mix. Easy to Apply. A Powerful Cleanser & Invigorator.

HAMPTON LOADE, NR. BRIDGNORTH. Sept. 1st 1908.

Dear Sirs,—I may say your V1 Fluid has exceeded my expectations, foliage very dense and apples a lot larger, in fact I have some trees which only bore small ones but this season good bold fruit, which speaks for itself; trees very healthy. I may say I left some unsprayed, and it does not need pointing out which they are.

Yours faithfully, GEOFFREY BOOTH.

1 Gallon of this Fluid makes 100 Gallons of Spray Mixture.

LARGEST IMPORTERS AND GROWERS OF ORCHIDS IN THE WORLD.

THOMSON'S CELEBRATED MANURES. For full advertisement see page facing 826.

TO-DAY! AND FOR YEARS AND YEARS PAST the XL ALL Specialities are and have been the best on the market. Where is the Gardener who does not pin his faith to one or the other of these celebrated Insecticides or Fertilisers? XL ALL FERTILISER has pleased all who have used it this season. The Sales of XL ALL FUMIGATOR prove that it is more popular than ever. XL ALL LIQUID NICOTINE INSECTICIDE is always spoken of by gardeners and growers as the most deadly to Mealy Bug, Thrip, etc. XL ALL WINTER WASH for dormant Trees acts like magic, clearing the Trees and Bushes of all Insects' Eggs, Moss, and Fungoid Growths. XL ALL LAWN SAND, a weed eradicator and fertiliser for weedy and poor lawns. XL ALL WEED KILLER used once a year "No weeds can live." Please ask your Nurseryman, Seedsman, or Florist for a copy of my small pink list, giving particulars of these and many other XL ALL Preparations, which can be obtained from the Horticultural Trade throughout the World. G. H. RICHARDS, Manufacturer and Patentee, 234, Borough High Street, London, S.E.

SPECIALITIES:

ROSES in all forms, from open ground and in pots. Silver-gilt Cup (value 55 guineas) for the most meritorious exhibit at the great Temple Show, May, 1904; Five Gold Medals 1907 and 1908.

FRUIT TREES for the Orchard, Garden, and Forcing House, Hogg Memorial and Silver-gilt Knightian Medals.

HARDY TREES for Street, Park, and General Planting. Silver Medal from the Royal Agricultural Society of England.

SHRUBS, Evergreen and Deciduous, for General Planting.

HARDY CLIMBING PLANTS for all Purposes.

RHODODENDRONS, CAMELLIAS, and AZALEAS.

HERBACEOUS PLANTS in great variety.

BULBS and SEEDS, and all Garden Sundries.

Price Lists on application. Inspection invited. Upwards of 1,000 Gold Medals, First Prizes, and other Awards at leading Exhibitions during the past 48 years.

NOTES OF THE WEEK.

Deciduous Trees and Shrubs.

The life of a leaf, as distinct from that of the form of vegetation which bears it, is almost invariably of much briefer duration. In all trees, even the evergreens, a few seasons sees them drop or dry up and perish, but in those which are termed deciduous, they all die off annually, fall to the ground and rot away, and in this fashion restore to the soil at least some of the material which the roots have extracted from it during the growing season. Deciduous trees are found in the tropics dropping their leaves in the dry season, while the greater number which are found in temperate and higher latitudes do so in the autumn, and therefore in a season usually very humid. We have, therefore, probably two distinct evolutional causes for the fall of the leaf. In the tropical dry seasons, when great heat and great drought prevail, it is difficult to conceive of the possibility of full foliaged trees being able to withstand the immense resulting transpiration, hence they are, as it were, shed wholesale. In temperate regions, on the other hand, though there is ample moisture both at the roots and in the environing atmosphere, not only does the great fall in the temperature check activity of growth, but widespread dense foliage and landscape, if maintained, would become very apt to lead to the destruction of the tree by severe winter gales, and be still more imperilled by the snowfall usually prevalent in cold regions, and which would inevitably break them down by the sheer weight of the clinging snowflakes. Non-deciduous northern trees consequently consist mainly of the needle-leaved pine tribe, the foliage of which is the least adapted to retain such a burden, while other non-deciduous examples, such as hollies, laurels, meet this difficulty by having highly polished leaves well adapted to let the load slip off before it accumulates to a dangerous extent. We all know, however, that a heavy snowfall is often accompanied by considerable breakage of evergreen shrubs, despite these provisions for protection. As a rule, the fall of the leaf is not determined merely by its death, but by the actual provision of an arrangement for throwing it off when it has fulfilled its last functions of completing its contribution to the annual ring of bark and fattening up the axial bud at its base which is destined to replace it the following season. At the point of its attachment to the tree there is usually a joint, and at the time indicated the segment next the tree swells, while that of the dying leaf shrinks, the result being a severance. In some trees, such as the beech, there is no such joint, and the dead leaves consequently remain attached until broken off by the wintry gales. It is during the dying period of deciduous leaves, and as they are presumably parting with any sap within them which may be of service to the sustaining tree, that those beautiful changes of tint occur which give such gorgeous colour effects to the autumnal woodland prospects. Subtle changes occur within the cells as the vital chlorophyll perishes, which causes the normal green tint to change into a series of pale greens, yellows, oranges, and reds, into, in short, all the tints of the rainbow; and as each kind of tree has its own peculiar gamut of colours, and these are all run through within a comparatively short period, it is little to be wondered at that the effect is so entrancing. Finally, as a rule, these tints merge into browns, which really indicate that decay has set in, but by this time the fall has usually taken place, and it is now the turn of the fungus and insect tribes to complete the work of dissolution, always provided that that universal undertaker, the omnipresent worm, has not drawn them into his burrow beforehand. In any case, the material will be restored to the soil and to the roots, and doubtless play its part time after time in the regeneration of the woodland, added to, moreover, by the draught which the living leaves have made throughout their growth and activity upon the carbon stored in the air we breathe.

MR. THOMAS HUMPHREYS,
Curator Edgbaston Botanic Gardens.

Mr. Thomas Humphreys, whose portrait we have much pleasure in giving herewith, was some five years ago appointed to the important position of Curator of the Edgbaston Botanic Gardens, and during that period has more than justified the wisdom shown by the Council in the selection of a successor to Mr. W. B. Latham, and won golden opinions from all who are interested in horticulture in the Birmingham district. In giving Mr. Humphreys' portrait, it is interesting to call to mind that for some years he occupied in the Royal Gardens, Kew, the position of arboretum propagator, which he relinquished about sixteen years ago, when he was appointed by the Council of the Royal Horticultural Society assistant superintendent at Chiswick. Here, under the late Mr. A. F. Barron and

Mr. S. T. Wright, he rendered such splendid service as to afford abundant proof of his remarkable abilities. During the period he occupied this position he acted also as secretary of the R.H.S. Floral Committee, and consequently he entered on his duties at Birmingham with an experience that was quite unique in garden management and the conduct of horticultural meetings and exhibitions. Since his occupying his present position, Mr. Humphreys has effected many important improvements in the Edgbaston Botanic Gardens, has organised various flower shows on quite new lines, and in other ways endeavoured to make the gardens the centre of horticultural activity in the district. Among other honorary positions filled at the present time, Mr. Humphreys is the secretary of the Midland Carnation and Picotee Society, one of the most successful of the associations in the United Kingdom that have for their object the advancement of these fragrant flowers.

Chestnut Avenue, Bushey Park.—The work of repairing the damage done to this historic avenue by the great storm of June last, is now in progress. The damaged chestnut trees are being replaced by trees of moderate size from Richmond Park, and the blanks caused in the outer rows of limes have been filled with young trees.

Paris Chrysanthemum Show.—The chrysanthemum show to be held in the greenhouses on the Cours la Reine on November 6 to 15, will be the twenty-fifth exhibition of the kind held by the National Horticultural Society of France. Great preparations are being made to celebrate the event, especially as it will be the last one to be held in the greenhouses, which have been condemned by the Municipality of Paris. Part of the show will be devoted to a retrospective exhibition of the popular autumn flower. Exhibits of old varieties are provided for, and a remarkable collection of books, pamphlets, old catalogues, prints, engravings, and other literary and artistic objects connected with the chrysanthemum have been collected for the purpose.

A British Fern Society.—Mr. C. T. Druery writes: Although the British Pteridological Society, established at Kendal, has done good service as a centre of the British fern cult for many years, there is no doubt that its purely local character militates against its wider usefulness, and that now that our beautiful, and, in many cases, unique British ferns are becoming popular, a society on a more extended basis is desirable. The objects of such a society should embrace a periodical publication describing and illustrating new finds and fresh developments in cultural selection, and also providing such general data as may assist the amateur in growing and propagating and acquiring a knowledge of what is being done in this particular direction. The writer would be glad to hear from their admirers by a simple postcard in order to judge whether such a society is practicable on the basis of a moderate subscription sufficient to cover printing and other expenses incidental to the programme indicated. Mr. Druery's address is 11, Shaa Road, Acton, W.

Wrest Park Gardens.—In our next issue we shall give a freely-illustrated account of the gardens of Wrest Park, Ampthill, Beds., the residence of the Hon. Whitelaw Reid, the American Ambassador.

Pentstemons from Hawick.—From the Hawick Nurseries Mr. John Forbes sends us a large gathering of named pentstemons, and, notwithstanding their long journey, the splendidly developed spikes present a charming appearance arranged in plain glass vases upon our table. Some thirty or more varieties are represented in the gathering, and they are of much interest as a practical demonstration of the immense improvement that has been effected in these attractive flowers within recent years. The spikes are stout and of great length; the flowers large, of fine form and well arranged, and the colours are rich and varied. Especially remarkable for their high quality and effectiveness are H. J. Alsopp, rich purple, with white throat; Mrs. D. McAinsh, bright carmine pink, with crimson markings; Mrs. Forbes, deep ruby crimson; Marchioness of Linlithgow, brilliant pink; Peach, white, with picotee edge of pink; Mrs. A. Brown, white, suffused rose; Sir Dighton Probyn, brilliant scarlet, very effective; Lady Chesterfield, bright ruby-purple; Pink Beauty, delicate pink, the flowers of medium size, a fine variety for bedding purposes; Thomas Hay, white, with pink lobes; Sir W. T. Thiselton Dyer, rich scarlet; John Deacon, white, with well-defined purple margin; Dr. R. Koch, purple rose, the flowers very large and somewhat frilled; Ernest Bichat, rich violet; and Lord Rothschild, rich pink. White Newbury Gem must have special mention, forming as it does an excellent companion to Newbury Gem, one of the very best of the high-coloured pentstemons for bedding.

Manchester Children and Flower Culture. — The Education Committee of Manchester, anxious to encourage flower culture among the children in the Board Schools, offered plants at a small fee in the spring of 1907, but was able only to accommodate 16,000 of the 29,000 applicants. In the spring of 1908, thanks to the generosity of many ladies and gentlemen and the aid of the Parks Committee's resources, no fewer than 32,000 plants were sold to the children. At a given date the plants are submitted for examination, and the best 25 out of every hundred are selected for public exhibition, two such exhibitions being held during the year. Prizes are awarded at the rate of about one to every twenty plants. Fuchsias and pelargoniums appear to be the most popular subjects.

Curious Growth of Potato.—Mr. Veitch submitted to the R.H.S. Scientific Committee, on behalf of Mr. Rumsey, of Leyton, a curious potato, which had been growing in the light but out of the soil for eighteen months. It had, as usual under such conditions, produced a number of short purplish shoots reaching in all a length of about 2in. to 2½in., and from these were developed a large number of closely oppressed greenish roots.

Trials at Wisley in 1909-10.—The Council of the Royal Horticultural Society have arranged for trials at the Wisley Gardens of the following fruits, flowers, and vegetables during 1909: Fruits—Autumnal raspberries, 15 canes of each variety, to be sent at once. Flowers—Tree carnations, two plants of each variety; annuals, seed to be sent in January; garden dahlias (show and cactus excluded), early-flowering outdoor chrysanthemums, and pentstemons, two plants of each variety in each class, to be sent in April. Vegetables—Potatoes, 20 tubers of each variety to be sent by February; also experiments with the same variety of potato secured from as many varying sources as possible, under different soil and climatic conditions; cauliflower, ¼oz.; lettuce, ¼oz.; and kidney beans, ½ pint of seed of each variety. Each variety of potato must be labelled as being "early," "mid-season," or "late." Everything sent for trial must be named and the name and address of the sender attached, and all parcels should be sent to the Superintendent, R.H.S. Gardens, Wisley, Ripley, Surrey.

"**Points in Fruit Culture,**" formed the subject of an instructive address given by Mr. E. Molyneux, V.M.H., before the Basingstoke Gardeners' Association the other evening. Mr. Molyneux strongly advised the planting of varieties that were not only good, but were well adapted to the conditions that obtain in the garden or plantation where they are to be grown. Attention was directed to a method of procedure by which Blenheim Pippin can be brought into a productive state in five or six years. The practice that frequently obtains of purchasing inferior trees because of their being low in price was condemned, as was the practice of allowing the grass to grow close up to the stems of orchard trees, which frequently did much harm. Mr. Molyneux advised the trenching to a depth of three feet of strong soils to be planted with apple trees, and stated that while the expense was comparatively heavy, it would give an ample return. With reference to the all-important question of pruning, Mr. Molyneux suggested that the shoots of newly-planted trees should be pruned back to within three or four buds of the base, and that subsequently the pruning should be so carried out as to ensure the branches being far enough apart for the air to circulate freely among them, and the light to reach the whole of the growth. Root pruning was another point that had reference made to it, and Mr. Molyneux advised that when trees were so luxuriant as to fail to produce well ripened wood freely set with fruit buds, the roots should be carefully pruned for the purpose of checking the growth. It was not, he said, of any use to cut the shoots back for the purpose of restoring unduly vigorous trees to a state of fruitfulness, but the pruning of the roots would accomplish all that could be desired.

Salisbury Plain and the War Office.—The purchase of 6,000 acres of land for military purposes on the Devizes side of Salisbury Plain has given rise to considerable anxiety among the tenant farmers and others affected thereby. The Secretary of War having had his attention drawn to the hardship likely to be entailed upon those engaged in the cultivation of this large area, states that the site selected for the additional artillery ranges required is the only one that is really suitable. He has also promised that should special cases of hardship arise among the labourers they shall be considered with a view to compensation. It is much to be regretted that so large an area of excellent land should be withdrawn from cultivation.

The Azalea Gall, which is produced by the fungus known as Exobasidium japonicum, Shirai, is the subject of an interesting note in the new part of the R.H.S. "Journal," by the editor, Mr. F. J. Chittenden. Twelve years ago Mr. Shirai described a gall upon the Indian azaleas, and stated that it was common upon these plants at Tokyo. The gall was found to be due to the attack of a fungus which up to that time had not been described, and this Shirai described and named. Recently specimens of galls have reached the Royal Horticultural Society from Cornwall and the Continent, and have been investigated by Mr. Chittenden at the Wisley laboraery. The galls are of relatively large size, being in many cases fully an inch in diameter, and are greenish or yellowish green at first, sometimes pink, but later become covered with a whitish bloom, owing to the breaking through the epidermis of the fruiting threads of the fungus. Sometimes, according to Shirai, the fungus causes the malformation of a single leaf only; but in all the specimens that have come under the notice of Mr. Chittenden, the whole of the terminal bud of the shoot has been involved in the swelling. Mr. Chittenden states that the best method of controlling the pest is to remove the galled leaves on the appearance of the galls and burn them. If this is done before the spores are produced there will be but little danger of the disease spreading.

N.C.S. Annual Dinner. The annual dinner of the National Chrysanthemum Society and presentation of prizes will take place in the Throne Room, Holborn Resturant, High Holborn, W.C., on Thursday, November 26, 1908, at 6.15 p.m. for 6.30 p.m. Sir Albert Rollit, D.C.L., LL.D., president of the society, will preside. The challenge trophy, the Holmes Memorial cups and medals will be presented to the winners during the evening. Tickets, 5s. each (exclusive of wine), to be obtained from the secretary, Mr. Richard A. Witty, St. James' Villa, Swain's Lane, Highgate.

An Interesting Ceremony.—On the occasion of the visit of M. Fallières, the President of the French Republic, to the Paris autumn show, a great granddaughter of Capitaine Blancard, who introduced the chrysanthemum to Europe in 1789, will present to M. Fallières a bouquet of chrysanthemums. It will be remembered that two of the granddaughters of Blancard are living in England, and have been for many years past. "Le Chrysanthème," in its current number, gives several pages to an account of the life and doings of Blancard, who, in spite of his hazardous career as a navigator in the 18th century, died at the age of 85 years.

Sweet Peas and Their Cultivation.—We have before us the second edition of "Sweet Peas and Their Cultivation," by Mr. Charles H. Curtis, hon. secretary of the National Sweet Pea Society, and we find it even more interesting and useful than the first edition. The first edition was dated January 1, 1908; the second edition is dated October 1, 1908. Could anything more eloquently show the widespread love for sweet peas and the high value set upon Mr. Curtis's advice? An entirely new chapter has been added, and it deals with the propagation of sweet peas from cuttings, a subject of importance and interest to those who have seedlings of merit. Not a few people now sow sweet peas in pots in late autumn and winter them in cold frames, and to such, as well as to all who are anxiously awaiting the advent of seed catalogues, the new edition of this little work comes in excellent time, as it contains up-to-date lists of the best varieties of sweet peas in their respective colours, the most promising novelties for 1909, and additions to the lists of Too-Much-Alike and Outclassed and Obsolete varieties. The best of the old illustrations have been retained in the new issue, but, in addition, and this is of great importance, portraits of the best novelties seen this season are given. We believe the new issue will run its course as rapidly as the old one. The price of the book is 1s. net (by post 1s. 2d.), bound in cloth 1s. 6d., or by post 1s. 8d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

CIDER ORCHARDS.

According to the Board of Agriculture, the general revival of interest in cider making suggests that a leaflet dealing with the planting of cider orchards—a somewhat neglected question—and the selection of suitable varieties, would prove useful to a wide circle of growers. Many orchards which are being planted are stocked with varieties reputed to be useful for cider purposes, and of vigorous growth, without any regard being paid to suitable proportions of each kind and similar points of importance from the vintage point of view. The present leaflet is an attempt to deal briefly and practically with these important questions.

Necessity for Planting Fresh Orchards.

The future welfare of the industry chiefly depends upon a large increase in the planting of fresh orchards during the course of the next few years. Probably the majority of existing orchards have long passed their best days, and are now dying out; and few are being planted to fill their places. In unfavourable seasons the supply of fruit is by no means equal to the demand, with the result that prices are high, and it is difficult to manufacture pure cider at a reasonable profit. The present state of affairs points to a regular and more serious shortage of cider fruit within a few years, and this, unless something be done, means a decline of the industry from the position it now occupies. The matter is so serious that it cannot be too forcibly impressed upon those interested that fresh orchards must be planted, if a suitable supply of fruit is to be maintained. The number of young orchards is small, and inquiries show that the demand for young trees is still limited. It is indeed stated that in many nurseries, where cider trees were formerly extensively raised, their propagation has been given up in consequence of the lack of demand.

Characteristics of a Cider Orchard.

Since it is of importance that fresh orchards should be planted, and since there are indications in some quarters that the need is beginning to be recognised, it may be opportune to consider what the essential characteristics of a good cider orchard should be from the cider-makers' point of view. The general arrangement and the selection of varieties for a vintage orchard are matters which involve questions of some complexity, quite distinct from those met with in connection with the laying out of orchards for market purposes. It must be borne in mind that the value of an orchard for vintage purposes is determined by the quality of the cider which can be made from its produce; and the quality is primarily determined by the kinds of fruit and the relative proportions of the three main types of cider fruit, viz., sharp, sweet, and bitter-sweet apples.

The suggestions here made for the construction of a cider orchard have been based to some extent upon the general experience of cider-fruit growers, and are supported by the results of experimental work which has been carried on at the National Fruit and Cider Institute.

Selection of a Site.

An important point to be remembered is that, the more the fruit is exposed to the sun, the better is the quality of the cider. The situation should, therefore, be such that the trees can catch the maximum amount of direct sunlight. A slope facing to the south or south-west is perhaps best. Cider makers with extensive experience agree that the best and most full-bodied ciders are made from fruit grown on a heavy soil, especially a stiff loam with clay subsoil.

Methods of Planting.

The methods of planting, the distance of the trees from one another, and their general treatment do not differ materially from those suitable for apple orchards in general, details of which will be found in Leaflet No. 134 (Apple Culture). It is, however, customary in the West of England to allow cider orchards to become grassed over, even if, as is the rule, they are not originally started on grass land. The fruit, which is commonly gathered by being shaken off the trees on to the grass, can thus be obtained in a reasonably clean condition and free from adherent soil.

Arrangement According to Varieties.

Mixed Orchards are Unsatisfactory.—The special feature of a vintage orchard should lie in the selection and arrangement of the varieties of the fruit. Many existing orchards are composed of a very large number of varieties, with but few trees of a kind, some orchards consisting mainly of sharp fruit, and others of sweet or bitter-sweet sorts. Cider made from the produce of any one of such orchards may be of inferior quality on account of the predominance of one or the other type. To obtain the best results, it is necessary to blend the fruit with fruit of the types which are deficient, obtained from other orchards, or to utilise only a portion of the fruit of the predominating type. Other drawbacks of these miscellaneous orchards are: (1) All the varieties do not ripen at the same time, the fruit-gathering season in a single orchard thus being spread over probably the whole cider-making season from September to December, while the orchard is not available for grazing purposes during that period: (2) the tendency is to gather varieties before they are properly ripened, in order to get the orchard cleared of fruit; (3) in gathering, the task of keeping different varieties separate is difficult, if not impossible; (4) there is not a sufficiently large quantity of any of the varieties to enable cider of a regular standard to be made; and (5) the number of varieties utilised for cider purposes is so large, that it is impossible to become properly acquainted with the vintage qualities of more than a few sorts, control of the quality of the product being thus practically impossible.

General Arrangement.—There are clearly then the following points regarding the general arrangement of the orchards which might with advantage be adopted:—

(a) The varieties having different ripening periods should be separated into distinct orchards. There should be at least three classes of orchards:—(1) Early, containing varieties ripening from September to the end of October; (2) Mid-season, containing varieties ripening from the end of October to the end of November; and (3) Late, containing varieties ripening in December and later. The advantages of such a system are obvious.

(b) The number of varieties should be restricted, but relatively large numbers of trees of the varieties selected should be propagated. By this means only can the comparative uniformity of a maker's produce from season to season be attained, and that control guaranteed which is the outcome of a thorough knowledge of the qualities of the varieties in use.

(c) The varieties selected for any orchard should be chosen and planted in such proportions that the whole of the fruit grown in that orchard if mixed together, would yield a good cider that would not require blending. The object in view here is to make each vintage orchard self-contained for vintage purposes, and quite independent of other orchards. The advantage to the maker in such a case would be considerable. While the number of varieties which it would be necessary to plant depends upon the characters of those selected, it would probably be advisable, in order that the total produce might yield a satisfactory blend, not to plant more than three kinds in each orchard—(1) a sharp, (2) a sweet, and (3) a bitter-sweet variety. There is no necessity to increase the number; while, if each of the three types just mentioned is represented, it is possible to obtain a cider of any desired standard of chemical composition by the adjustment of the proportions of the number of trees of each kind. In many instances three varieties would not be necessary, as there are several pairs of varieties which go well together, and do not, owing to their chemical composition, require a member of the third class to complete the blend. In certain cases only one variety need be planted, the juice in this instance having a suitable chemical composition without blending. As an example, the Kingston Black variety may be quoted. As a rule, however, a single variety has some element in its composition either superabundant or deficient, and blending is therefore required to correct the proportion.

While these are the general lines upon which the selection and proportion of the varieties may be based, the matter will not be found so simple in practice. For instance, most cider varieties only bear full crops once in two years, and it does not follow that the bearing season for all the trees will be the same. The proportions of fruit of the different classes each season would thus be disturbed, possibly to a serious extent. Again, in bad apple years, sharp and sweet cider varieties are usually sold largely for market purposes and for jam making, thus causing a preponderance of bitter-sweets for cider making. This, however, could not be avoided under any arrangement, and the simplest way out of the difficulty would appear to be to reduce the planting of the bitter-sweet types to the lowest practical proportions. Such an arrangement represents a considerable advance beyond the usual method; and whether or not the cider maker may eventually decide to make all varieties up separately, and to blend the juices or the ciders instead of the fruit, as at present practised, the fact that the produce, as a whole, of a single orchard could be relied upon approximately to yield a good cider, would facilitate matters considerably.

(d) Trees of the same variety should be planted in blocks or groups. Undoubtedly the most scientific method of dealing with fruit for vintage purposes is to have the different kinds gathered and kept separately, so that the maker can either mix the fruit himself in the proportions which he desires, or can press each sort separately, and blend the liquor afterwards. By planting comparatively few varieties, but a large number of trees of each sort, and by grouping trees of one sort together, it will become perfectly practicable to deal with the fruit in this manner.

There seems to be considerable reason for believing that some varieties, at any rate, fruit more abundantly if their blossom is cross-fertilised; and consequently it may be of importance that too large a number of trees of any one kind should not be planted in proximity.

(To be continued.)

WINTER SALADS.

Though, as a rule, salads are not so much in request during the winter months as they are through the hot weather in summer, still, where there is a large establishment to supply, it is necessary to always have plenty of material. If we take into consideration the number and variety of plants that were formerly grown for this purpose, some idea may be formed of the care that was necessary to keep up a constant supply; but since the days of cheap glass and hot water, many of the plants that were formerly used have either gone out of cultivation or are only grown in large old-fashioned gardens. There is the American cress, for instance. Most gardeners are well acquainted with various species of erysimum as flowering plants for the herbaceous border, but there are not many that cultivate them in these days as a salad for winter. Formerly many native plants were used, but of late years there has been but little call for them, as many others more tender and palatable are to be found.

At one time there were two species of erysimum grown, E. præcox and E. barbarea, the former being a biennial and the latter a perennial. The first-named was sown in the autumn to give a supply of leaves in the spring; the latter was increased by divisions of the roots. The young leaves taste much like those of the common cress, but are more bitter. Another plant not much in request now is the common sorrel, Rumex acetosa and R. scutatus. These plants being evergreen, the foliage was formerly much in request by the French chefs for making or mixing with salads. To obtain the finest and most tender leaves a fresh plantation should be made each year, and this can be effected either by sowing seed in the spring, and transplanting the seedlings a foot apart, or by dividing the roots in September, as then the plants have time to become established before winter. There were numerous other plants, such as chives, which took the place of the young onions. These were propagated by division of the roots.

During late years it has been possible to have good tender crisp lettuce all the year round, especially by the use of a gentle hotbed, and growing the quick-hearting varieties, such as Golden Queen. Endive, too, may be had all through the winter if the precaution be taken to have the plants lifted before severe frost sets in, and stored away in an open shed where the foliage may be kept dry. By placing a few of these plants in a dark place, where a gentle heat is provided, young, tender white leaves are soon formed, which are very acceptable. On light dry soils and in elevated situations endive will usually withstand the severity of our winters, but in low-lying places where the soil is retentive the plants suffer much, therefore, it is advisable to afford them protection.

Chicory is another plant that is now grown largely for winter salading. To have nice, clean, crisp, well-blanched leaves two things are absolutely necessary. One is to have strong, well-grown roots, and the other to have a suitable place for blanching the foliage in. If the seed is sown in well-cultivated soil about the first week in July, and the plants thinned out to a foot apart each way to allow the foliage to develop, very few will run to seed, and strong roots will be formed, which will produce crowns similar to those of seakale. When the foliage has died down these may be lifted and planted in the mushroom house or other like structure where light can be excluded, and blanched in the same way as recommended for endive.

Small salads are such as are usually used in the seed leaf; these include mustard and cress, small onions and others. The two former are easily grown, a few days sufficing to produce a supply. It is not so, however, with the latter, as during the dull winter months the seeds germinate slowly, therefore it is necessary to make sowings some time in advance of the time they are required. Some people have very peculiar tastes. I once lived with a nobleman who would have young onions sent up for salad every day, and they must not be more than three or four inches high, having just formed their second or third leaf, and the celery had to be about the same. Where a quantity of such things have to be provided it is necessary to pay close attention to the various sowings, otherwise there might be a blank just at a time when they were most needed. It is the attention to these little details that enables the gardener to keep on friendly terms with the cook and other heads of the establishment.

NEW PLANTS, ETC.

◆

LÆLIO-CATTLEYA CORNELIA, WESTONBIRT VAR.

This might well be described as a glorified Cattleya labiata, as it resembles a very shapely, bright, and substantial bloom of that well-known species. It is derived from Lælia pumila and C. labiata, and the former parent has given shape and substance. Sepals and petals bright rose-purple; lip rich deep crimson-purple, margined with lilac-purple. A.M., R.H.S.

ROSES.

Mrs. Alfred Tate.—An exquisitely beautiful hybrid tea rose, figured on page 787. It has big broad petals, but these are not numerous enough to make up a first-rate show flower. The buds are elongated and very pretty, indeed this is a charming rose, and its copper-red colouring makes it very distinct. A.M., R.H.S., October 13. Messrs. S. McGredy and Son, Portadown, Ireland.

Mrs. E. J. Holland.—A soft, rosy-pink, hybrid tea rose, of considerable beauty. A.M., R.H.S., October 13. Messrs. S. McGredy and Son, Portadown.

Mrs. Wakefield Christie Miller.—A large-flowered globular hybrid tea rose, of bright rose-pink colouring, shaded with silvery-pink. A very attractive rose. A.M., R.H.S., October 13. Messrs. McGredy and Son, Ireland.

DRACÆNA BRAUNTI VARIEGATA.

An elegant and useful dracæna, with leaves freely variegated with bright yellow. This is sure to become a favourite plant. A.M., R.H.S., October 13. Messrs. W. Cutbush and Son, Highgate.

CHRYSANTHEMUMS.

Kathleen Lambrick.—A soft rosy-mauve Japanese variety that appears to be admirably suited for pot culture, as the plant carried five good blooms in a seven-inch pot. F.C.C., N.C.S., October 7. Mr. W. Seward, Boston Road, Hanwell.

Mrs. J. Kempley.—A large Japanese variety of deep old rose colour and golden reverse. A pretty variety. F.C.C., N.C.S., October 17. Mr. W. Seward.

Master James.—A full-sized, solidly-built Japanese variety that is very effective; rosy-chestnut, with deep golden reverse. F.C.C., N.C.S., October 7. Messrs. H. J. Jones, Lim., Ryecroft Nursery, Lewisham.

Shanklin.—A well-proportioned and large Japanese variety, with broad florets of a pleasing blush tint, shading to white. F.C.C., N.C.S., October 7. Mr. M. Silsbury, Isle of Wight.

October Gold.—A very handsome and free-flowering variety that should prove very useful. Its colour is a deep and rich old gold colour. This is of Source d'Or type. F.C.C., N.C.S., October 7. Messrs. W. Wells and Co., Merstham.

Fee Parisienne.—A deep pink or mauve, decorative variety. It flowers freely, and the colour is enhanced by the silvery reverse. The plant grows about 2½ft. high. F.C.C., N.C.S., October 7. Messrs. W. Wells and Co.,

Nellie Riding.—This is a very pretty and useful single chrysanthemum of bright rich terra-cotta colouring. Very free, and a [illegible] addition. F.C.C., N.C.S., October 7. Messrs. W. Wells and Co.

RHODODENDRON MICRANTHUM.

A compact growing species from Northern China, and bearing terminal racemes of white flowers. Bot. Mag., t. 8,198.

BULBOPHYLLUM FASCINATOR.

A handsome species, with large pale [illegible] flowers, marked with crimson. Bot. Mag., t. 8,199.

DIDYMOCARPUS CYANEA.

An interesting species, native of [illegible] in the Malay Peninsula, and bearing [illegible] blue flowers. It has been grown some [illegible] at Kew, but has not proved a success. Bot. Mag., t. 8,204.

ERIGERONS.

Although the species of erigeron known to science are numerous enough to form a comparatively large genus, but few possess sufficient merit to justify their inclusion in collections of hardy plants, except they be of a very comprehensive character. The number of really good garden plants is so small that they can be counted on the fingers of one hand, and to these the general body of cultivators should confine their attention.

The finest of all the species for beds and borders is unquestionably the free-blooming and handsome Erigeron speciosus, of which there are two varieties of much merit. This species is now so well known in gardens that there is no occasion to it in detail or eulogise its merits. grown under favourable conditions ains to a height of about two feet, produces its daisylike purple-lilac in such profusion as to produce a rming effect in association with other herbaceous plants. The variety rbus, which has been in cultivation for years, differs from the type in the r size and more perfect form of the Quakeress, of which an illustration herewith, is a fine variety of introduction. This originated Mr. G. Davison, the able gardener at House, Worstead, the residence Petre. Mr. Davison, who has one of the most successful cultiof hardy perennials, selected this seedlings raised in the West- gardens, and has exhibited it occasions in his winning collec- Norwich and elsewhere in Nor- also has flowers of larger size than are those of the type, and they are somewhat deeper in colour and of fine form. Neither of these varieties differ so materially from the type as to enable those not specially acquainted with the erigerons to at once recognise the difference when cut flowers are placed before them without flowers of the type for comparison. When seen growing side by side, there is no difficulty in distinguishing them, and the superiority of the last-named form over the species is most marked.

The cultivation of this and other of the forms thriving in beds and borders is of the simplest. They require a moderately rich and deep soil, and previous to planting the stations selected for them should have a moderate dressing of well rotted manure, and the soil be broken up to a depth of eighteen inches. In the breaking up of the soil the manure, it need hardly be said, should be well mixed with it. Subsequently the soil can be enriched by annual top-dressing of stable or farmyard manure or artificial fertilisers, as may be most convenient. E. speciosus and its varieties can be readily increased by division, which can be accomplished in the spring or early in the autumn. It is a good practice to lift plants that show signs of a diminution of vigour, divide them into portions having four or five growths, and replant in fresh positions. This, of course, can be done in either of the seasons mentioned.

The other species of value for the garden include E. salsuginosus, a handsome North American species, attaining a height of about fifteen inches, and blooming freely, the flowers being of large size, and a soft mauve hue. This is well adapted for planting along the front of the mixed border, and also for broad ledges in the rock garden. E. alpinus grandiflorus, a pretty native plant bearing small purple-lilac flowers. E. mucronata, an Australian species, the ray florets white marked with pink at the tips. E. Roylei, a Himalayan species with blue-purple flowers. The three last-named are all of dwarf growth, and best suited for culture in the rock garden.

G.

ERIGERON SPECIOSUS VAR. QUAKERESS AT WESTWICK HOUSE.
Flowers large and finely formed; the ray florets purple-lilac and the disk florets bright yellow.

AMONG THE ALPINE FLOWERS.

"Swift summer into the autumn flowed,
And frost in the midst of the morning rode,
Though the noonday sun looked clear and bright,
Mocking the spoil of the secret night."
—Shelley.

Alpine flowers give us their sweetest pleasures early in the year, and they, as a rule, have their mission of brightening our gardens in the spring and early summer time. Thus autumn is by no means a welcome time for the lover of the plants of the rock garden, save, possibly, that it tells him that the spring is on its way again to bear him her precious cargo of delightful flowers and charming leaves. Yet the autumn is not devoid of pleasure to those who have many such flowers. Even though those which naturally bloom in autumn are few and far between, there are others which gave us their beauties earlier in the year which have once more come into bloom, and welcome are their flowers, even though they have come, as it were, "out of due season." It is no slight pleasure to see these blooms at a time when days grow short and the sun wanes in strength, even although in this October we are having some compensation for the dreary September time through which we have passed.

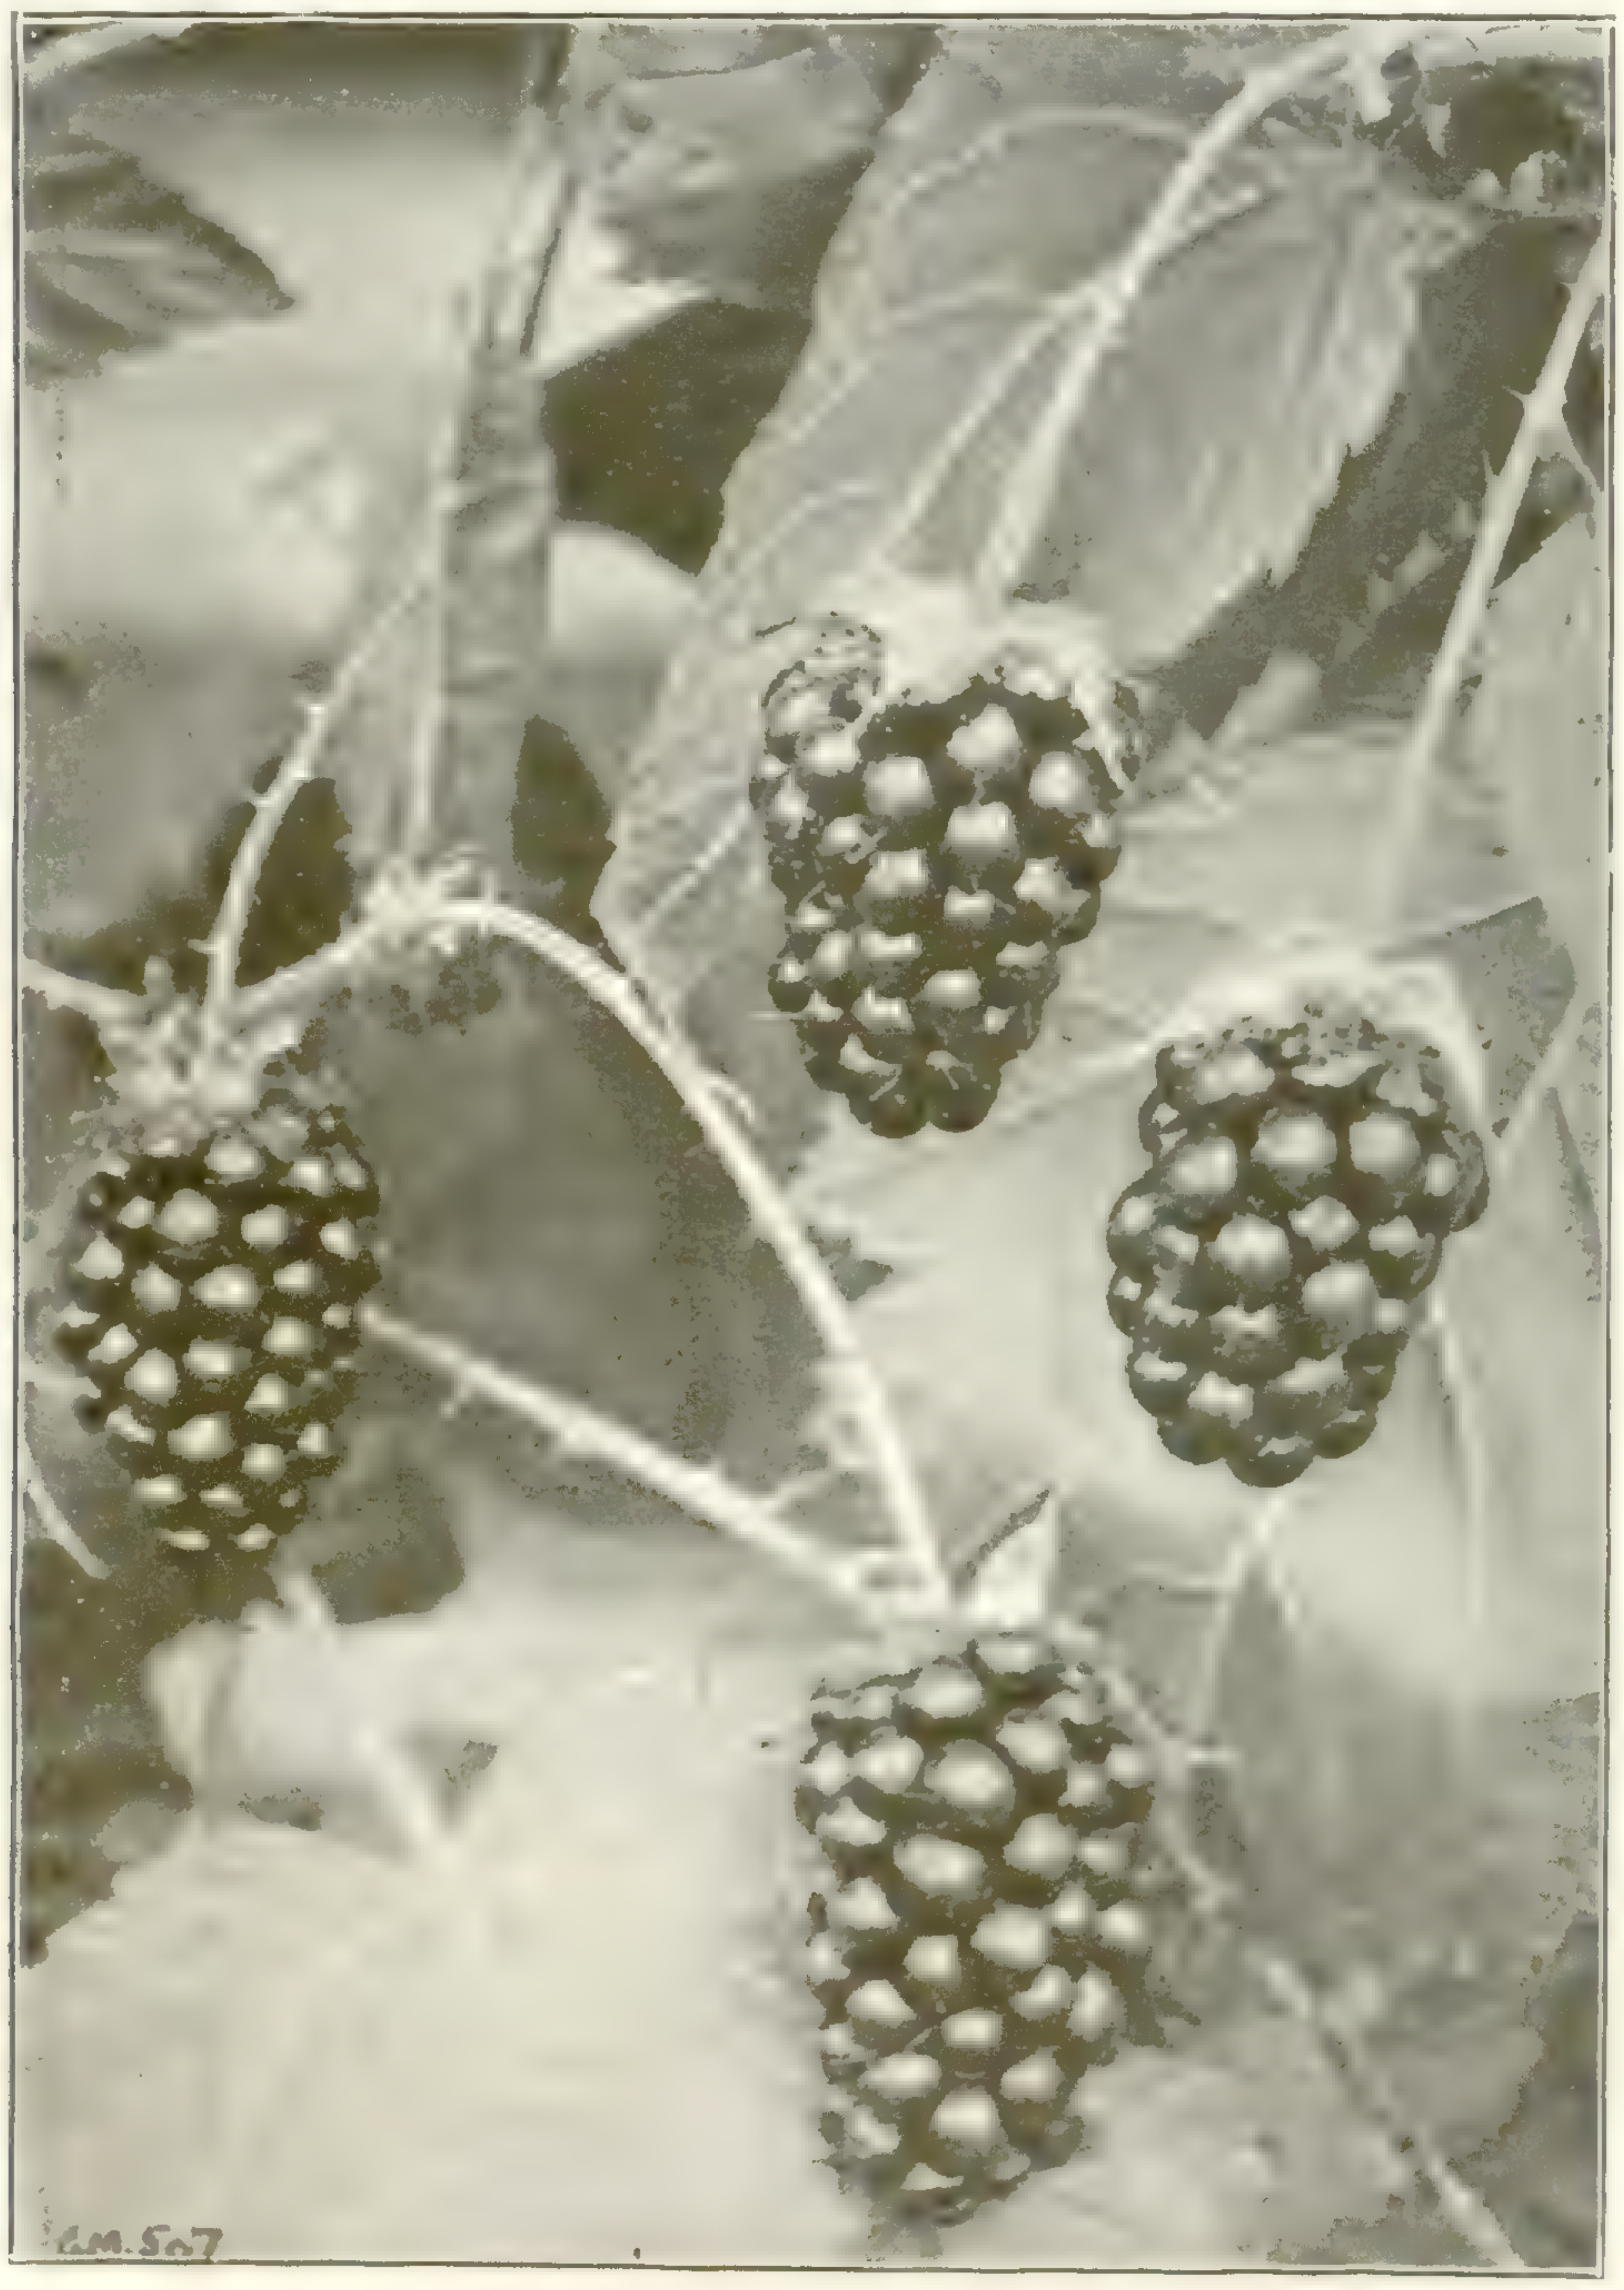
But there are also flowers of the time

plants which have their mission to serve in the brightening of the gardens at this season, even should the spring and summer bloomers fail to give a second show.

None of these are more delightful than the autumn crocuses, and of all these none is so charming as the fine

Crocus iridiflorus

of which I have spoken before in these pages, but which cannot have its value too prominently or too frequently brought before one's readers. It is a gem among crocuses which come in autumn, and it would be difficult to find for it a rival at any season, even in the gay crocus time of spring when the earth is aglow with the various species and the noble Dutch varieties of Crocus vernus, or the shining flowers of the golden yellow one. Crocus iridiflorus is unique among the race in respect of its form, inasmuch as it is really iris-like in its shape, and is a standing witness to the discernment of the botanist who called it "iridiflorus" or "iris-flowered" crocus. Then its colouring is so beautiful, of a fine purple-lilac, set off to the highest by the lovely white anthers, the combination forming a tout-ensemble almost unique among these flowers. Its form caused one author to consider that it should form a separate genus, to be distinguished as Crociris, but there is nothing structurally to differentiate it from the other crocuses of the autumn and spring. It is a true lowland plant, and one, too, which is not devoted to the sunshine, seeing that it grows naturally in woods and thickets in the district bordering on the eastern Carpathians, where, according to Maw, who gives the information regarding its habitats, it grows in chalky alluvium. This gives a hint to those who have such a soil or one to which some chalk or old lime can be added. Crocus iridiflorus is variable, and I have in my own garden several very beautiful forms, besides the type and C. iridiflorus majus, a fine variety. Some of my plants were raised and selected by the late Mr. James Allen, and these give a succession of bloom for a considerable time. As this is being written some are past, but others are in full blow, and very beautiful are they. There are others in bloom, such as C. lævigatus, C. speciosus and its variety Aitchisoni, the form of C. sativus called autumnalis, C. pulchellus, and one or two more.



A NEW HYBRID FRUIT—THE LOWBERRY.
The result of crossing the Loganberry with the Blackberry. A.M., R.H.S., July 7.
Messrs. Hugh Low and Co., Enfield.

The Double White Meadow Saffron.

One never grows tired of the double white meadow saffron, by which name we call Colchicum autumnale album fl. pl., an old flower, but one which is still too high in price to be planted by the dozen by all save a few with well-filled purses. The double white colchicum increased more slowly than the other double varieties, and it is hence much higher in price than they. It has been in my garden for many years, and its blooming is always looked forward to, so distinct does it look near the front of the border with its narrow ribbon-like segments of ivory white. It is always admired, and my clump lasts a wonderfully long time in flower, although in September, when the first flowers opened, they had a sorry time indeed with drenching rains and furious winds.

The October Snowdrop.

The first of my snowdrops to appear this year has been one received through the kindness of Mr. D. Melville, of Dunrobin, more than two years ago. It is one of the octobrensis forms of Galanthus nivalis, of which there are several of more or less worth. This particular one, which is practically fixed in its October blooming, is a bold variety for a group generally small and of less appearance than some of the spring snowdrops, and it is now charming with its green stem, and its snowy flowers with their green ovary drooping from the stems with all the grace and beauty of the flower so familiarly known to us as the "firstling of the infant year." It is all very well for those who know them not to speak of the autumnal blooming snowdrops as "unnatural and unseasonable," but to those who cultivate them they are welcome flowers, growing in their affections from year to year, and helping to shorten over the long interregnum which too often interrupts our enjoyment of the garden because the flowers are at rest.

The Hairy Gargano Bell-flower.

It is always worth while to recall to the thoughts of one's readers particularly meritorious flowers, especially at a season when flowers are scarce, and I thus venture once more to pen a word or two in praise of the hairy variety of the Gargano bellflower, whose name is Campanula garganica hirsuta. It is such a delightful little plant with its greyish foliage, and its charming light-blue flowers, together with its moderately trailing habit, that it is always a charming thing when in bloom, and never more so than in these October days, when the plants are covered with hoar frost in the morning, and are lightened up by bright sun through the day. This variety of the Gargano bellflower is a much finer thing than the typical Campanula garganica, and no one who has ever grown it in the rock garden is willing to discard it for anything else, however rare. Something else may have to be cast into the outer darkness, but never this variety of the Gargano bellflower.

Other Flowers.

Were it not that the considerations of space are imperative, one might talk at some length of sedums showing plenty of second bloom; of hardy heaths than which no flowers are more beautiful in the rock garden in autumn; violas in plenty, although not so full of flower as in the halcyon spring days; arenarias, achilleas, hardy crane's, and heron's bills; some potentillas, a few alyssums; the neat little Polygonum vaccinifolium, with its small spikes of pinkish flowers; a few St. John's-worts, and a number of others, trifling in themselves as they may appear, yet combining to give us some gleams of brightness to show that the rock garden, though not like the border, glowing with sunflowers and asters, is yet full of pleasure to those who love these little denizens of the mountains.

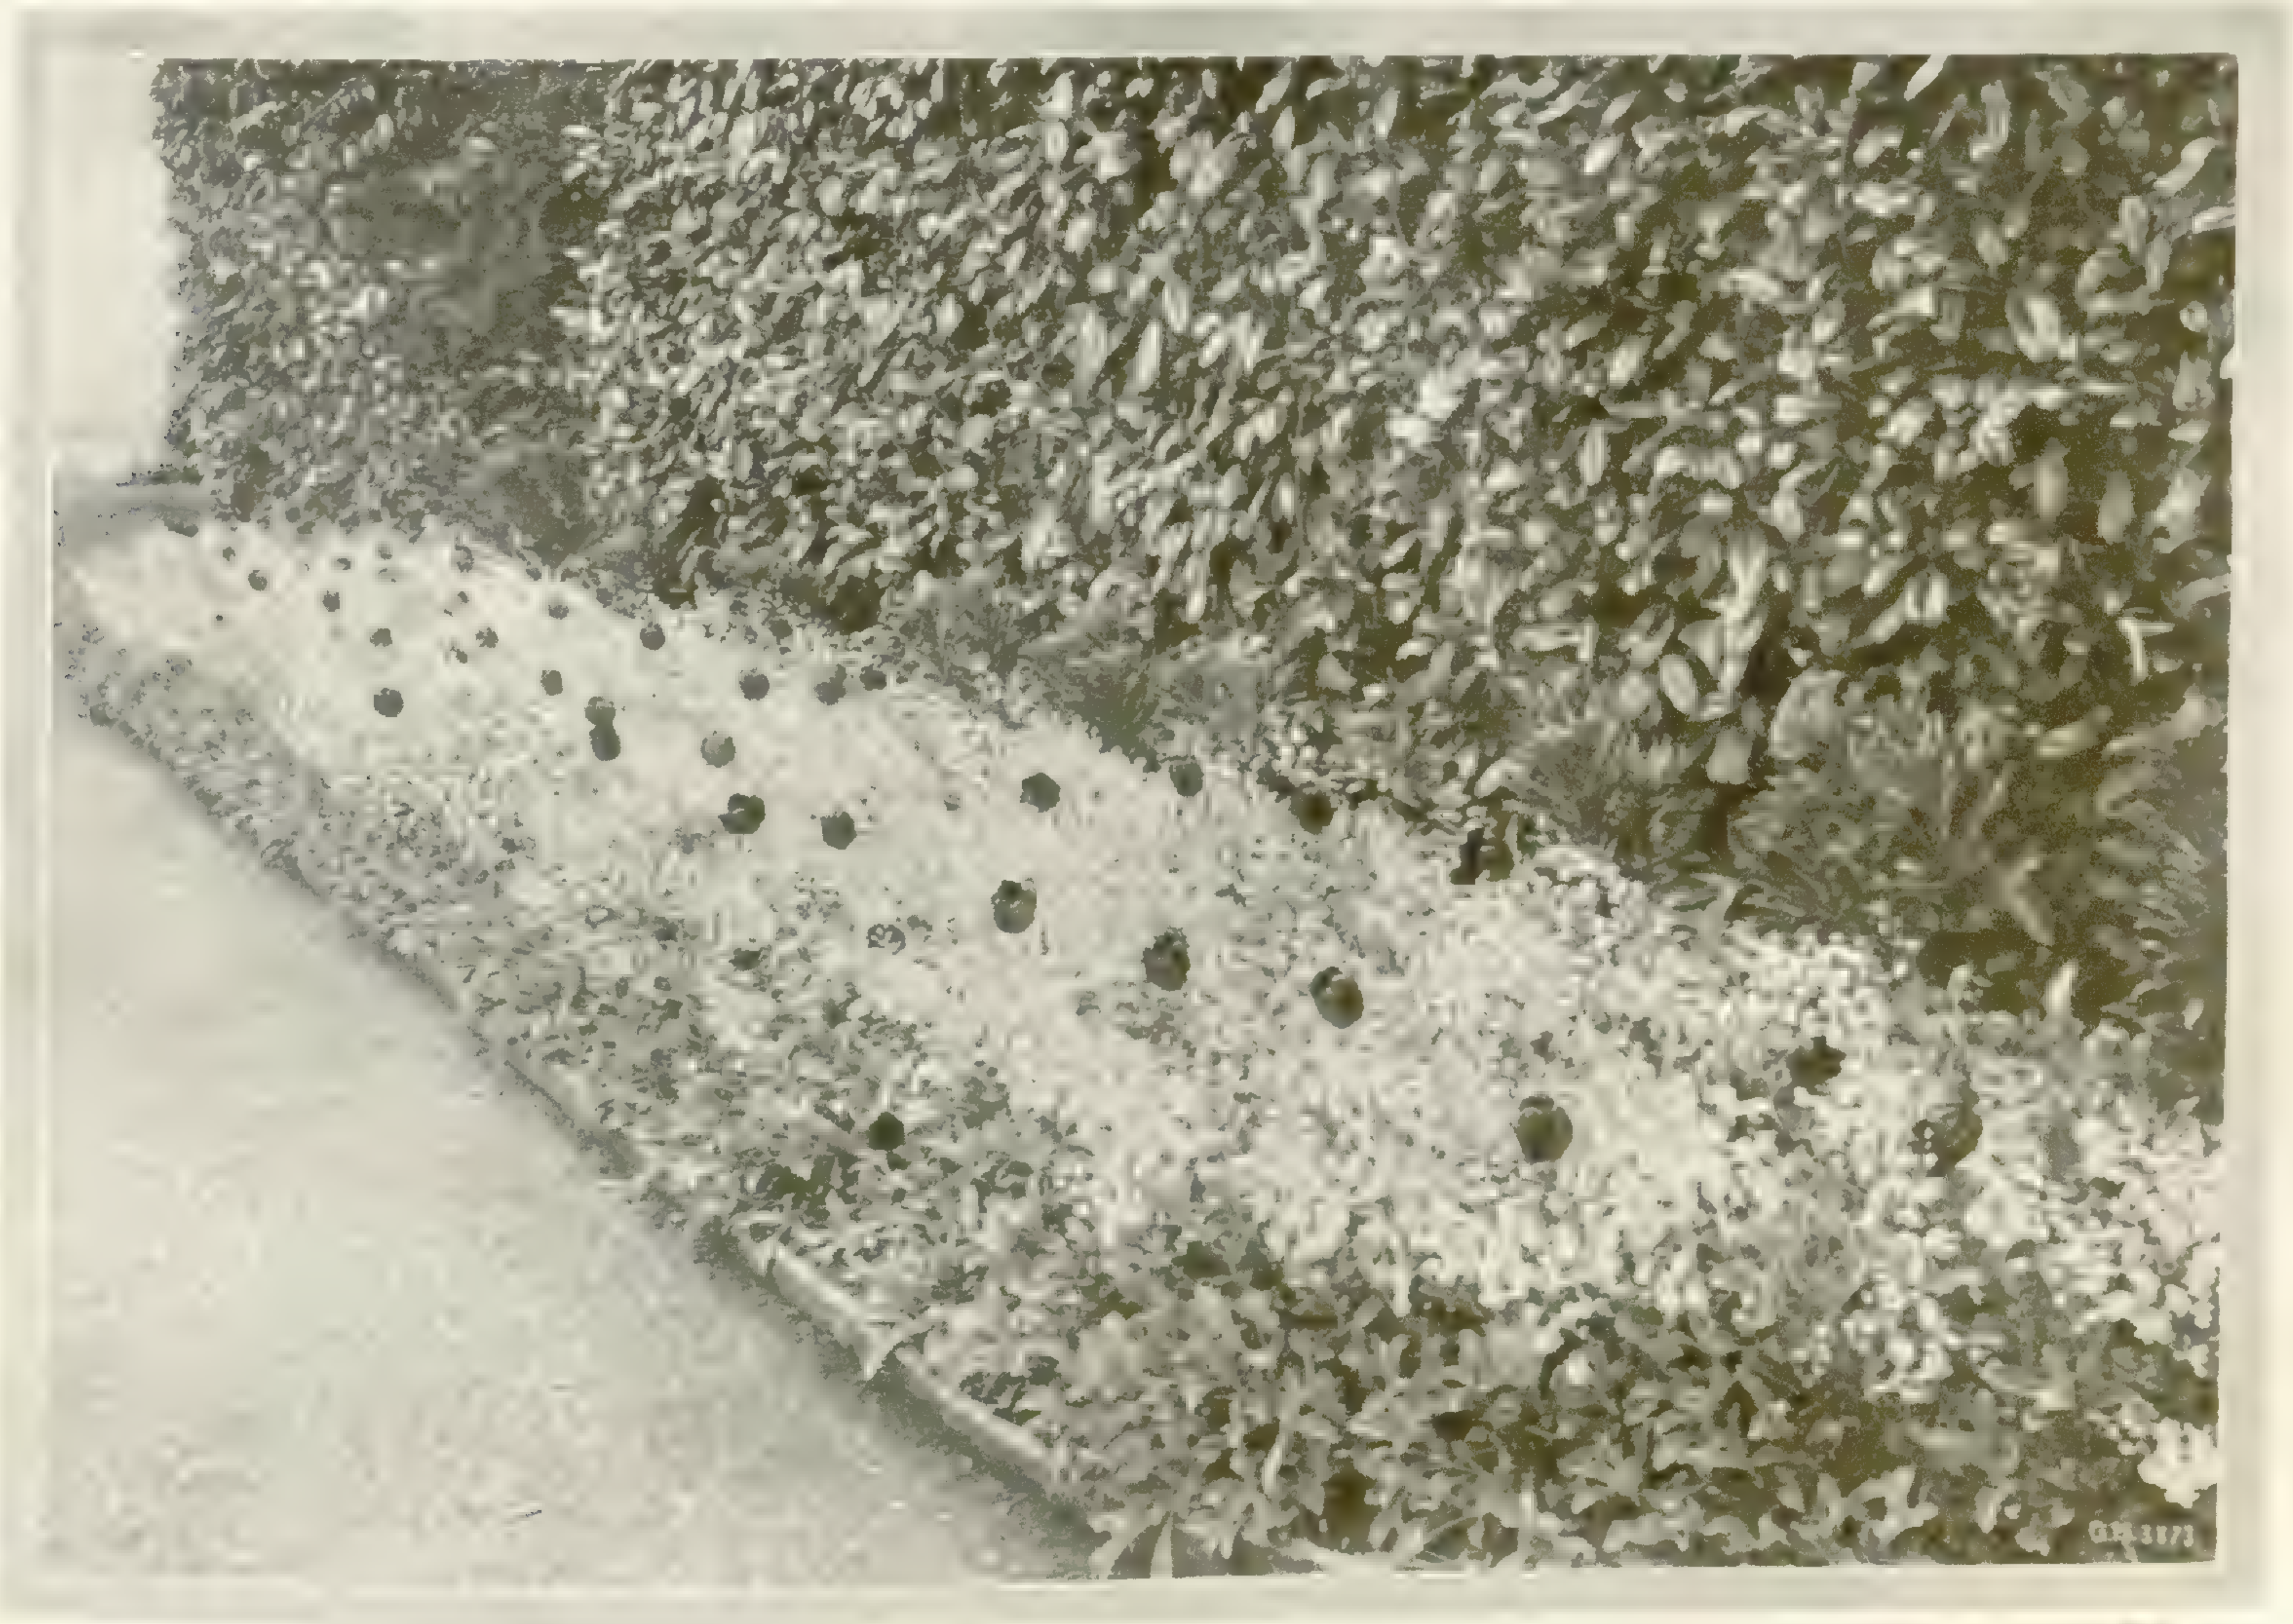
S. Arnott.

Snails and Water Lilies.—Mr. G. S. Saunders contributed leaves of Nymphæas eaten by water snails to the R.H.S. Scientific Committee, and in the course of the discussion Mr. Hudson stated that he had found that an insecticide forced into the water so that it would rise just underneath the leaves had proved an effective remedy against the attacks of these pests.

A NEW BERRY.

A few years ago it seemed possible that any number of new berry fruits might be forthcoming, as the success of the loganberry set hybridisers to work in the hope of securing other distinct and useful novelties. Then there were new introductions, or old plants brought into prominence, and we had various blackberries, the aforesaid loganberry, the wineberry, the so-called strawberry-raspberry, the Mahdi, and possibly others also. Then there came several years of quietness, so far as new berries were concerned, but now a newcomer of considerable excellence has appeared on the scene, and it has been called the Lowberry. Messrs. Hugh Low and Co., of Bush Hill Park, Enfield, have introduced this new fruit, which is the result of crossing the loganberry with the native blackberry. The fruits were first shown at the Holland House Show, in July last, and on that occasion an Award of Merit was granted by the Royal Horticultural Society. The fruits then staged had been produced under glass, and were from one to one and a-half inches long, very deep black and extremely pleasant in flavour. This hybrid appears to be a good grower and free fruiter, and it is interesting because of the length of the fruit stalks. The illustration herewith gives a good idea of the form of the fruits, and shows that they are very [illegible].

Turnips.—When it is seen that the roots are large enough for use they should be pulled up and put into a pit, for if left in the ground too long they become woolly, and useless for culinary purposes. Garden swedes are very useful, and provide a little extra variety for the winter, but it is necessary to obtain a good strain of seed, as the ordinary field swede is always too strong in flavour, and also "gritty."—T. W. B.



[Photo: J. E. Tyler.

A BORDER OF DOUBLE FLOWERED WHITE ARABIS AND SCARLET TULIPS.

COMBINATIONS OF SPRING FLOWERS.

We have been careful to constantly keep before our readers the desirability of associating with the spring-flowering bulbs used in filling beds and borders in the open suitable fibrous-rooted plants that bloom at the same season. There are two reasons for our having consistently advocated the practice, and these can be stated in a few words; the first being the improved appearance of the beds and borders during the winter months, and the second the greater beauty and charm of the effect produced when the bulbs are in bloom.

As so well known to all who have had experience in the employment of bulbs in the production of colour effects in the flower garden during the season of spring, beds that are filled with bulbs present a bare appearance throughout the late autumn and winter months unless carpeted with plants that retain their foliage throughout the year. This bareness is nowhere pleasant, but when the beds are contiguous to the dwelling house, and constantly under the eye, it is very objectionable. By planting the beds with arabis, silene, myosotis, dwarf wallflowers, or other suitable subjects, and putting them close enough together to form a moderately thick carpet, they will present a pleasing appearance from the time of planting the bulbs until they come into bloom. When this stage is reached the fibrous-rooted plants will be growing freely, and yielding of their floral beauty, and, provided the combinations have been formed with due regard to colour harmony, the general effect will be greatly enhanced.

There is no great difficulty, so far as relates to the association of spring-flowering bulbous and fibrous rooted plants, in the production of colour contrasts that will satisfy artistic perceptions, and evidence in support of this assertion may be readily obtained on all sides during the spring months. The two points to observe are the use of fibrous-rooted plants that will when in bloom be of such height as to carry the flowers of the bulbs well above them, and the combination of colours that will harmonise. The illustration given herewith depicts a border furnished with scarlet tulips and the double white arabis, and one can readily see that with its glossy green background the display was highly attractive. The effect would, no doubt, have been better had the tulips been more thickly planted, and, generally speaking, all the bulbs used in spring displays should be planted closer together than is usually the case. There is no occasion to write at length on colour contrasts, as for our present purpose it will suffice to state a few rules that should have attention in associating the two classes of plants under consideration. On a carpet of white-flowered plants hyacinths and tulips having pink, rose, scarlet, or lemon-yellow flowers, present a charming appearance. On a light blue carpet, such as that formed by a light blue forget-me-not, white, pink, or pale yellow flowered bulbs appear to the greatest advantage. Beds having a golden carpet, such as that formed by Alyssum saxatile, or dwarf wallflowers, should be planted with scarlet, crimson, and bronze-coloured tulips. For crimson carpets, such as those formed by dark wallflowers, primroses, and polyanthuses, yellow tulips and daffodils will be preferable. A pink carpet, such as that of Silene pendula compacta, will form a pleasing contrast to white and purple tulips.

We need hardly add that the sooner the planting of both bulbous and fibrous-rooted plants is completed after this date the better are the results likely to be. G.

THE FUTURE OF THE HYACINTH.

The past few years have seen a great decline in the "cult of the hyacinth," especially in England. Narcissi and tulips have indeed ousted these one-time favourites from their high position, until at the present time there is but comparatively little of the public interest vouchsafed them. Times have changed, and one seldom sees the groups of hyacinths exhibited at the spring shows, such as were shown in years past by Cutbush, and Paul, and Bull. The probable reason for the decline of the hyacinth is furnished by the change in public ideals of floral beauty, and in a lesser degree by the wondrous improvements which have been made among the daffodils and narcissi. Flowers, to be popular nowadays, must be specially adapted for cutting purposes. The day of the pot plant has, to a great extent, gone by, and the need of the moment is light, graceful, and lasting blossoms for vases, etc.; therefore the hyacinth has dropped from its high pedestal.

It must be admitted by all flower lovers that our present subject, although very showy, and boasting of a glorious range of colouring, falls far short of present-day requirements. It is heavy in structure, and even when grown as a pot plant, it is far from satisfactory, as its perfume is exceedingly heavy and oppressive, a fact which bans it from the boudoir.

To all intents and purposes the hyacinth may be regarded as a part of Holland itself. Holland is essentially the home of the hyacinth, for there it has reached its highest development; there have been grown the bulbs which in their day have delighted the gardening world, and there a host of varieties first saw the light. There is no doubt that the hyacinth was a leading factor in fostering the Dutch bulb industry, and its present decline has hit the bulb growers of Holland very hard indeed.

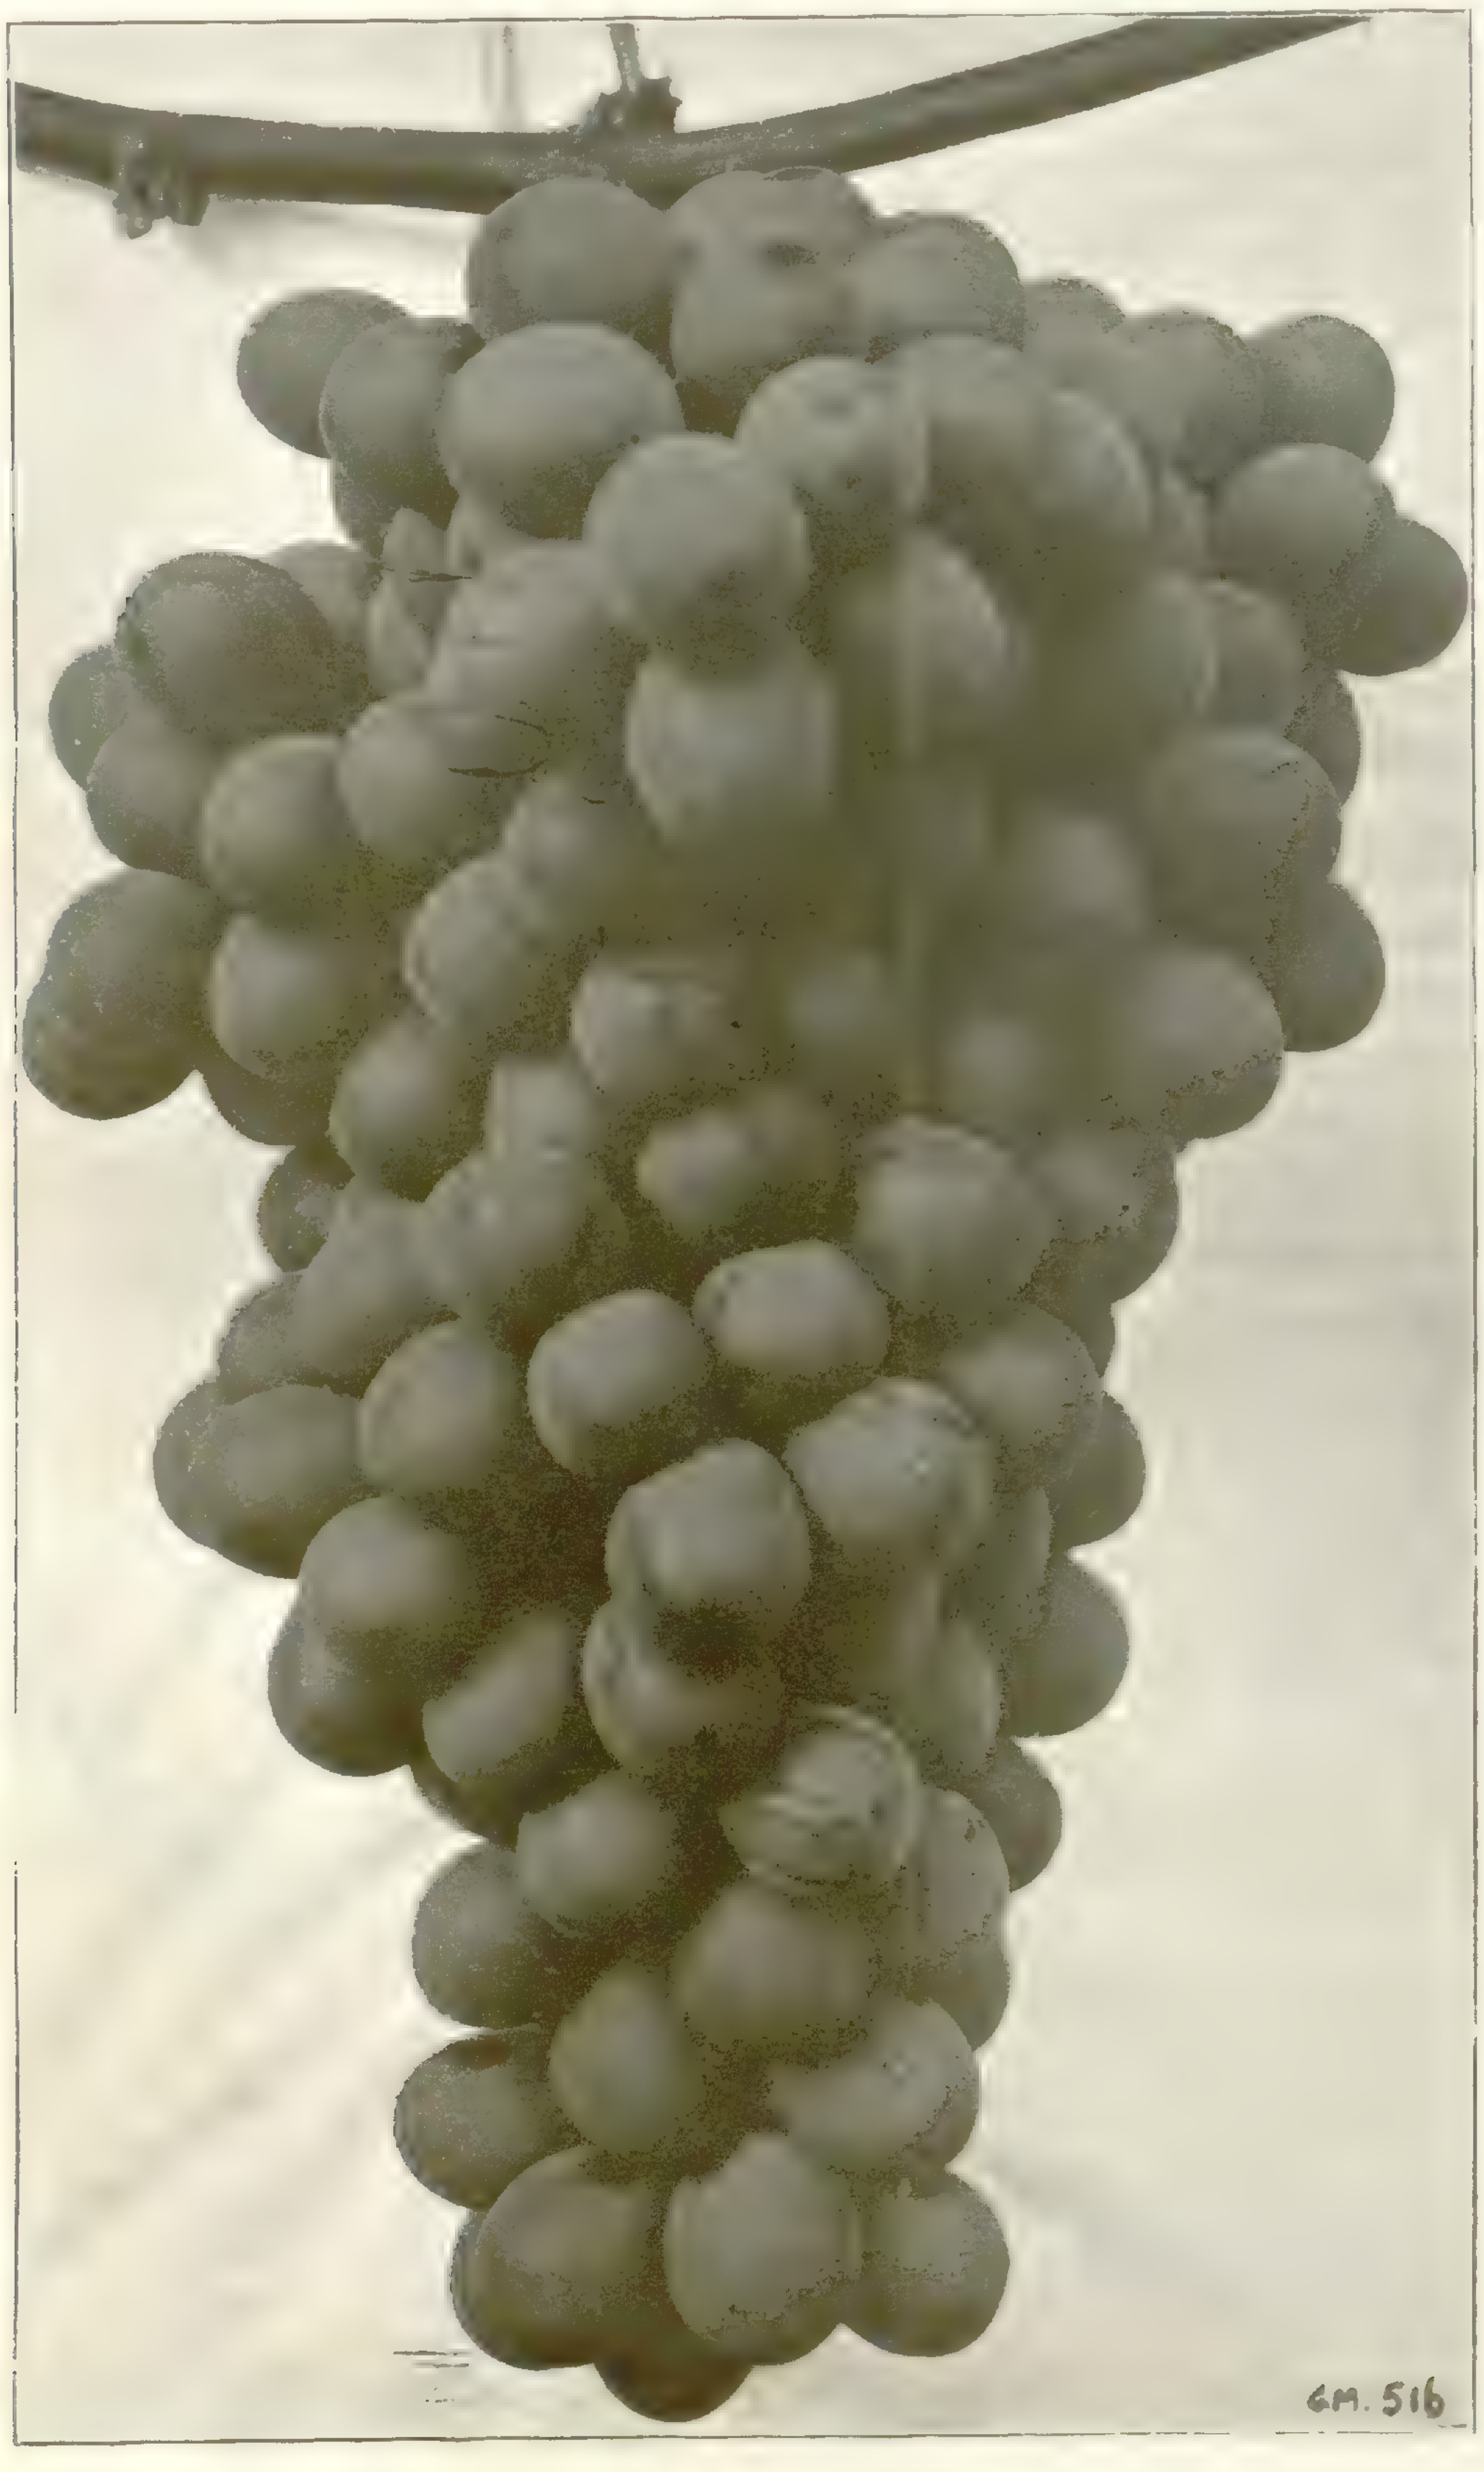
Many importers of Dutch bulbs could readily tell of diminished sales of these bulbs (hyacinths), and moreover where they previously dealt largely with first-sized bulbs in named varieties, the principal demand now is for the second and third sized bulbs. And when you add to this the fact that in the culture of tulips and daffodils, both England and Ireland are establishing themselves as successful competitors to Holland, it must, indeed, be admitted that the lot of the Dutch grower is not a particularly happy one.

A noteworthy endeavour is being made to combat this state of affairs. The Dutch Bulb-Growers' Society has taken the matter up, and to stimulate greater interest among English customers it is offering cash prizes for collections of hyacinths, to be staged at the Royal Horticultural Society's exhibition on March 9, 1909. The prizes for amateurs and gardeners in private gardens approximate in value about £50, and the classes are for "eighteen hyacinths in single pots," "twelve in single pots," and "four pans each containing ten bulbs." Whether this prize scheme will have the intended effect in reviving a new interest in these bulbs it is difficult to say, but I should very much doubt (even if such an object were achieved) that it would prove lasting.

Be this as it may, I certainly wish for a good entry, and a keen competition for these prizes, if only to show to our horticultural friends in Holland that we in England fully appreciate the good work they have accomplished among bulbs generally.

To enumerate a list of the finest varieties would tax the keenest mind, and the readiest pen, and in view of coming competition, it would be wise to forbear. In closing, I may refer to three new hyacinths of merit. These are Correggio, a glorious satiny pure white, grand in all respects, early in blossom, with a fine spike, and the bells large and well formed. La Victoire, a grand variety, with bright carmine blossoms, produced in giant trusses, well formed, and early flowering; and Queen of the Pinks, a first-rate sport from King of the Blues. This is a deep rose-pink, with large satiny bells, and rather later in blossoming than the two preceding varieties.

One point the Dutch Bulb-Growers' Society has insisted upon in view of the competitive exhibits, is that "single varieties only be shown." This seems a very wise decision, for if the hyacinth is to be lifted again into public favour it must be by means of the single forms, for the doubles, with their ultra-heavy effect, would defeat the end in view. P. S. H.



NEW BLACK GRAPE PRINCE OF WALES.
(F.C.C., R.H.S., Sept. 29, 1908.)

NEW GRAPE PRINCE OF WALES.

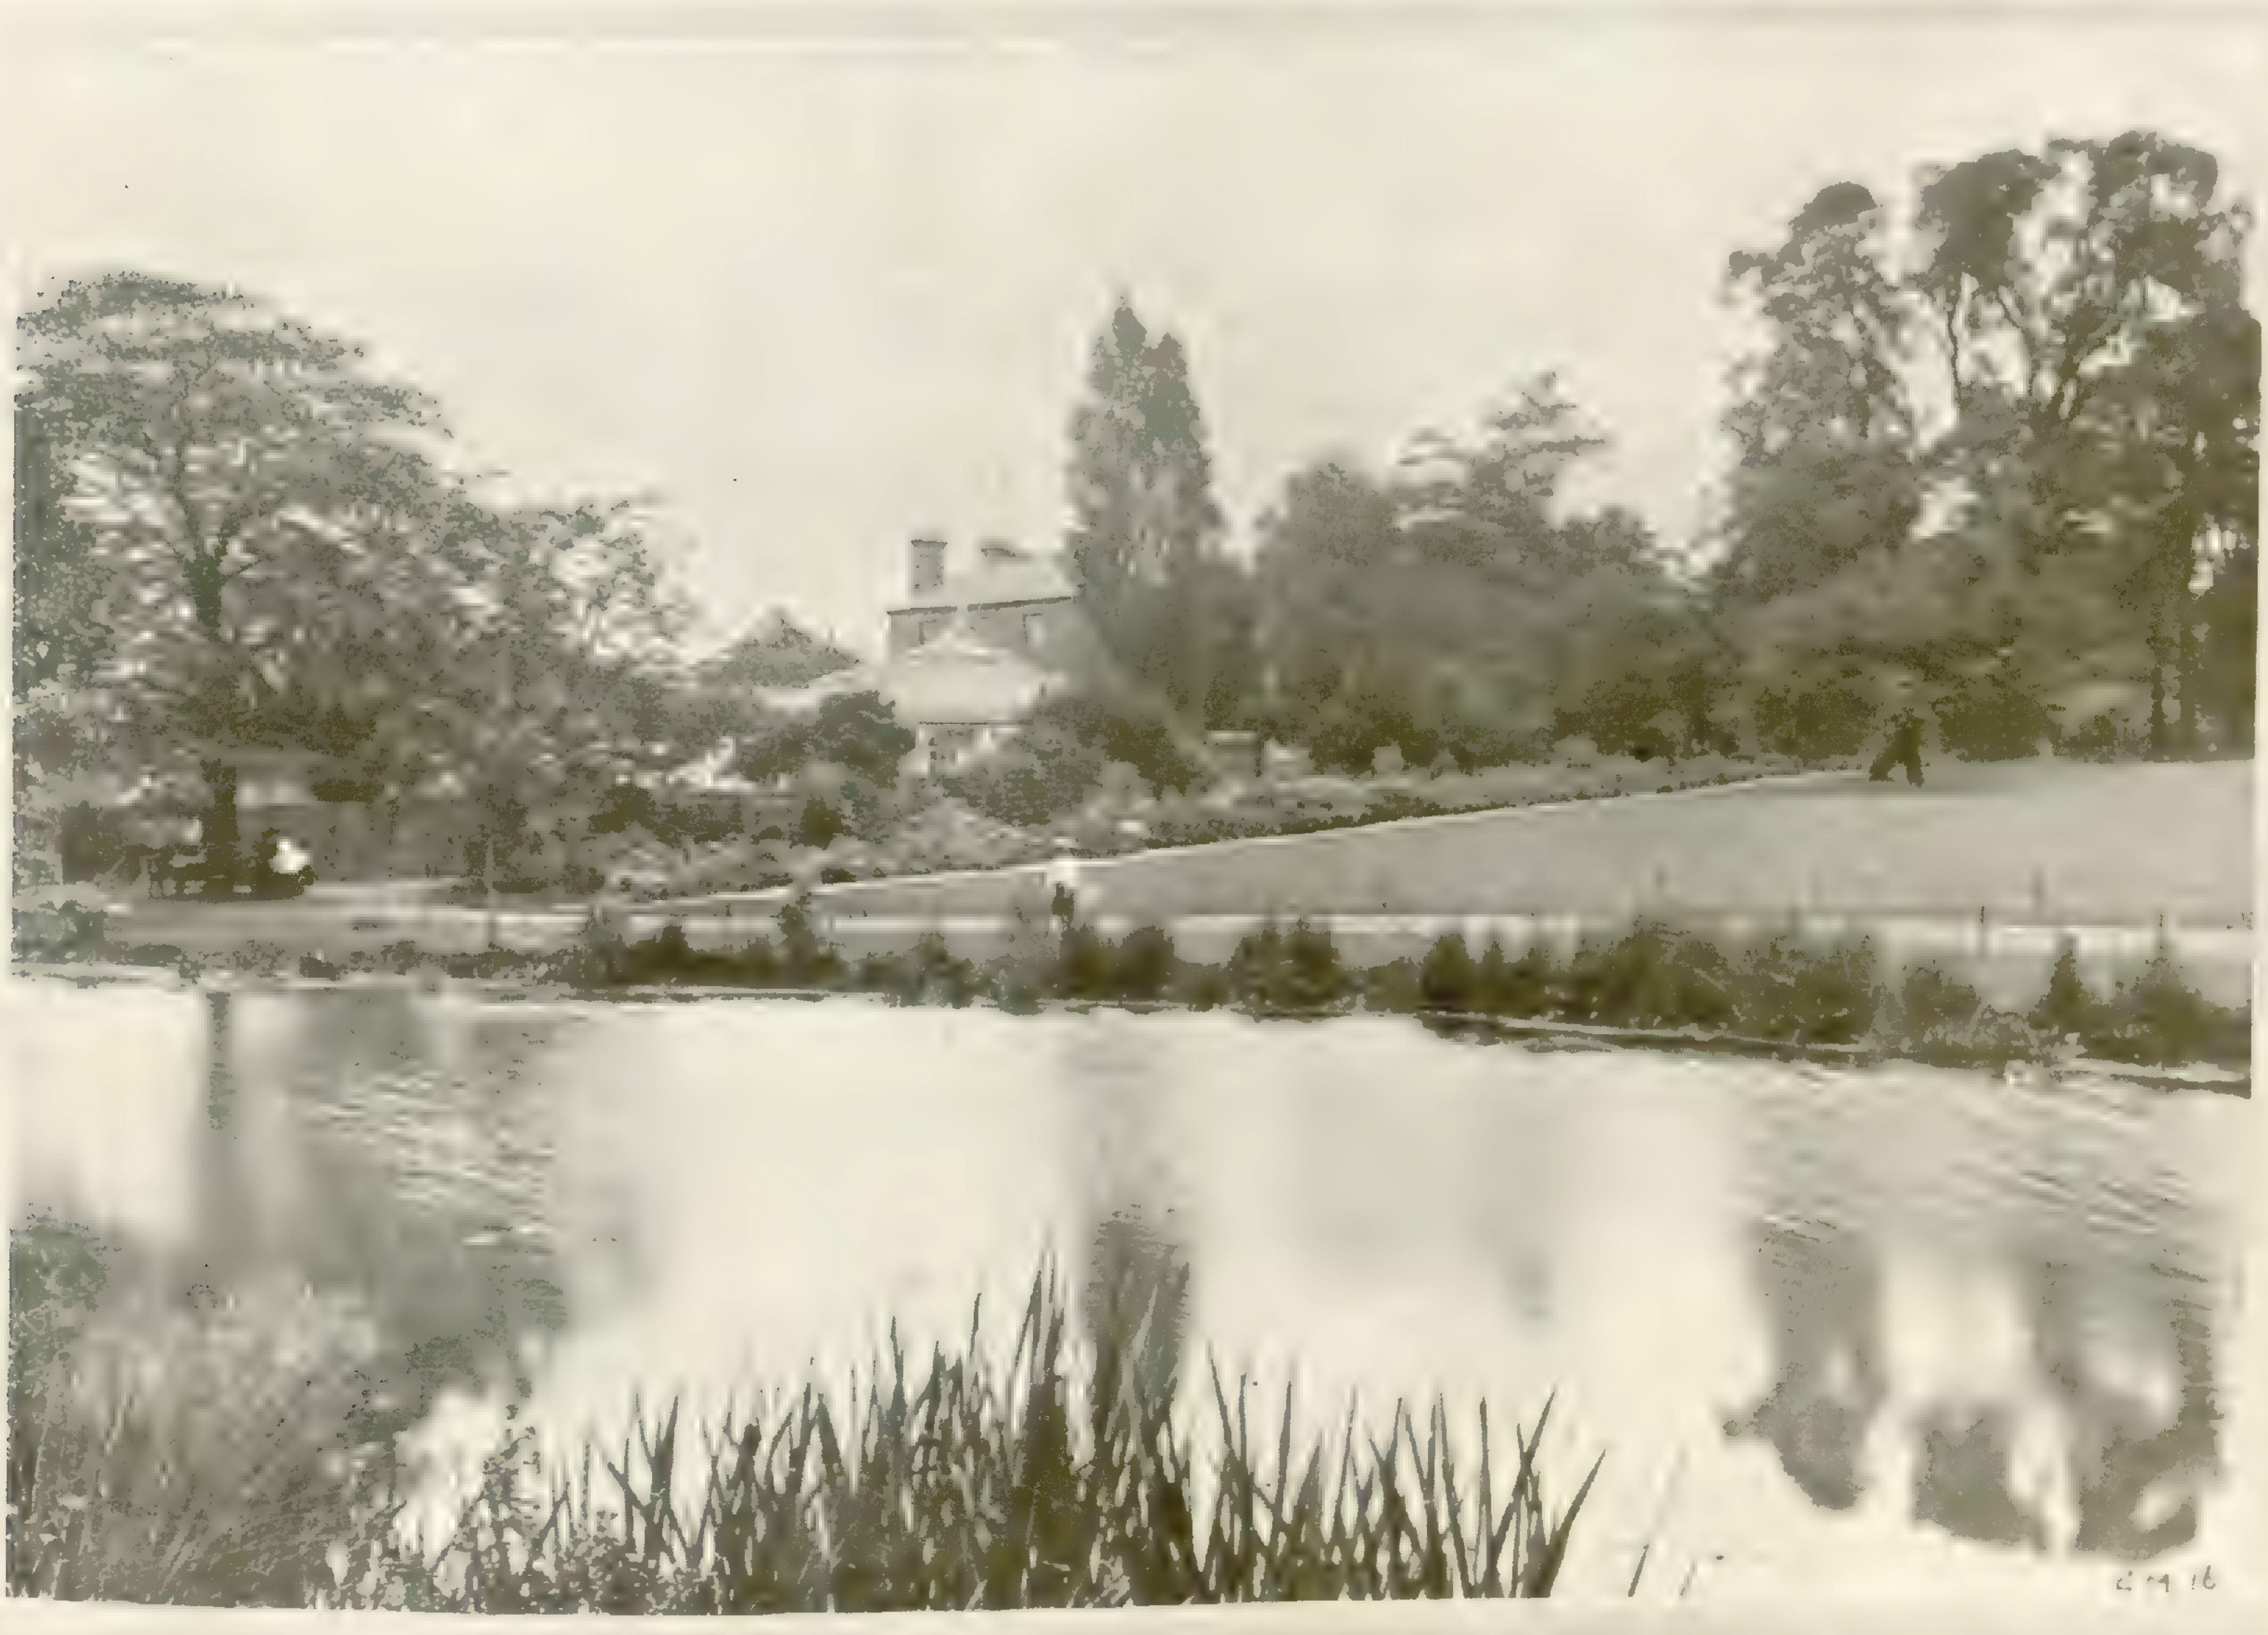
This fine new grape has been brought into special prominence during the present autumn, and, as a consequence, its merits are now likely to become more widely appreciated. Prince of Wales is a handsome grape, deep black, with roundish-oval berries, and elongated, shapely bunches that taper slightly. The newcomer is a sport from Mrs. Pince's Black Muscat, and it is of fine quality, with a distinct Muscat flavour; moreover, it is an attractive exhibition grape. Prince of Wales was introduced a few years ago my Messrs. James Veitch and Sons, Chelsea, and it gained an Award of Merit, but when shown in the collection of grapes brought up from the Royal Horticultural Society's gardens at Wisley to the Horticultural Hall, on Tuesday, September 29 last, the variety secured the higher award of a First Class Certificate. The bunch we now figure is also grown by that well-known cultivator, Mr. Lintott, gardener to Sir Walpole Greenwell, Marden Park, Caterham Valley, who exhibited it successfully on the occasion of the Great Fruit Show, on October 15 and 16.

WATER SCENERY IN PUBLIC PARKS AND GARDENS.

It is rarely controverted that water scenery is well-nigh essential in the proper design and upkeep of a public park or garden of any pretensions, and yet, not seldom, it is omitted because of its cost. When considering the cost of water scenery one point is frequently forgotten, i.e., the beneficent influence of water, in the form of pond, lake, or stream, upon the surroundings. With few exceptions plants and trees used in parks and public gardens do well in the vicinity of water, so that the water not only adds to the interest and beauty of the place, but also aids the growth of plants near it. Of course, since water gardening has become so popular, the attractions of water scenery have been materially increased. Fortunately the plants needed to beautify water margins, or even the surface of the water, are not really expensive, and the lovely results that follow their careful use are full justification for the expense incurred.

At this season of the year it is usual to commence alterations and additions to parks and gardens, private and public, hence this little plea for the inclusion of water scenery in any new operations, wherever this is practicable. It is not given to everyone to secure such a splendid [illegible] of water as that in Roath Park, Cardiff; or the long stream and falls found in Jesmond Dene, Newcastle; or the charming, well-furnished lake at Kew. But where there is a will the way can mostly be found. In these pages numerous examples of both large and small views of water scenery in the park and garden have been given, and now another is presented, where little else but the commonest plants have as yet been pressed into service. A simple little lake or pond is the one at Ruskin Park, one of London's newest open spaces, but it, like the famous Ruskin Avenue, gives character and beauty to the place, and helps to make this one of the most interesting of our metropolitan public gardens.

C.



WATER SCENE IN RUSKIN PARK, LONDON.

AN OCTOBER REVERIE.

Perhaps the one season of the year when the gardener can, so to speak, lay aside his armour and put his sword into the sheath, is from the middle to the end of the month of October. His apples and pears are all garnered, and arranged on the fruit-room shelves, his late grapes are ripe, his peaches and nectarines gone, and his flower garden is over for the summer. The lawn mower and scythe are put away, the peas are a pleasant recollection, his potatoes are all harvested, and, beyond a stray one or two, his melons are done, and small fruits are forgotten; in short, it is a transition period between one season and another.

It is quite true the chrysanthemum season is just commencing, and we wonder how our winter carnations will flower, but still it is a very interesting time, as the memory is still fresh with our successes and failures of the past season. The days are shortening fast, and the longer evenings give time for reflection. It is really wonderful, when we start our early vinery in November, and our early peach house about Christmas, or a little after, how soon another season is upon us.

In country establishments the winter is rather a dull time for the gardener, and his young men in the bothy; the garden labourers arrive later, and leave work earlier as the days shorten, and this adds to the quietude of the surroundings. Long evenings were rather monotonous when the only illuminant was a tallow candle, and the snuffers were an old pair of vine scissors, though some young men could remove the superfluous wick with a sharp, dexterous pinch with their finger and thumb. Nowadays good lamps prevail, if not gas, and in one case I know the bothy is electrically lighted, which is much more conducive to the young men's comfort, and also more encouraging for them to study the "G.M." and good gardening books, as with the old flickering light they could more easily see to play dominoes or cards.

By the middle of October the gardener has all his charges safe in either houses or frames, so that he can cover them or shut them up as the weather requires, out, speaking generally, he is not troubled with much frost or the labour of excessive firing till towards the end of the year. Even with the orchid grower October is, so to speak, a restful time, shading in abeyance, less damping down, less watering and syringing—every condition, as far as possible, to induce rest. Surely with such a strenuous life as gardeners live it is good to have a little breathing time once a year, so there is little wonder that after the rushing torrent of summer work they welcome the comparative quietude of October.

Cheshire. W. M.

Jerusalem Artichokes.—These have now completed their growth, so the stems may be cut down and a portion of the crop lifted. The tubers should be graded, and the planting sets picked out for next year's crop. It is important to gather up all the small tubers, for if left on the ground they will become covered with soil, and be a nuisance next season. The tubers for present use, and also for planting, may be stored in clamps the same as potatoes.—T. W. B.

CHRYSANTHEMUMS.

Hints to Young Judges.

Every year sees the advent of new judges, as it should do, but those who have not previously acted as judges must of necessity feel some trepidation when making their first award, especially if the class is well filled with exhibits close in point of merit. Exhibits in some classes judge themselves, but when the competition is keen, it is then that a good method of adjudicating is beneficial. Often, too, much more difficulty is experienced in finding the third prize than the first. This class of prize deserves as much attention as does the first.

The enormous increase of varieties in the Japanese section during the last twenty years alone requires the adoption of a quick, and at the same time a sure method of dealing out justice to exhibitors.

In the case of cut blooms prizes are generally offered for a specified number of blooms, and not for a stand collectively irrespective of its number. Every bloom should be judged upon its individual merits or why ask for "Twelve Incurved distinct"?

There are various methods adopted of arriving at a definite issue as to the relative merits of exhibits, and I contend that all judges should be able and willing to give the reason why Stand A is better than Stand B. If a judge is able to give a reason why he has made an award, then there is little cause generally to think a mistake has been made in the awards. I am a believer in giving exhibitors the information they require as to their position in a competition, because it is very often a lesson of much value to them afterwards.

One cannot get away from the fact that adjudicating on the many blooms placed before the judges is very much a matter of individual opinion and taste. For instance, one judge may consider the broad incurving florets of some variety to represent higher culture than his colleagues will admit, while the latter may have a leaning to varieties with semi-drooping, and possibly narrow florets. One very strong point to observe is that those varieties extremely difficult to produce should have full weight, and here a practical knowledge of culture is an advantage to the adjudicator.

There are two methods of judging in vogue, i.e., pointing and comparison. Twenty years ago, when varieties were less numerous, we found the same varieties in nearly every stand, and comparison under such circumstances was possible; but now, with such a vast number of varieties in competition comparison does not do justice, except, of course, in two stands that are wide apart in quality. Apart from the justice of the case, in close competition, the comparison method entails much unnecessary labour, as well as loss of time. How can any set of judges carry in their mind's eye, as it were, the merits of a stand of twenty-four blooms, much less forty-eight or sixty, especially when there are as many as fifteen competitors? At Birmingham once, I had twenty exhibitors in a forty-eight-bloom class of Incurved and Japanese. To me it seems a waste of time to carry a stand of blooms about a show for the purpose of comparison. Some experts select what they think is the best stand of blooms in a certain class, and place it in front of all others in competition with it; very often a better is found, and the first must then be replaced, and so on goes the wearisome task of finding the winner. Surely this cannot be the easiest, quickest, and most accurate method of dealing with competitive exhibits.

Some judges have a weakness for giving equal prizes to stands close in point of merit. This is a doctrine that I strongly condemn. It is an easy way for judges to avoid a knotty point, and they think such a decision will please the competitors. I do not think it will; there is a first always, and it should be found.

It is a safe thing to say that no person can select two sets of twelve blooms and make them really equal, and for this reason I do not agree with the granting of equal prizes.

How to judge the blooms should be my next point. I have spoken strongly against the comparison method and those who complain should produce a remedy. In all well-arranged shows the exhibits in one class are placed together, or as nearly so as possible, except under exceptional circumstances. Judges should make themselves acquainted with the rules of the particular society they are acting for, such as classification or conditions, remembering they are not there to make laws, but to administer those made by the society they are acting for; even if, in their opinion, these are faulty. A walk round the room is then taken, and this may prove of much value later on, as it gives the key to the class of blooms to be dealt with, and may guide an adjudicator in fixing the scale of points. I have known judges fix the maximum at too low a rate when dealing with the first set of blooms, and later, they find superior specimens, and their previous calculation is upset. This cursory glance enables a judge to understand what he is likely to encounter, and enables him to allocate the points accordingly. A mere glance at some of the competing stands is sufficient to know that they will not require closer scrutiny. Those that necessitate a closer inspection are noted in some way. If a second glance is not sufficient to settle the position of each, then the individual merit of each bloom is considered.

The judges, generally two in number (and here let me say, I think two are equal to three in a set; very often one has to deal with large classes single-handed, but this involves a serious responsibility, especially when valuable prizes are hanging in the balance), fix upon a maximum number of points, or the committee desire them to adopt their standard of points, which may be twelve. It matters not whether the points are upon a high or a low basis, the result is the same, but perhaps the twelve point maximum is more pleasing to the exhibitor when they see their blooms gain ten or eleven points, even if they do not gain the coveted award.

Now comes the question of allotting the points. If the new judge is a cultivator and an exhibitor he will be conversant with the properties of chrysanthemum blooms, such as size, depth, solidity, breadth of petal, finish, freshness, form and colour. If he is not a cultivator he should be posted up in these points. Size is not determined by diameter alone, some exhibitors take too much note of extra wide flowers, But too often these lack depth, which is of primary importance; or again, it may display a want of freshness, density of colour for the variety, or the florets may be narrow and lacking in substance. Such defects deprive it of the maximum number of points, and seldom indeed do we find maximum blooms, as generally there is a defect of some kind. On a low point basis half points are valuable, and I have even known quarter points brought into use. Some may say this splitting of points is ridiculous. In my opinion, it is the only way of dealing out justice accurately. A bloom may be too good for five points, it is not up to maximum, and five and half is then given, and so on, throughout the stand; and when a total is then made of the points, seldom do two stands come equal. If they do, then the setting up of the blooms and arrangement of colour should be taken into consideration. On the high point basis half points are not necessary.

There is a growing tendency amongst exhibitors to stage blooms not fully expanded, and while this may be preferable to blooms that are stale and display a lack of colour for the variety, such young blooms cannot merit the maximum.

When it is determined that a number of stands, perhaps four, have to be pointed, I write a letter or a figure in pencil on the class card or name card, and make a corresponding mark in my note-book, which is most useful for future reference. Instead of taking each bloom separately from left to right beginning at the back row, I commence at the left-hand end of the stand, taking the blooms in rows of three, upwards or downwards, it matters not which, so long as the practice is the same throughout the show. I would here impress upon beginners the importance of preferring quality in a flower, such as depth, richness of colour, shape, and a well-filled centre; in fact, a fully-developed bloom in which the art of "timing" has been shown thoroughly, in preference to one that has but mere size of diameter. Perhaps if I give one example of pointing, this article on a difficult subject may appear more clear to the uninitiated; even exhibitors like to know how their blooms were dealt with for future experience.

The front row bloom is a full-sized one of Reginald Vallis, but has lost that richness of tint that is so pleasing in this variety, to this is given four points on the lower basis. The middle bloom lacks size, but is in every other respect a perfect one of Bessie Godfrey; to this is given five and a-half points. The back row bloom is a full-sized one of Mrs. A. T. Miller, but the lower florets are stale; to this is also given five and a-half points, making in all fifteen points, and so on, until all the rows are done. In the case of an equal number of points being given to two stands, and it is felt they should be gone over again, it is a good plan to start from the opposite end, and should they again be equal, then the arrangement of colour and method of display will decide the difference.

Swanmore Park. E. Molyneux.

Beetroot and Carrots.—Where these have not already been lifted the grower should give his attention to the work. Both these useful roots should be taken up with care, not bruising them in any way or they will not keep. They keep firm if placed in clamps outside, with a covering of straw and a fair thickness of soil on the top of them. —T. W. B.

Winter Moth.—No time should be lost in placing a band of Willesden paper round the stems of standard trees, etc., and dressing this with prepared grease to prevent the wingless females ascending the trees. The grease should be renewed at intervals. In this way a great number may be caught. This prevention, together with a good spraying with caustic soda, will prove very efficacious. The latter cleanses the trees from mussel scale and other injurious insect pests, but it must be carefully used and kept from the skin and clothes, etc., as it is very powerful and burning.—H. Markham, Wrotham Park, Barnet.

SOME USEFUL EXHIBITION ROSES.

When a boy at an elementary school gains a medal for regularity of attending, the credit may be wholly or partly his own, but in nine cases out of ten it is to the influence of his parents that he really owes his position; it is the parents rather than the boy who should have received the medal. In other words, the scholar owes his position to other influences in addition to his own good conduct. And so it is with a rose analysis.

In compiling a list of exhibition roses there are contributory circumstances to which the rose owes its position in the list such as is here given, the chief one being the number of plants grown of each variety. Of course, this plays an important part and will naturally be borne in mind when examining the list, but at the same time we must recognise that unless a variety is a good one, it will not be grown in greater numbers than others.

As has already been explained in former years, the subjoined list is based upon the roses staged by the exhibitor during the season of 1908. At each show, as soon as the judging is over, and if time permits, the names of the roses staged are taken down—a sort of rose attendance is compiled—and at the close of the exhibition season the roses are tabulated. It is not a table made out at one particular show; if that were done we should have a preponderance of early or late-flowering varieties, according to the date on which the list was made. This table, on the contrary, is based on the roses appearing in an amateur's exhibition stands at shows ranging from June 24 to August 4; at early, mid-season, and late summer shows respectively.

Before giving the list, let us offer a few remarks on the premier nine varieties; those that have obtained double figures. With two exceptions, A. K. Williams and Mrs. John Laing, all are hybrid teas. A. K. Williams owes its position to its colour and form, very few, if any, of the flowers this year being up to the average size. Another thing to be noticed is that with the exception of A. K. Williams and Mildred Grant, all are free-flowering varieties equally appropriate for the garden as for the exhibition bench. Early and late, one can always cut blooms of Dean Hole, Bessie Brown, Florence Pemberton, Frau Karl Druschki, and Mrs. Theodore Roosevelt. These varieties are all very active, and give a constant succession of blooms well on into the autumn. We had bunches of Frau Karl Druschki, Bessie Brown, Dean Hole, Lady Ashtown, and Florence Pemberton at the autumn show of the N.R.S., and all except Mildred Grant found a place in the box of eighteen distinct exhibition varieties. So that would be a fallacy to think that an exhibition rose is not also a good garden variety.

Name.	Times Exhibited.	Name.	Times Exhibited

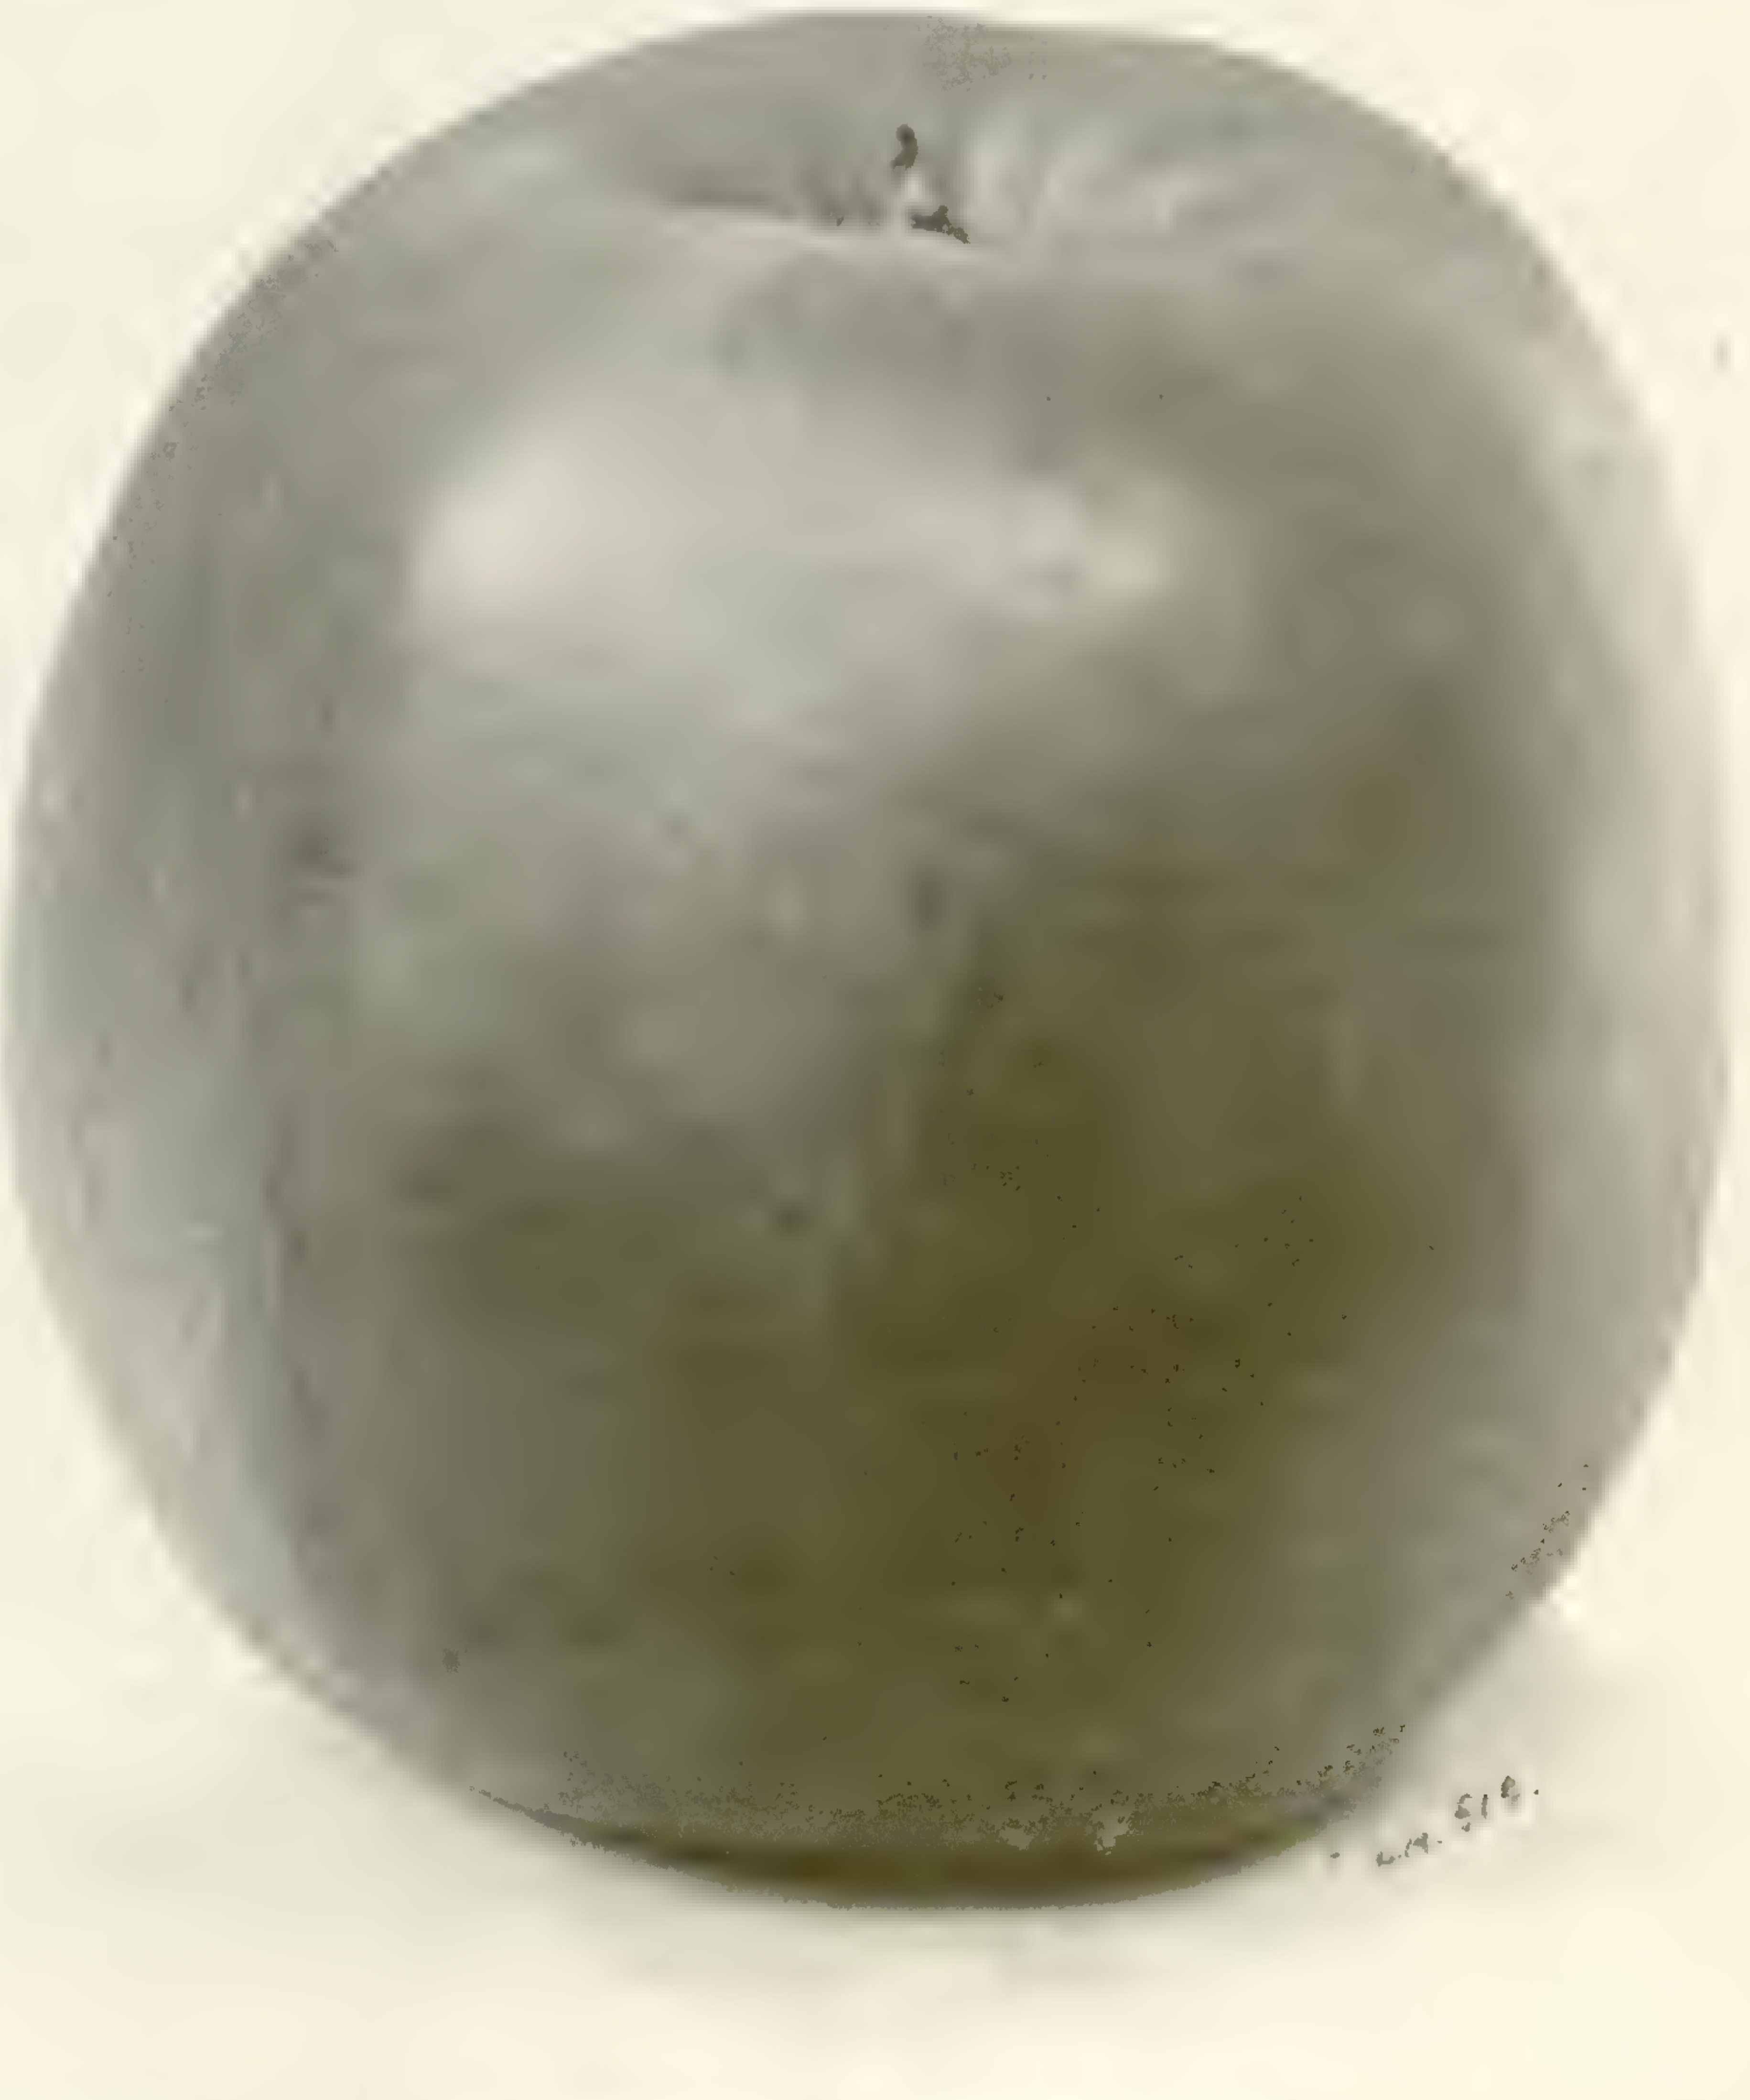
JOSEPH H. PEMBERTON.

NEW APPLE ENCORE.

This new apple appears likely to be one of the best of the varieties raised by Mr. Charles Ross, of Welford Park, Newbury. It is the result of crossing Warner's King with Northern Greening, and these parents have produced a strong-growing apple that is also a free bearer. Encore will take a prominent place among late cooking apples, as it has been proved to keep admirably, under favourable conditions, until June of the year following that in which it was gathered. The fruits are rather higher than wide, but they are rounded, and not ribbed. The greenish-yellow skin shows a slight flush on the sunny side, but does not take on a brilliant colouring. This is a fine cooking apple, and it won for Mr. C. Ross the first prize at the recent fruit show for the best dish of cooking apples in the "any other" class. Encore is to be distributed this season, and Messrs. J. Cheal and Sons, Crawley, are sending it out. We may add that Encore gained an Award of Merit from the Royal Horticultural Society in December, 1906.



NEW COOKING APPLE ENCORE.

PROFITABLE FRUIT GROWING for Cottagers and Small Holders of Land.—By John Wright, V.M.H. A Gold Medal Essay, written for the Worshipful Company of Fruiterers. Fully illustrated. Price 1s., by post 1s 3d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

SOWING ODONTOGLOSSUM SEED.—The general practice of keeping orchid seed until the turn of the days before sowing may be departed from in the case of odontoglossums, but it is well that only a portion of the seeds should be sown as they ripen, the remainder being held over until the end of January. If this line is followed it gives an opportunity of seeing whether or not the seed is germinating, and, if not, of sowing again later, when the days are lengthening and more encouragement is given to rapid germination. I have particularly noticed here that when seeds are sown in the late autumn they germinate even more satisfactorily than is the case during the hot summer months. This, I have no doubt, is owing to the condition of the atmosphere. I do not think that a frequent use of the watering can is altogether advisable when seed is in its earliest stages of germination, so the advantage of being able to retain the seed bed in a moist state for a long period lies with autumn sowing, and it is of considerable importance to those engaged in raising as well as to the young plants themselves. I have no doubt there would be many difficulties to be contended with in the matter of sowing seed of odontoglossums in autumn in districts affected by fog.

SUITABLE SEED BEDS.—The question of a seed bed is by no means an easy one to solve, because one finds that if you sow seed on, say, half a dozen seed beds, that is to say, half a dozen different pots in which odontoglossums are growing, it will generally be found that the seed altogether fails to germinate on some, while on others they grow practically as thick as mustard and cress. The uncertainty of having a suitable bed for germination of seed being so great, it is desirable to select plants that may appear to be the most suitable, and the only way to combat possible failures is to sow on a number of pots. It is best to select plants that have been potted some weeks previously, and all moss and growing material, which may have a tendency to overgrow and choke the seeds, should be removed. This being done, the seeds should be sprinkled thinly and evenly over the surface of the potting compost. Care should be observed to have no other plants handy when sowing the seed except those on which it is intended to sow, or the possibility of the light seed being blown on to other plants may lead to confusion of the records. It is remarkable how seeds are carried to the surface of other plants on which no seed has been sown, and it is still more curious to find that such seeds so frequently produce plants. I am often asked why we are so successful in raising seedling odontoglossums now, while in years gone by large quantities of seeds were sown by those who are the most successful raisers to-day, and yet they failed. Speaking from my own experience, it is a difficult question to answer. The only difference now in our treatment of odontoglossums is that we grow the plants a few degrees warmer, and include in our potting compost a small percentage of broken leaves. Otherwise, as far as I am concerned, there is no apparent reason to account for our present success. — H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

WALLFLOWERS AND MYOSOTIS.—In gardens where there are few if any plants of the usual forcing type, or means to do them justice, there is no need for an absolute dearth of flowers in spring, especially where there is enough glass to shelter a few of the early outdoor flowers. Take, for instance, the wallflower in its many varieties. A batch of these sown at the usual time, transplanted once, will new lift with good balls of soil, and if carefully potted up, and placed for a while in a cold frame to be brought on gently later on, will give a magnificent display of sweet-scented and valuable flowers. If well watered in and shaded for a few days they will scarcely lose a leaf. Then, again, we have the forget-me-not. Under the roughest treatment these plants will flower well if only afforded the shelter of glass, and it is amenable to forcing, so that a batch will cover a long season if only sufficient are potted up. The value of myosotis for forcing is not recognised as it should be. I find them most useful for many purposes when grown in small pots.

ROMAN HYACINTHS.—Where a batch of these was potted early in August or early in September, a few pots may now be taken from the plunging bed and brought into any fairly warm house or pit, where, in the course of from two to four weeks or so they will expand and fill the place with their delicious perfume. The Paper White narcissus will also respond to the same treatment, though not quite so quickly. If there is at hand a warm frame or plunging bed, some lilies of the valley may also be forced into bloom very quickly. At this early season the retarded roots force much more easily and quickly than others.

TUBEROUS PLANTS.—Gloxinias, achimenes, and tuberous begonias will now be dried off. They winter well in a suitable temperature if left in their pots and stood under the stages where they may be kept dry, but if the accumulation of pots is thought to be untidy, a better way is to shake out the various tubers and put them thickly in boxes of dry sand or cocoanut-fibre refuse, covering them well over. The gloxinias will require warmth in which to winter, and if they have to occupy shelves where they might be damped by the syringe, it is a good plan to cover each box of tubers with some stout material. This will prevent wet getting in among the tubers, and also help to prevent shrivelling.

SOLOMON'S SEAL.—This plant is most useful for the embellishment of the greenhouse in early spring. If the plants are forced gently into bloom, the long, arching shoots studded with thin, small drooping blossoms form an exceedingly pretty feature. They should be grown with several spikes in a pot. To obtain this result plants are lifted in the autumn from the open ground and divided into single crowns, selecting only those for potting that are stout enough to flower well. These selected crowns may be grouped in any way that is likely to be useful, about half a dozen spikes in a pot six inches or seven inches in diameter being convenient for general purposes. The forcing must be gradual, as if too much heat is used the spikes will be weak and greatly inferior to those brought on gently. The true Solomon's seal, Polygonatum multiflorum, is the best for forcing.—T. B. Field, Ashwellthorpe Gardens.

THE FLOWER GARDEN.

AUTUMN PLANTING should be forwarded as much as possible while the weather is suitable, and before the ground has lost its heat, as root action is still active enough for cuts to heal over and new roots to be formed, thus enabling plants to start into vigorous growth in spring. Deciduous trees will now have lost their foliage sufficiently for transplanting; in all cases be very careful not to damage the roots more than is absolutely necessary, and when lifting start well away from the stem of the plant and work well under the roots. If a plant has only to be removed from one part of the grounds to another retain as large an amount of soil as possible. Cut off all damaged ends of roots with a sharp knife, and the wound will soon heal over. Use good soil on the roots, and very carefully work it between them; spread all roots out and in the proper direction for them to go. See also that everything large enough to require it is carefully staked, and if the ground is in the least dry give a good soaking with water after planting.

ROSES.—Now is the best time for transplanting these, and many of the foregoing remarks apply to them, but unless the ground can be properly prepared, do not attempt to plant. Planting in unsuitable soil or site is a waste of labour and money, though in some cases what is unsuitable for one kind is suitable for another. Noisettes, teas, and H.T.'s appreciate a lighter and warmer soil than H.P.'s, but all like a nice depth of good soil to grow in. Beds should be prepared at least two feet deep; if on a hot, gravelly bottom, a layer of clay three to four inches thick should be given, and well trodden down all over, raising the centre so that water will not remain on it; then fill with soil, and a good loam with a liberal addition of well-decayed manure is most suitable, except just on the roots, where soil without manure should be used. With dwarfs plant so that where the bud was inserted is just below the surface; roots of standards should be about three inches below the soil and evenly spread out. Where there are a number of beds much better results are obtained by massing one variety in each bed than if several varieties are used, as the habit of growth in each is more even, and the display of colour more effective. If pillar or climbing roses are being planted, whether singly, in groups, or on arches, prepare for them in the same way, and, if such are procurable, the best supports that can be given are yew tree stems with the branch stems left about six inches long. These will last a large number of years, and, sometimes, when large alterations are being made, a number of these can be obtained.

ROCK GARDEN.—Carefully clean over the rock garden, and remove any accumulation of fallen leaves. Some amount of thinning out or shortening back may be also necessary where growth has been very vigorous. See that no roots are unduly exposed by the removal of growths, and note if there are any vacancies for filling, either now or early in spring.

GENERAL.—In many gardens suitable sites may be found for planting bold clumps of pampas grass, Arundo donax, tritomas, yuccas, etc.—E. F. Hazelton, Knowsley Gardens.

HARDY FRUITS.

TOP DRESSING FRUIT TREES.—This is a matter of great importance, and one that at this season of the year might be more generally practised, remembering that where such work has been properly carried out the trees have improved both in growth and in the quality of their fruits. In fruit growing it has often been experienced that the trees have grown freely from the time they were planted, and within a comparatively short space of time commenced to bear good crops of fruit in proportion to their strength, and continued bearing for some few years, but even under good management this vigorous and free-bearing condition suddenly comes to an end. This, in many instances, is due to the soil having become exhausted, hence feeding the roots, and top dressing when once the trees begin to bear good crops, especially if the soil is rather light, should not be neglected. Good maiden loam or turf from old pastures, is generally recommended for all kinds of fruit, but sometimes this is, to the inexperienced, a most deceiving material, which may be too light, or just the reverse. That of a brown fibrous character should, if possible, be obtained, and if stacked for twelve months so much the better; all fruit trees, if needed, may be top dressed at this season with advantage. For pears on walls remove several inches of the top soil, using a four or five-tined fork; if the roots are near the surface, as they should be, less soil need be removed, but if not, then reach down to the roots and bring some of them nearer the surface, and relay them in the new soil. Good dressings of a suitable compost are most essential if the trees are expected to keep on bearing. Old lime rubble, wood ashes, or burnt earth, and a good sprinkling of crushed bones or bone-meal, may be worked carefully amongst the roots before filling up with the mixture of turf and well-decayed manure. After each tree has been top dressed lay a moderate quantity of strawy litter over the new soil. I have top dressed pears, apples, plums, in fact, all kinds of fruit trees, early in autumn, and have been well satisfied with the results.

PEACH AND NECTARINE TREES.—The recent warm, dry weather has been a great help toward the ripening of the new fruiting wood; the foliage, with us, has this year kept very free from insects, and the growth is not too strong. Our trees, which cropped heavily, have been well supplied with nourishment, but those on a west aspect, lightly cropped and inclined to grow too strong, have not received a watering at all this season. The leaves are stout and the wood looks well and is changing to the right colour. I hope to purchase a few fresh trees to grow for a couple of seasons, and then take the place of those requiring renewal. Trees planted and trained for the different purposes in view are the better for this treatment, and if taken up carefully and replanted against the peach wall proper they fill up a good space, and begin fruiting almost at once.

FRUIT GATHERING.—If not gathered all the very late kinds of both apples and pears should be carefully plucked when dry, and then stored. Midseason pears with us were soon over, owing to the heat, but the flavour was excellent. Those about to plant should not omit that valuable pear Nouvelle Fulvie; with us it bears freely, and is one of the best flavoured late pears we grow. Keep a sharp look-out for decayed fruits, and remove these at once from amongst the sound ones. Be careful not to bruise any of the fruits when looking over them, as they are very tender, and easily damaged. Keep the atmosphere sweet, and the room clean and free from anything which might impart a bad taste to the fruits.—H. Markham, Wrotham Park Gardens.

BOLTON.

The 22nd GREAT EXHIBITION of CHRYSANTHEMUMS, ORCHIDS, FRUIT, etc., November 20th and 21st, in the ALBERT HALL.

Upwards of £160 cash Prizes, 4 Silver Cups, 4 Gold and Silver Medals, and other Special Prizes.

Entries close Nov. 14th.

Schedules on application to the Secretary,
GEORGE CORBETT,
Heaton Grange Gardens, Bolton.

BRADFORD CHRYSANTHEMUM SOCIETY.

The 22nd ANNUAL EXHIBITION will be held in ST. GEORGE'S HALL on FRIDAY and SATURDAY, November 13th and 14th, 1908.

£27 for 24 Blooms, Japanese (on Boards).

Prize Money and Classes again increased for Open Competition.

Entries Close November 7th.

Schedules, with Entry Form, post free from
H. SPENCER, Hon. Sec.,
Horton Park, Bradford.

NATIONAL CHRYSANTHEMUM SOCIETY.

GREAT AUTUMN COMPETITION AT THE CRYSTAL PALACE,
November 4th, 5th, and 6th.

Apply at once for Schedule and particulars of membership, from the Secretary,
Mr. RICHARD A. WITTY,
St. James's Villa, Swains Lane, Highgate, London, N.

SCOTTISH HORTICULTURAL ASSOCIATION.

CHRYSANTHEMUM EXHIBITION.

The Association will hold its next Great Chrysanthemum Exhibition in the WAVERLEY MARKET, EDINBURGH, on the 19th, 20th, and 21st November, 1908.

Copies of the Prize List, which contains all particulars as to Prizes, conditions of competition, etc., may be obtained on application to the Secretary,
A. D. RICHARDSON,
19, Waverley Market, Edinburgh.
Entries close on 11th November.

SHEFFIELD CHRYSANTHEMUM SOCIETY'S GREAT ANNUAL SHOW.

CORN EXCHANGE, SHEFFIELD,
FRIDAY and SATURDAY, Nov. 13th and 14th.

£25 for 8 Vases Japs. (First £10).
Special Vegetable Classes.

Schedules and particulars free on application to Secretary.
C. COOK, City Road, Sheffield.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Royal Horticultural Society.

OCTOBER 27.

There were many bare table spaces at the Royal Horticultural Hall on the above date, but this notwithstanding, there was a fine display of orchids, chrysanthemums, ferns, begonias, and fruits.

FLORAL COMMITTEE.

A large, bold, and effective exhibit of chrysanthemums, comprising single varieties of great beauty, huge Japanese blooms in various colours, fine decorative varieties, and outdoor-grown varieties of the semi-early section, was set up by Messrs. W. Wells and Co., Merstham. Tall stands of a variety were put up at the back, and the exhibit was gracefully mounded and had an informal front line. It was also of great interest and value because it contained a large number of plants, thus showing the habit and freedom of the varieties. We were specially attracted by such single varieties as Mary Richardson, Florrie Stevens, Annie Stevens, [illegible], Pink Beauty, Mrs. R. Redden, Ladysmith, Merstham White, and the new, large crimson-scarlet Jessie Curtis. One very fine decorative variety, with fair-sized reflexing soft velvety crimson flowers, was Clara Vernum; this makes a grand bush plant for conservatory decoration. The Messrs. Wells also had pentstemons and Michaelmas daisies.

Mr. P. Ladds, Swanley Junction, showed a creamy-white market chrysanthemum of reflexing Japanese form, named Felton's Favourite (A.M.); this promises well. Mr. Silsbury, Mr. Mileham, and several others showed chrysanthemums. Mr. H. W. Thorp, Darrington, Woking, sent H. W. Thorp (A.M.), a large creamy-white incurved variety, and Mr. D. Fairweather, Bifrons Gardens, Canterbury, gained an A.M. for Mrs. R. H. B. Marsham, a big, solid, creamy-white Japanese variety. Outdoor chrysanthemums, late phloxes, and a number of Michaelmas daisies were boldly staged by Mr. Frank Brasier, Caterham Valley; Soleil d'Octobre, Diana, Jimmie, Mary Richardson, Le Pactole, and Mrs. A. Thomas were a few of the best of the chrysanthemums.

Ferns, chiefly gleichenias, were finely shown by Messrs. J. Hill and Son, Barrowfield Nurseries, Edmonton, this firm occupying half the space along the end of the hall. These graceful ferns were represented by G. splenuncæ, G. semivistita, G. Mendeli—an old favourite, G. dicarpa longipinnata—one of the best, G. dichotoma, and G. flabellata. Conspicuous, at the back of this group were a few exquisitely beautiful plants of Nephrolepis todeaoides. Winter-flowering begonias were largely shown by Messrs. James Veitch and Sons, Chelsea, who had batches of B. Elatior, the dwarf pink B. Agatha compacta, and B. Mrs. Heal—large-flowered and brilliant, one of the very best of this useful race. The Chelsea firm also staged a small group of choice single chrysanthemums in pots, showing the usefulness of these flowers for greenhouse decoration.

Begonia Gloire de Lorraine, B. Turnford Hall, and B. Mrs. Leopold de Rothschild were all well shown by Messrs. H. B. May and Sons, Edmonton, this firm also submitting a batch of the very useful late-flowering varieties of Veronica Andersoni, bouvardias, statice, plumose nephrolepises, and carnations. The pretty Erica gracilis and E. vernalis, the fragrant Daphne indica rubra, groups of bright berried pernettyas, and Skimmia japonica, as well as Otaheite oranges, were effectively grouped by Messrs. W. Cutbush and Son, Highgate, who also set up a very pretty exhibit of fine blooms of such popular perpetual carnations as Enchantress, Helen M. Gould, Robert Craig, White Perfection, Victory, and General Roosevelt. A pan of the charming Iris alata was also an attraction in the Highgate exhibit.

Mr. L. R. Russell, Richmond, sent up berried aucubas, variegated ivies, and other useful shrubs. Mr. Henry Perkins, gardener to H. W. D. Smith, Esq., Greenlands, Henley, sent a number of bright new seedling chrysanthemums; Master David (A.M.), Sir Frank Crisp (A.M.), and Lady Crisp being the best. A large-flowered single pink chrysanthemum, named Hilda Lawrence (A.M.), was shown in bush form, undisbudded, by Mr. Lawrence, gardener to Mrs. Gregory, Shoreham Cottage, Shoreham; this is a pretty variety. The Misses Hopkins, Shepperton, showed rockwork and alpine plants. Messrs. Hugh Low and Co., Enfield, had a pretty exhibit of perpetual carnations arranged in tall glass vases.

A very interesting plant was Nicotiana colossea variegata, a bold-leaved plant, with soft green leaves heavily variegated with cream and paler green. This was shown by Mr. Markham, gardener to Lady Marcus Beresford, Englefield Green, and the plants were but lifted from the open ground on the previous Wednesday, and were grown from cuttings put in last March. Succulent plants in variety, saxifragas, sedums, and a small group of Salvia splendens grandiflora were shown by Messrs. John Peed and Son, West Norwood. Very bright and beautiful were the bunches of fine zonal pelargoniums set up by Messrs. H. Cannell and Sons, Swanley, Kent; in size of pips and truss, and in brilliance and purity of colouring these single pelargoniums were excellent. Mr. G. Reuthe, Keston, showed a pretty collection of nerines. Miss Fanny Farrer, Shaa Road, Acton, exhibited numerous oil paintings of flowers, the odontoglossums and wallflowers being specially good.

ORCHID COMMITTEE.

A glorious exhibit of orchids from Lieut.-Colonel Holford's collection at Westonbirt, Tetbury, Gloucester, beautifully arranged by Mr. H. Alexander, was the feature of the show. Mr. Alexander seems to continually surpass himself, both as a grower and exhibitor, and on this occasion he had what was probably the best-finished display he has ever made. He contrives to set up an abundance of plants and flowers, but nowhere, even in a big display, does he crowd anything. In this magnificent and brilliant group there were superb plants of the glorious Cattleya Fabia, C. Lord Rothschild, the very useful Cattleya Mantini, and the rounded C. Mantini Westonbirt var., C. labiata Kate Brassier, a white-petalled form, C. Mrs. Pitt, C. Hardyana, C. Dusseldorfi, C. aurea, C. gigas, and a fine plant of C. fulvescens. The cypripediums included a C. insigne Sanderæ with fifteen splendid blooms; C. i. Harefield Hall var., with fourteen immense blooms; C. Fairrieanum, C. Charles Rickman, C. Rossetti, C. Germaine Opoix Westonbirt var., the old C. nitens-Leeanum Hannibal, and C. Maudiæ. Other conspicuous things in this wonderful exhibit were Cymbidium erythrostylum, with three spikes of beautiful blooms; two masses of the elegant Vanda Kimballiana, the rare white Dendrobium Phalænopsis hololeucum, and Odontoglossum crispo-Harryanum. Maidenhair fern and green moss were used as a groundwork for the plants, and not a pot could be seen. Tall palms formed a suitable background, and from among these the long spreading spikes of golden flowers of Oncidium varicosum Rogersi arched out over the bold and gorgeous cattleyas, etc., arranged below. To Lieut.-Colonel Holford and his able orchid grower we tender our heartiest congratulations upon this splendid addition to their many fine successes

An interesting little exhibit of flowers of Cattleya labiata, in variety, came from Mr. C. Moore, Hackensack, New Jersey, U.S.A., the blooms had been cut about twenty days, and some were in almost perfect condition. Mr. H. Lovegrove, gardener to H. Spicer, Esq., Aberdeen Park, Highbury, showed a small group of Cypripedium Spicerianum. Mr. A. W. Jensen, Lindfield, Hayward's Heath, contributed a small exhibit of the beautiful Cattleya aurea. Messrs. Stanley and Co., Southgate, brought up good forms of Cattleya labiata, C. l. ignescens, C. Mrs. Pitt, C. aurea, Cypripedium insigne Sanderæ, and C. nitens. An effective little group of orchids was set up by Mr. G. Day, gardener to H. S. Goodson, Esq., West Hill, Putney, and in this display the leading features were Cattleya Mantini, C. Hardyana, C. Fabia Goodson's var., C. labiata, C. Alicia, L.-c. Clonia, Miltonia vexillaria, the white Lycaste Skinneri alba, Cypripedium insigne Harefield Hall var., C. i. Sanderæ, and a pretty hybrid between Cattleya Harrisoniæ and C. Hardyana.

Messrs. Charlesworth and Co., Hayward's Heath, Sussex, had a famous group of orchids wherewith to signify their first display from their new quarters. Here they had fine examples of Lælio-cattleya Luminosa in the centre, with Vanda cærulea in fine form, and the lovely pure white variety Charlesworthi (F.C.C.), Brasso-cattleya Queen Alexandra, Cattleya Mantini, Cattleya Venus, Vanda Sanderiana, Brasso-cattleya Mrs. Maron—very beautiful, Lælio-cattleya Portia gigantea, Cattleya Aliciæ, and Oncidium varicosum Rogersi. Messrs. Hugh Low and Co., Bush Hill Park, Enfield, had a thinly arranged group of orchids, and prominent in this group were the white forms of Cattleya labiata, notably C. l. R. I. Measures, and C. l. Reedleyensis; other good things were Oncidium ornithorhynchum album, Cypripedium Maudiæ, C. triumphans, C. Ajax, Cœlogyne pandurata, and a long spike of the quaint Cycnoches peruviana.

Mr. Black, gardener to R. G. Thwaites, Esq., Chessington, Streatham, sent the bright Lælio-cattleya Ophir, Cattleya Fabia, etc. Messrs. Cypher and Sons, Cheltenham, showed a few good cypripediums, notably C. triumphans, C. gigas Corndeani, and C. Fairrieanum. The beautiful and brilliant Renanthera coccinea, with a big branching spike, was shown by Mr. Flack, gardener to Mrs. Joel, Worthing. Mr. Chapman, gardener to N. C. Cooksen, Esq., showed Calanthe Angela, a brilliant ruby-coloured hybrid. Cattleya aurea, in variety, was well shown by Mr. J. S. Moss, Wintershill, Bishop's Waltham.

Mr. White, orchid grower to Sir Trevor Lawrence, Bart., Burford Lodge, Dorking, sent the little Vanda dasypogon, Sigmatogyne Pantlingi, and Lælia pumila margaritacea. Mr. W. Watson Butler, Edgbaston, sent a white-petalled Cattleya Hardyana. M. Maurice Mertens, Mont St. Amand, Ghent, showed a few odontoglossums, and Mr. Moore, Chardwar, Bourton-on-the-Water, showed Cypripedium Actæus var. Milkmaid.

MAGNIFICENT GOLD MEDAL GROUP OF ORCHIDS.

Exhibited by Mr. H. Alexander, orchid grower to Lieut.-Colonel Holford, of Westonbirt, Tetbury, at the meeting of the Royal Horticultural Society on Tuesday, October 27.

FRUIT AND VEGETABLE COMMITTEE.

A very fine collection of fruit and fruit trees in pots came from Messrs. T. Rivers and Son, Sawbridgeworth, who invariably show finely. They had finely cropped trees of Gascoigne's Scarlet, Buckingham, Melon, and other apples, and some pears, in pots, while their picked samples of King of Tomkins County, Cox's Pomona, Bismarck, St. Martin's, King of the Pippins, Blenheim Pippin, Hambling's Seedling, Peasgood's Nonsuch, Cox's Orange Pippin, Thomas Rivers, and Ribston apples, were splendid and beautiful. Potatoes were largely and well shown by Mr. R. W. Green, Wisbech, who put up a good collection of clean, shapely tubers, the leading varieties being Eldorado, Beauty of Hebron, Snowdrop, Early Rose, Windsor Castle, King Edward VII., Duke of Albany, Superlative, Satisfaction, Eclipse, Epicure, and Green's Favourite.

A few dozen baskets of very clean apples were set up by Messrs. Hugh Low and Co., Bush Hill Park, Enfield, and the varieties that attracted us most were King of Tomkin's County, Blenheim Pippin, Royal Jubilee, Sturmer Pippin, King of the Pippins, Gascoigne's Scarlet, Lord Derby, and Lane's Prince Albert. Mr. H. W. Whiteley, Endsleigh Place, Torquay, set up a small collection of apples, all clean and bright; Newton Wonder, Mère de Menage, Charles Ross, and Cox's Orange Pippin were good.

CERTIFICATES AND AWARDS.

First Class Certificate.—To Vanda cœrulea Charlesworthi, from Messrs. Charlesworth and Co.

Award of Merit.—Brasso-cattleya Madame Hye superba, from Lieut.-Colonel Holford, Westonbirt, Tetbury, Gloucester; Lælio-cattleya Ortrude superba, from Lieut.-Colonel Holford. Dendrobium Cœlogyne maximum, from Messrs. Charlesworth and Co., Haywards Heath; Brasso-cattleya Queen Alexandria, Glentherne var., from Mr. Gurney Wilson, Glenthorne, Haywards Heath; Lælio-cattleya Lustre gigantea, from Lieut.-Colonel Holford; Chrysanthemum Hilda Lawrence, from Mrs. R. Gregory, Shoreham; Chrysanthemum Mrs. R. H. B. Marsham, from Mr. R. H. B. Marsham, Canterbury; Chrysanthemums Master David and Sir Frank Crisp, from Mr. Henry Perkins, Greenlands Gardens, Henley; Chrysanthemum Felton's Favourite, from Mr. Philip Ladds, Swanley; incurved Chrysanthemum H. W. Thorp, from Mr. Thorp, Darrington, Woking.

MEDALS.

Gold.—Mr. H. Alexander, gardener to Lieut.-Colonel Holford, Westonbirt, Tetbury, Gloucester.

Silver-gilt Hogg.—Messrs. T. S. Rivers and Son, Sawbridgeworth.

Silver-gilt Medal.—Messrs. W. Wells and Co., Merstham; Messrs. Charlesworth and Co., Haywards Heath

Silver-gilt Banksian.—Messrs. W. Cutbush and Son, Highgate; Messrs. J. Hill and Son, Edmonton.

Silver Flora.—Miss Farrer, Shaa Road, Acton; Mr. Day, gardener to H. S. Goodson, Esq., Putney; Messrs. Hugh Low and Co., Enfield.

Silver Knightian.—Messrs. Hugh Low and Co., Enfield (fruits).

Silver Banksian.—Mr. J. S. Moss, Bishop's Waltham; Mr. C. Moore, Hackensack, New Jersey, U.S.A.; Messrs. H. Cannell and Sons, Swanley; Messrs. Hugh Low and Co., Enfield (carnations); Messrs. H. B. May and Sons, Edmonton; Messrs. James Veitch and Sons, Chelsea; Mr. F. Brazier, Caterham Valley; Mr. R. W. Green, Wisbech.

Croydon Chrysanthemum Society.

The twenty-first exhibition of this society, held on October 27 and 28, in the Public Hall, Croydon, was a comparatively small one, compared with some of the earlier efforts of the society. All the flowers are shown in vases at Croydon, boards are not used at all. Some excellent flowers were staged.

Mr. T. Butcher decorated the platform with palms, ferns, and flowering plants, and he showed floral designs. Messrs. C. W. and S. Rogers, Croydon and Thornton Heath, showed cloches and cheap frames suitable for the cultivation of salading plants, and these created a good deal of interest. Mr. G. J. Allen, Coombe Cliff, Croydon, contributed a group of ornamental foliage plants.

CUT FLOWERS.

There were four entries in the open class for thirty Japanese blooms, distinct varieties, set up in six vases, and here the premier position was won by Mr. T. Beeson, gardener to J. Newton Mappin, Esq., Headley Park, Epsom, who also won the Champion Challenge Cup in this class in 1907. He had fine examples of Mrs. A. T. Miller (also a premier bloom), Henry Perkins, Valer Greenham, Bessie Godfrey, Mrs. J. Mileham, Mrs. R. H. Pearson, Madame P. Rada Mrs. A. H. Lees, Mrs. W. Knox, Mdll [illegible] A. Bertrand, Miss E. Smith, [illegible] W. Paget, Mrs. G. Hearne, Mary Inglis, W. Beadle, Mrs. F. W. Vallis, J. H. Silsbury, Chrysanthemiste Montigny, Miss O. Mill White Venosta, Algernon Davis, J. H. Doyl Lady Henderson, Norman Davis, Mrs. Norman Davis, Reginald Vallis, George Lawrence, Duchess of Sutherland, Mrs. F. Beckett, and Beatrice May. Second priz fell to Mr. C. J. Dicker, gardener to the executors of the late Hon. Louisa Canning, Frant Court, Tunbridge Wells; and Mr. G. Halsey, gardener to Mrs. Jeremiah Lyon, Riddings Court, Caterham, was placed third.

For fifteen blooms, in three varieties, arranged in vases, Mr. T. Beeson was again to the front, leading with Miss Edith Smith, Reginald Vallis, and Bessie Godfrey in good form; Mr. W. Graysmark, gardener to R. Barclay, Esq., Bury Hill, Dorking, second; and Mr. C. J. Dicker third; five entries. Mr. Halsey scored for ten incurved blooms, in one or more varieties, set up in two vases, and he led with bold specimens of Romance, Lady Isabel (2), Buttercup, Frank Tristram, Pantia Ralli (2), Boccace, and Mrs. G. Denyer; Mr. C. J. Dicker won second place with ten bright flowers of Romance; and Mr. C. Crett, gardener to B. F. Smith, Esq., Hetherset, Leigham Court Road, Croydon, third. Mr. Beeson, who was not placed, had the premier incurved bloom in a very big, full flower of Buttercup.

The leading local class was for twenty Japanese blooms, in four distinct varieties, arranged in four vases, and here Mr. C. Crett led with Mons. G. Rivol, Mrs. Norman Davis, Reginald Vallis, and Madame Paolo Radaelli, all fine; Mr. G. Edwards, Windmill Cottage, Shirley, came second, and he had Mrs. F. S. Vallis and Bessie Godfrey in fine form; Mr. R. Gladwell, gardener to A. Lawrence, Esq., Portland Road, South Norwood (the winner in 1907), was placed third; five entries. The best ten Japanese blooms came from Mr. T. Tomlinson, gardener to R. Hcffman, Esq., Tower House, Streatham, who showed Mrs. George Mileham and Madame P. Radaelli, the last very good. Mr. L. Gooch, gardener to F. Wickham Jones, Esq., Selhurst Road, Croydon, second; and Mr. P. Gladwell third.

The best vase of five blooms of one or more varieties of incurved blooms was one of C. H. Curtis, exhibited by Mr. G. Edwards; Mr. A. J. Beacon, gardener to F. Allen, Esq., Duppas Hill Terrace, second, with Romance; and Mr. C. Mearing, gardener to J. M. Paice, Esq., Park Lane, Croydon, third. For one vase of five Japanese blooms, one or more varieties, Mr. L. Gooch won first prize; Mr. Finch, gardener to G. H. Fisher, Esq., Downs View, Godstone Road, Croydon, second; and Mr. C. Mearing third.

In less important cut bloom classes Mr. F. A. Beadle, Newark Road, led for single varieties; Mr. W. Philpot, 57, Church Street, led for pompones; and Mr. H. E. Marden, Godstone Road; Mr. F. A. Beadle; Mr. C. R. Clark, 23, Neville Road; Mr. F. F. [illegible]ight, Holmesdale Road, South Norwood; and Mr. Norman Wrightson, 53, Elgin Road, were the leading winners in various Japanese classes.

PLANTS AND GROUPS.

Plants were not a great success. Mr. G. Lewry, gardener to the Misses Blake, Duppas Hall, led for three plants of single varieties, and he had a good specimen of Ladysmith. First prize for nine foliage plants suitable for table decorations was won by Mr. W. [illegible], gardener to Sir Walpole Greenwell, Bart., Morden Park, Caterham, with elegant crotons, dracænas, and aralias; Mr. F. [illegible], gardener to G. H. Fisher, Esq., Downs View, Godstone Road, second. Mr. Mills, gardener to Frank Lloyd, Esq., [illegible] House, Croydon, scored for Begonia Gloire de Lorraine, three plants, with beautiful examples; Mr. A. Fry, gardener to H. [illegible], Esq., Heathfield, Addington, second; and Mr. A. J. Beacon, third.

Groups of miscellaneous plants were dis[illegible]. Mr. G. Lewry gained the first prize, Mr. A. J. Beacon was second, and Mr. J. [illegible], gardener to H. Hales, Esq., [illegible], Kenley, was third. There was only one group of chrysanthemums, and this was a good, though rather formal one, set up by Mr. Frank Brazier, Addison Road, Croydon. It contained fine flowers of Mrs. Norman Davis, Leslie Morrison, Mrs. L. [illegible], etc.

A rather cold design in silvery-pink chrysanthemums won for Mrs. Vaughan, Bonnie Cot, Beulah Hill, the first prize for table decorations; Mrs. Green, London Road, West Croydon, second; and Mrs. Houlton, The Cottage, Station Walk, Dulwich, came third.

FRUIT AND VEGETABLES.

Mr. Lintott was an easy first for two bunches of black grapes, with Prince of Wales, the new variety figured in the present issue; Mr E. Houlton, gardener to J. Gardener, Esq., Croxted House, Dulwich, second; and Mr. T. Beeson third. Mr. Lintott was the only exhibitor of white grapes, and he was awarded first prize for good bunches of Muscat of Alexandria.

For six dishes of pears Mr. Lintott was again forward, with Beurre Bachelier, Conference, Beurre Diel, Doyenne du Comice, Pitmaston Duchess, and Souv. du Congres; Mr. W. Paulley, gardener to Dr. Jackson, Thornton Heath, second. Mr. Paulley had the best nine dishes of apples, six kitchen and three dessert varieties, and here he was followed by Mr. W. Lintott and Mr. C. J. Dicker, these three sets making a fine display. Mr. O. Jeal, gardener to M. Waterall, Esq., Waddon Lodge, scored for three dishes of dessert apples, and he also led for three dishes of culinary apples, while Mr. J. Johnson, gardener to Mrs. A. Crowley, Bramley Oaks, Croydon, scored for three dishes of pears.

In the vegetable classes Mr. T. Finch, Mr. C. Lane, gardener to E. H. Coles, Esq., Burntwood, Caterham; and Mr. F. J. Hainge, were the leading prizewinners.

National Chrysanthemum Society.

A well-attended meeting of the Floral Committee was held at Essex Hall, Strand, on Monday afternoon, October 26. There was a fine display of flowers, indeed one of the best seen for two or three years, not forgetting one very fine meeting last year. Messrs. W. Wells and Co., Merstham; Mr. D. Fairweather, Bifrons Gardens, Canterbury; Mr. H. Perkins, Greenlands Gardens, Henley; Mr. Martin Silsbury, Isle of Wight; and Mr. H. W. Thorpe, Woking, were the leading exhibitors. Several varieties gained certificates.

In the evening there was a large attendance at the meeting of the General Committee, Mr. T. Bevan presiding. It was resolved that this year, as last, the prize money for the three shows be not paid until after the conclusion of the last show for the season. The Secretary reported a balance of £45 14s. to the good on the accounts to date. The annual dinner (November 26), and the allocation of the Dean Medal at the November show, were matters considered. It was agreed to provide six sets of two judges each for the November show, and twelve gentlemen, with six reserves, were duly elected to fill these onerous and honorary positions.

The election of new members raised a good deal of enthusiasm; the president, Sir Albert Rollit, sent a good list of nominations. The result was that five members at 21s., eight at 10s. 6d., and sixteen at 5s. subscription were duly elected, and one society was admitted to affiliation.

United Horticultural Benefit and Provident Society.

There was a good attendance at the Waldorf Hotel, Aldwych, on Thursday evening, October 15, when the above-named excellent society held its twenty-second annual dinner, under the presidency of Dr. Robert Boxall, of Abinger, Dorking. The tables were handsomely decorated with flowers and plants and fruits sent by numerous members and several traders who have always been firm friends of the society. The arrangement of the decorations was in the capable hands of Mr. J. Bulford, Mr. J. Hudson's foreman at Gunnersbury House, Acton.

After dinner, following the toast of "The King," and liberty to "fumigate," the Chairman proposed "Success to the United Horticultural Society," and in a very capable speech he pointed out the excellencies of the several funds, the soundness of the society, and the special advantages offered to young gardeners. He thought there was need among all classes for greater providence, and he could not understand why so few, comparatively, joined their society. The rules seemed to meet every possible occasion, while the management was economical in the extreme, and in the matter of safety the society was in a very fine position, having about £31,000 invested. He much regretted that, though long interested in horticulture, it was not until a few months ago he knew even of the existence of the society, but he promised to advance its interests and advertise its advantages among gardeners whenever the opportunity offered.

Mr. Charles H. Curtis, chairman of committee, responded, and thanked Dr. Boxall for his presence and kindly interest in the society, an interest shown in a practical way inasmuch as the chairman had become an honorary and life member. Mr. Curtis pointed out that the society was progressing steadily, and had now about 1,100 members, and £31,000 invested funds, £1,100 having been invested during the present year. Everything worked so smoothly that there was a danger the members might become so self-satisfied as to neglect to advance the claims and advantages of the society among their fellows, and he, therefore, urged a warmer interest be taken, and a stronger endeavour made to secure the membership of the younger members of the profession. Just recently someone had severely criticised the society and endeavoured to pour contempt upon its methods, but it was interesting to note that eleven new members joined on the previous Monday, probably as a result of the attention that such criticism had drawn to the society. For himself Mr. Curtis said he was satisfied with the report of the U.H.B.P. as to method and finances issued by the Registrar of Friendly Societies, and in view of that report he felt that criticism and protests from outsiders could do no harm, but by advertising the society, would do it a great deal of good.

Mr. A. J. Brown, of the School of Handicrafts, Chertsey, proposed "The Honorary and Life Members," and referred to the kindness and generosity of those who carried such household names as Sherwood, Veitch, Sutton, Marshall, etc., and who had always shown their appreciation of the good the society was doing by retaining their honorary membership. He hoped that others might follow the excellent example thus set, because he was convinced the society was one of the best of its kind. He ventured to hope that even though the committee might not see its way to form a branch or section for members' wives, that at any rate at future anniversary dinners members might be allowed to bring wives or sweethearts to enjoy such a pleasant function.

Mr. Cox, of Messrs. Hurst and Son, Houndsditch, briefly and pleasantly responded, and also expressed a hope that at future anniversary dinners ladies would be admitted.

"The Visitors" was ably proposed by Mr. J. Harrison Dick, who said that visitors were always welcome, because it was found they usually became honorary members after a visit. He urged the importance of securing more of the young gardeners as benefit members, and hoped that the visitors present would spread a knowledge of the society's work among their horticultural acquaintances.

Mr. A. E. Bowles, M.A., chairman of the R.H.S. Scientific Committee, responded in a very neat little speech and confessed that though long connected with horticulture and horticulturists, he had no idea the society was such a large, useful, and wealthy one. He would do his part in making it better known, and said that this would be the last, as it was the first, time he would be present as a visitor.

Mr. Riley Scott proposed thanks to the donors of fruit and flowers, to Mr. Bedford for the decorations, and to Mr. Winter and his friends of the Waverley Glee Party for the admirable music rendered. This was accorded most heartily, and Mr. Bedford and Mr. Winter replied, both agreeing that the success of the meeting, so far as they had contributed, was ample thanks.

Mr. E. F. Hawes proposed "The Chairman," and this toast was heartily received, and accorded musical honours. Dr. Boxall expressed his pleasure at being present, and said he felt a great honour had been conferred upon him in being invited to preside over such an important gathering.

Mr. Curtis asked leave to propose one other toast, that of the health of their hard-working secretary, Mr. Collins. This was cordially accepted, and Mr. Collins replied in his usual modest way.

Miss R. Green, Miss C. Green, Miss E. Little, and Messrs. W. L. Helsdon, Charles Brown, and Ralph Paine discoursed sweet music during the evening, under the direction of Mr. Winter, and they gave their services.

The meeting was a very successful one, the speeches short and the music abundant and good. Among those present were: Messrs. G. Gordon, James Hudson, T. Bevan, W. Anderson, J. Wheeler, J. George, J. Heal, W. P. Thompson, J. Gunner, Pusey, Frogbrook, Wesker, Linford, Archer, Macdonald, etc., etc., in addition to those previously named.

British Gardeners' Association, London Branch,

The second meeting of the autumn session was held at Carr's Restaurant, Strand. It proved to be a most successful gathering, at which several new members were nominated. The chair was taken by Mr. E. F. Hawes, and it was resolved to hold committee meetings at seven p.m., and general meetings at half-past seven, instead of eight p.m. It was also decided to set apart a time for mutual instruction before the usual paper is read. Each member is invited to bring up one question on paper, and hand it to the chairman, and this will be answered by the members as fully as time will permit.

A splendid collection of conifers was brought by Mr. R. J. Frogbrook (vice-chairman of the branch), many of which were bearing cones, and several instructive remarks were made upon them by Mr. Frogbrook, to whom a hearty vote of thanks was accorded.

The Chairman introduced a discussion on the subject of "The B. G. A., its influence, and how to increase it." He was ably supported by Messrs. Frogbrook, Hill, Hartless, and others present.

East Anglian Horticultural Club.

There was a full meeting of members at the October gathering of this club held at the Boar's Head Hotel, Norwich. Mr. J. Powley was in the chair, supported by Mr. James Forder and the prominent professional and amateur horticulturists of the district. Mr. E. Peake was to have given a lecture, but his time being so much occupied he had enlisted the help of five members of the botanical department of which he is leader. These all came prepared with short papers, or lecturettes, as follows: Mr. H. Perry, on "How Plants Feed"; Mr. H. Goude, on "Leaves"; Mr. L. Smith, on "The Leaf Insect"; Mr. T. Notley, on "Our Native Poisonous Plants"; and Mr. C. Burtenshaw, on "Summer Bedding." Each had thoroughly thought out his subject, and dealt with it in an interesting manner. The range of subjects opened out a wide field for debate, and this was heartily entered into by the President, Messrs. E. Peake, J. Forder, J. C. Abel, C. Hubbard, and others.

The exhibition tables were filled with choice cultural examples. Apples and pears were fine specimens. The plants of Begonia de Lorraine, shown by Mr. W. Palmer and Mr. W. Shoesmith, were fine examples of good culture. Messrs. Daniels, Bros., Lim., Norwich, offered prizes for their new potatoes, Prince Edward and Royal Norfolk, and fine tubers of these two varieties were staged. Messrs. Hobbies, Lim., Dereham, exhibited very good autumn rose blooms from their fields in the county, and a new dark cactus dahlia named Vigil, from this firm, also attracted much attention. A novelty in vegetable growth was put upon the table by Mr. S. Hunt, gardener to Mrs. Willis, Ipswich Road, Norwich. It was a carrot, which in its young state had passed through the neck of a broken bottle and had developed on each side of it. New members still continue to be enrolled, and the secretary, Mr. W. L. Wallis had a busy evening.

Beckenham Horticultural Society.

Under the presidency of Mr. Cardross Grant, the first lecture of the winter session of the above society was given on Friday, the 9th inst., by Mr. E. H. Jenkins, proprietor of the Queen's Road Nurseries, Hampton Hill, the subject being "Methods of Propagation."

There was a very full room, and a most instructive discourse was followed very closely. Leaf cuttings claimed first attention, and begonias and gloxinias were taken as examples of plants increased by this means. The propagation of lilies by bulbils and bulb scales; examples of plants increased by root cuttings; and succulents also received attention. The physiological reasons were given for making the base of cuttings immediately under a joint or "node." The making of the carnation cutting received a little extra attention, and the lecturer favoured cuttings made in the ordinary way rather than those stripped off, as often advised, giving as his reason the larger rooting surface; and he considered the splitting upwards of the cutting, which is often done, of no advantage whatever. Some few questions were asked and replied to by the lecturer, after which the hearty thanks of the meeting was accorded both lecturer and chairman.

A special certificate was awarded Mr. Abrahams for eight dishes of apples, and an exhibit of outdoor grown tomatoes secured to Mr. Chandler a certificate. At the previous ordinary meeting Mr. F. W. Price, of Broadclyst Gardens, secured a special award for well-grown apples, and Mr. Webster also placed on the table four beautiful examples of The Queen apple.

On Monday evening, by kind invitation of the committee of the Beckenham Congregational Church Guild, a strong contingent of this society attended a lecture given by Professor Bottomley, of King's College, London, on "Microbes, friendly and otherwise." This was highly appreciated.

Birmingham Gardeners' Association.

The second meeting of the autumn session was held on October 19, with Mr. Walter Jones presiding. Considerable interest was centred in the fact that Mr. George Giles, head gardener at Harborne Hall, the delightful suburban seat of Edwin Nettlefold, Esq., had been scheduled to give an essay on "The Winter-flowering Carnation."

In the course of his thoroughly practical remarks, the essayist, in adverting to the various systems of propagating the carnation, remarked that the most successful method he had adopted was not altogether in harmony with the stereotyped one of placing cuttings in a warm frame, and regularly every day until rooted wiping the condensed moisture from the glass, and admitting a little air. He preferred to keep the light or sash closely shut, and ignore the wiping of the glass, thus keeping the frame almost hermetically sealed, except when an occasional slight spraying of the foliage seemed needful. This resulted in a considerably quicker rooting of the cuttings, and with less attention. The history of the perpetual or winter-flowering carnation, soils, manures, diseases, and other items connected with the general cultivation of the plants were included in the essayist's remarks, and Mr. Giles was duly thanked for his instructive address.

An interesting discussion followed, in which Messrs. Wm. Spinks, A. R. Brown, Wm. Gardiner, Thos. Humphreys, A. Cryer, and W. L. Deedman participated. One of the members brought a bunch of a polygonum for identification, and this proved to be the too sparsely grown and somewhat rare P. amplexicaule oxyphyllum, with whitish inflorescence and peculiarly long pointed lanceolate foliage.

Cardiff Gardeners' Association.

This association held its fortnightly meeting on the 20th inst. at the Central Free Library, by the kind permission of Mr. Ballinger and the Library Committee. Mr. H. R. Farmer presided. The minutes of the last meeting were read and confirmed, and the Chairman, in his opening speech, drew the attention of the members to the number of books on horticulture and forestry that Mr. Ballinger had so kindly arranged for the benefit of the members for the evening. Mr. Ballinger replied that he was pleased to welcome the members of the association, and hoped that they would be interested in the collection. During the past twelve years the members have enjoyed this privilege, and the number of books on the subjects mentioned had been materially increased. At the close of the inspection Mr. F. G. Treseder offered a hearty vote of thanks to Mr. Ballinger and Mr. Farr, and referred to the loss the society would sustain when the former would take up his new appointment as chief librarian to the Welsh National Library at Aberystwith. Mr. Mountney seconded the proposition, which was carried with applause. Mr. Farr suitably acknowledged the compliment.

Sandhurst Gardeners' Association.

There was a good attendance of members and friends at the meeting held on Tuesday, October 20, with Mr. L. Dupond in the chair. The subject for the evening was "A Garden at Different Seasons of the Year," by Mr. W. J. Townsend, Sandhurst Lodge Gardens, who illustrated his lecture by about 125 lantern slides made by himself. These showed various garden scenes and plants at Sandhurst Lodge. Some of the snow scenes (taken last April) being especially good. The discussion that followed was sustained by Messrs. Dupond, Pendry, C. W. Goddard, Shepherd, etc. A hearty vote of thanks was accorded Mr. Townsend. Mr. L. Dupond, Crowthorne Nurseries, staged a well-flowered pot of nerines, and Mr. W. H. Chapman, Hilfield Gardens, Yateley, contributed two dozen bunches of dahlias.

OBITUARY.

MR. P. FAIRGRIEVE.

A distressing accident occurred on Monday the 12th inst., and terminated fatally in the Worksop Hospital on the following Wednesday evening, the unfortunate victim being Peter Fairgrieve, the foreman under Mr. J. Gibson, in the gardens at Welbeck Abbey. The sad ending spread quite a gloom over the whole estate, where the deceased was one of the most popular figures, and a great favourite with all classes, including the Duke and Duchess of Portland. The accident happened in rather singular fashion. Deceased was very fond of animals, and whilst in the gardens on Monday morning, offered an apple to one of the horses attached to a cart. In order to facilitate its eating, Fairgrieve undid the bit, with the result the horse bolted. The unfortunate man tried to stop its career, but was knocked down, the wheel passing over the lower part of his body. His remains were interred in Cuckney Churchyard on Saturday, and he was carried to the grave by his bothy comrades.

ANSWERS TO CORRESPONDENTS.

GARDENER AS DOMESTIC SERVANT.—T. R. P., Branksome: In somewhat similar cases it has been decided that a gardener resident on the place is a domestic servant. If you resided in the garden then you should make a claim upon the executors for the sum named in the will, and failing a satisfactory answer, place the matter in the hands of a solicitor.

HOLLIES.—R. B., Leeds: Yes, both green and variegated hollies can be successfully transplanted at this season of the year. The large specimens you are desirous of moving from one part of the garden to the other should be lifted with as large a ball of soil about the roots as possible. Take the necessary precautions to prevent the ball of soil splitting during the removal, and if the soil is dry give a good soaking of water when the planting is finished. When water is given while the planting is in progress there is a risk of the soil being converted into a puddle, and when this happens the roots do not push very readily into it. In the case of those obtained from the nursery you should be careful to allow the packing material to remain about the roots until you have everything ready for planting them. Much harm is sometimes done unwittingly by exposing the roots to atmospheric influences longer than is really necessary. The roots of hollies and other shrubs suffer less from exposure now than at other seasons, but this fact does not in any way render it less necessary to avoid undue exposure.

DAFFODILS.—F. G. S., Herts: Daffodils may still be planted with satisfactory results, provided the bulbs have been well ripened and kept under conditions that have ensured their remaining dormant. In other words, daffodils such as are supplied by the trade will, if planted within the next few weeks, bloom satisfactorily. Bulbs that have remained in beds and borders cannot now be transplanted with any measure of success. They are now furnished with roots and growing freely, and will suffer a severe check if removed.

ROOT PRUNING.—Young Gardener: We published an article on this subject in our issue of the 24th inst., from the pen of Mr. H. Markham, one of the leading fruit growers at the present day, and we would advise you to take advantage of the information contained therein. We would strongly advise you to commence the work at once, and proceed with it as rapidly as circumstances will permit. The soil will rapidly lose its heat from this time, and the weather may be such as to put a stop for a time to the moving of trees.

ERADICATING THE COLTSFOOT.—M. B., Hants: We quite agree with you that when once established the colt-foot is very difficult to eradicate, but in expressing this agreement, it is important to point out that the difficulty is not so great that it cannot be surmounted. The colt-foot is propagated by means of the seeds, and by the roots, and those who, like yourself, have land much infested with it should give first attention to seed reproduction. The flowers are produced quite early in the year, in advance of the leaves, and, owing to their insignificant appearance, their importance in the economy of the plants is frequently quite overlooked. The yellow flowers are of comparatively small size, and are borne on scaly stalks from six to ten inches high, the height depending upon the vigour of the plants. If the conditions are favourable to pollination each flower head produces a large number of seeds, which are distributed by parachute-like appendages, not unlike those of the dandelion. Therefore, one means of checking the spread of this weed is to cut off with hoe or other implement the flower stalks as they rise in February and March, and thus prevent the development of the flower heads and the production of seeds. Owing to the great depth to which the roots extend in the soil it is practically impossible to wholly clear the soil of them. Where the ground is so fully occupied with the coltsfoot as in your case, the soil should be dug over during the winter or spring, and every scrap of root be picked out and burnt. This will not clear the ground, but it will reduce the plants and render the work of the hoe later on more effectual. No plant can live for any great length of time when it is not allowed to make top growth, and we suggest that immediately there are signs of young leaves the hoe be brought into requisition, and that the ground be hoed over at comparatively short intervals. It is a somewhat tedious process, but your persistence will be amply rewarded.

UNHEALTHY BEGONIAS.—H. J., Wrexham: Your begonias have been seriously injured by the begonia mite, a destructive pest when efficient repressive measures are not adopted at an early stage of the attack. Dusting the leaves with tobacco powder, spraying them with tobacco water, or other solution of nicotine, and fumigating the house or pit with a nicotine compound are excellent remedies.

PROPAGATION OF ASPIDISTRAS.—M. H. F., Sussex: Aspidistras are propagated by division, and this is best done early in March, when new growth is commencing, and if you will write then we shall be pleased to give you the necessary information relating thereto. For the present allow them to remain undisturbed at the roots.

ROMAN HYACINTHS.—S. S., Wolverhampton: The bulbs, having commenced to make new growth, the proper procedure will be to remove them from the plunge bed and put them in an unheated frame, or in the greenhouse, for a few days, and then remove them to a pit or house where they will have the assistance of a temperature of about 60 degrees.

GRAPES SHANKING.—M. H. W., Essex: You need not apologise for stating the case so fully, as the information you have given enables us to advise you with a greater degree of confidence than is possible when we have to base our opinions on a few meagre details. There can be no doubt that the border is too deep, and the drainage imperfect; and until the latter is improved the shanking will continue. As the vine borders are inside the houses they should have sloped from the front to the back, and a pipe drain laid along the lower side of the bottom of the border to carry the surplus water into the nearest drain. This is the best possible period of the year in which to improve the borders, and we suggest the vines be lifted, the bottom of the borders be made to slope from the front to the back, and when this has been done be trodden firmly, and covered with a six-inch layer of concrete. On the concrete put a twelve-inch layer of broken bricks, which should be covered with thin turf. Lay along the lower part of the border, and on the concrete, a pipe drain, and connect it with a main drain outside. It will also be advisable to block up the arches along the front wall to prevent the roots extending beyond the house and pushing into the cold clay. We need hardly say that the lifting and replanting of the vines will require great care, and that the work should be proceeded with as expeditiously as possible. Only two vines should be lifted at a time, and immediately they are lifted the roots must be carefully gathered up and have damp mats wrapped about them. If the work is done at once in accordance with the advice given herewith, the vines will not receive a great check, but next year the crop should be reduced somewhat, as compared with that taken this year. We suggest you lift the vines in one house this year, and those in the other house twelve months hence, in case you may make a slip in carrying out any of the details. There is, however, really no risk in lifting vines at this season. We have lifted vines in July, when in full growth, made new borders, and then replanted them with satisfactory results; but to lift a house of

How's Your Garden?

Are your plants thriving—or are they being steadily killed by soil pests?

If your garden is being laid waste by wireworms, grubs, slugs, snails, centipedes, beetles, etc., free your soil from these pests **at once.** Here is a new discovery that can be relied upon to do the job well.

"KILOGRUB" is just what you and your poor plants have been waiting for—the ideal destroyer of all vermin of the soil. "KILOGRUB" is a perfect scientific preparation, in the form of a strong chemical powder which effectively exterminates all these soil pests **by means of the fumes it gives off.** The deadly vapour of "KILOGRUB" is the secret of success.

Kilogrub

has been thoroughly and successfully tested under every possible condition. All you have to do is to well sprinkle "KILOGRUB" and work it into the soil—a very little will suffice.

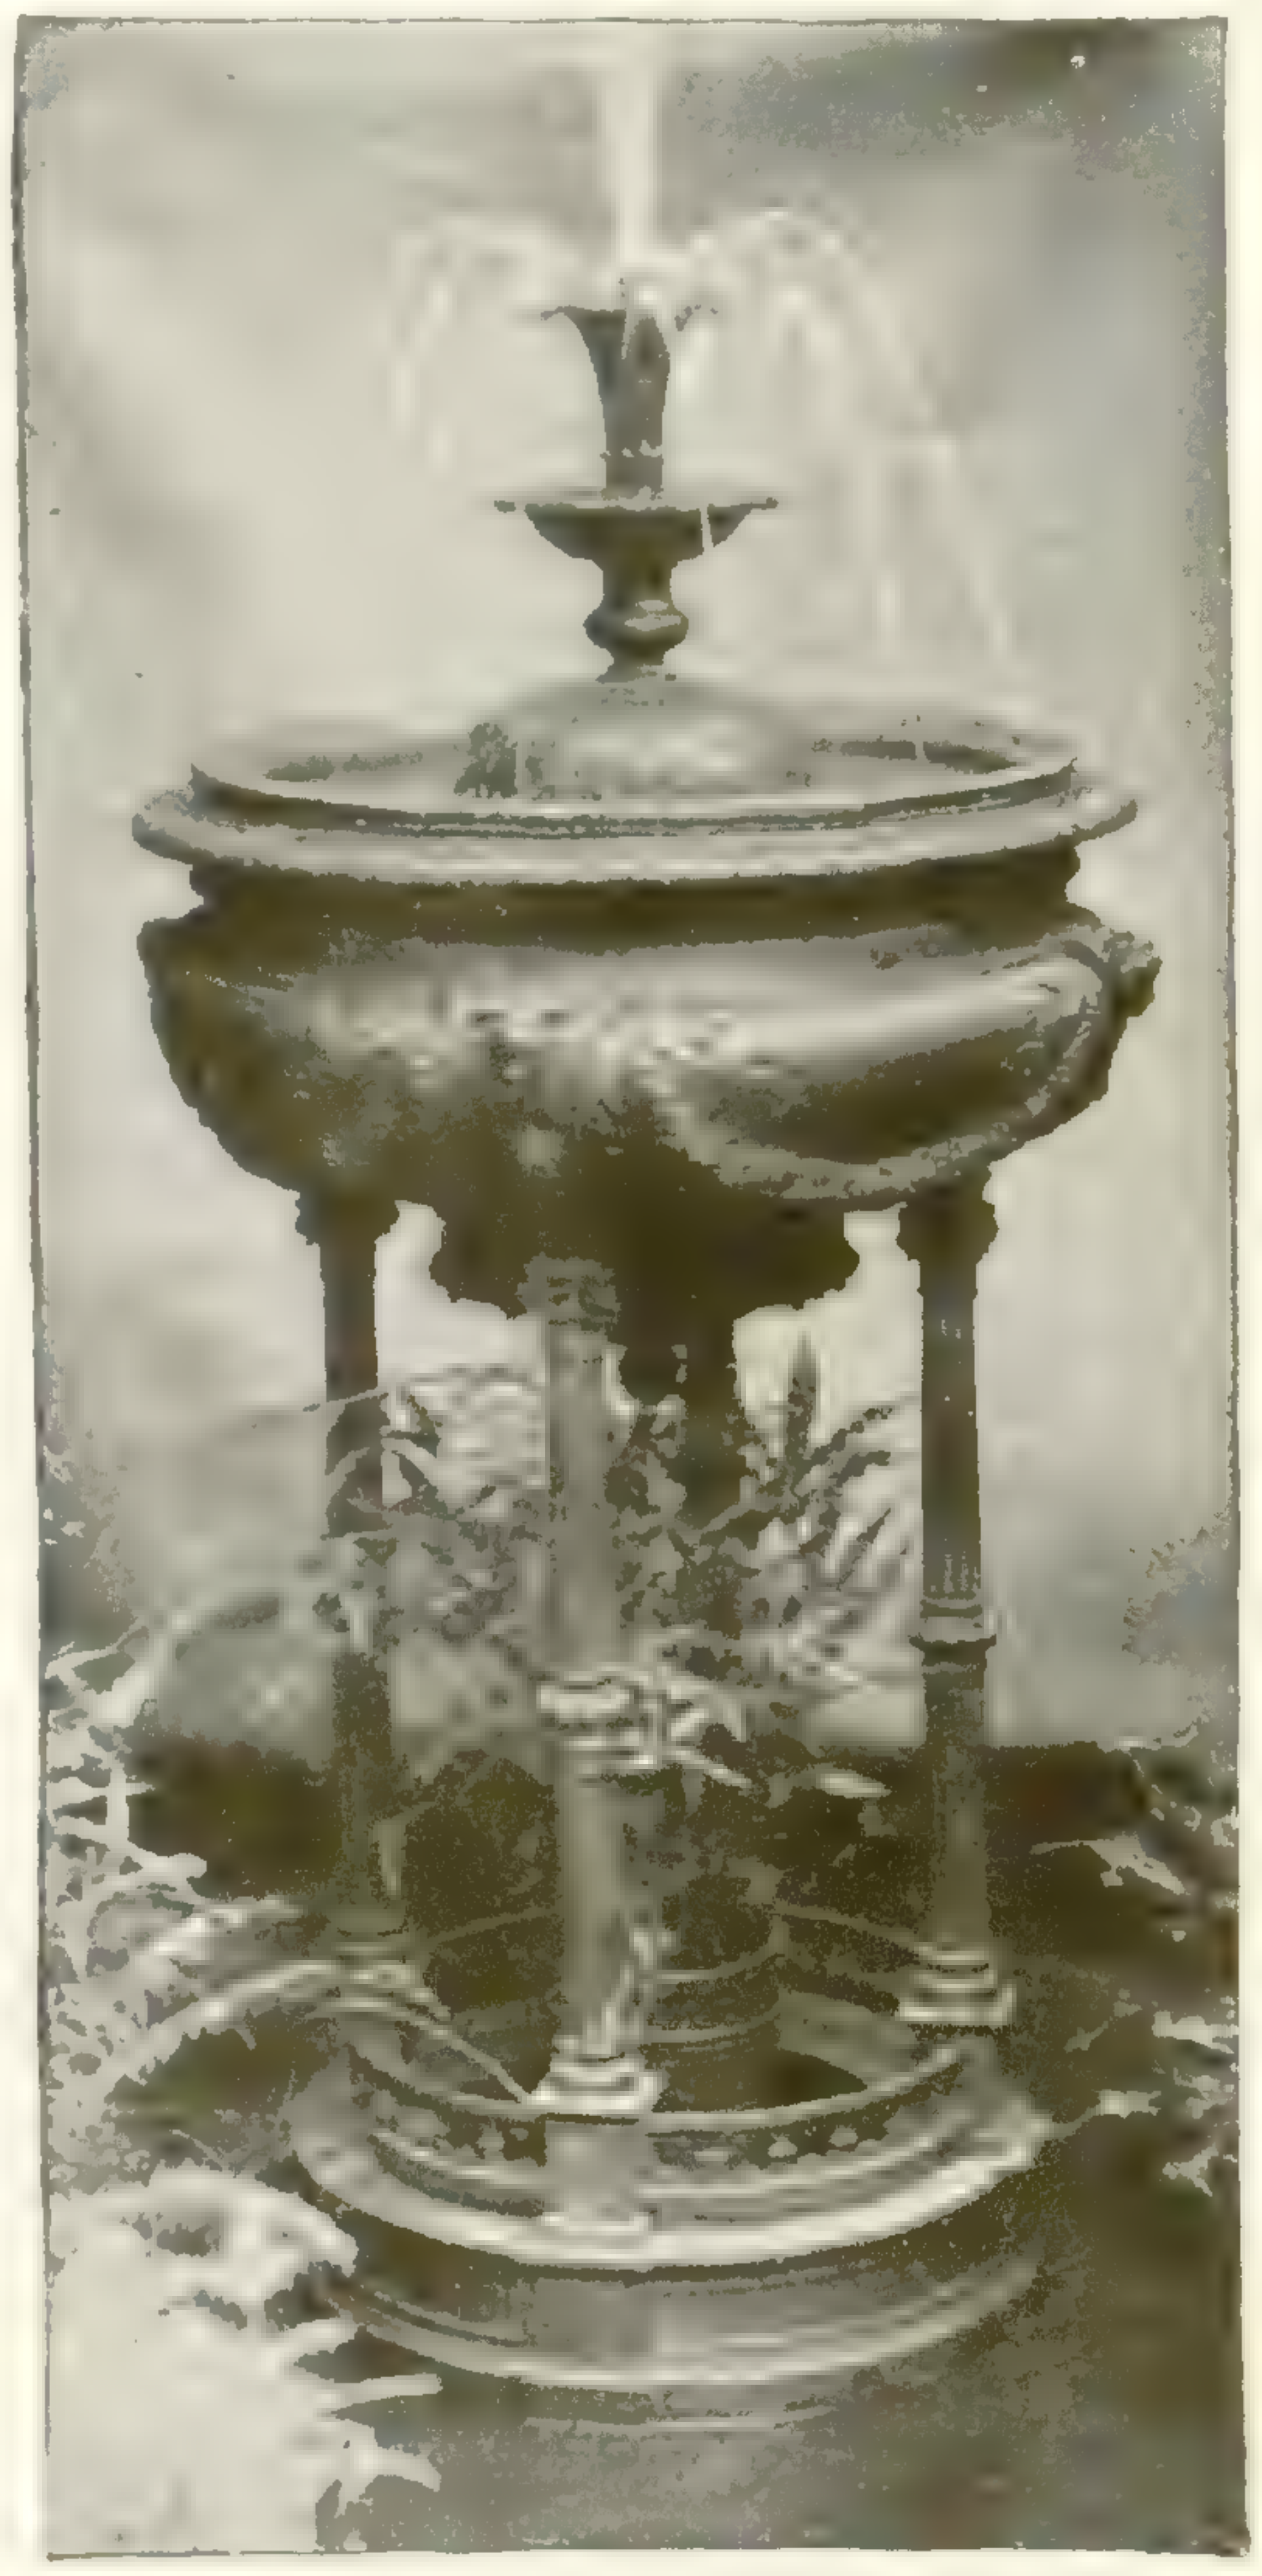
ELECTRIC FOUNTAINS.

At one of the recent meetings of the Royal Horticultural Society Messrs. W. Wood and Son, Wood Green, N., exhibited several of the electric fountains for the adornment of the dwelling-house and conservatory that they are introducing; and having regard to their unique character it is not surprising they should have attracted much attention. Elegant in design and ingenious in construction, they enable one to have a fountain amid the foliage and flowers in the conservatory without any of the difficulties associated with small fountains that derive their water supply direct from main or tank. What is perhaps still more important, they afford an opportunity of utilising fountains in the adornment of indoor apartments and indeed for the embellishment of the dinner table. The fountain we have the pleasure of illustrating is made of antique bronze, and is equally suitable for rooms and small conservatories contiguous to the dwelling-house, but various designs are made in silver plate suitable for dining-room tables. This fountain was designed by the Chief Art Decorator of the Vienna National Museum, and the casing manufactured by the Royal Bronze Works of Vienna.



AN ELECTRIC TABLE FOUNTAIN.
Introduced by Messrs. W. Wood and Son.

These fountains are a quite new invention, and are quite independent of the usual water supply, a few pints of water poured into the basin being all that is required. The fountain is connected up to the nearest available point of the electric lighting supply, and can be run at a cost of about 1d. per 14 hours. A small motor is fixed in the interior of the fountain, and is lubricated for two years; and the fountain will play without any attention indefinitely. In the case of fountains used on the table, a small contact plate is placed underneath the tablecloth, and the wire carrying the current is attached to the plate, and runs underneath the table and down the legs thereof to the nearest electricity point. The fountain is stood on the tablecloth above the contact plate, which prevents any seeing how the fountain is worked.

THOMSON'S CELEBRATED MANURES. For full advertisement see page 845.

TO-DAY! AND FOR YEARS AND YEARS PAST, the XL ALL Specialities are and have been the best on the market. Where is the Gardener who does not pin his faith to one or the other of these celebrated Insecticides or Fertilisers? XL ALL FERTILISER has pleased all who have used it this season. The Sales of XL ALL FUMIGATOR prove that it is more popular than ever. XL ALL LIQUID NICOTINE INSECTICIDE is always spoken of by gardeners and growers as the most deadly to Mealy Bug, Thrips, etc. XL ALL WINTER WASH for dormant Trees acts like magic, clearing the Trees and Bushes of all Insects' Eggs, Moss and Fungoid Growths. XL ALL LAWN SAND, a weed eradicator and fertiliser for weedy and poor lawns. XL ALL WEED KILLER used once a year. "No weeds can live." Please ask your Nurseryman, Seedsman, or Florist for a copy of my small pink list, giving particulars of these and many other XL ALL Preparations, which can be obtained from the Horticultural Trade throughout the World. G. H. RICHARDS, Manufacturer and Patentee, 234, Borough High Street, London. S.E.

GARDENER (Head Working), where more are kept; 25 years' practical experience all branches, Inside and Out, early and late Forcing, Vines, Cucumbers, Melons, Stove, and Greenhouse Plants, Herbaceous Borders; thoroughly reliable; highly recommended; married, without encumbrance. WOODHOUSE, Eastwood Road, Bramley, Surrey.

GARDENER (Head Working), age 47; good practical experience in all branches, Inside and Out; many years as Head; can have good references. H. TURNER, Fineshade, Stamford.

GARDENER (Head Working, where two or more are kept); 16 years' good practical experience in all branches; thorough knowledge of grapes, melons, cucumbers, stove and greenhouse plants, flower and kitchen garden; age 30; married when suited; good ref.; 2½ years in last place. B. BROOKS, Minerva Cottage, Elm Grove, Worthing.

GARDENER (Head), where two or more are kept; thorough knowledge of gardening generally, both Inside and Out; life experience; good references; abstainer; age 31, married, no family. L. A. KETTEL, 33, Adelaide Road, Chislehurst, Kent.

GARDENER (Head Working) where three or more are kept; 28 years' practical experience Inside and Out; 13 years as Head in good establishments; good references. T. WALLIS, Clematis Cottage, Moorlands Road, Camberley, Surrey.

GARDENER (Head Working), where three or four are kept; life experience in all branches, both Inside and Outside; highly recommended; married, no family; 4½ years in last situation, 12 in previous. W. SKEET, Hurst Wood, Buxted, Sussex.

J. H. WHITE and CO., Nurserymen, Worcester, can confidently recommend an experienced HEAD GARDENER; married; capable of managing a good establishment. Particulars on application.

S. C. GIBBONS, Esq., Great Walstead, Lindfield, can with confidence highly recommend J. TANNER to any Lady or Gentleman requiring a reliable, practical Man as HEAD GARDENER; life experience in all branches; excellent references. J. TANNER, Gardens, Great Walstead, Lindfield, Sussex.

GARDENER (Head or good Single-handed); life experience in all branches, including landscape and re-modelling; aged 34; married; good character. W. P., 31, Oaksford Avenue, Sydenham, S.E.

GARDENER (Head Working or Single-handed); age 39; married, two children; good all-round experience Inside and Out; cows and poultry if required; good references. G. A., 49, Norman Road, Ilford.

GARDENER (Single-handed or with help); three years in present situation. All round experience; age 27; married. A. STAPLES, 15, Victoria Road, Sevenoaks.

GARDENER (Single-handed or with help), 20 months' good character; 8 years' previous; age 33; abstainer. H. HUNT, 10, Herongate, Brentwood.

GARDENER (Single-handed or charge of Kitchen Garden); 1 year and 8 months in present situation; 8 years previous; good references; age 32; total abstainer. Apply GARDENER, St. Michael's Cottages, Ingrave, Brentwood.

GARDENER (Single-handed or otherwise); willing to be useful; 5 years' good reference from last place; life abstainer; age 26; married when suited. A. S., Trammere, Sunbury-on-Thames.

GARDENER (Single-handed or otherwise); life experience, Inside and Out; can be well recommended; single, age 34. F. S., 3, Alexandra Road, Uxbridge.

GARDENER (Single-handed) seeks SITUATION; 6 years in present place; 4 and 2 years previous; married; age 35 years. F. CLARKE, 32, Parkhurst Road, Bengeo, Hertford.

GARDENER seeks SITUATION; single-handed or Second; 10 years' experience; good references; age 24; disengaged. A. RANDALL, 62, Sussex Road, South Croydon.

GARDENER (Second, where three or four are kept); Inside and Outside; life experience; 6½ years' character from last place; single; age 32. G. EUSTON, Shrubbs Hill, Sunningdale, Ascot, Berks.

FOREMAN or GROWER; middle age; married; life experience in London Market Nurseries; no objection to Grow, and Manage Shop; accustomed to Seed and Bulbs, Making Up, etc.; South Coast preferred; 10 years last place as above. A. B., 45a, Lindrop Street, Fulham, S.W.

FOREMAN (Inside); age 26; good practical experience in first-class gardens; bothy preferred; good references. F. E. COTTRELL, 31, Stamford Road, Fulham, S.W.

JOURNEYMAN (Inside).—Mr. ADCOCK can highly recommend Young Man as above; seven years present place; age 24. Apply N. WELLS, Gardens, Ditcham, Petersfield, Hants.

GARDENER (Under) seeks SITUATION in Kitchen Garden or Pleasure Grounds; well used to Scythe, Horse Machine; good references; bothy preferred; age 28. W. FULLER, Caxton, Cambs.

GARDENER (Under), age 19, seeks SITUATION; five years' experience Inside and Out; three years' good character. A. WORSFOLD, Benenden, Cranbrook, Kent.

GARDENER, experienced, middle-age, seeks PERMANENT SITUATION; excellent at laying out new Gardens or any improvement on a Gentleman's Estate; married, wife only; highest references and qualifications. B., 31, Queen's Road, Horley, Surrey.

M. DARCY WYVILL, Esq., Constable Burton Hall, Yorks, will be pleased to recommend his GARDENER to any Lady or Gentleman requiring the services of a thoroughly practical man; well up in all branches; age 36; present place seven years, previous 12 years. Address ROBT. SINCLAIR, The Gardens, Constable Burton; or as above.

IMPROVER, in Gentleman's Garden, age nearly 17; won Essex County Horticultural Scholarship, 1907; also Second-class Certificate R.H.S.; has had one year's training at Horticultural Gardens, Chelmsford; now disengaged. H. BRANSDEN, Stifford Lodge Cottage, near Grays, Essex.

MR. J. HERDMAN, Underfell Gardens, Burton, Westmoreland, will be pleased to recommend smart intelligent LAD as IMPROVER; takes a keen interest in his work.

SEED and BULB TRADE.—Advertiser seeks SITUATION as SHOPMAN; 14 years' experience in all branches of the trade; highest references. FOSTER, 14, High Park Terrace, Paignton.

STOKER or HANDY MAN, willing to be generally useful; 10 years' good character one situation; age 34; married. Apply STOKER, 48, Fifth Avenue, Bush Hill Park, N.

TO FRUIT GROWERS.—Man, energetic, seeks PERMANENCY; not afraid of work if paid well; Fruit Growing for Market; good knifesman and grafter, picking and packing. H. J., 2, Alma Road, Hemel Hempstead.

YOUNG MAN seeks SITUATION as UNDER GARDENER; age 22; Bothy preferred; strong and willing; good references. J. FALLOWFIELD, Church View, Natland, near Kendal.

YOUNG MAN; abstainer; 7 years' experience in Kitchen and Flower Garden; little knowledge of Nursery, Tomatoes; useful in house; good character.—RICHER, 13, Riverdale Road, Erith.

Situations Vacant.

WANTED, Young MARRIED MAN for Inside and Out. Wages 18s. per week. Cottage and garden. Apply, stating particulars, to HEAD GARDENER, Manydown Park, Basingstoke.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Tilth.

Considering how large is the amount of attention devoted by those engaged in experimental work in this country to testing the action of various manurial agents on garden and farm crops, it might, with some justification, be assumed by those who had but little experience in tillage operations that the chemical condition of the soil is the first point that should be considered in crop production. This, however, is not so, and although we might draw other conclusions from what is being done, we have no doubt that the majority of those who are giving attention to manurial experiments are in full agreement with ourselves upon this point. Prominence is given to the experiments with manures at training colleges, and in the experimental stations because they can be carried out with a large measure of success in a limited area, and results can be obtained from a set of experiments in a comparatively short period. The second of these two points should not have undue consideration from those engaged in experimental work, but many things not altogether desirable may be justified on the ground of expedience. For teaching purposes experiments that can be carried through in a year or two are the most useful, and public bodies such as County Councils like to be in a position to show that they are active in the interest of cultivators. Manurial agents are, we need hardly say, of immense importance in the cultivation of garden and farm crops, and it is desirable cultivators should receive the assistance that experiments are able to give, and be thus placed in a position to use them to the best advantage. Exclusive attention should not, however, be devoted to them, for the foundation of successful culture is a good tilth. This fact was recognised in the United States many years ago, and much work has been done at the experimental stations with a view to effect a solution of the many problems associated with the management of soils. Experiments well-nigh innumerable and extending over long periods have been conducted with a view to the solution of such questions as to the best depth at which to cultivate, the conservation of moisture in the soil, and the influence of a fine tilth on plant growth. The results obtained from these experiments have brought into prominence the enormous advantage of a soil in such condition that the roots can extend freely on all sides, and that air and water can pass readily through it, and in the course of their passage assist in setting free some portion of the food constituents locked up within the particles. If the soil is regarded as a store-house of plant food rather than as an inert mass, the value of efficient tillage will be the more readily appreciated. Further aid in the appreciation of thorough cultivation will be obtained by remembering that the soil contains immense numbers of micro-organisms actively engaged in breaking down certain of its soil constituents and converting them into a form in which they can be utilised by the plant in building up its structure. For these not less than for the roots, air, moisture, and warmth are necessary, and these can only be obtained in proportions favourable to the maintenance of bacteria in an active state when the soil has been prepared in accordance with advanced practice. Depth is essential to a full development of the root systems other than those which do not extend far below the surface, and it is not less necessary the soil should be converted into a comparatively fine tilth throughout its depth. The soil of land under cultivation consists of organic and inorganic matter, the one derived from decayed plants and animals, and the other from the débris of rocks. The percentage of the former is in some degree the measure of the soil's fertility, for while contributing to the available food supply, it renders valuable service in conserving the moisture in the soil. The inorganic matter, or humus, does not serve directly as a plant food, but the products of its decay do so, and are important sources of nutrient matter. Humus varies in character according to the conditions of moisture, and undergoes various changes in process of decomposition, and this is continued until it is resolved chiefly into water, carbonic acid gas, and nitrates. The decomposition of organic matter is materially assisted by bacteria, and both the process of oxidation involved in the decay and the work of the micro-organisms in the liberation of nitrogenous substances are dependent upon the passage of the air through the soil, and this is practicable only when the soil is thoroughly broken up and maintained in a more or less loose state on the surface. Moisture is equally as essential to nitrification as air, and as the activity of bacteria is greatly checked by drought, a fine tilth that will materially check the evaporation from the surface, and maintain the capillarity of the soil in a high state of efficiency is essential. That plants suffer from drought is a matter of common knowledge, but it is not so generally known that the injury to the plant or crop is not so much due to it having been deprived of a sufficiency of water for a certain period as to the food supply having been greatly reduced for some time after the restoration of the soil to a moist condition. Hence

MR. W. H. DIVERS.

it is imperative that strenuous endeavour should be made to conserve the moisture in the soil. In making this endeavour the first step will be to dig or trench deeply, and well break up the whole of the soil when the ground is undergoing its needful preparation, and the second to use the hoe freely during the spring and summer months. The observant cultivator is so fully acquainted with the beneficial results of the free use of the hoe in dry weather that we need not refer to this point at any length. Were it necessary we could give figures of the most striking character in support of our views, but with reference to this point it will suffice to say that the best results are obtained by hoeing to a depth between two and four inches.

Mr. W. H. Divers, whose portrait we have the pleasure of giving in this issue, has for so long a period occupied a prominent position among the leading practical horticulturists of his day, that there are but few who take an interest in gardening to whom he is not more or less well known. Mr. Divers is not only well known, but is held in the highest respect, for he has shown that he not only possesses cultural skill and administrative ability of a very high order, but is keenly alive to all that concerns the welfare of gardeners, and ever ready to support the movements which have for their object the advancement of the craft or the support of those members who have in their old age fallen on evil days. When for many years in charge of the gardens of Ketton Hall, Mr. W. H. Divers made for himself a high reputation as one of the leading authorities on, and cultivators of, hardy and other fruits. We remember with pleasure the many fine collections he has presented to public notice at the exhibitions of the Royal Horticultural Society and elsewhere. Some fourteen years ago Mr. Divers was, on the death of Mr. William Ingram, appointed head gardener at Belvoir Castle, the seat of the Duke of Rutland. These gardens had become famous for their wondrous displays of hardy spring flowers; and while maintaining his interests in fruits and fruit culture, he entered fully into the spirit of the Belvoir gardens, and succeeded in enhancing their deservedly high reputation. To have maintained their traditions would have been an accomplishment of which any man might well have been proud; but to have surpassed them brings into strong relief the ability to which reference is made at the commencement of this brief note. From the first Mr. Divers has shown a warm sympathy with the objects and work of the British Gardeners' Association. He has served on the Executive Council, and has occupied the position of its chairman, and in both he has rendered valuable service. As chairman he contributed in no small degree to the success of the association, for his occupancy of that position was a proof that the business would be conducted on lines wholly free from the objectionable features of trade unionism, and that the endeavour to improve the position of gardeners would be made in a manner free from anything to which the employers of gardeners could well take exception.

Royal Society's Medals.—Two of the Royal Society's medals have been awarded by the President and Council to naturalists. The Copley medal to Dr. Alfred Russell Wallace, on the ground of the great value of his numerous contributions to natural history and the part taken by him in working out the theory of the Origin of Species by Natural Selection. The Darwin medal to Professor August Weisman in recognition of his eminent services in support of the Doctrine of Evolution by means of Natural Selection.

Horticultural Club.—The next house dinner of the club will take place on Tuesday, November 10, 1908, at 6 p.m., at the Hotel Windsor, when Mr. C. D. McKay will talk about "French Gardening."

Weather in October.—We need hardly tell our readers that the temperature of last month was considerably above the average for October, but it may be of interest to mention that the mean temperature for the month was higher than in any previous October during the past thirty-seven years. The mean maximum temperature registered in London for the month was 62.6 degrees, or 5.8 degrees above the average, and the mean minimum temperature 48.9 degrees, or 6.0 degrees above the average. There were twenty-two days in which the maximum temperature was above 60 degrees, and only one in which the maximum temperature was below 50 degrees. The average maximum temperature during the first seven days of the month was 71.71 degrees; the lowest maximum day temperature was 47 degrees, and the lowest night temperature 35 degrees, this temperature being experienced on the nights of October 25 and 26. There have been four other mild Octobers during the past thirty-seven years, and these occurred in 1874, 1886, 1898, 1906. In the last-named year the mean maximum temperature was 61 degrees, and in 1898 it was 60.3 degrees, in 1886 60.6 degrees, and in 1874 60 degrees. There have been two exceptionally cold Octobers during the period mentioned, and these were in 1905 and 1887. In 1905 the mean maximum temperature was 53 degrees and in 1887 52.8 degrees, and the frosty nights were seven and eight respectively, as compared with one only in the five mild Octobers, which was recorded in 1874. The sunshine registered in London during last month was 98 hours, or 29 hours above the average, but the total was less than in 1903.

National Sweet Pea Society.—This society will hold its London show in 1909 at the Royal Horticultural Hall, Westminster, on July 23, and the Provincial show will be held at Saltaire, in conjunction with the Saltaire Horticultural and Rose Society, on July 13. The annual meeting of the society for 1908 will be held at the Hotel Windsor on December 11, at three o'clock. Arrangements have been made for holding trials of sweet peas in the gardens of the University College, Reading, in 1909, and it is proposed to make a charge of 2s. 6d. per variety sent for trial, and to receive varieties only from the raisers or original distributors. Any information respecting the forthcoming trials will be given gladly by the hon. secretary, Mr. Chas. H. Curtis, Adelaide Road, Brentford.

George Nicholson Memorial.—We gladly give publicity to the following communication from the Rev. W. Wilks: The Council of the Royal Horticultural Society have been requested to raise a fund for the establishment of a permanent memorial of the late Mr. George Nicholson, V.M.H., F.L.S. With this they most cordially agree. There are few, if any, men, to whom the present generation of gardeners owes a deeper obligation than to the author of "The Dictionary of Gardening," a work which "has done more towards the standardisation of plant names and developing an interest in horticulture than anything published since Loudon, 1829." Mr. Nicholson was for many years a most valued member of the Scientific Committee of our society. He also took a very active part and keen interest in the re-establishment of examinations by the society, and himself acted as one of the examiners. It is in view of this last point, and after carefully estimating the amount likely to be subscribed that the Council propose to establish a "Nicholson Prize," to be awarded annually after examination to the students at Wisley. Subscriptions should be sent addressed "The Nicholson Prize Fund, R.H.S. Office, Vincent Square, London," and cheques and postal orders made payable to "The Royal Horticultural Society," crossed London and County Bank.

Fungus Foray in Epping Forest.—On the 31st ult. the Essex Field Club made its annual excursion to Epping Forest for the study of the fungi growing therein. Fungi were less plentiful than in some previous seasons, and no species that are particularly rare were met with. In the evening a meeting was held at Morgan's Farm, Theydon Bois, and in the course of the proceedings Mr. George Massee, V.M.H., of Kew, made the collection the subject of an interesting demonstration. Mr. Massee referred to the importance of the study of mycology from an economic point of view. For coping with injurious fungi he advocated the employment of lecturers, who should make themselves acquainted with the needs of the places visited, so that they could tell their hearers what to look for and what steps to take. Much practical information might, he suggested, be conveyed by means of lantern demonstrations.

Orchid Nomenclature. — To those who may have an objection to what is being done on the initiation of the R.H.S. Orchid Committee, with a view to simplify the nomenclature of hybrid orchids by the inclusion of not more than two genera in any one compound name, we would commend sulphobenzylethylisobutylsilicyl, a name which the chemists have coined as descriptive of one of the compound substances with which they have to deal. This name is of interest as evidence of the possibilities in the coining of names and of rendering them unintelligible to all but a few who are especially well versed in technical terminology. We have not discovered this name as the result of diligent search in an abstruse scientific treatise, but had it brought under our notice by the agenda of the meeting of the Chemical Society on the evening of Thursday last (November 5), which included, among other subjects for discussion "The synthesis of di-sulphobenzylethylisobutylsilicyl oxide."

French National Chrysanthemum Society.—The 13th show and conference of this society was held at Tours on November 3, 4, and 5. The agenda comprised the following subjects: (1) Grafting Chrysanthemums. History and description of the Means Employed. (2) The publication of the society's Handbook for propagating a knowledge of chrysanthemum culture. (3) The Floral Committee; Its Aim, What it is, and What it Ought to be. (4) Trials of Manures for Outdoor Chrysanthemum Culture. (5) Insects and Diseases. (6) Best Means of Packing Plants and Cut Flowers. (7) Sports; How to Obtain and Fix Them. Other subjects supplementary to the above were on the subject of a pocket edition of the "Repertoiré des Couleurs," and on fertilisation. The first two days would be busy ones according to the programme, both at the show and at the conference. The third day was devoted to showing the members the sights of the town.

The Grange Orchids.—At the recent sale by Messrs. Protheroe and Morris of the collection of orchids formed by Mr. J. Bradshaw, The Grange, Southgate, the whole of the 840 lots were disposed of, the total sum realised being £5,078.

South - Eastern Agricultural College, Wye, Kent.—A meeting of the Governors of this college was held at Caxton House, Westminster, on Monday, under the chairmanship of the Right Hon. Lord Ashcombe. The Principal, Mr. M. J. R. Dunstan, reported an entry of 129 students for the session, of whom 124 were in residence, this being the largest number on record. A resolution was passed agreeing with the conclusions of the report of the Committee on Agricultural Education and Research. A special horticultural course has been instituted under the superintendence of a practical fruit grower and will commence next January. A fruit growers' conference will be held at the college on November 27, when insecticides, spraying, the packing and grading of fruit, etc., will be discussed.

Burnham Beeches.—There are about 2,000 pollard trees, chiefly beeches, at the famous Burnham Beeches, and many of these, after having been lopped for centuries, have now developed top growth out of proportion to the strength of the boles. The City of London Coal, Corn, and Finance Committee has to face the question of lightening this top growth, and also the serious and increasing attacks of Beech coccus. It is estimated that the removal of the limbs of trees will increase the annual expenditure by £150. At present a small income is derived from the sale of old limbs, and of beech-mast, but there does not appear to be any portion of the area of the Beeches that can be suitably set apart for the purpose of increasing the income. The number of timber trees is being increased; cricket-bat willow is being planted by the stream side, and the question of what is to take the place of the old beeches as they disappear, is to be discussed by the committee shortly.

Potato Experiments in Oxfordshire.—With a view to prove to the members of the East Oxfordshire Allotment Association the importance in the cultivation of potatoes of proceeding on scientific lines, one of the vice-presidents conducted during the current year a series of experiments in potato culture. The plot of ground selected for the experiments contained ten rods, and the soil was a heavy loam. The whole of the area received a dressing of dung manure, the quantity used being two tons. One-half the plot, in addition, received a dressing of artificials, consisting of 7lb. of sulphate of ammonia, 7lb. sulphate of potash, and 14lb. of superphosphate. The potatoes were planted on May [illegible], which appears to us rather late, and the varieties selected for the experiment were Duke of York, Duchess of Cornwall, and Epicure, and of the Duchess of Cornwall and Epicure, Scotch, Irish, Oxon, and Lincoln tubers were planted. Of the Duke of York the tubers were Scotch, Berks, Oxon, and Lincoln. The results of manuring were not sufficiently marked to necessitate reference being made to them. The yields from the several sets of tubers are as follows: Duke of York, Scotch seed, 248lb.; Berkshire seed, 127½lb.; Oxon seed, 144lb.; Lincoln seed 153lb. Epicure, Scotch, 147¾lb.; Irish, 143¼lb.; Oxon, 137½lb.; Lincoln, 146½lb. Duchess of Cornwall, Scotch, 167lb.; Irish 271lb.; Oxon, 250lb.; Lincoln, 272lb. In giving these figures it appears necessary to call attention to their somewhat inconclusive character.

CORDON APPLES.

Having recently seen some cordon apples carrying heavy crops of splendid fruit, I am prompted to make this mode of culture a subject of remark. No one, of course, who wants apples in large quantities, and has the convenience for growing large bushes or standards, would think of adopting the cordon for the purpose of securing them. This system, however, has, under some special, though comparatively limited circumstances, decided advantages. Amongst these there is the case of the amateur and cottage gardener, who may be desirous of growing many varieties in order to have a small, but lengthened supply of fruit from a small space, and of those also who plant with a view of reaping quick returns. In cases like these the advantages to be gained by growing cordon trees are considerable, though it must be admitted that trees with their growths restricted upon this principle, do not keep in a satisfactory state of health anything like the length of time that trees of larger proportions do.

The cordon tree adapts itself to various uses, such for example as that of clothing iron arches, placed over walks, iron trellises, fences, walls, or other similar erections that may be at command, and here it is grown upon the sides of an iron and galvanised netting structure that encloses bushes of other kinds of fruit. In any case cordons should be upon what is known as the English paradise stock, as on that stock the trees may be kept under satisfactory control with comparatively little trouble, and they commence to bear good crops of fruit while they are quite young, though even then, when planted as here upon heavy soil, attention may have to be given to root-lifting and root-pruning. If grafted or budded upon the crab stock, they may be expected to grow strong, and produce but few fruits, as is sometimes the case with bush trees unless they are skilfully managed, but no one is better acquainted with the raising of trees than are nurserymen, and that may be safely left in their hands.

For planting, trees of from 3ft. to 4ft. in height, with single stems, are the most useful for general purposes, and they may be either trained upright or in an oblique direction. Pruning is an important point in the management of apple trees in whatever form they may be grown, but cordons, owing to the restrictions to which their growth is subjected, require perhaps more pains taken with them than any other form of tree. It is well known, however, that cultivators differ in their practice of pruning, and yet each may be successful in procuring satisfactory crops. This can, in a measure, be accounted for from the varied effect that soils of extreme natures, say, light and heavy, have upon trees.

Until trees have filled their allotted space a leading growth must be laid in annually, and this should be stopped when it has reached eight or nine inches in length. A secondary growth from this should be allowed to extend, to be cut away late in the autumn. By this treatment even varieties that are unsuitable for cordons will be adequately furnished with spurs. Side growth should be shortened to about the sixth leaf at midsummer, and their secondary growths be stopped at two or three leaves, the original growths being pruned back to two or three leaves late in the autumn.

Some varieties, owing to their freedom of making spurs, such, for example, as Ribston Pippin, Cox's Orange Pippin, Sturmer Pippin, King of the Pippins, Claygate Pearmain, Frogmore Prolific, Dumelow's Seedling, Annie Elizabeth, Lane's Prince Albert, and Seaton House, are much better suited for this mode of culture than are stronger-growing kinds, of which Tyler's Kernel, Mère de Menage, Emperor Alexander, Peasgood's Nonsuch, Bramley's Seedling, and Striped Beaufin are types.

T. Coomber.

The Hendre Gardens.

PERGOLAS VERSUS HEDGES FOR ROSES.

The fashion for pergolas in gardens has become very pronounced. These structures have, owing to their effectiveness, increased very much during the last ten years, and as a distinct feature of the garden they have much to recommend them.

I am especially partial to pergolas, but, as the result of observation, I have come to the conclusion that they are not so suitable for roses as for other forms of support. Pergolas should be an attraction during the autumn, winter, and early spring months, as well as during the summer, when covered with blossoming roses in proportion, of course, to the difference in the seasons.

To effectively clothe pergolas in view of assuring their attractiveness during the periods named, I would cover them with honeysuckles and early-flowering clematis, such as C. montana, jasmines, clematis, wistarias, Pyrus japonica, Polygonum Baldschuanicum, and so on for summer. For an autumn and winter display I would employ vines, Clematis flammula, Bignonia radicans, ivies, etc.

My objection to the use of roses for pergolas is that when fully established on this structure the best of the rose blossoms are on the top of the pergola, and much difficulty is experienced in obtaining a full view of them from the ground. Therefore, the finest portion of the floral display is lost. This opinion, gained from experience of some years, has of late been strengthened by a request from the owner of a very fine rose-covered pergola to suggest a stairway with a platform on the top from which his friends and himself can enjoy the full beauty of the roses both on the top and at the sides.

My alternative suggestion for enjoying the full display produced by climbing roses is to form hedges in suitable sites and in such a way that they can be seen from all sides. A fence composed of larch poles, with the spurs left on, say, eight or twelve inches long, will provide capital support for the roses, and have a rustic appearance until covered. In this way the full beauty of the roses can be seen, and it is a convenient manner of attending to the plants themselves. The hedge should not be less than 12ft. high, a foot or two more would give a bolder effect, and provide increased variety in the garden at the same time.

Structures can be made also with stout wire, either stretched horizontally or upright. Stout oak poles or branches can be rustically built, or even light brick pillars can be arranged; in fact, the suggestion affords abundant scope for arrangement.

S. P.

RENOVATING VINES.

Vines which have for many years produced heavy crops of luscious grapes, and which now show signs of waning vigour, may usually be greatly improved and brought into a very satisfactory condition by having their roots lifted entirely and replanted in a sweet and suitable compost. Heavy top-dressing annually with good turf, bone-meal, wood ashes, etc., assists the formation of healthy roots near to the surface, and this, together with good nourishment at intervals, in a liquid state, keeps the vines in a satisfactory state for several years. But when these repeated top-dressings fail, then something more must be done, and if it is not desirable to destroy the old vines and plant healthy young canes, root lifting is the only remedy to adopt.

It is remarkable what may be done with the roots of aged vines, and how quickly they recover if the work is done at the right time. Some years ago I lifted a houseful of Muscats early in October, took up the roots entirely and fully renewed the border, and with excellent results. I have on several occasions renovated vines and brought them into a very satisfactory state of bearing by the same method. My modus operandi is probably quite in common with that of many other growers, but to the inexperienced, whose vines have been gradually declining, and whose crops are very unsatisfactory, the method may prove interesting.

In the first place soil sufficient to meet the requirements should be prepared in readiness. This should consist of sweet fibrous loam, taken, if possible, from a grass field which has been grazed by cattle or deer. Good turves six inches thick, or a little more if the soil is good in quality, should be carted to the nearest place to where it is required, and should be chopped up; of course, if enough soil has been already carted and stacked for a twelvemonth, so much the better. To every ten cartloads of this soil there should be added one load of wood ashes (including some charcoal), two of old plaster and lime rubbish, one of decayed manure, 3cwt. of crushed bones, one of bone-meal, and a moderate quantity of some approved artificial vine manure. If these are well mixed a couple of times, good grapes will be produced by it.

Keep the soil dry; then open out a trench right along the front of the border and clear away all the old soil, preserving the roots as much as possible as the work proceeds. Having removed all the old soil put the drainage right, and then commence to refill the border and relay the roots at various depths. All the damaged ends should be cut clean, and along the bare thongs incisions should be made so that fresh roots may strike out into the new soil. Having remade and planted the border, give a good soaking of water in a tepid state to settle the soil. In the case of outside borders give a mulch with strawy manure, and shutters or tarpaulins ought to be used to keep the soil from becoming saturated in wet weather and also to keep the roots warm.

The vines should be syringed in fine weather twice a day, and the house kept close for at least a fortnight, when air, more or less, should be admitted until the usual course of ventilation is adopted. After the leaves have fallen from the vines they should be pruned, and a few fresh rods trained in the following season of growth to encourage plenty of fresh roots. If the vines are lightly cropped for the first year after disturbance the berries should be large and of good quality. I often think when seeing vines in a rather bad state how much better the crops might be if the roots were thoroughly examined and put into better soil, instead of being allowed to remain and gradually get worse year by year.

If it is intended to lift vines where the crop is still hanging, the bunches might be cut and bottled in the usual way, so that the work can be taken in hand at once. A month earlier is probably the best time to lift the vines, but when carefully done (especially if the roots are in an inside border) at any time during October and in the early part of November, good results will follow.

Black Hamburgh, Madresfield Court, and Foster's Seedling are capital grapes for early use; and for late crops I am very satisfied with Appley Towers, and believe, when better known, more of this variety will be grown. I have it growing worked on the Black Hamburgh and on its own roots, and in both cases it crops very well and the berries are of good size and colour, but with us it does not keep so long as Lady Downes.

H. Markham.

Wrotham Park Gardens.

THE BAMBOO GARDEN.

As the value of the bamboos have been fully demonstrated, and are now regarded as fitting subjects for the embellishment of English gardens, a few notes concerning them may be of service both to garden makers and garden lovers.

The fact that in many ways we have introduced several aspects of Japanese gardening into our own gardens, should not preclude us from again copying them in the extensive use of bamboos, etc., for the garden beautiful. It is worthy of note that some forty species are hardy in this country, and forthwith the old idea that bamboos are but half-hardy must give way in the light of the experience of recent years.

They will withstand severe frost, but the great obstacles to success are the fierce, cutting winds which blow from north and east. Therefore the ideal position is one that is sheltered, and where consequently the bamboos can make free, healthy growth without being buffeted by cold winds.

Any good loamy soil to which some well-rotted manure has been added will suit the bamboos. They must have a good root-run, where they can gain the necessary strength to establish themselves, and once this is done they grow vigorously and present a charming appearance.

The uses of the bamboo are many. The natural grace and elegance which characterise them lend their aid in making a charming feature in gardens. Take, for instance, the scenic beauty which is evolved by the planting of bamboos by the waterside. The moist banks of streams and the margins of lakes may be turned into beauty spots by a judicious use of the different species.

For forming a screen to a sheltered lawn, and for covering the sloping, grassy banks, for grouping in the woodland and wild garden they are indispensable. Again, what lovely lawn groups one can form with them; indeed there are few spots in the sheltered garden where these useful subjects would not create a charming effect. The main points in the formation of a successful bamboo garden are to secure a suitable site, to make a good selection, and to arrange and plant the same in an artistic manner. Every garden or park has its own distinctive features, consequently no hard and fast rules can be laid down for the promulgation of a definite plan. Each newly-modelled garden of bamboos should be based upon the idea of harmonising the garden with the surrounding landscape. My favourite idea of bamboo scenery is in conjunction with water effects.

A running stream, which could be margined with Japanese irises, primulas, and other dainty waterside plants, widening at intervals for the formation of lily pools in which could be grown a series of the most beautiful nymphæas and other aquatics, will provide a pretty starting point for the formation of an exquisite bit of bamboo scenery.

Allowance should also be made for the necessary pathway to intersect the garden. We have seen grass paths utilised for this purpose, but as the bamboo garden is a source of interest at all seasons it is as well to make a gravel pathway in order that one might go dry-shod at all seasons. It will be well to construct a rustic bridge over the water and train a few rambling roses, clematis, or wistarias over it; and to provide a quaint tea-house of Japanese design in a quiet nook, and, if possible, a bit of rugged rock-work with small waterfall.

The planting of the bamboos in the most effective sites is a matter of primary importance. It is the "finis" of the dainty scene, and if carried out artistically will prove a source of delight for many years. The tall-growing species of arundinarias, bambusas, phyllostachys, etc., will naturally demand positions in which they can by their taller proportions dominate, and form a fitting background to either side of the garden, while the dwarfer forms, among which are some very dainty subjects, could come down to the very margin of the water itself. Dwarf species could also be used in filling up vacant spaces among the tall forms, while some of the very dwarf species could be utilised as carpeters in open spaces.

With reference to the tall bamboos some very good forms are to be found in each section. Such arundinarias as anceps, aristata, Falconeri, Hindsii, japonica, Hookeriana, macrosperma, nitida, nobilis, Nobilis, are of much value, as also are Bambusas Alphonse Karr, palmata and verticillata, Phyllostachys aurea, Boryana, Castillonis, flexuosa, Henonis, nigra, Quillioi, and viridiglaucescens can also be strongly recommended.

Of the dwarfer forms we may note Arundinarias auricoma, Fortunei, humilis, senanensis, etc.; Bambusas angustifolia, disticha, marmorea, pumila, pygmæa, and tessellata, while the dwarf phyllostachys furnish the pretty ruscifolia.

P. S.

Camellias. — These are at all times handsome, whether in flower or in leaf only, and there are no better subjects for the conservatory or greenhouse. They succeed in the smoky atmosphere of large towns better than anything else of the kind, flowering freely under the most unlikely conditions, and they suffer less from lack of light and sun than most other plants. Just now the flower buds are swelling up preparatory to expanding, and during this stage the soil must be kept in an evenly moist condition. Where the pots are filled with healthy roots they should have a dose of weak soot water or even a little guano or the like dissolved in the latter occasionally. Keep the glossy leaves free from dust and insects by means of sponging with tepid water, and on bright days spray the plants gently overhead with a fine-rosed syringe, especially where the atmosphere of the house is naturally dry. These plants must not be forced in any way at this season, or the result will be loss of buds.—T. B. Field.

NEW PLANTS, ETC.

◆

VANDA CÆRULEA CHARLESWORTHI.

This is a wonderful new orchid that resembles the well-known Vanda cærulea in everything but colour. Instead of beautiful blue colouring we have in V. c. Charlesworthi the purest whiteness. The flowers have not the least bit of colouring, so that this variety is one of the purest and most remarkable of albino orchids. F.C.C., R.H.S., October 27. Messrs. Charlesworth and Co., Haywards Heath.

BRASSO-CATTLEYA MADAME HYE SUPERBA.

A very beautiful form of the white, lilac-tinted hybrid from B. Digbyana and Cattleya Harrisoniæ. It is probably of better form than the type. A.M., R.H.S., October 27. Mr. H. Alexander, orchid grower to Lieut.-Colonel Holford, Westonbirt, Tetbury, Gloucester.

BRASSO-CATTLEYA QUEEN ALEXANDRA GLENTHORNE VAR.

This very fine orchid differs little from the type; the white flowers are very large, and the fringed lip is especially attractive. A.M., R.H.S., October 27. Mr. Gurney Wilson, Glenthorne, Haywards Heath.

LÆLIO-CATTLEYA LUSTRE GIGANTEA.

A handsome orchid of dwarf habit, but producing large and substantial flowers. The sepals are whitish, and the broad, wavy petals are bright rose, with a little white showing through the colour. The elongated lip is very deep purple, with golden lines at the base and throat. A.M., R.H.S., October 27. Lieut.-Colonel G. L. Holford.

LÆLIO-CATTLEYA ORTRUDE SUPERBA.

This is one of the Lælia anceps crosses, the second parent being Cattleya Dowiana aurea. The present variety of this hybrid has creamy-white sepals and petals, shaded with rose, and large ruby-crimson lip lined with yellow. A.M., R.H.S., October 27. Lieut.-Colonel G. L. Holford.

DENDROBIUM CŒLOGYNE MAXIMA.

A large form of this very distinct, handsome, and rare dendrobium. The ground colouring is tawny-yellow, and over this are ample markings and shadings of red-purple. A.M., R.H.S., October 27. Messrs. Charlesworth and Co., Haywards Heath.

CHRYSANTHEMUMS.

Master David.—A very fine, large Japanese variety, with broad, rich crimson florets that have an old gold reverse. A splendid novelty. F.C.C., N.C.S., October 26; A.M., R.H.S., October 27. Mr. H. Perkins, Greenlands Gardens, Henley-on-Thames.

Sir Frank Crisp.—A bold Japanese variety of rich chestnut-red colouring. The florets are rather narrow, but they make up a fine bloom. F.C.C., N.C.S., October 26; A.M., R.H.S., October 27. Mr. H. Perkins.

H. W. Thorp.—This fine incurved chrysanthemum is sure of a welcome. It is of good type, large, and creamy-white in colour. A seedling from Buttercup. F.C.C., N.C.S., October 26; A.M., R.H.S., October 27. Mr. H. W. Thorp, Dunnington, Worthing.

Mrs. R. H. B. Marsham.—This large, high-built Japanese chrysanthemum is a fine addition. The colour is creamy-white, and the narrow florets are long and slightly curled. F.C.C., N.C.S., October 26; A.M., R.H.S., October 27. Mr. D. Fairweather, gardener to R. H. B. Marsham, Esq., Bifrons, Canterbury.

Exquisite.—An effective Japanese variety with long, drooping florets; bright chestnut-red, with golden reverse. F.C.C., N.C.S., October 26. Mr. G. Mileham, Emlyn House Gardens, Leatherhead.

J. Lock.—A deep and broad Japanese chrysanthemum, with long reflexing florets. It is bright yellow lightly splashed with red. F.C.C., N.C.S., October 26. Mr. G. Mileham.

Rose Pockett. A large Japanese variety with broad petals of a soft buff-yellow shade. A distinct and effective variety. F.C.C., N.C.S., October 26. Messrs. W. Wells and Co., Merstham.

Lady Crisp.—A beautiful reflexed Japanese chrysanthemum, with long drooping florets of a rich golden-yellow hue, with paler reverse. F.C.C., N.C.S., October 26. Mr. H. Perkins.

Lady Edward Letchworth.—A soft lemon-yellow Japanese variety, of loosely incurving form, and with paler reverse colour. F.C.C., N.C.S., October 26. Mr. G. Mileham.

W. J. Davis.—A rosy-red Japanese variety with golden reverse. The long florets curl at the tips in a very pretty manner. F.C.C., N.C.S., October 26. Mr. G. Mileham.

GENISTA GLABRESCENS.

A dwarf-growing broom, bearing a profusion of bright yellow flowers. Bot. Mag., t. 8,201.

CŒLOGYNE PERAKENSIS.

A Malayan species, with greenish-yellow flowers, but of little value horticulturally. Bot. Mag., t. 8,203.

OLEARIA RAMULOSA COMMUNIS.

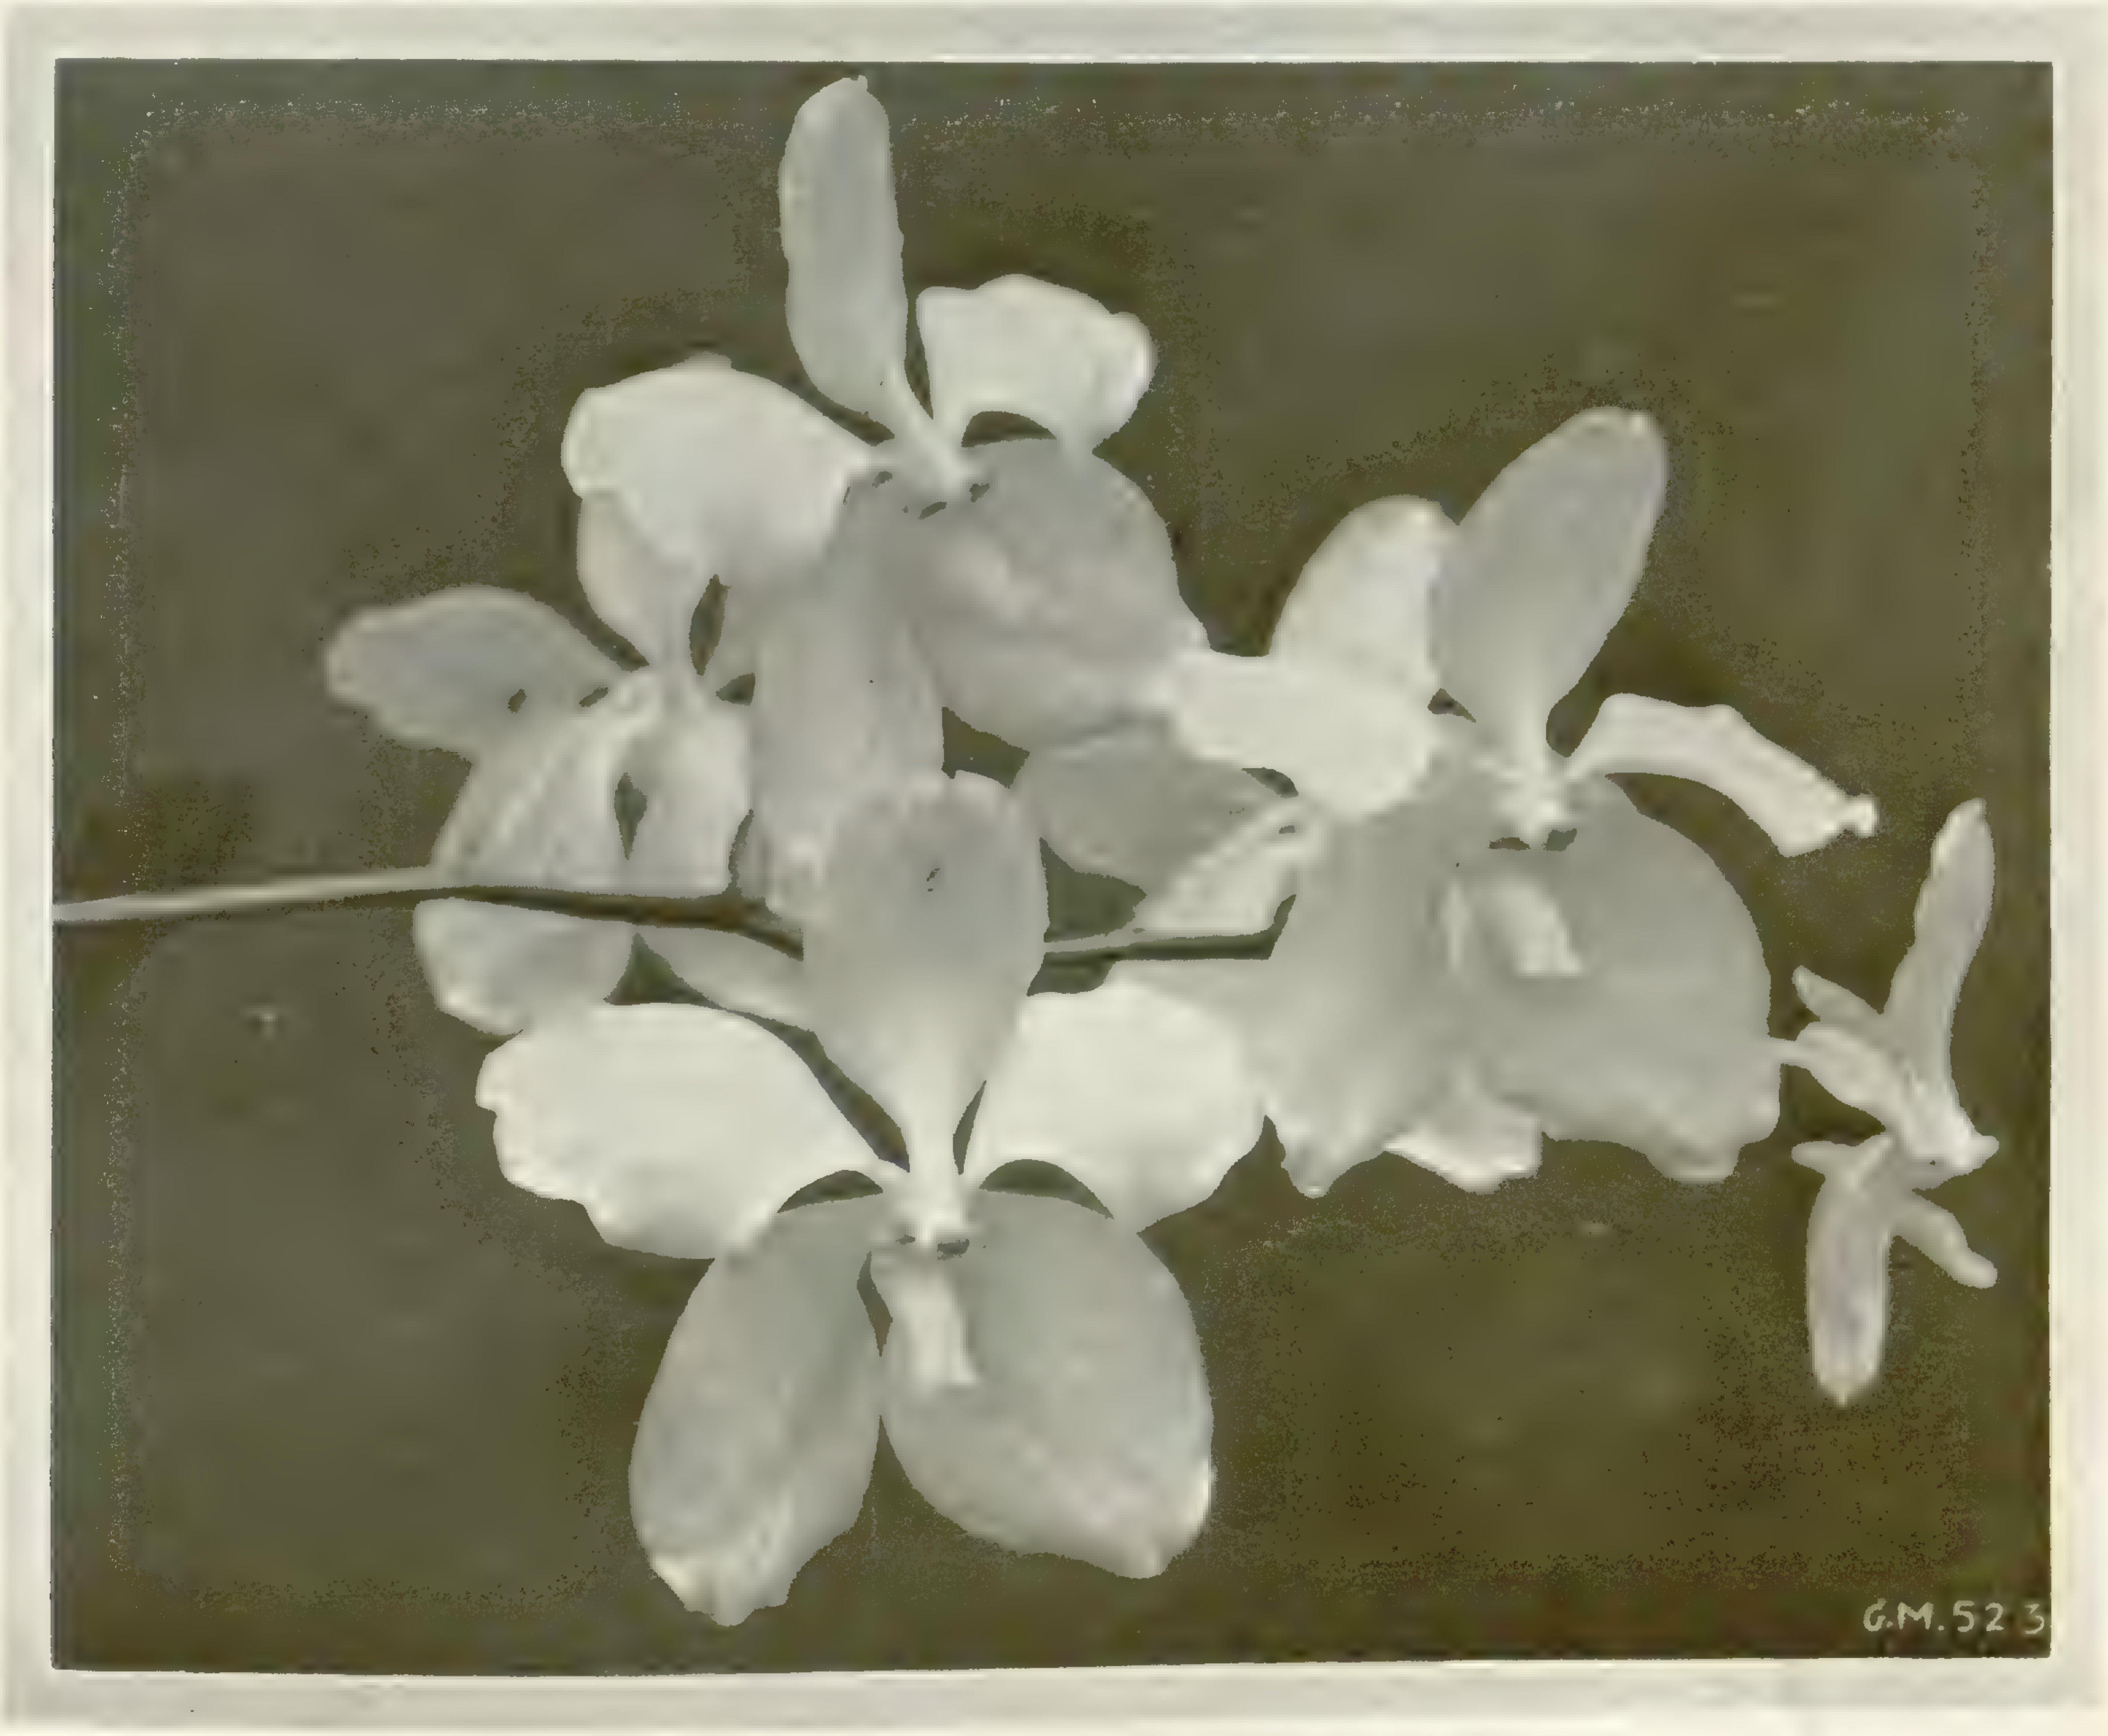
A graceful form, bearing white star-shaped flowers, and growing to a height of five or six feet. Bot. Mag., t. 8,205.

CHIRITA BARBATA.

An Indian species possessing considerable attractions, although not equal to some other chiritas in cultivation; flowers, pale blue. Bot. Mag., t. 8,200.

RHODODENDRON MARIESI.

An attractive species from Central China, bearing light pink flowers marked with purple spots on the upper segments. Bot. Mag., t. 8,206.

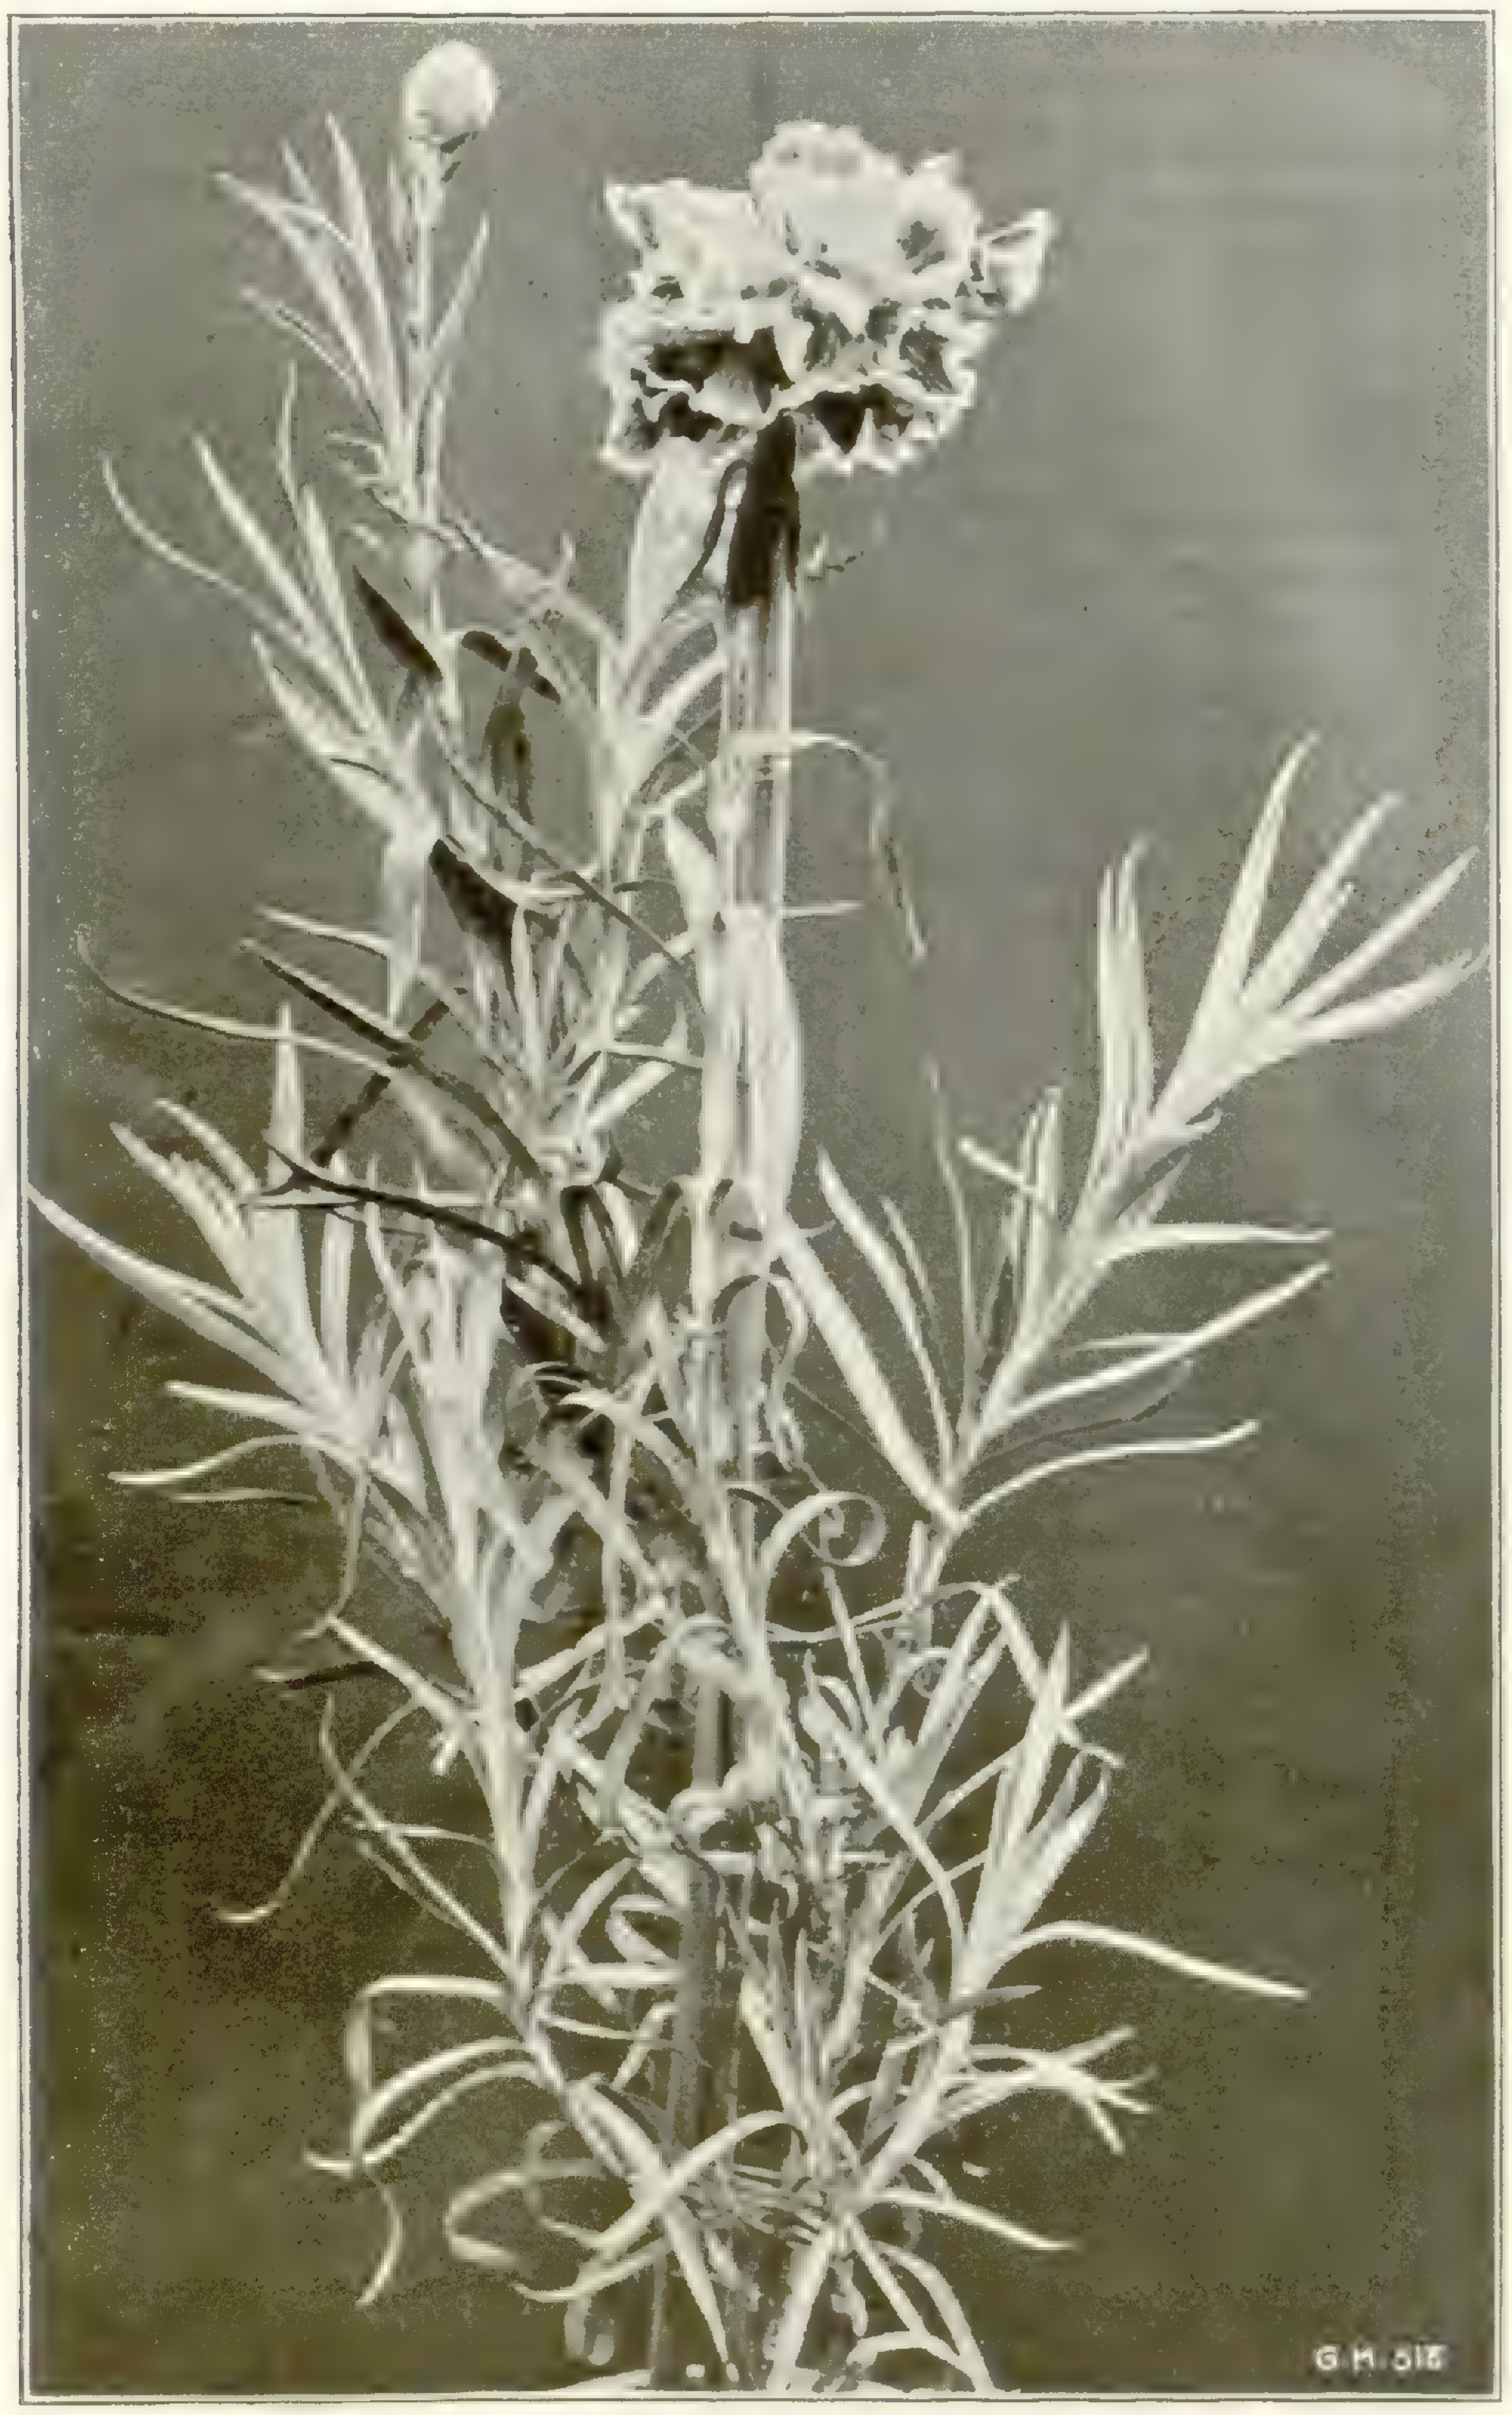


VANDA CÆRULEA CHARLESWORTHI.

F.C.C., R.H.S., Oct. 27. Messrs. Charlesworth and Co., Hayward's Heath. Flowers pure white.

GARDEN VARIETIES OF BOUVARDIAS.

At this season of the year the numerous varieties of bouvardia now in cultivation are particularly valuable for the embellishment of the greenhouse or conservatory, and also for cutting purposes. Of late, however, the demand for huge blossoms, such as the largest Malmaison carnations, for buttonholes, has led to bouvardias being less grown for this purpose than they formerly were. As pot plants, however, delightful little specimens, bristling with flowers, are brought into Covent Garden Market, and as an object-lesson on the possibilities of a pot only five inches in diameter, they are especially worthy of mention.



TREE CARNATION LADY AUDLEY NEELD.
Flowers large, colour bright scarlet-red, and pink.

Unfortunately, in the London district, bouvardias often suffer severely from the dense sulphur-laden fogs frequently experienced at this season, and whose area of destructiveness is continually enlarging. The more hairy the leaves the more quickly are they injured by fog. In looking through a collection of bouvardias one cannot fail to be struck with the fact that very few novelties occur amongst them, as they are nearly all old and well-tried kinds.

The long-time popular variety Hogarth was raised about fifty years ago by Mr. Parsons, a nurseryman, of Brighton. It has played a very important part in the production of new varieties, for about the year 1870 it produced in America two white-flowered sports, which were put into commerce under the names of Davisoni and Vreelandi. They were soon after sent across the Atlantic, and quickly became popular here. In the year 1880 a double-flowered variety of bouvardia was put into commerce by Messrs. Nanz and Neuner, of Kentucky, U.S.A. This, known as Alfred Neuner, originated as a sport from the before-mentioned Davisoni. It was in this country given a First Class Certificate by the Royal Horticultural Society in 1881, and from that time it rapidly became popular here. It still remains the best, or perhaps I should say, the only, double white that we have, and a pale pink form of it distributed a year later under the name of President Garfield is unsurpassed in its colour. Next we have another American variety Pride of Brooklyn, which has in some cases at least superseded the older Davisoni and Vreelandi. It is of good free growth, and the flowers, which are of the purest white, are borne in great profusion.

This by no means exhausts the varieties that have resulted directly or indirectly from the Brighton-raised Hogarth, for in 1885 it sported with Messrs. Jacob Makoy and Co., of Liège, into a double form, retaining the colour of the original Hogarth. Known as Hogarthi flore-plena, this is far and away the best of the double forms with red blossoms.

There yet remains another American variety whose origin I am unable to give, but which about twenty years ago created quite a furore by reason of the intense scarlet colour of the blossoms. This is President Cleveland, which is now largely grown and generally recognised as the best of that tint.

While most of the above have been sent here from the United States of America, the newer variety, King of Scarlets, had even a longer journey from the land of its birth, for it was raised in Sydney, New South Wales. It was given an Award of Merit on December 9, 1902. The flowers of King of the Scarlets are larger than those of most bouvardias, particularly in the width of the lobes, while the colour is a clear bright scarlet with the tubes almost white. It is perfectly distinct from President Cleveland, and flowers earlier than that does. W. T.

CARNATION LADY AUDLEY NEELD.

This new perpetual carnation, of Malmaison type, attracted a good deal of attention when it was exhibited by Messrs. Heath and Son, Cheltenham, at the Royal Horticultural Hall, Westminster, recently, because of the likeness of its flowers in form and colouring to the well-known Marmion. The new variety appears to differ from the older one, however, in its habit of growth and continuity of flowering, and these are differences that will appeal strongly to the grower who has not over much room to spare for carnations. The big blooms are pale pink and bright scarlet-red, a bold association of colours that is most effective.

A correspondent, who writes over the signature of "W. F. C.," sends us the following note:

"Having seen your report of the new carnation Hon. Lady Audley Neeld, in a recent issue, as shown by Messrs. Heath and Son, of Cheltenham, I should like to say that you are correct in your supposition, so far as my experience goes, in that, although similar to Marmion, it is a better grower. I have several plants of both, and find a marked difference in habit. I am told by Messrs. Heath and Son that they raised it by crossing the tree carnation Prosperity with a scarlet Malmaison, and that this was saved on account of its beautiful and unique colour, and it was not until later that they discovered it to be a true perpetual-flowering carnation in habit. My experience of it is that it flowers all the year round and branches all up the stem, whereas Marmion is very shy of branching, indeed, only throwing off shoots from the base after the stem has flowered; it is true that Marmion is perpetual in that it flowers practically at all times of the year, but it can hardly rank as a tree carnation. Lady Audley Neeld seems to me to mark an entirely new break in the race; Messrs. Heath and Son tell me they have raised several seedlings from it, some of which seem likely to be good things, especially a batch that has Enchantress as a parent."

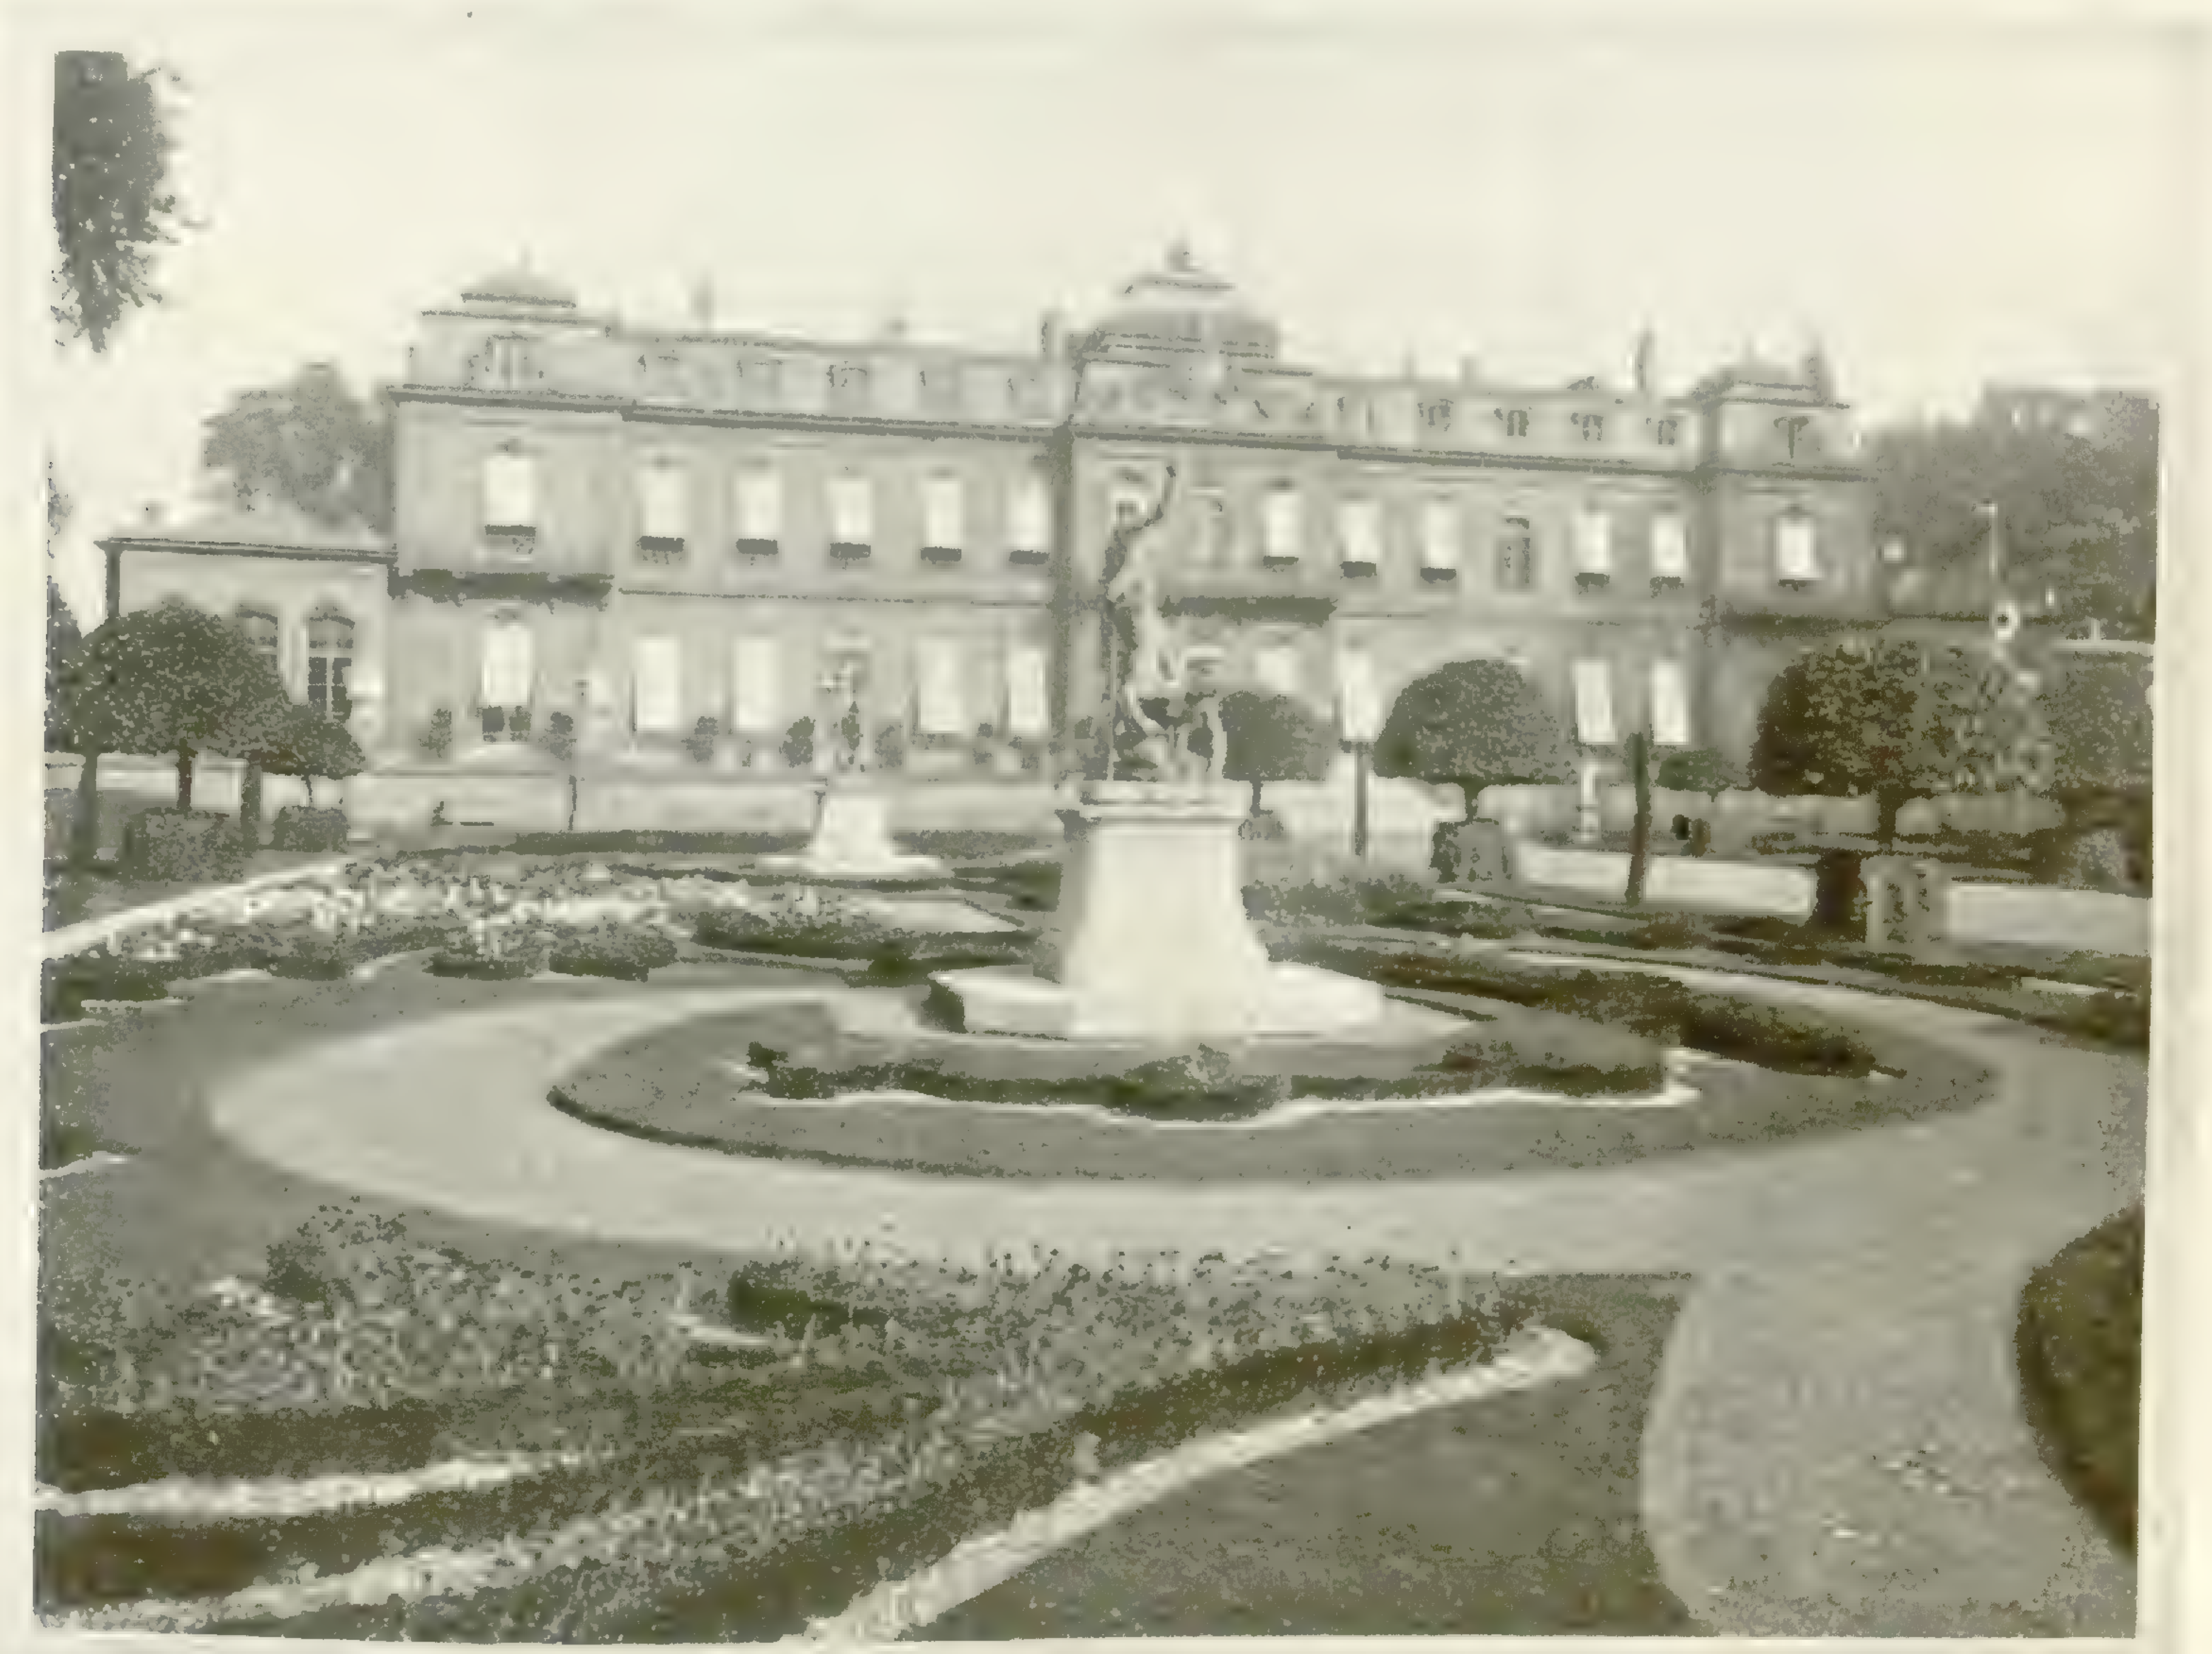
Medlars.—These ought to be gathered when perfectly dry. They are appreciated by some when they have been allowed to become quite soft. The fruits, apart from dessert, are used for jelly, cheese, and as a sauce for game. The trees will grow almost anywhere, but require artificial nourishment in some soils when bearing fruit.—H. Markham, Wrotham Park Gardens.

WREST PARK.

In the pleasant shire of Bedford, about four and a-half miles from quiet Ampthill, and the same distance from Flitwick Station on the Midland Railway, lies Wrest Park, the property of Lord Lucas, but for some time since the residence of His Excellency the Hon. Whitelaw Reid, the popular Ambassador from the United States of America.

The Mansion.

Wrest Park is to the eastward of Flitwick and a little to the south-east of Ampthill, and the stately mansion and ample gardens are set in a fine deer park. A broad, long, and straight double avenue of ancient elms and Spanish chestnuts, many of the former, alas, now showing too evident signs of great age, leads from the chief entrance to the north front of the mansion, and as one approaches the latter, passing the splendid walls that surround the gardens on this side, the fact is at once made evident that some one "builded finely."



[Photo: H. N. King.

WREST PARK; GARDEN FRONT OF THE MANSION.

The north front of the mansion is not nearly so fine as the garden front, and formerly there was nothing to relieve the immediate surroundings of the approach other than the grass and the big elms. But a considerable improvement has been effected since His Excellency came into residence, for now, on either side of the front entrance very large groups of ornamental flowering trees and shrubs, with a few that have beautiful foliage, have been planted. Choice rhododendrons and azaleas have been largely employed, together with a selection of the best double-flowering peaches and cherries, spiræas, berberis, and other suitable subjects. These two fine groups will be still finer in a year or two, when they have better filled out their alloted space, and when the golden elders and other quick growing plants have been removed to permit of tne full development of the permanent trees and shrubs.

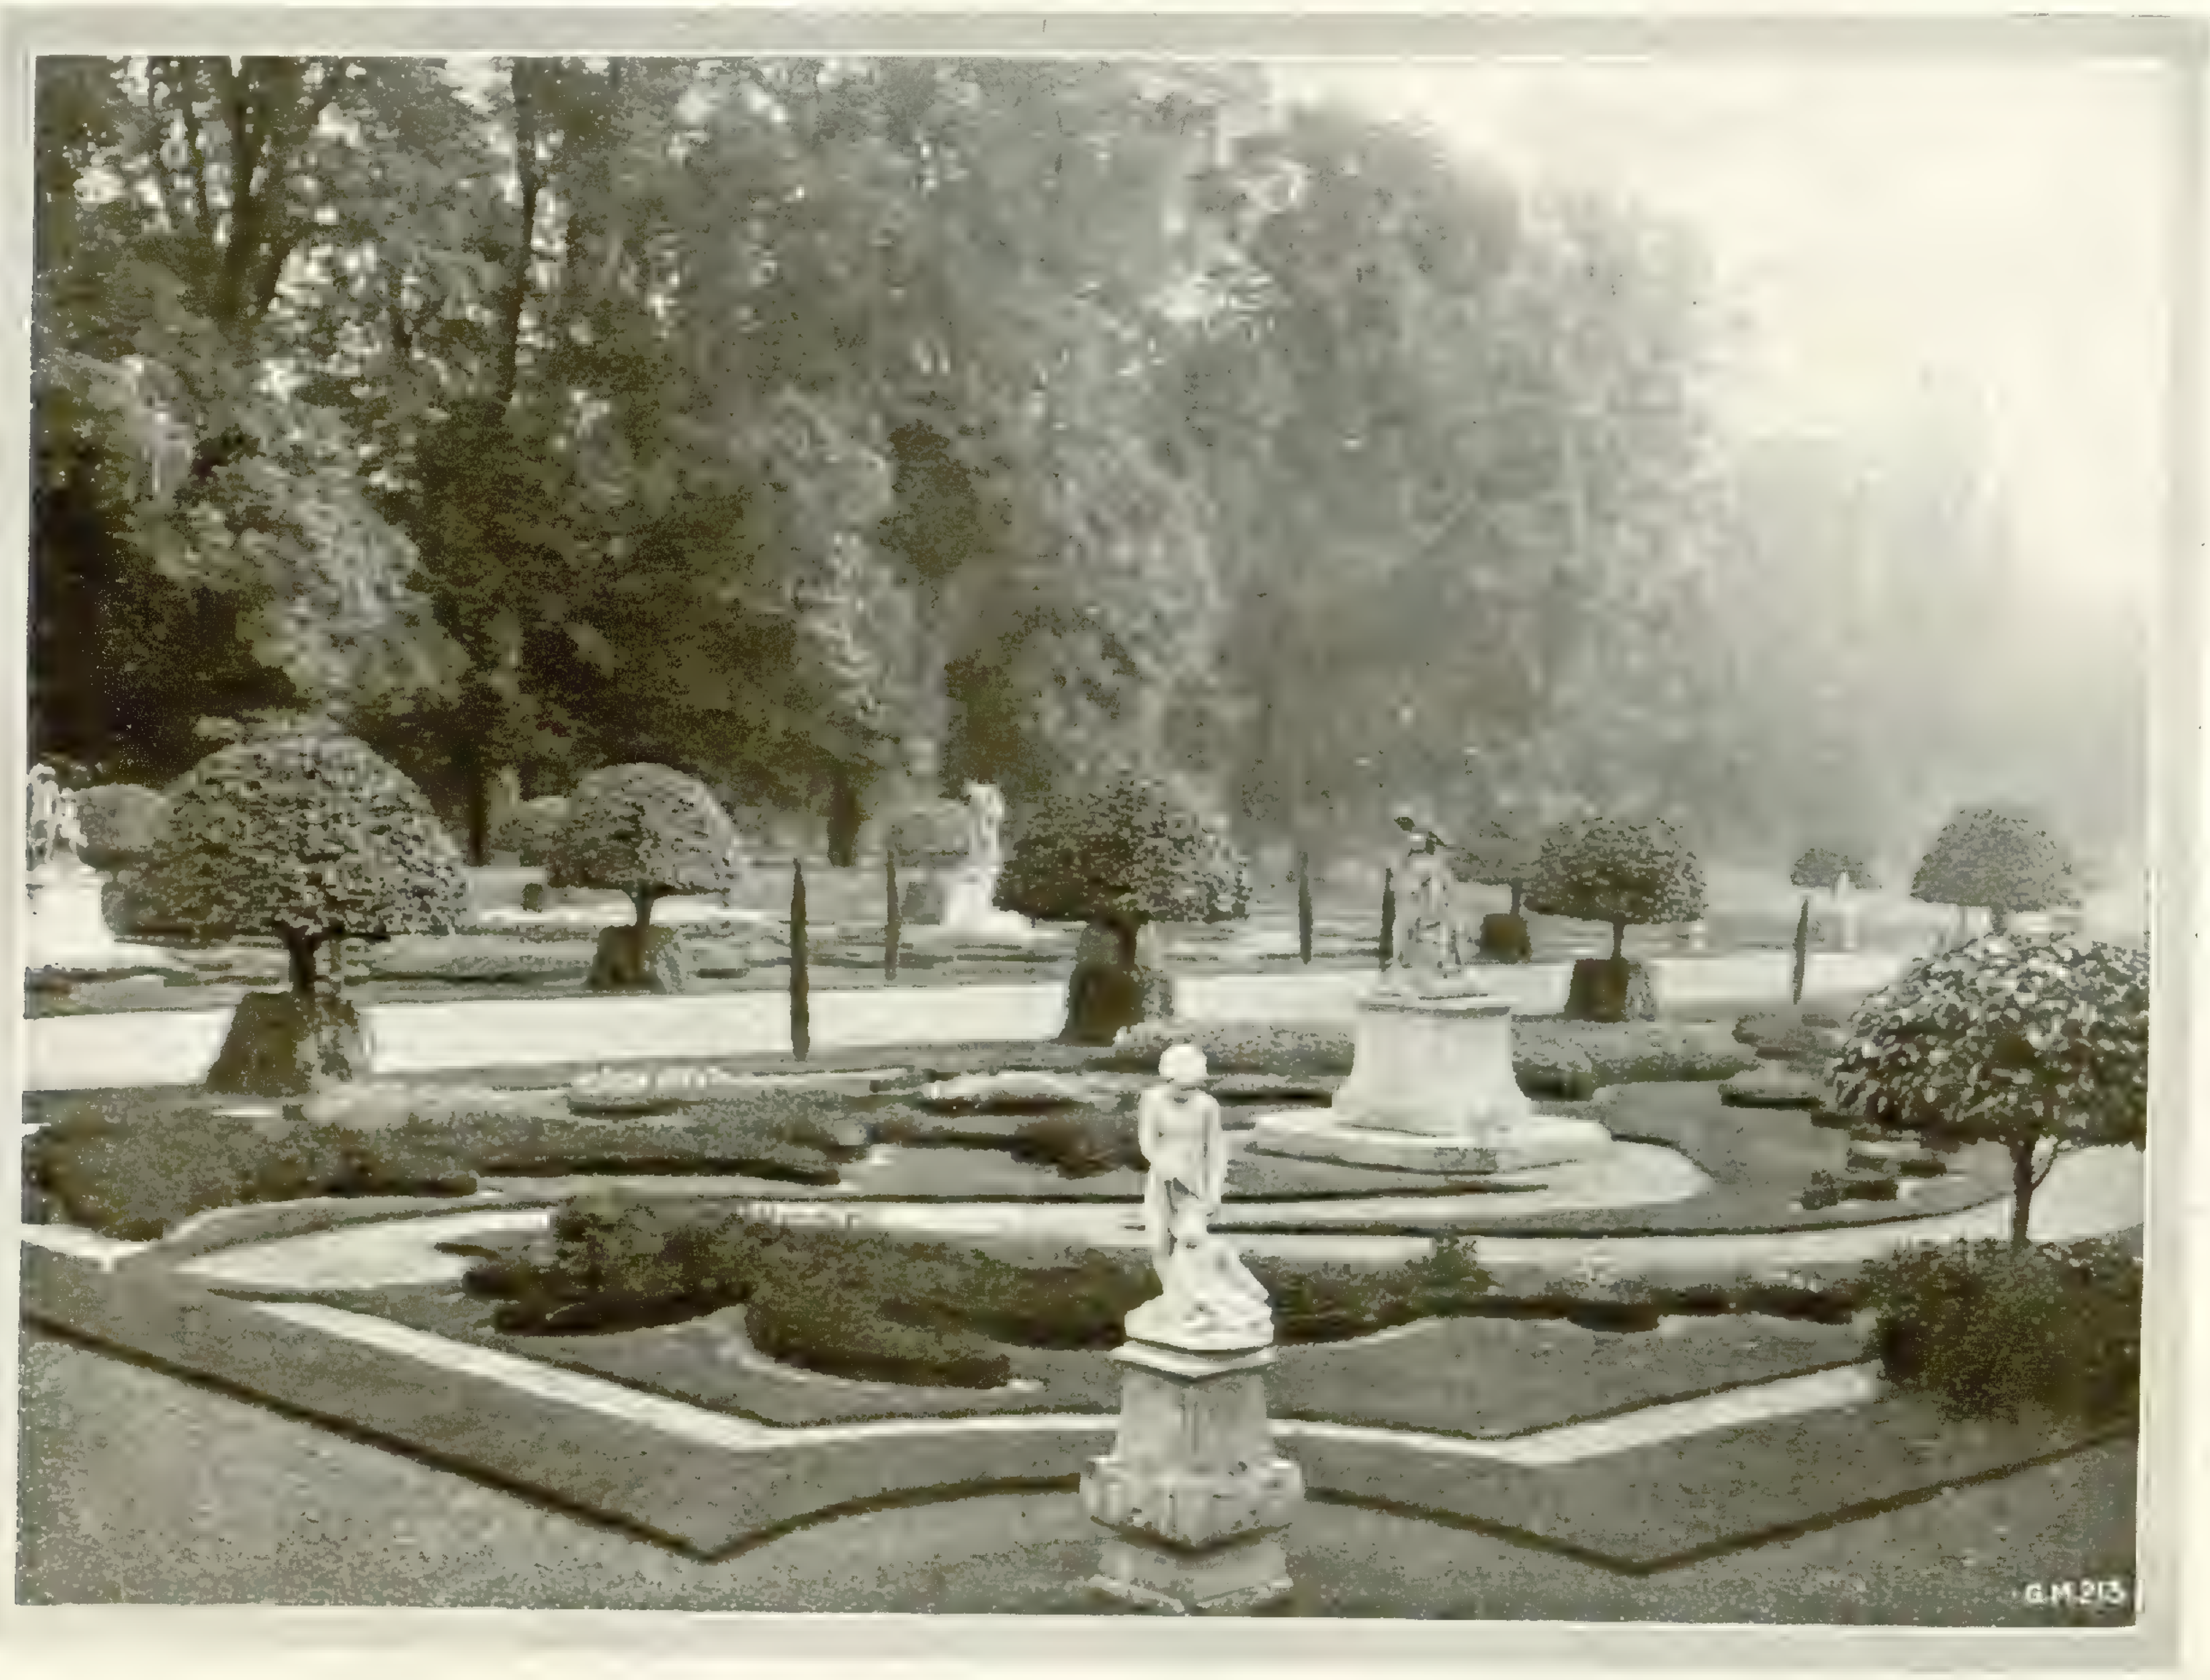
Although some parts of the gardens at Wrest Park, like many of the grand trees on the estate, are very old, the present mansion is less than a hundred years of age. There were at least two other houses previous to the present fine pile, which was built in 1836 by Earl de Grey, he being his own architect. On the garden side a paved terrace runs the whole length of the mansion. At one end, and quite a part of the building, is a large conservatory. This is kept well filled with foliage and flowering plants according to the season of the year, and as an Ambassador has necessarily to do a good deal of entertaining and everyone knows the Hon. Whitelaw Reid and Mrs. Reid have a splendid record for hospitality, Mr. Mackinlay, His Excellency's head gardener, finds his resources heavily drawn upon to keep mansion and conservatory amply supplied with plants and flowers. The conservatory is a splendid withdrawing room, but it is not an ideal plant house.

The Formal Garden.

Just below the terrace there is a large formal garden flanked on either side by large groups of huge old elms. If Nature avoids a straight line then art does not, and where there is ample space and consequently no need to design a garden so as to make it appear limitless, then straight lines are not out of place, indeed, they have a way of suggesting immense distance. From the terrace steps at Wrest Park there opens up a long straight vista. At one's feet the broad pathway divides the formal garden in half, passing for a long way between rows of fine standard Portugal laurels. Then comes a broad lawn, and beyond this is a straight piece of water with stately trees on either side, and at the end of the water is a very large and handsome pavilion, that, in the old days, ere motor-cars and express trains had brought London so near, was frequently used as a dining-room during the summer time.

Returning to the formal garden. This is in some measure a combination of Dutch, French, and Italian styles, but is, I believe, usually called the French Garden. Most of the beds are cut out in the grass, but the grass is intersected by narrow paths, and every bed is edged with clipped box. In some of the narrow spaces between the box-edging and the grass, clean spar is laid down, the remains of a very old style, now seldom seen. Zonal pelargoniums and French marigolds are the subjects most extensively used in these beds, and very large quantities are needed for this garden, for the smaller garden at the conservatory end of the house, and for the borders.

A moderate amount of statuary finds a place here, and as the garden is divided



[Photo: H. N. King.

FRENCH GARDEN AND PORTUGAL LAUREL AVENUE AT WREST PARK.

down the centre, it, naturally, has eight corners. Next the house these corners are marked by small, beautiful works in marble, representing Air, Water, Earth, and Fire—the four elements, while on the far side there are representations of the seasons—Spring, Summer, Autumn, and Winter. There are also large central groups bautifully modelled in leadwork and set on stone bases.

The Old Yew Hedge.

Yew hedges abound at Wrest Park, and so for that matter do laurel ones, the latter being very numerous and thick in what are known as the Bath Grounds. Here is the remains of an old Roman bath house, close to the rock fernery, and to the place where the water that supplies the streams and ponds rises. There is an abundance of water at Wrest Park, but unfortunately it is so heavily impregnated with lime and iron that it is not suitable for everything—orchids and the sphagnum moss used in their culture resent its use.

But in addition to the smaller yew hedges there are grand groups of splendid old yews that have been allowed to grow at will, and one piece of rising ground known as Oliver's Mount, is covered with big-trunked, ancient specimens still in splendid health.

The great yew hedge, however, is one of the features of Wrest Park, and deservedly so. It is supposed to be 350-380 years old, measures 26ft. through, and along its straight front is 121 yards long, while the end that curves round towards the Orangery is about another 60 yards long. It is one of the finest of yew hedges in the country, and one that has received the careful attention of many gardeners.

American Garden and Orangery.

Where the avenue of standard Portugal laurels ends, beyond the formal or French garden, a pathway runs crosswise, and along this are stood a number of very large standard orange trees, planted in stout slate tubs. This pathway leads to the Orangery, a very handsome building, wherein these giant oranges are wintered.

Across the lawns from this point is the American Garden, but the features usually associated with an American garden, i.e., azaleas, rhododendrons, andromedas, heaths, etc., are almost conspicuous by their absence. There are some rhododendrons, but Portugal laurels and yew are mostly in evidence. The whole is surrounded by dwarf closely-clipped yew hedges, and it provides a stretch of deep green foliage at a time when the surrounding limes, elms, and oaks are leafless.

Continuing the walk in this direction, passing the boat house, and through the yew-enclosed water-lily garden, one comes to a stream of water crossed by a high-pitched bridge. Here is a reproduction of the famous Willow-pattern picture so familiar on old plates and dishes. Here is the bridge, yonder the little temple, and here the willow tree and there the shell-like fountain basin. A little imagination quickly fills in the details and peoples the scene with an eloping couple and an irate father. Close by is a fine tulip tree, and in the park at this point are several large oaks.

Kitchen Garden and Glass-Houses.

Mr. Mackinlay's house occupies a commanding and corner position in the garden, and here, close under his eyes, are the vegetable and fruit quarters and the glass-houses. It is impossible for Mr. Mackinlay to reach any other part of the garden without passing through the kitchen garden, unless he turns out into the park and makes a long circuit. It is as though the designer of the garden had in mind that utility should stand before mere beauty, and remembered that a supply of fruits, flowers, and vegetables was a matter of the first importance.

The kitchen garden, itself sub-divided and surrounded by finely-built walls, is of considerable extent. The soil is good, and the crops of all kinds testify to the skill of the gardener. A small plot just cleared of onions afforded a little surprise. Mr. Mackinlay asked me what would be a good crop from such a space, and my reply was half a ton or a little over. Another friend had ventured the remark that half a ton would be the limit, and yet when the produce was harvested the crop of onions weighed just over 22cwt. Celery and Brussels sprouts are very fine just now, and even in mid-October Mr. Mackinlay is supplying good dishes of Autocrat peas, thus continuing a supply that has not failed since last May.

Salading is increasingly in demand in these days, and it is interesting to notice that Mr. Mackinlay follows a modification of the French system. He, like many other first-rate private gardeners, fully understands the value of cloches or bell-glasses; of sunny, sheltered borders, hand-lights, and frames. He has lettuces of various kinds and many sizes in every favourable position. He has also a fine crop of young Shorthorn carrots growing between rows of long-rooted turnips, the latter affording plenty of protection for the carrots, and also providing succulent roots from now onwards. These are, of course, on a very favourable site.

Strawberries do finely at Wrest Park, indeed, the Flitwick district is a fine one for strawberries and celery, a fact made evident to anyone passing through this part of the country, where market garden-

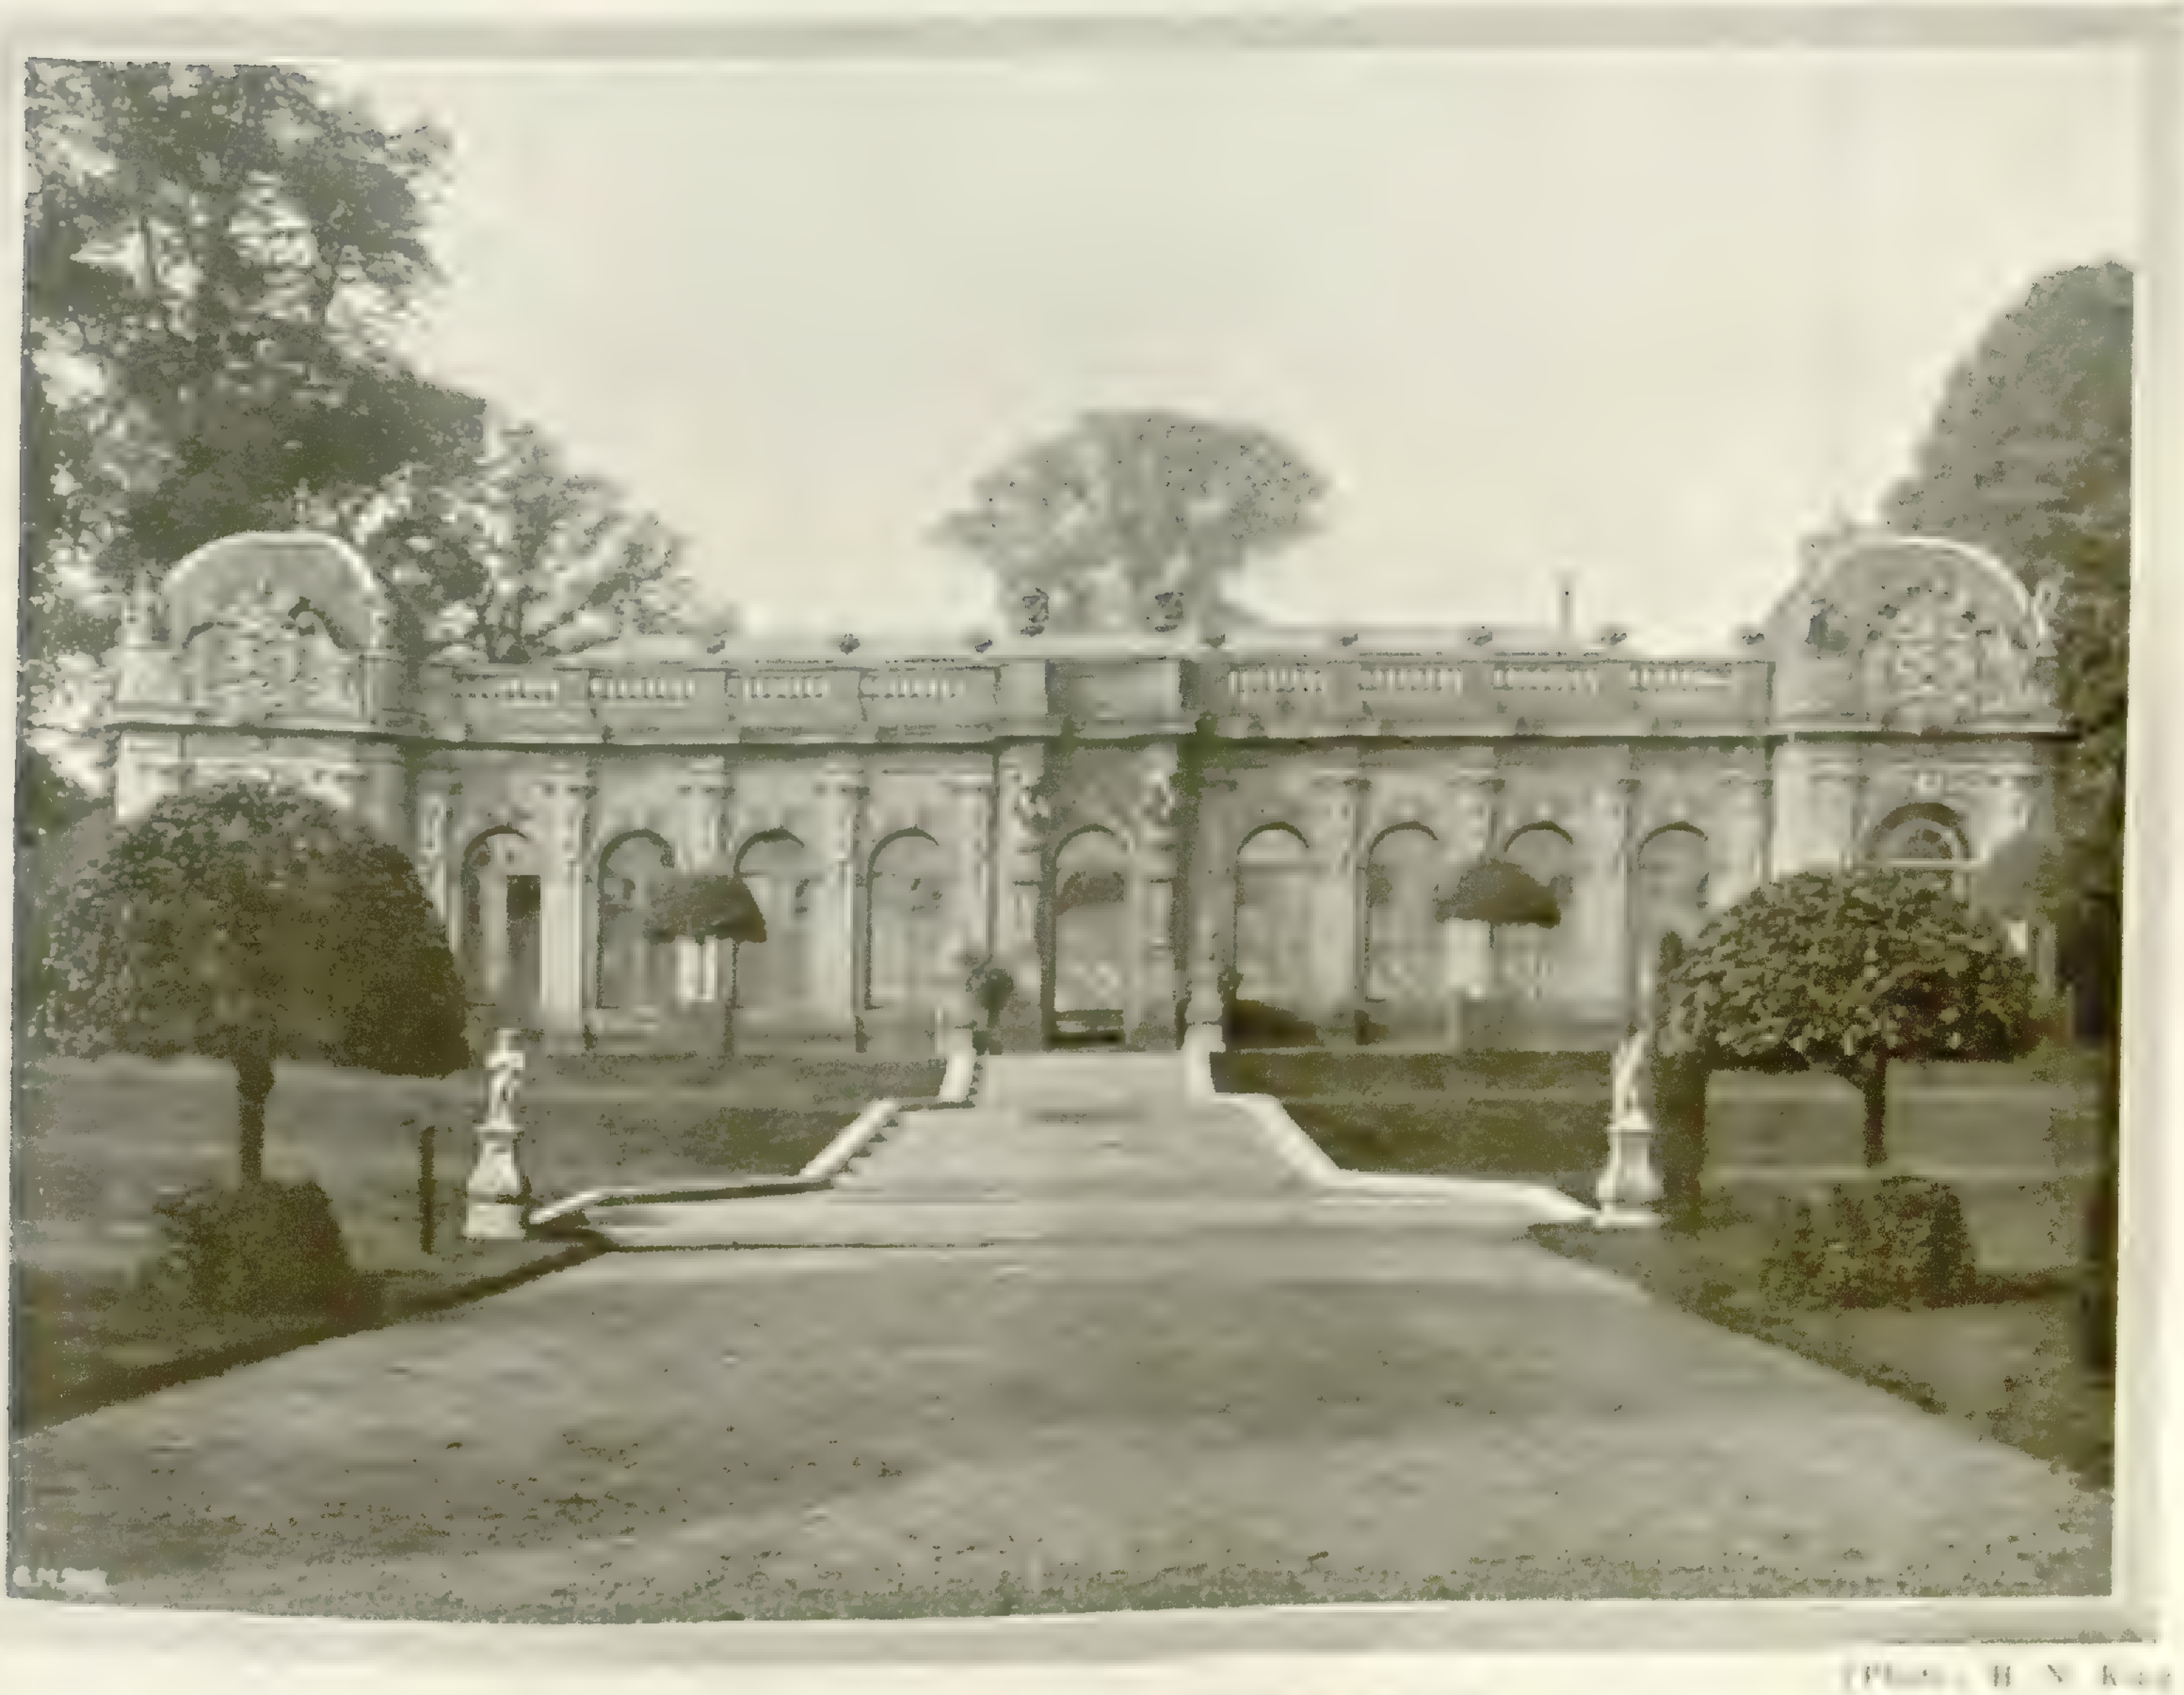
THE ANCIENT YEW HEDGE AT WREST PARK.

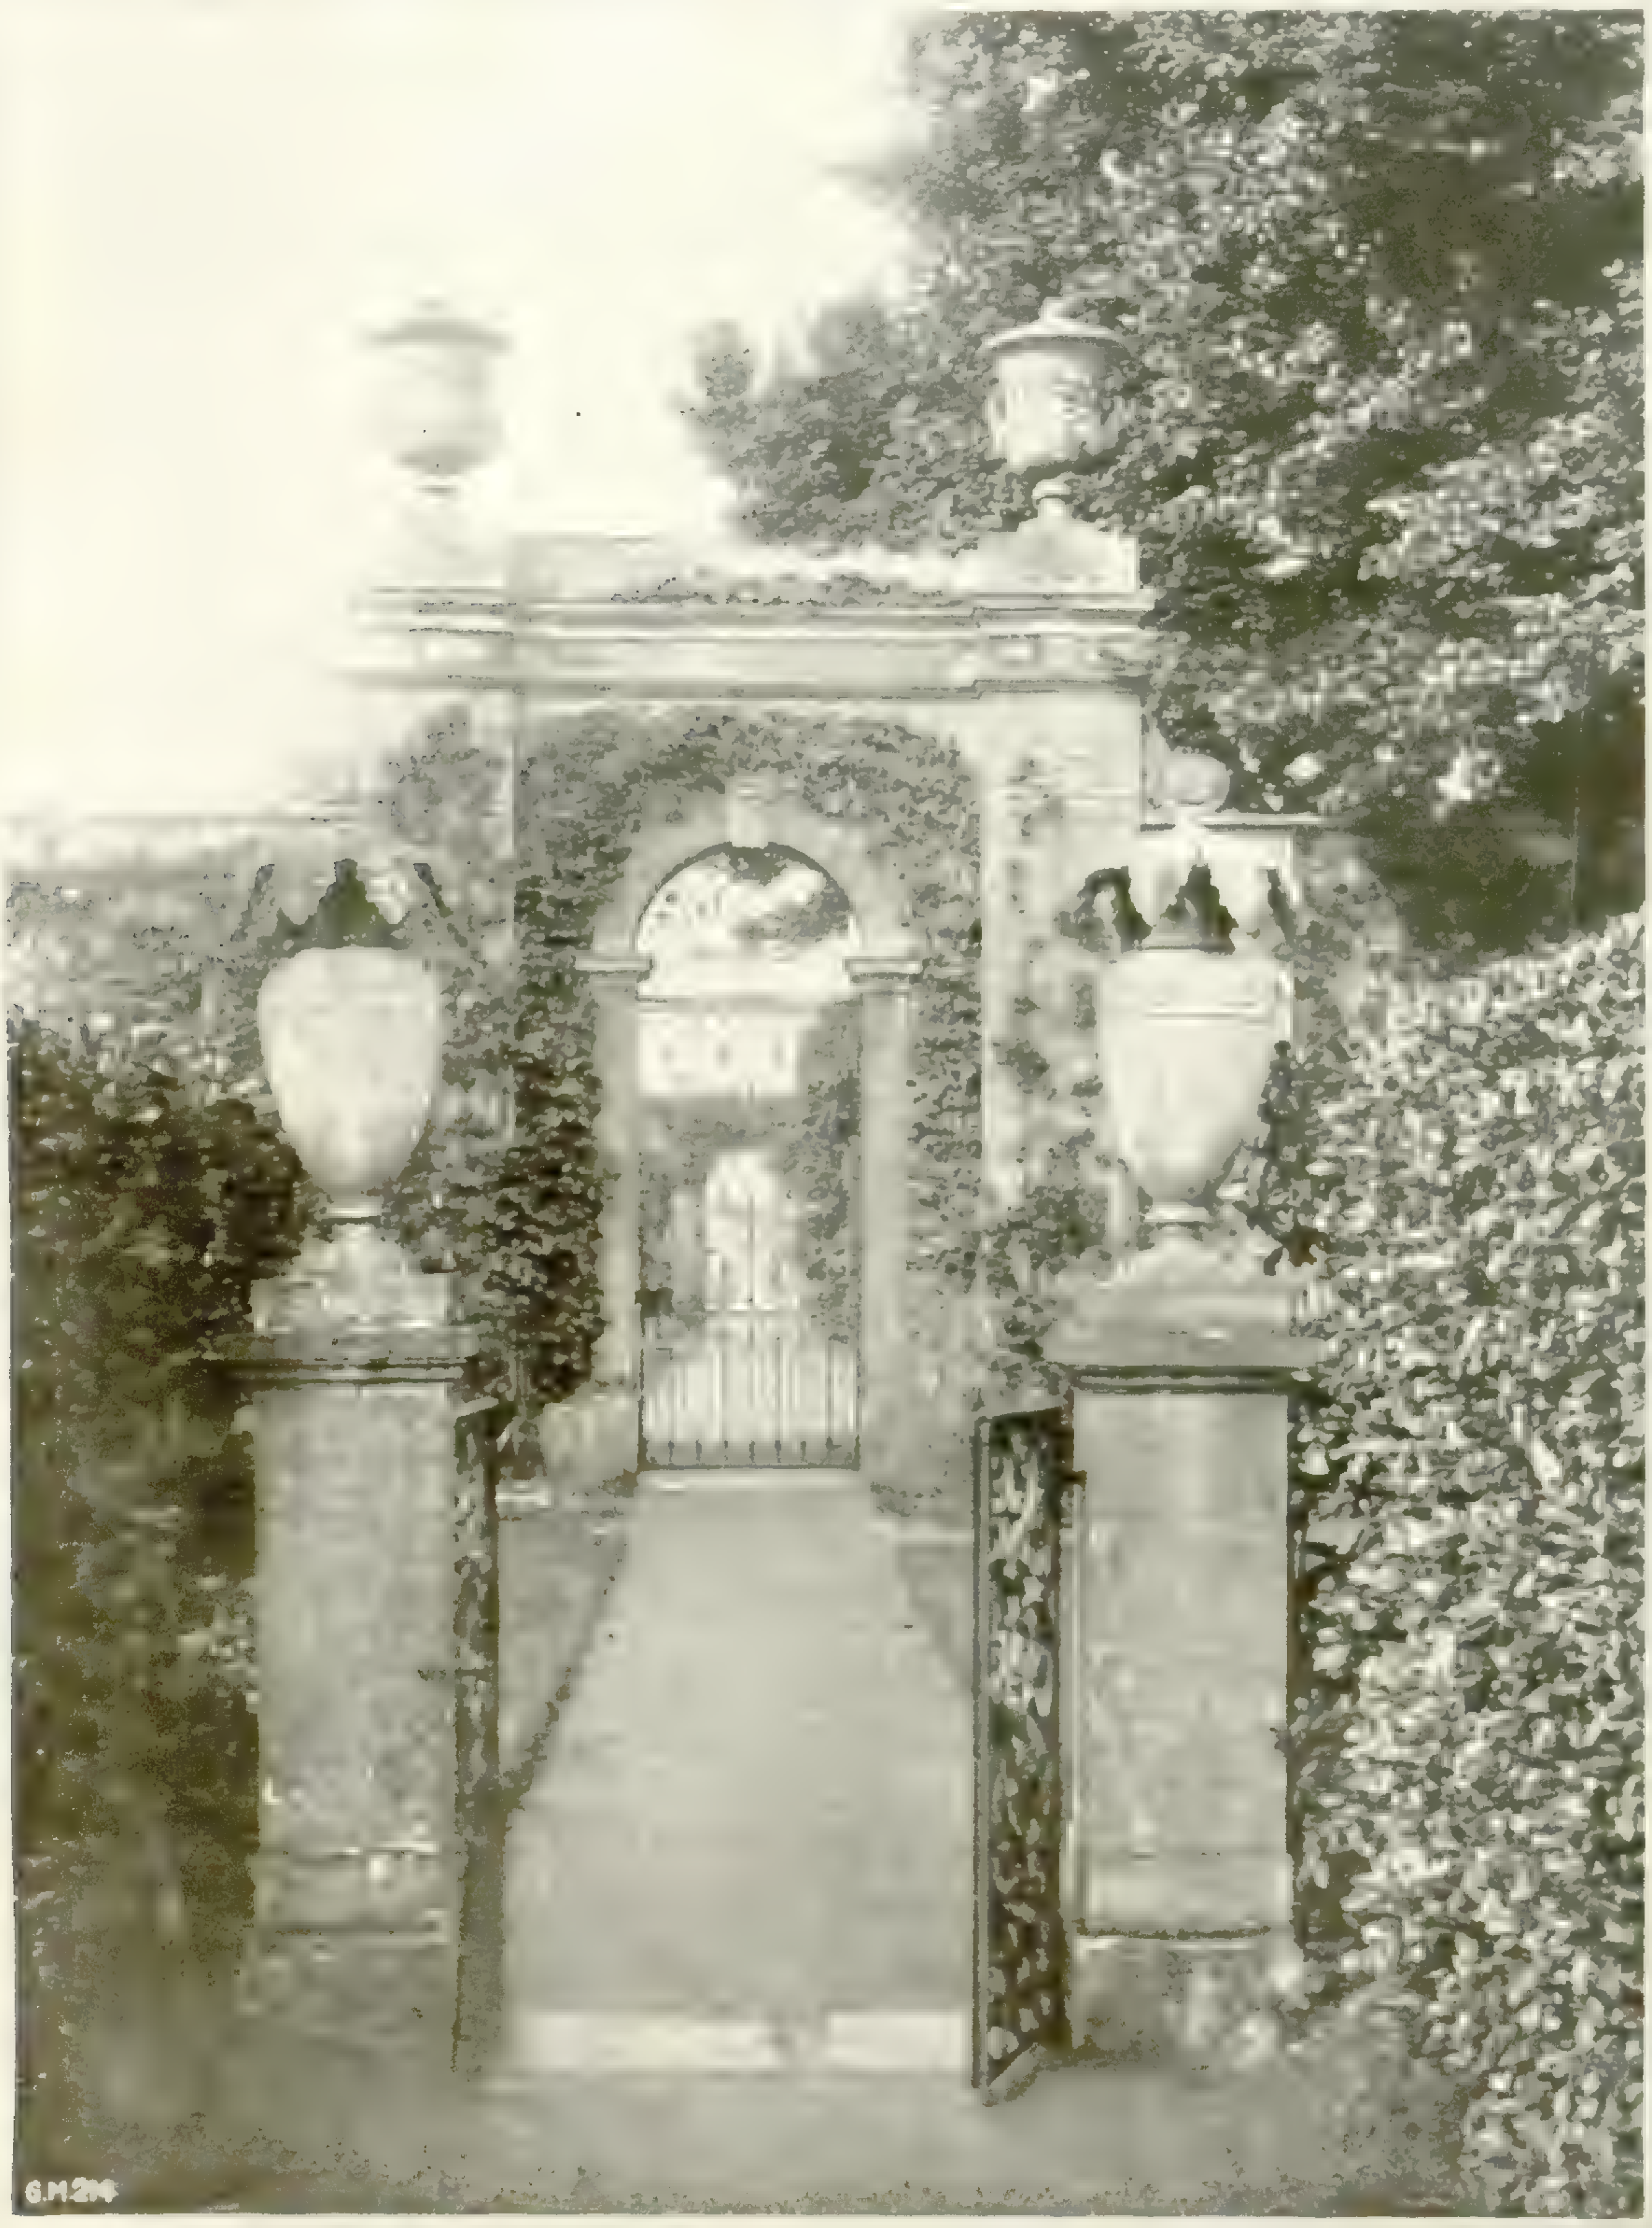


[Photo: H. N. King

THE ORANGERY AT WREST PARK.

ing allotments, and small holdings provide enormous quantities of fruits and vegetables for the people of Luton and Bedford, and not a little also for Covent Garden. At Wrest Park the "annual" method of strawberry culture, a method first advocated in these pages many years ago, is skilfully followed, and with the very best results.

The walls of this garden are amply clothed with peaches, nectarines, pears, apricots, plums, and cherries. Some of the old trees are now worn out, and, each season, a number of these are removed, and younger trees are substituted. The pear crop at Wrest Park has not been a full one this year, but apples have done particularly well, as an inspection of the long, low fruit-room quickly proves. Just inside the fruit rooms rows of fruits of every variety of apple grown here, and also of the same variety from different positions, are set out and labelled. This arrangement is specially useful, as a glance reveals how rapidly, or otherwise, the apples are maturing, and gives a key to condition of the crop in bulk.



[Photo: H. N. King.

GATEWAYS LEADING FROM THE KITCHEN GARDEN TO THE FLOWER GARDEN, AT WREST PARK.

Of the glass-houses little need be said. Some of them are in excellent condition, but others are very old, and still have the small panes of glass so well known to our grandfathers. Grapes and peaches are well managed, and, among plants, Begonia Gloire de Lorraine, pancratiums, chrysanthemums, primulas (Kewensis and sinensis forms), roses, and carnations are specially noteworthy. In one of the oldest houses, and one that is doomed to early demolition, the brilliant Bignonia venusta is very much at home, growing freely and providing a profusion of its clusters of vivid orange-coloured flowers.

I have already suggested that Wrest Park and its gardens were designed on bold and handsome lines, and it may be noted that Mr. Mackinlay's house and the entrances to and from the kitchen garden quarters are all finely built—there is nothing cheap or skimpy about them. The upper walk that leads in a straight line from the gardener's house to the conservatory, right through the kitchen garden and the smaller flower garden, is worthy of notice for its fine gates and for the choice flowering trees and shrubs that adorn the walls at the end of the walk near the mansion.

Outside these walls the deer are busy finding toothsome morsels in the fruits of sweet and horse chestnuts that strew the ground, and we, too, must pass outside, regretfully.

Chas. H. Curtis.

FORESTRY IN GERMANY.

Among the numerous valleys of the region of the Black Forest, the Murgthal is the most famous for natural beauty; and perhaps at no point along its entire course does Nature, combined with the simple, quiet, peasant life, form a more charming picture or a more restful retreat than in the little valley where the Red Murg and the Right Murg unite. Along the bottom of the narrow valleys, hemmed in on all sides by lofty ridges, hamlets lie scattered along the streams, while here and there a dwelling, hid partly by fruit trees, looks down from the sunny slopes of the hillside or projects its quaint gable from the dark background of the pines and firs.

The chief charm of this region lies in the forest, whose beauty is rivalled by its usefulness. It furnishes the inhabitants of the valleys their chief means of support, and its culture, care, and management constitute the best example of that thrift, industry, and economy in which the Germans excel.

Formal permission has to be obtained from the proper authorities before one can enter the royal forest.

The way grows fairly dark as one enters deeper into the forest, the pines and firs rising to majestic heights. Their shafts, standing in rows of uniform distances apart and supporting a dome of dark green foliage, give an appearance not unlike the interior of a great cathedral.

The Forest Nursery.

Here, at last, is the nursery (Pflanzschule). This is a small clearing of, perhaps, an acre of well-cultivated ground, usually an east or north-east slope of average forest-growing elevation, protected from the hot sun by the tall trees surrounding it. Here, in beds prepared with scrupulous care, the seeds of the future forest are sown in early spring. The pines and firs predominate, but in order to provide for every locality, other varieties of seeds are sown such as beech, maple, ash, walnut, birch, and even fruit trees. As soon as the tiny shoots unfold their leaves above the earth every precaution is taken to procure a vigorous seedling. After having attained the height of three or four inches, they are transplanted to more spacious beds where they are allowed to remain three or four years. They are now ready for the forest clearings from which a crop of timber has been removed. But these clearings are already, in part, supplied by self-propagation, and it may be necessary to supply a seedling only here and there to give the required average stand of three feet apart. In fact, recent forestry methods are taking into account the economic advantage of assisting Nature in the propagation of her species, and every effort is bent upon having a well-developed second growth when the veterans are cut down. This, of course, is not always possible, as the seeds do not readily germinate where the soil is dry or is covered with a thick layer of leaves. But occasionally one finds, in passing through a tall forest, a square spot from which the leaves have been raked and the earth laid bare to receive the seeds as they fall from the open cone.

The nursery is an expensive institution, and is now seldom relied upon to furnish the entire supply for a new forest. By skilful and careful management 85 per cent. of the required growth of a new forest may be supplied by natural reproduction.

But whatever means be employed to reproduce a forest area, when once the trees are removed the new growth requires constant care and attention, especially if the location be unfavourable.

The System of Felling Trees.

In removing mature trees, the so-called "strip system" is usually applied. This consists in cutting long, narrow openings of about a hundred yards in width extending from the main road, and at right angles to it, on up to the crest of the hill; and as the roads are always parallel to the streams the strips are also at right angles to the prevailing winds which sweep up and down the valley. The forest is thus protected from the destructive cyclones, and reproduction readily follows from the trees on both sides of the narrow openings. Another advantage of this method of cutting lies in the fact that the trees, when cut, may easily be skidded down the slopes to the road, from whence they are transhipped to the sawmills. When the trees are finally removed, the new clearing is given very careful attention; every vacancy is now filled from the nursery, so that a forest cover may be established as soon as possible. A permanent vacancy means, in the end, considerable loss; but in spite of care and watchfulness, in the course of ten or fifteen years the new forest has an occasional opening. To fill the vacancy by a tree of the same variety would mean a cripple for life, or a premature death. A hardy and more rapid-growing variety is therefore planted, which, in a few years rivals its companions and holds its own in the struggle for light and room. At the end of twenty years there is little danger of death.

The thinning process now begins; for if trees do not have enough space they will be too small in diameter. With the right growing space they grow both tall and of good diameter, and as the space requirements become greater with age, the number of trees in a given area must be gradually diminished. Not long after the proper forest cover is established, and natural pruning has stripped the sapling of its lower branches, the first cutting takes place, and the forest is thinned to an average stand of five feet apart. Twenty years later the same process is repeated by reducing the number to an approximate average of eight or nine feet, then again to [illegible] and finally to eighteen feet, when those remaining are allowed to develop to veterans, worth about six guineas [illegible]

They may finally be cut down when they have reached the age of four score years, but often not before they have attained the age of 150 years, the average forest cycle being 120 years.

Amount of Timber Removed.

One of the central ideas of forestry is that the average yearly cut shall be equal to the average yearly growth. This is determined by a forest survey, which is made every ten years. During the succeeding ten years only the amount added during the previous period may be removed, [illegible] of this amount being cut each [illegible] This rule applies not only to the royal forest, but also to the forests of a local community over which the State has general control. In thus limiting the amount of timber removed to the growth for a given period several points are gained: it preserves to the State and community a perpetual forest; it furnishes constant employment to a large and definite number of people; every phase of forestry becomes a science; and every individual from the chief official to the common woodsman becomes an expert, since his employment becomes a life occupation.

After the trees are cut down they are stripped of their bark, and are then ready to be classified according to species, size, and grade of lumber. The pines fall into five classes, the first-class having a length of at least sixty feet and a diameter of at least a foot at the smaller end, while the fifth grade must be at least twenty-five feet in length and two and three-quarter inches in diameter. The price of the first grade is usually about twenty-five shillings, and that of the fifth grade fifteen shillings per cubic yard. Hard wood is, of course, more valuable, the first grade selling as high as ninety shillings per cubic yard. The royal forest of the entire state of Wurtemburg approximates a net revenue of 3½ per cent., based upon forest valuation. Stated in other terms, this forest district which consists of, roughly, 20,000 acres, produces an annual yield of fifty shillings per acre, and furnishes constant employment to 500 men.

It would be difficult to find a better example of industrial economy than is here exhibited. Destructive lumbering is unknown. There is system from beginning to end, and that system has long since been reduced to a science which is being constantly perfected by the co-operation of the forestry schools throughout the empire.

The trees, planted by one generation, cared for by the next, and cut down by a third have then to be sawed into lumber and shipped to all parts of the world.

James F. White.

SCHIZANTHUSES IN BASKET.

The schizanthuses or "Butterfly flowers," are so popular at the present time that no garden worthy of the name is considered complete without them. Their numerous and attractive little flowers, their accommodating habits and easy culture, render them most useful for decorative purposes, winter and summer. The object of this note, however, is to call attention to the usefulness of schizanthuses for baskets. Readers who visited the Temple Show last spring probably observed the baskets of schizanthuses in the first tent. This, so far as I know, was the first time these plants have been exhibited successfully in baskets, and so attractive did they prove that they received much attention. Yet I see no reason why even amateur gardeners should not produce such baskets. Their culture is simple and easy, and they require very little heat.

For spring flowering seed should be sown in August, and the seedlings potted off singly, and grown on in pots in a cool house or frame till February, when they may be transferred to the baskets. Schizanthuses do not require a rich soil. A mixture of loam, leaf-soil, old manure, and sand, or a good old potting soil suits them admirably. The plants, which should by this time be good bushes, are arranged at the rate of about three to a twelve inch basket, and the growth allowed to hang over the sides.

The main shoots should then be pegged into the basket with layering pins, continuing this process as the plants grow, until the whole of the basket is evenly covered. From the commencement, both in pots and baskets, the points should be frequently pinched out until about a month before flowers are required. They enjoy a light position, a moderate temperature, and fresh atmosphere, also to be kept free from draughts or sudden changes, and if the above simple hints are followed the results will fully repay the attention given.

C. H. Middleton.

WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

CATTLEYAS.—There are many autumn-flowering cattleyas, which recently bloomed, that are at the present season rooting freely, and consequently any potting necessary should be attended to without delay. Other kinds which have recently completed their growths but do not produce their flowers until the spring will be at the rooting stage, when they are best suited for removal, and these should be attended to as soon as possible. I consider cattleyas and allied genera which require autumn potting are best attended to at the earliest possible moment, as this affords the best opportunity for the new roots to get hold of the compost before the colder weather sets in, thus avoiding the strain usually occasioned by the use of more or less excessive artificial heat.

CLEANING.—At the present season the insect pests become more troublesome among the inmates of the cattleya house, and constant care and observation are necessary to keep these in check. It is generally found that when the leaves of the trees are falling black thrips are more troublesome than at any other season of the year. These pests find their way, no doubt blown by the winds, to the roofs of the houses, and with the least shower of rain they are carried to the water tanks, from which they are naturally dipped when the water is used for damping or watering purposes, and so they find their way to the plants. One may destroy the pests by fumigation or spraying, but in the course of a day or two the plants may probably be infested again. A great deal of perseverance is necessary to prevent the thrips remaining sufficiently long to establish new generations. Scale insects, especially the small white kind, which has become so prominent since the advent of C. labiata in quantity, are perhaps the most annoying of all the cattleya pests at this season of the year, so close do they infest both leaf, pseudo-bulb, and rhizome that one wonders at what season of growth the pests increase, and how it is possible for them to have become secreted inside the growth and outer sheaths, for we frequently find them almost immediately the leaves appear and commence to expand.

SPONGING CATTLEYAS is an operation not to be lightly passed by, and should be only done by an experienced workman. The least scratch or even twist of the leaves, although perhaps not apparent at the time, will in a very short period show a permanent disfigurement to the plants. Care should also be taken to see that any insecticide used does not exceed the advised strength. I have on several occasions suffered from carelessness in this respect, and it is one of the greatest risks one has to contend against with inexperienced workmen. I think it far safer to use only rain water for sponging some of the kinds, such as, for instance, C. labiata and C. Mossiae, which frequently [illegible] when only sponged with clear water. It is a good plan to spray at regular intervals or as frequently as the case may demand, as this is the best means of checking the pests. Choose a day with favourable outside conditions for the purpose, and spray sufficiently early in the day to permit of the foliage becoming dry before the cool evening temperatures are reached.—H. J. Chapman, Oakwood Gardens.

STOVE PLANTS.

EUCHARIS AMAZONICA.—Plants that have been resting in the intermediate house for some time will now be throwing up their flower spikes, and may be removed to a temperature of [illegible] 70 degrees, and, where convenience permits, plunged up to the rim of the pot in tan bark or cocoanut-fibre refuse, and afterwards given a thorough watering with tepid water. If it is desired to prolong the flowering season they may be divided into batches and brought into the stove at intervals. As soon as flowering is over the plants will push new growth, and after the full development of these the resting and drying process should be repeated. Do not allow eucharis to suffer at any season for want of pot room, or a deterioration of bulbs will follow. When the plants are rooting freely they will be greatly benefitted by alternate applications of weak liquid farmyard manure and clear soot water.

BOUGAINVILLEA.—Specimens now thoroughly ripened up may be afforded greenhouse protection during winter. The cooler these are kept, so long as they are preserved from frost, the better will they commence their new season's growth.

GLOXINIAS. — Autumn-raised plants ought now to be afforded a position as near the glass as possible, and grown on steadily throughout the winter months in a temperature of 65 degrees (minimum). Careful attention must be given to watering. If the earliest ripened corms are selected from those which have been at rest the longest, and given a position in the stove, they will soon push up their growth, and will be found most serviceable for a display of bloom in the early spring. For this purpose I recommend the corms to be allowed to remain in the same pots undisturbed.

ALLAMANDAS.—These have now finished flowering and may be gradually dried off to assist the ripening up of the wood. Some of the weakest shoots may also be removed, and as soon as the leaves have fallen the plants may be wintered in a temperature of 50 to 55 degrees. It is advisable to examine the pots at intervals with a view to watering, for should the soil become too dry during the resting season, and the wood allowed to shrivel, the plants will not start freely into growth again.

VENTILATION.—Very little ventilation will be required for the remainder of the year, and the temperature of the stove may range from 65 to 70 degrees, which is consistent with the diminished light of the season.—John Donoghue, Bardon Hill Gardens.

FRUITS UNDER GLASS.

EARLY VINERY.—The vines should now be pruned, and it is a good plan to apply a little styptic; the wood may seem perfectly matured and hard, but with a rush of sap they will bleed—and nothing will stay this after it has started. Wash the house down thoroughly with soft soap and water, clean over the rods, and remove all loose bark, but do not scrape the rods. If the vines are found to be very dirty, wash them over frequently with a good strong solution of some approved insecticide. Remove the top soil carefully down to the roots, and if the vines are old, and carry good crops, they may be liberally top-dressed with good turfy loam, half-inch bones, and some vine manure, the latter put on before the top-dressing is applied. The soil should be rather dry so that it may be made firm. If the vines are sickly the drainage should be examined without disturbing much of the border; the drains that lead from the border sometimes become choked, especially when too much fall is allowed. For early vines the borders are best inside. If the vines are young, and the border is made up as required, the existing border should be well filled with roots before adding to it. When making up borders plenty of lime or mortar rubble should be used. The new part of the border should be made wider at the bottom than at the top, and some old iron gratings should be placed against this and shored up to make all firm. If ripe grapes are required at the end of May, the house may be left open till the last week in this month.

STRAWBERRIES. — These should be placed in frames and plunged in ashes to keep the pots from being broken by the frost and to keep the wet from the plants. The weather has been favourable to the ripening and plumping up of the crowns, so that good fruit may be looked for. The light should only be left on when heavy rains occur.

EARLY PEACHES AND NECTARINES.—If the growths were thinned out after the fruits were gathered there will be little to do in the way of pruning. Proceed to wash down the house, and if scale or other insects are on the trees wash them over with some soft soap and water, taking care not to rub the buds with the brush. Remove the old top soil, and top-dress with some good turfy loam and half-inch bones; the use of artificial manure must be governed by the state of the trees, as it is apt to cause too strong a growth. If the borders should be found dry, give them water, but not too much at once as this often causes bud dropping, especially if the soil has been very dry for too long a period. When tying in the shoots leave plenty of room for light, and for next season's wood to be laid in without crowding and covering up the fruits.

MIDSEASON AND LATE HOUSES.—On no account should the borders be allowed to become dry. If they have carried heavy crops, and the drainage is clear, water should be given freely or bud dropping will result. The trees that have given late crops should be at once thinned out and given every encouragement to ripen their wood, the borders well watered, and the trees well syringed, as the foliage is hanging on late this season. Keep the house wide open night and day.—A. B. Wadds, Paddockhurst Gardens.

THE KITCHEN GARDEN.

FORCING SEAKALE.—It is now quite time to think about placing a batch of crowns in the forcing pit. I always find that eight or nine good crowns packed into 10-in. pots, with other empty pots placed over the crowns to keep them dark, gives good results, and this method permits of more or less heat, at the cultivator's discretion. Seakale does very well like this for the earliest supply, but when the crowns are better matured, larger batches can be planted out in the mushroom house, or any other convenient place that can be kept dark, and where a temperature of 60 to 65 deg. is maintained. The soil for planting or potting up the crowns should consist of good sweet loam, with a little decayed manure. After the crowns have been planted a few days water them well, and do not let them suffer from want of moisture at any time. Keep up a moist heat by syringing the paths and walls every day, for by growing the seakale quickly the produce is the more tender.

RHUBARB AND CHICORY.—A few roots of each should now be put into the mushroom house, giving them the same treatment as advised for seakale. If the roots can be lifted and left outside for a few days, open to the weather, they will respond quicker when placed in the forcing house.

ASPARAGUS.—A good batch of this useful vegetable should now be lifted, and if a house or pit can be set apart for the roots so much the better. A hotbed prepared and a frame put on the top, with six or eight inches of soil put in, and the roots planted rather closely together, will soon give some good heads.

PERMANENT BEDS.—In most cases the asparagus growths are fully ripe and may be cut down. When this has been done clean the beds thoroughly from weeds, and apply a good top-dressing of manure. This will be washed down to the roots with the autumn rains, and prove most beneficial to next year's crop.

SOWING PEAS IN FRAMES.—Where pits and frames are available a few lights may be utilised for sowing some early peas in. Select a dwarf-growing variety, such as Little Marvel; sow the seeds in rows about 15in. apart, in fairly good soil, and when they have germinated keep them sturdy by giving them all the air possible, and by spring time they will have made a fine growth. Keep the plants well thinned out, and then with longer days, and a higher outside temperature they will come on apace.

HERBS.—Pot up three or four roots of tarragon, and place them in heat; also put a couple of boxes of mint in heat. If the stock of sage or thyme is running short, some cuttings should be put in at once, selecting nice shoots with a heel attached, and inserting them in lines; make the cuttings firm as the work proceeds.

VARIOUS.—A final clearing up for the season should now be made, pea and bean stakes should be pulled up, tied in neat bundles, and stored closely together. All weeds should be hoed or pulled up, the paths receiving the same attention as the plots. Give the paths a coating of fresh gravel if necessary, and fill up any unsightly gaps in the box edging so that the roots may become established before very frosty weather comes.—T. W. Birkinshaw, Hatley Park Gardens.

RED OR GRIZZLY GRAPES.

I do not see what beneficial end can be served by cultivating varieties of grapes that have only flavour to recommend them, as indicated in the plea put forth so eloquently by Mr. C. H. Curtis on p. 796. I think if growers would cultivate such varieties well as Muscat Hamburgh, Madresfield Court, Mrs. Pince, the newer Prince of Wales, and that deliciously flavoured variety, Lady Hastings, we should not require any red grape at all.

Surely it is not suggested that anyone of these grizzly coloured sorts is equal to Muscat Hamburgh, for instance, in flavour. Employers and gardeners, too, prefer to see well-coloured examples of grapes rather than those of an opposite character, because, for appearance alone, they are much superior, and seldom do we find a well-finished example of either of those I have named deficient in colour. As a rule, gardeners have no space at command to include varieties that have not the advantage of appearance as well as flavour.

At Sandringham at one time a house, or a portion of it, was devoted to the culture of what I call sentimental varieties of grapes, but it could not be said they were a success from any utilitarian point of view. Some few years ago many societies, especially the Caledonian Horticultural Association, at its exhibition held in September, in the Waverley Market, Edinburgh, offered prizes "for flavour only" in grapes. I have not known any of these grizzly varieties win a prize in competition at any show, which fact seems to me to prove their undesirableness.

No, no, Mr. Curtis, let us teach those who are not successful with the sorts I have named how to be successful, and I think there will not be a craving for varieties that have little to recommend them in appearance, and some peculiarity in flavour.

Swanmore Park. E. Molyneux.

Bulbs in Grass and Woodland.—However much of spring beauty we owe to bulbous plants in beds and borders, even in gardens of limited extent, there are endless positions where, for a small outlay expended upon the cheaper bulbs, added interest to the garden will be given in the coming year, and it will increase each succeeding season. Hardy cyclamen are not the cheapest, but they deserve a trial, as they are ideal subjects for a quiet corner in a half-shady spot, where, free from molestation, and planted in the natural humus which collects under trees and shrubs, they will naturalise themselves freely. There are also anemones, like blanda and apennina, to bejewel grassy banks and edges of woodland with their starry lavender flowers from February to May; both are votaries of sunshine and bright days, so that shaded positions must be avoided at planting. Equally good are chionodoxas, muscari, scillas, particularly the pink, white, and blue forms of Scilla nutans, or wild hyacinth, and with these, for its distinct golden flowers, I would include a good planting of our native Tulip sylvestris.—Thomas Smith.

BRADFORD CHRYSANTHEMUM SOCIETY.
The 22nd ANNUAL EXHIBITION will be held in ST. GEORGE'S HALL on FRIDAY and SATURDAY, November 13th and 14th, 1908.
£27 for 24 Blooms, Japanese (on Boards).
Prize Money and Classes again increased for Open Competition.
Entries Close November 7th.
Schedules, with Entry Form, post free from
H. SPENCER, Hon. Sec.,
Horton Park, Bradford.

THE BIRMINGHAM GREAT CHRYSANTHEMUM SHOW will be held in BINGLEY HALL, November 10th, 11th, and 12th. £500 in prizes.
ALFRED NOAKES, Secretary,
148, Bristol Street, Birmingham.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

Southampton, OCTOBER 28 and 29.

The annual autumn show was held in the Skating Rink, and was quite a success in every department.

PLANTS.

For the best collection of chrysanthemums grown in pots, quality and general effect only considered, Mr. C. Hosey, gardener to J. C. E. d'Estene, Esq., Elmfield, Southampton, was first with dwarf plants, clothed with large leaves, and carrying good blooms. Mr. H. C. Sivyour, gardener to C. H. Farnam, Esq., Rownhams House, Southampton, second. Plants suitable for conservatory decoration, in four varieties, were best shown by Mr. C. Dymott, The Nurseries, Freemantle, who presented well-flowered examples of free-flowering varieties; Mr. C. Hosey second. Mr. Dymott was again first with four bush plants.

In the amateurs' section for a group of chrysanthemums, Mr. F. Chandler, 75, Shirley Road, Southampton, won the premier prize (which also carries with it a silver challenge cup), for a charming exhibit. For a collection of miscellaneous plants, arranged for effect, in a space of 80 square feet, Mr. E. Wills, The Nurseries, Southampton, was first with desirable plants which were rather too closely arranged. Mr. E. Cook, gardener to A. F. Fynn, Esq., Red Lodge, Bassett, second.

CUT BLOOMS.

The leading class was for twelve varieties, Japanese, three of each arranged in vases, and obtained three entries. Mr. F. Bible, gardener to H.S.H. Prince Hatzfeldt, Dray[illegible] Park, Chippenham, was easily first with heavy fresh examples of Bessie Godfrey, Vis[illegible]te Venosta, President Viger, Mrs. F Pearce, Walter Jinks, A. Davis, Lady Talbot (extra fine), Lady Henderson, J. H Doyle, F. S. Vallis, J. H. Silsbury, and Mrs. [illegible] Davis. Mr. W. Iggulden, Lock's Hill Nursery, Frome, second with smaller blooms. For two varieties, white Japanese, three of each, Mr. B. Hollis, gardener to Major [illegible]ester, Embley Park, Romsey, with Edith Smith and Mrs. A. T. Miller, secured the premier award; Mr. W. Iggulden second; Mr. F. Bible third. In the class for six [illegible], any two varieties other than white, Mr. Bible was again the leading prizetaker with full solid blossoms of Algernon Davis and Bessie Godfrey; Mr. W. Iggulden second. In a class for gentlemen's gardeners and amateurs, for eighteen Japanese, in not more than three of any one variety, Mr. B. Hollis was first with desirable blooms of Mrs. Knox, Edith Smith, Norman Davis, and Mrs. A. T. Miller; Mr. H. Pearce, gardener to Mrs. Tragett, Awbridge Danes, Romsey, second. For twelve blooms, in four varieties, five competed. Mr. D. Edwards, gardener to W. Garton, Esq., Salisbury Court, Southampton, was distinctly ahead for the premier position; Mr. F. Chandler second. The last-named won for twelve blooms in not less than eight varieties, with desirable specimens; Mr. J. E. Robb, Inkerman Road, Woolston, Southampton, second. Single-flowered varieties were admirably staged, and formed a distinct feature. Five competed for six varieties in vases. Mr. B. Hollis first with typical blooms of Will Jordan, Annie Holden, Florence Robinson, and Mary Richardson as the best; Mr. H. Pearce second. For four vases of decorative sorts, undisbudded, eight competed, making a pleasing display. Mr. B. Peppler, Vernon Hill, Bishop's Waltham, was first with White Quintus, Soleil d'Octobre, Source d'Or, and La Triomphante; Mr. G. Baines, gardener to T. C. Wilson, Esq., The Thickets, Bishop's Waltham, second, also staging well.

For blooms staged on boards there was much encouragement and good competition. For twenty-four Japanese, in not less than sixteen distinct varieties, three competed. Mr. Bible was successful in obtaining first place with really good blooms of Lady Talbot, J. H. Silsbury, Mrs. W. Knox, President Viger, Marquise Venosta, Bessie Godfrey, F. S. Vallis, Mrs. Hooper Pearson, Jumbo, Valerie Greenham, and O. H. Broomhead; Mr. W. Iggulden second with smaller blooms.

Incurved varieties were few in number but good in quality. Mr. Bible was the only exhibitor for eighteen. He set up a desirable type of flower. Clara Wells, W. Biddle, Romance, and Buttercup were fine. In the class for twelve five staged, and here again Mr. Bible asserted his supremacy, winning quite easily with medium-sized neat blossoms, Mr. W. Neville, gardener to F. W. Flight, Esq., Cornstiles, Twyford, Winchester, coming second. In the amateurs' section Mr. Chandler won both in the incurved and Japanese classes with really good examples of well-known varieties.

FRUIT.

Fruit made a remarkable display, being plentiful and of high quality. For three bunches of grapes, distinct, there were five entrants. Mr. H. C. Dredge, gardener to J. Willis Fleming, Esq., Chilworth, Southampton, was first with exceedingly handsome bunches of Muscat of Alexandria, Mrs. Pince, and Gros Maroc; Mr. T. Hall, gardener to Lord Swaythling, South Stoneham House, Southampton, was a good second; Mr. G. Ellwood, gardener to W. H. Myers, Esq., Swanmore Park, Bishop's Waltham, third. Four staged two bunches of Alicante, the best coming from Mr. J. Hughes, gardener to A. P. Ralli, Esq., Twyford Lodge, Winchester, with large examples of this grape. In the class for two bunches, any other black, seven staged, Mr. Hollis, with Mrs. Pince in desirable condition, won easily. Muscat of Alexandria, in prime order, won for Mr. Dredge the premier position for two bunches of any white grape.

Apples were indeed a feature, there were no fewer than sixteen entries for four dishes, dessert kinds. Mr. Ellwood won easily with Cox's Orange Pippin, Blenheim Pippin, Allington Pippin, and Ribston Pippin; Mr. Hall second. For a single dish of dessert apples, other than Cox's Orange, there were twenty-five entries. Mr. Ellwood won with an excellent dish of Blenheim Pippin. Ten competed in the class for four kitchen apples. Mr. Botting, Railway Hotel, Botley, won with huge fruits of Mère de Ménage, Peasgood's Nonsuch, Blenheim Pippin, and Lady Henniker.

Vegetables were, as they always are here, a fine display. Mr. G. Ellwood obtained premier place in the two classes for six kinds, in which Messrs. Sutton and Sons and Messrs. Toogood contributed the prizes, with very fine examples of Colossal leeks, Perfection tomatoes, pink celery, Up-to-Date potatoes, Ailsa Craig onions, and Triumph cauliflowers. Mr. C. Budd, gardener to H. L. Hansard, Esq., Romsey, was second in Messrs. Toogood's class, Mr. Pearce occupying a like place in Messrs. Sutton's class.

Herefordshire Fruit and Chrysanthemum Society.

This society's seventeenth annual show was held in the Shire Hall, Hereford, on October 28 and 29. There were forty-nine classes devoted to apples alone, and, as most of these were well filled with fruit of high quality, the display thus made was an excellent show in itself. The same remarks, however, could not be made about pears, which were but poorly represented, as compared with previous years.

APPLES.

The leading class was for a display on a space of 70 square feet, with decorations of foliage. Three collections were staged, the best by Mr. Whiting, of Credenhill, Hereford, who had a finely selected lot of beautifully finished fruit, embracing many excellent dishes of dessert varieties; the following were specially noted: James Grieve King's Acre Pippin (highly coloured), Allington Pippin, Lord Hindlip, Egremont Russet, Charles Ross, Rival, Tillington Seedling (very handsome), Cathley's Kernel, Cox's Orange Pippin, Court Pendu Plat, King of the Pippins, and Ribston Pippin; amongst kitchen varieties there were grand dishes of Tibbet's Pearmain, Mère de Ménage, Peasgood's Nonsuch, Hormead Pearmain, Tyler's Kernel, Newton Wonder, Byford Wonder, Bramley's Seedling, and Bismarck. Mr. Caddick, of Caradoc, Ross, was second, but he had a few dishes slightly spotted. Messrs. Pewtress Bros., Tillington, Hereford, third.

In the class for an exhibit on forty square feet, Mr. Tagtor, gardener to J. Riley, Esq., Putley Court, was the only exhibitor, and was awarded the first prize for clean, medium sized fruit.

For twelve dessert and twelve culinary varieties, Mr. Kelly, gardener to Messrs. Getting and Newton, Glewston Court, Ross, took chief honours amongst four exhibitors with an attractive set, comprising Gloria Mundi, Hollandbury, Lord Derby, Lane's Prince Albert, Egremont Russet, Allington Pippin, Rival, and American Mother; Mr. Nunn, gardener to Mrs. Woodhouse, Burghill Court, was a close second; and Mrs. Blashill, Bridge Sollars, third. Five good exhibits were staged in a class for twelve dishes of culinary apples, the best being brought by Mr. J. Lee, Higher Bebington, Cheshire, who had extra fine dishes of Belle de Pontoise, Mère de Ménage, Golden Spire, Gascoigne's Seedling, Emperor Alexander, Altriston, Byford Wonder, Newton Wonder, and Annie Elizabeth. Mr. Kelly was placed second, and Captain Cox, Ashe Leigh, Ross, third. Eight dishes of dessert kinds made a splendid class, and Mr. Kelly again took the lead with large, clean fruits of Washington, Cox's Orange Pippin, Allington Pippin, Wealthy, Ashmead's Kernel, Ribston Pippin, and American Mother; Mr. Currie, gardener to the Rev. G. H. Devonport, was a good second, and Mr. J. Lee a close third.

DECORATIVE COLLECTIONS OF FRUIT.

Three exhibitors staged meritorious collections of fresh or preserved fruit in fifty square feet. Messrs. Pewtress Bros. were placed first, staging a capital lot of apples and pears, arranged in baskets, dishes, or in market boxes, intermixed with decorative plants and foliage; the second place was deservedly taken by the Herefordshire Co-operative Fruit Company with similar fruits arranged in like manner; Mr. Caddick was a good third.

Prizes offered by the Agricultural Committee of the Herefordshire County Council for apples, eight dishes of dessert varieties, brought out four lots, Mr. Whiting, Credenhill, being first with a remarkably fine set of large, highly coloured fruits; Mr. Kelly was a good second, and Mr. S. Glazzard, gardener to J. Carless, Esq., Blackbury, third. Mr. Kelly was first for eight dishes of cooking market varieties, and Captain Cox second. In a class for eighteen dishes, six dessert and twelve culinary, Mr. Kelly was placed first amongst three exhibitors, and staged good dishes of leading kinds; Mr. Roberts, gardener to P. H. Foley, Esq.

Stoke Edith, was a good second; and Mrs. Blashill third.

PEARS.

A class was provided for pears, to be staged with foliage decorations, in a space of thirty-five square feet, but no entry was made. Mr. Kenott, gardener to A. W. Foster, Esq., Brockhampton Court, Ross, showed a creditable lot of fruit in a class of eight dishes, and staged Easter Beurre, Emile d'Heyst, Marie Louise, Marie Louise D'Uccle, Doyenne du Comice, Pitmaston Duchess, Beurre Alexander Lucas, and Marshall de la Cour; the Rev. Prebendary Brierley (gardener, Mr. Foster) was second; and Colonel Henry, Ledbury, third.

CHAMPION DISHES.

Mr. Whiting scored for dessert apples with highly coloured, large fruits of Allington Pippin; Mr. J. Lee for kitchen apples with splendid fruits of Mère de Ménage; and Mr. Currie, gardener to the Rev. G. H. Devonport, for pears, with fine fruits of Doyenne du Comice.

DESSERT FRUIT.

The class for six dishes of ripe fruit brought only one exhibitor, Colonel Henry, who staged a creditable lot of Gros Maroc and Muscat of Alexandria grapes, Sutton's Ringleader Melon, Cox's Orange Pippin apples, Coe's Golden Drop plums, and a dish of pears. For three bunches of Gros Maroc grapes, Colonel Henry was placed first with good bunches of large, finely coloured berries; Mr. Nunn was a close second, and Mr. Currie third. Mr. Kenott was first in a similar class for Gros Colmar, and Colonel Henry second, each staging large, well-finished bunches. For three bunches of Muscat of Alexandria, Mr. Roberts, gardener to P. H. Foley, Esq., Stoke Edith, took chief honours with beautifully finished large bunches; Colonel Henry made a creditable second.

FLOWERS.

There were six competitors in the class for dinner-table decorations, in which chrysanthemums and ornamental foliage only might be used. The successful exhibitors were Miss Bott, of Brienton; Mrs. H. Hammonds, Castle Street, Hereford; and Mrs. Blashill, Bridge Sollars, who took the first, second, and third prizes in the order named. Messrs. Young and Co., of Hatherly, Cheltenham, arranged a choice collection of tree carnations in vases.

Portsmouth.

OCTOBER 28 to 30.

In the Town Hall the twenty-second annual show was held, and was a success, if not quite such a full show as last year.

CUT BLOOMS.

Cut blooms were the leading feature. Five open classes were provided, and there were twelve classes restricted to local growers, amateurs, and cottagers. The leading class was that for thirty-six Japanese, in not less than eighteen varieties, and not more than two of any one variety. A silver cup value £20, a gold medal, and £5 was the leading prize. Four competed, and the collections made a good display. Mr. G. Hall, gardener to Lady Ashburton, Melchet Court, Romsey, was an easy first with full, solid blooms, quite fresh, of F. S. Vallis, J. H. Silsbury, Madame P. Radaelli, Miss E. Smith, W. A. Etherington, Reginald Vallis, Lady Talbot, Algernon Davis, P. Viger, Bessie Godfrey, Mdme. G. Rivol, Melchet Beauty, W. Watson, Mrs. W. Knox, Magnificent, Marquis of Northampton, W. Jinks, and Mrs. A. T. Miller. Mr. G. Hunt, gardener to Pantia Ralli, Esq., Ashtead Park, Epsom, a good second, with smaller blooms; Mr. L. Dawes, Hambledon, third. For twenty-four Japanese, in not less than sixteen varieties, and not more than two blooms of any one variety, four competed; Mr. G. Hall was again the most successful with massive, well-staged examples. Mr. L. Dawes, gardener to Mrs. Ogilvie, Rosecroft, Hambledon, second, with smaller, bright blooms.

Incurved varieties were not numerous, but of good quality. Mr. Hunt won for twenty-four with well-finished examples of popular varieties; Clara Wells, Buttercup, and Boccaccio were noteworthy.

For twelve sprays of pompons, three blooms to each, not less than eight varieties, Mr. H. Snook, 5, Fitzroy Street, Fratton, was first with even, medium sized blooms, nicely staged; Mr. J. Nance, 98, Hampshire Street, Southsea, second, with some much superior, but the remainder not so good.

Single-flowered varieties, in twelve bunches of three blooms to each, in not less than eight varieties, are usually a feature here, and this exhibition was not an exception. Mr. C. J. Park, South Hayling, was first with excellent blossoms of Elsie Neville, Bronze Pagram, Mrs. J. Horton, and Lilian; Mr. H. Snook was a close second.

For twelve blooms each of incurved and Japanese, in not less than eight of each, and not more than two of one variety, open to residents within twelve miles of Portsmouth, three competed. Mr. J. Lowe, Park Road, Cowes, won with good incurved and fairly good Japanese. Mr. W. G. Adams, The Strand, Southsea, second, with superior incurved but weaker Japanese. In the smaller classes there was a good competition. Mr. J. Love had the best set of twelve Japanese amongst four entrants, Mr. Adams occupying a similar position for twelve incurved. Anemone-flowered varieties were best shown by Mr. J. Nance.

PLANTS.

Groups of chrysanthemums in pots, arranged for quality and effect in a space of sixty square feet, are a notable feature here. Mr. Papworth, gardener to The Parks and Open Spaces Committee, won the premier place with well-grown plants neatly arranged; Mr. W. Abbott, Twyford Nurseries, was second; three competing. In the class for twelve specimens in not less than eight varieties, with not less than twelve blooms to a plant, Mr. G. Lambert, Bognor Road Nurseries, Chichester, was easily first with dwarf plants carrying good blooms and foliage; Mr. Papworth second. In the class for eight plants, these two exhibitors occupied similar places. Mr. Lambert, with Matthew Russell carrying fifty shapely blooms, won the premier award for a single specimen.

FRUIT.

Fruit was quite plentiful and good. For two bunches black grapes, Mr. G. Ellwood, gardener to W. H. Myers, Esq., Swanmore Park, Bishop's Waltham, was easily first with Lady Downes, as also was he for two bunches white grapes with Muscat of Alexandria in prime condition. Ten staged six dishes of apples; Mr. Ellwood, with remarkably high-coloured examples, won first prize easily. Mr. G. Hoar, Havant, won for six dishes of pears, staging good fruit.

VEGETABLES.

Vegetables were a feature, so well were they staged. Mr. Ellwood won Messrs. Sutton's prize for six dishes, and was first in the class for nine dishes, amongst five competitors, with high quality produce.

Hertford.

OCTOBER 28.

The annual exhibition of the Hertford Horticultural Society was held in the Corn Exchange on the above date, and, from a horticultural point of view, was one of the most successful of the many autumn shows held at Hertford.

PLANTS.

The groups arranged for effect constituted as usual a highly attractive feature, and contributed in no small degree to the charm of the display produced in the large hall. In competition for the prizes for groups of chrysanthemums, Mr. J. Dance, gardener to H. A. Currell, Esq., The Chaplains, Hertford, was a splendid first, the plants having ample foliage and finely developed flowers, and the arrangement remarkably good; the second place was occupied by Mr. J. Parkes, gardener at Wallfields, Hertford, with a group of great excellence; and Mr. Harding, gardener to Mrs. Harris, Sele Lodge, Hertford, was third. The premier award in the class for a group of miscellaneous plants was made in favour of Mr. O. Catling, gardener to H. Clinton Baker, Esq., Bayfordbury, Hertford, who had a bright and tasteful arrangement; Mr. W. H. Beale, gardener to H. V. McConnell, Esq., Carnfield Place, Hatfield, and Mr. R. Smith, gardener to E. E. Pearson, Esq., Brickendonbury, Hertford, followed closely for second and third places. The most successful of the exhibitors of specimen chrysanthemums were Mr. J. Marsh, Mr. J. Turk, Mr. H. Bates, and Mr. E. H. Palmer. There were two classes for groups in which the competition was limited to amateurs who do not employ more than two gardeners, and in these the most successful of the exhibitors were Mr. H. Bates, Mr. H. Harding, Mr. J. G. Marsh, and Mr. J. Dance. Chinese primulas were admirably shown, and the prizes were awarded to Mr. J. Turk, Mr. O. Catling, and Mr. J. Howell, gardener to Morton Tomlin, Esq., Bengeo House, Hertford. Zonal pelargoniums made a bright display of colour, and the most successful exhibitors of these were Mr. W. Johns, Mr. J. Turk, and Mr. O. Catling.

CUT BLOOMS.

Cut blooms were staged in large numbers, and the quality was high for so early in the season. Mr. A. Haynes, gardener to Mrs. Browning, Bramfield House, Hertford, scored in the principal class, which was that for twenty-four Japanese; Mr. W. Phillips, gardener to J. H. Buxton, Esq., was second; and Mr. J. Turk, gardener to P. Bosanquet, Esq., Little Berkhamsted, third, both staging collections possessing much merit. In the class for four vases, which was a very attractive one, the prizewinners were Messrs. A. Haynes, W. Johns, and J. Turk. These exhibitors were also the most successful in the classes for six blooms of a Japanese chrysanthemum other than white, and for six blooms of any variety other than white. Single chrysanthemums were finely shown by Mr. F. Bradbrook, gardener to Miss Young, Mangrove Hall, Hertford; Mr. H. Bates, gardener to Miss Robertson, Sele Grange, Hertford; and Mr. W. Phillips. The best Japanese bloom in the show was Bessie Godfrey, exhibited by Mr. A. Haynes; and the best bloom of a single variety was Edith Pagram, exhibited by Mr. W. Phillips.

FRUIT.

Fruit was well represented, the apples being particularly good. In competition for the prizes for twenty-four dishes of apples grown in the County of Herts, Mr. R. Smith was successful in securing the premier award, which consisted of a silver challenge cup and a prize in cash; the fruits were of large size and finely coloured, the finest examples being those of Allington Pippin, Blenheim Pippin, Bramley's Seedling, Mère de Ménage, Fearn's Pippin, Peasgood's Nonsuch, and Rival; Mr. A. J. Willsher, gardener to the Rev. Martin Reed, The Vicarage, Ware, was second with a fine collection; and Mr. C. W. Hodges, gardener to A. S. Hay, Esq., Sacombe Park, Hertford, was third with fruit of high quality. The exhibitor last named occupied the premier position in the class for six dishes of pears, and the corresponding position in the classes for six dishes of dessert and six dishes of cooking apples was occupied by Mr. R. Smith. Mr. G. Langhurst had the best three dishes of pears, Mr. O. Catling the best three dishes of dessert apples, and Mr. J. Hornett the best three dishes of cooking apples.

VEGETABLES.

These, as in previous years, were largely shown, as evidenced by the fact that twenty-four collections were staged. The cup in the open class for a collection was won by Mr. H. Bates, while the winner of the cup in the amateurs' class for a collection was Mr. Douglas Garratt; and in the corresponding class for cottagers the cup was awarded to Mr. E. Day, New River Head, Hertford.

National Chrysanthemum Society.

The great annual exhibition of this society was held at the Crystal Palace, Sydenham, on November 4, 5, and 6, and it was one of the best displays seen in recent years. The show was spread down the length of the great building, and partly in the transept. Competition in many of the classes was very keen and the blooms were, on the whole, very good and clean. There was also a good display of table decorations, of apples, and of vegetables, while the trade displays were so numerous and fine that they constituted a real big flower show in themselves. We were specially glad to find an improvement in the show, and also to find a quite considerable number of new competitors coming forward.

GROUPS.

First prize for a large group of cut chrysanthemums, foliage, and foliage plants, was awarded to Mr. F. Brazier, Addison Road, Caterham, who had a bold exhibit, in which large blooms figured towards the margin, while the central features were big vases of single and decorative varieties associated with autumn foliage, etc.

In the trade-excluded class of similar character, Mr. W. Howe, gardener to Lady Tate, Park Hill, Streatham, was awarded the chief prize for a stately and bright exhibit. The centre consisted of a cone of big blooms and crotons, and round this were small mounds of decorative varieties with specimen crotons, etc., and a groundwork of ferns.

GREAT VASE CLASS.

In the great vase class, for a dozen vases of Japanese blooms, distinct, three blooms in each vase, Mr. G. Hall, Melchett Court Gardens, Romsey, won the coveted premier award with grand examples of Lady Talbot, Maud Jefferies, Magnificent — beautiful colour, Mrs. Knox, J. H. Silsbury, Mdme. Rivol, Edith Smith, W. E. Etherington, Marquis of Northampton, Reginald Vallis, Madame P. Radaelli, and F. S. Vallis—specially fine. There were four competitors, and second prize fell to Mr. J. Dymock, gardener to G. D. Faber, Esq., C.B., M.P., Rush Court, Wallington, whose best flowers were of F. S. Vallis, Reg. Vallis, Mrs. Norman Davis, Mrs. A. T. Miller, Bessie Godfrey, and Lady Talbot. Mr. W. Iggulden, Lock's Hill Nurseries, Frome, Somerset, secured the third prize.

HOLMES' CUP CLASSES.

There were four entries for the Holmes' Memorial Cup that is offered as first prize for thirty-six incurved blooms, distinct, and here Mr. W. Higgs, gardener to J. B. Hankey, Esq., Fetcham Park, Leatherhead, was once more the winner, and he set up a splendid lot of flowers, the finest being Buttercup, F. Trestian, Mrs. Judson, Souvenir de Wm. Clibran, Mr. J. Wynne, Romance, Daisy Southam, Embleme Poitevine, Pantia Ralli, Le Peyron, Mr. H. J. Jones, May Phillips, C. H. Curtis, G. F. Evans, Mrs. J. Hygate, Epsom, came second; and Mr. W. Mease, gardener to Pantia Ralli, Esq., Ashtead Park, Epsom, came second; and Mr. W. Mease, gardener to A. Tate, Esq., Downside, Leatherhead, was third.

There were six entries of four dozen Japanese blooms, distinct, and here the cup was won by Mr. G. Hall, gardener to Lady Ashburton, Melchett Court, Romsey, with a bright set of good blooms, his leading varieties being F. S. Vallis, Madame P. Radaelli, Mrs. Knox, Mrs. Norman Davis, Melchet Beauty, Mrs. G. Mileham, Bessie Godfrey, Marquis of Northampton, Algernon Davis, Magnificent, Eric Crossley, Edith Jameson, Lady Conyers, Valerie Greenham, Duchess of Sutherland, Madame Rivol, Maud Jefferies, and J. H. Doyle; Mr. W. Mease was second, and he had a fine set of flowers; Mr. W. Higgs secured third place, and Mr. W. Iggulden, Lock's Hill Nurseries, Frome, came fourth.

CUT BLOOMS.

Mr. W. Higgs won Mr. C. E. Shea's prize for a dozen vases of incurved blooms, distinct, three flowers in each vase, with first-rate examples of Embleme Poitevine, Miss C. Holding, Mr. W. Higgs, Duchess of Fife, Lady Isabel, Pantia Ralli, W. Pascoe, Frank Trestian, Boccace, Mrs. Barnard Hankey, and Buttercup; Mr. W. J. Hunt came second, and Mr. H. Parr, gardener to F. A. Bevan, Esq., Trent Park, Barnet, was third.

In a special class for two dozen Japanese blooms, distinct, varieties distributed during 1906-7-8, the prizes were provided by Mr. Norman Davis, Mr. W. J. Godfrey, Mr. H. J. Jones, and Messrs. Wells and Co. There were five entries, and here Mr. G. Hall, Melchet Court Gardens, Romsey, won first place with handsome examples of Mrs. N. Davis, Norman Davis, Mrs. J. Niel, British Empire, Mary Donellan, W. King, Mary Mason, Thos Stevenson, Mrs. H. Pearson, Edith Jameson, etc.; Mr. A. Jefferies, Moor Hall Gardens, was a good second; only two prizes were offered, but they were the substantial ones of £12 and £8.

The silver cup presented by Sir Albert Rollit, D.C.L., President of the Society, for the best twenty-four Japanese blooms, distinct, was won by Mr. J. Dymock, Rush Court Gardens, Wallingford, with a grand lot of flowers, the best being Bessie Godfrey, Mrs. Norman Davis, J. H. Silsbury, F. S. Vallis, Walter Jinks, Madame Nagelmakers, Mrs. Coster, Lady Talbot, Valerie Greenham, General Hutton, Reg. Vallis, Edith Smith, and Leigh Park Wonder; Mr. W. Holden, Ewell House Gardens, second; Mr. A. Chandler, Coton House Gardens, third; and Mr. G. Hall, Melchett Court Gardens, fourth; seven entries.

There was a very keen competition in the class for a dozen Japanese blooms, distinct, Mr. G. Hall coming to the front with beautiful examples of F. S. Vallis, J. H. Silsbury, Bessie Godfrey, Magnificent, Annie Hamilton, Reg. Vallis, Marquis of Northampton, W. A. Etherington, Mdme. P. Radaelli, Lady Talbot, Edith Smith, and Algernon Davis. There were ten entries; Mr. A. Chandler, gardener to A. James, Esq., Coton House, Rugby, came second, and Mr. W. Holden, gardener to R. B. Jacombe, Esq., Ewell House, Ewell, third.

In the class for a dozen incurved blooms, distinct, there were eight entries, and here Mr. Preece, gardener to Miss Willmott, V.M.H., Warley Place, Great Warley, Essex, won with round full flowers of Mrs. G. Denyers, Emblem Poitevine, Duchess of Fife, Buttercup, Triomphe de Montbrun, Daisy Southam, Mrs. F. Judson, Godfrey's Eclipse, Lady Isabel, W. Biddle, Mrs. H. J. Jones, and Clara Wells; Mr. W. Higgs had to be content with second place, and Mr. W. Mease was third prize winner. Mr. G. Mileham, gardener to A. T. Miller, Esq., Emlyn House, Leatherhead, scored for six incurved blooms, one variety, with Buttercup in fine form; Mr. A. Osmond, gardener to A. Kempt, Esq., Ross Road, South Norwood, second, with C. H. Curtis, and Mr. H. Parr, third with Buttercup.

Mr. Vert, gardener to Lord Howard de Walden, Audley End, Saffron Walden, scored for a vase of five white Japanese blooms with Mrs. A. T. Miller in superb form; Mr. G. Mileham second, with the same variety, and Mr. F. Brazier, Caterham, third, with Mrs. Norman Davis. For a vase of five yellow blooms, one variety, Mr. W. Iggulden led with F. S. Vallis, very fine; Mr. A. Jefferies, gardener to J. Balfour, Esq., Moor Hall, Harlow, second, and Mr. W. Higgs third with the same variety.

First prize for a dozen bunches of single varieties fell to Mr. H. Redden, gardener to G. W. Bird, Esq., Manor House, Wickham, who showed Frank Redden, Mrs. H. Redden, Edwin Nottell, Crown Jewel, Wickham Giant (new), Pink Beauty, Maud Matthews, Edith Matthews, etc., all fine varieties; Mr. C. J. Simpson, St. John's Nursery, Chelmsford, second, and Mr. W. Waterton, gardener to R. H. Comyns, Esq., Heath Farm House, Watford, third. The best six vases of anemone pompons came from Mr. F. Fitzwater, gardener to F. Braby, Esq., Bushey Lodge, Teddington, and this exhibitor was also an easy first prize winner in the class for six vases of pompones; Mr. J. A. Humphries, gardener to J. E. Burgess, Esq., Hill House, Maisey Hampton, coming second in the latter class.

Mr. A. C. Horton, gardener to J. L. Boyd, Esq., North Frith, Tonbridge, led for Japanese anemones, twelve blooms, with Le Chalonaise, Sabine, Madame Lawton, John Bunyan, W. W. Astor, etc.; Mr. A. Henderson, gardener to C. Douglas Clark, Esq., Eccleshill, Bromley, second, and Mr. J. A. Humphries, third. For large-flowered anemone varieties these competitors maintained the same positions.

Premier place for a collection of cut chrysanthemums, arranged on a table 12ft. by 6ft., was won by the Dulwich Chrysanthemum Society, with a fine lot of Japanese, incurved, decorative, and single varieties, all pleasingly disposed with fern fronds. This was the class for Affiliated Societies; second prize fell to the Reigate Chrysanthemum Society, which also showed well.

AMATEURS.

In the chief amateurs' division, Mr. W. Rigby, gardener to Rev. A. C. Cooper-Marsden, Wickham Road, Beckenham, had the best twelve Japanese blooms, Mr. T. W. Stevens, gardener to W. H. Stone, Esq., Donnington, Laurie Park, Sydenham, second; and Mr. C. B. Gabriel, Easdale, Horsell, third. There was but one entry of twelve incurved blooms, and this, from Mr. A. Osmond, was awarded first place.

In another amateurs' class for twelve Japanese blooms, Mr. C. M. Collingwood, St. David's Hill, Exeter, scored easily with fine examples of F. S. Vallis, Algernon Davis, etc.; Mr. C. Fox, Richmond Lodge, Tunbridge Wells, second; and Mr. A. Williamson, East Street, Haslemere, third. In the corresponding class for twelve incurved blooms, Mr. James King, East View, Hendon, came first, and Mr. C. M. Collingwood second. Mr. Collingwood led for twelve vases of single chrysanthemums with pretty bunches of medium sized flowers.

In the amateurs' class for a vase of single blooms, Mr. E. Houlton scored a first, and was followed in order by Mr. G. Hagger, gardener to H. Kerr, Esq., South Woodford; and Mr. C. Bowyer, gardener to B. Dawson, Esq., Maybourne, Laurie Park, Sydenham.

In the smaller amateurs' classes, a few of the more important exhibitors and exhibits were: Mr. A. Osmond, six incurved; Mr. L. Gooch, gardener to T. Wickham Jones, Esq., Frocester Lodge, South Norwood, six Japanese, one variety, F. S. Vallis; Mr. W. Rigby, six Japanese, distinct, a fine set; Mr. W. J. Connell, gardener to J. H. Payne, Esq., Chatswood Road, West Norwood, three vases of pompones; Mr. A. Osmond, six incurved, one variety, Chas. H. Curtis; Mr. C. M. Collingwood, six Japanese, three varieties—Reg. Vallis, Algernon Davis, and Mrs. C. Beckett; Mr. Childman, St. Margaret's, Twickenham, six incurved, three varieties; Mr. C. Fox, Tunbridge Wells, three Japanese; Mr. W. Childs, Grays, Essex, six incurved; Mr. C. M. Collingwood, three vases of pompones.

FLORAL ARRANGEMENTS.

In the open class for table decorations, Mrs. A. Robinson, Park Hill, Carshalton, led with a pretty design in yellow and bronze varieties of the Source d'Or type; Mr. T. W. Stevens, Laurie Park, second; and Mr. A. W. Trossell, gardener to H. Attenborough, Esq., St. Helens, Beckenham, third. There were fifteen entries, and the tables were in two distinct groups, and one of these groups would appear to have been entirely overlooked.

For a table decoration of other than yellow or bronze flowers, Messrs. R. Felton and Sons, Hanover Square, W., gained first prize for a combination of pink, rose, and green flowers, but the design was too heavy for the size of the table, at least, so we thought; Mr. A. W. Trossell second, and Mr. H. Baker, gardener to T. Glass, Esq., Borrowdale, West Hill, Sydenham, third, the latter setting up red and white single flowers prettily.

Miss C. B. Cole led for a hand basket of chrysanthemums, and she was also first for a basket of autumn foliage and berries with a very handsome arrangement; Mrs. Brewster, St. Peter's, Canterbury, second, and Mrs. G. Knights, Border Crescent, Sydenham, third.

For a vase of Japanese blooms and foliage Mr. C. Fox, Tunbridge Wells, led with fine flowers of Beatrice May, arranged with grasses and berberis sprays; Mr. E. Dennis, gardener to A. Grove, Esq., Bollards Park, Chalfont St. Giles, second, and Mr. C. B. Gabriel third. The best vase of decorative chrysanthemums was adjudged to the one staged by Mr. C. B. Gabriel, and it was a fine one of yellow and crimson flowers; Mr. E. Houlton, gardener to J. Gardner, Esq., Croxted House, Dulwich, second, and Mr. Hugh Kerr, Ard Gowan, South Woodford, third; four entries.

Mr. J. W. Harrison, gardener to R. Girvin, Esq., Laurie Park Gardens, Sydenham, had the best vase of single chrysanthemums in the open class, and he was followed in order of merit by Mr. A. Robertson, gardener to F. G. Yarrow, Esq., Abbey Road, St. John's Wood, and Mr. R. Edwards, gardener to C. A. Morris, Esq., Beechy Lees, Sevenoaks; there were nine entries.

There were four entries in the class for a decorative display of flowers, on a table 8ft. by 6ft., and here Mrs. F. Brewster won first prize with single flowers and autumn foliage; Mrs. H. L. Sell, Kempton Villa, Luton, second, and Miss E. H. Ekins, Rushden, Lattimore Road, St. Albans, third.

VEGETABLES AND FRUITS.

Mr. E. Beckett, V.M.H., gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree, was an easy first for a collection of eight kinds of vegetables, in a class provided by Messrs. Webb and Sons, Stourbridge; he had Masterpiece onions, Viceroy tomatoes, Champion Prize leeks, and Late Guardian cauliflowers in fine condition; Mr. W. Waterton, gardener to R. H. Comyns, Esq., Heath Farm House, Watford, second.

Mr. R. Sydenham, Birmingham, provided a number of special prizes for vegetables, and in the chief one, for a collection of eight kinds, Mr. Silas Cole, gardener to Earl Spencer, Althorp Park, Northampton, was a good first, among seven entrants; he had splendid Ailsa Craig onions, Autumn Giant cauliflowers, Hollow Crown parsnips, and Claythorp's Prize Pink celery; Mr. W. Folkes, Ampthill, Beds, second, and Mr. J. Kerr, Loudwater, Rickmansworth (gardener, Mr. T. Avery), third. Mr. A. Basile, gardener to Rev. J. McMurdie, Woburn Park, Weybridge, led for celery—Clayworth Prize Pink; Mr. Basile for potatoes—Royal Kidney and Windsor Castle; Mr. Ellis, gardener to V. Earle, Esq., Franks Hill, Farningham, for turnips; Mr. W. Folkes for beet—Pragnell's Exhibition; Mr. S. Cole for leeks—The Lyon; Mr. Basile for parsnips—Hollow Crown; Mr. Basile for onions—Ailsa Craig; Mr. Folkes for carrots—St. Valery; Mr. Folkes for Brussels sprouts—The Wroxton; Mr. Ellis for savoys—Drumhead; Mr. T. Avery for red cabbage; and Mr. Basile for cauliflowers, Autumn Giant.

Mr. W. Stowers, Harold Road, Sittingbourne, had the best set of six dishes of dessert apples, showing a very even lot of King of the Pippins, Cox's Orange Pippin, Chas. Ross, Rival, Fearn's Pippin, and Paroquet; Mr. E. Montague, gardener to Colonel Biddulph, Grey Court, Ham, second, and Mr. R. Edwards, gardener to C. A. Morris-Field, Esq., Beechy Lees, Sevenoaks, third.

Mr. Stowers led for culinary apples, six dishes, with heavy fruits of Emperor Alexander, Bramley's Seedling, Mère de Ménage, Lane's Prince Albert, Peasgood's Nonsuch, and Bismarck; Mr. H. Ellis, gardener to V. Earle, Esq., Franks Hill, Farningham, second, and Mr. H. Parr, Trent Park Gardens, third. Mr. Horton was first and Mr. R. Edwards second for six dishes of pears, and both showed well.

In the grape classes premier place for three black bunches was won by Mr. T. W. Hill, gardener to S. J. Wigg, Esq., Rockshaw, Merstham, with Alicante; Mr. W. Lintott, gardener to Sir Walpole Greenwell, Bart., Marden Park, Caterham, second, and Mr. W. Howe, third. For white grapes Mr. W. Lintott was first, and Mr. H. Parr second, both showing Muscat of Alexandria.

NON-COMPETITIVE.

Messrs. R. Felton and Sons, Hanover Square, W., showed a few beautiful floral designs, that included a cross of white chrysanthemums, with violets, dendrobiums, and cattleyas grouped lightly around the base; a chaplet of white and pink chrysanthemums, and cattleyas; and a harp of golden chrysanthemums and Odontoglossum grande, with violets making a striking and beautiful contrast to the golden base. Messrs. W. Wells and Co., Merstham, had a fine bank of chrysanthemums, that, we were glad to see, consisted largely of plants, so that there was ample evidence of the capabilities of the market, decorative, and single varieties. Of course, there were big blooms, notably of Mrs. W. H. Lewis, Rose Pockett, F. S. Vallis, the new Wm. Mease, Mrs. W. Wells, Bessie Godfrey, etc. Among market varieties we noticed Freda Bedford, the new golden-yellow R. E. Felton, and the deep crimson-red Foxhunter. Among singles the new Sylvia Slade, deep rose-red with white ring round the eye; Grace, Bronze Pagram, Jessie Curtis, and Metta were very fine. This was a most interesting group. Messrs. J. Peed and Son, West Norwood, contributed a very attractive circular display of chrysanthemums, tastefully disposed. Mr. T. Williams, Ealing, had some pretty table decorations.

Mr. W. J. Godfrey, of Exmouth, contributed a bank of blooms, consisting chiefly of large flowers set amid ferns and asparagus; conspicuously good were Mr. Frank Pearce, Melchet Beauty, Mrs. Norman Davis, Lady Talbot, Miss Lily Baker, Mrs. W. Wells, and Dorothy Goldsmith. Single varieties set up in large vases of a variety, and incurved varieties similarly treated, went to make up this attractive group. Messrs. Hobbies, Dereham, showed the value of roses for autumn decoration, and their group of these fragrant flowers attracted a good deal of attention. The same firm had a display of single chrysanthemums in vases, and here Gaiety, Edith Pagram, Bronze Pagram, Miss Irene Cragg, Alice Crate, and Nellie Richardson were very good. Mr. H. W. Thorp, Durrington, Worthing, showed a small group of chrysanthemums that included the new incurved H. W. Thorp, and a good selection of singles.

Messrs. J. Peed and Son, West Norwood, contributed an attractive exhibit of clean apples, that included all the leading varieties. Messrs. G. Bunyard and Co., Maidstone, had a wonderfully fine exhibit of fruit, the apples being especially clean and bright, and the pears of fine size. The display was also an artistic one: Chas. Ross, Ribston Pippin, Cox's Orange Pippin, Wealthy, American Mother, Mère de Ménage, King of Tomkin's County, Newton Wonder, Gascoigne's Scarlet, and Peasgood's Nonsuch were a few of the two hundred and twenty varieties that were specially attractive in this exhibit. Messrs. H. Cannell and Sons, Swanley, had a very fine group of apples and pears, and here the apples were particularly well-coloured and the fruits fine in size; King of the Pippins, Cox's Orange Pippin, Wealthy, Blenheim Pippin, Yorkshire Beauty, Cox's Pomona, Cellini, and Emperor Alexander were notably fine dishes. The fruit display made by the Agent-General of British Columbia, Salisbury House, London Wall, was also a great attraction, most of the fruits being staged in boxes as packed; of Golden Russet, Spitzenberg, Cox's Orange Pippin, Hubbardston Nonsuch, Hyslop Crab (fine for jelly making), Rome Beauty, Grimes' Golden Pippin, and Jonathan, there were splendid samples.

Mr. P. Ladds, Swanley Junction, put up a large display of market chrysanthemums associated pleasingly with heaths, palms, the newer nephrolepises, forced spiræas, dracænas, etc. Messrs. H. Scott and Sons, Woodside, S.E., had a big display of summer-houses, rustic arches, pergolas, etc. Mr. G. W. Riley, Herne Hill, also showed pergolas, rustic arches, summer-houses, and two large plant-houses of good design.

Mr. Norman Davis, Framfield, Sussex, had a particularly large and fine exhibit. Close up to a background of palms he had tall stands of fine flowers of True Gold, Mrs. F. G. Coster, Formality—a fine white, Mdlle. J. de la Crouée, Marquis of Northampton, Mrs. C. Penford, North Pole, and the crimson Joseph Stoney, all Japanese varieties. In the central foreground was a group of the lovely pure white Mrs. Norman Davis, splendid blooms, and on either side of this group were vases of fine singles, such as White Pagram, Nellie Richardson, Virgo, Leo, etc. Mr. Davis is naming his new singles after stars—a good method. We may add that Algernon Davis, G. Mileham, W. J. Davis, W. Beadle, Splendour, Clara Wells, and C. J. Champion were show varieties grandly represented, and Mr. Davis had also several fine new seedlings.

A large, bold, and very beautiful group of chrysanthemums was staged right in the centre of the show by Mr. H. J. Jones, Ryecroft Nursery, Lewisham. This display was a fine effort; it was of oval shape, with tall stands of a variety rising well above a groundwork of blooms and foliage. Mr. Jones is a fine decorator, and no one knows better than he how to display big blooms. Over the central mass of white flowers there rose a bold stand of yellow and bronze bloom, while set well out from this, in tall stands, were fine bouquet-like groups of Buttercup, H. J. Jones, Mrs. T. Tagg, etc. Smaller or lower stands were of Moneymaker, F. M. Lever, Reg. Vallis, Crimson King, C. E. Harrison, and other fine varieties. Among the many specimen flowers set out in the groundwork we noted Master David, Master James, Lady Crisp, Sir Frank Crisp, Rev. R. D. Eves, Melba, F. S. Vallis, and other good things, but there were also decorative and single varieties in great profusion. This group won the special Witty medal as the best miscellaneous display.

Miss R. Davis, Upper Norwood, contributed floral designs. Messrs. W. Cutbush and Son, Highgate, sent up several new seedling chrysanthemums, including the recently certificated single variety Hilda Lawrence.

MEDALS.

Large Gold.—Mr. Norman Davis, Framfield, Sussex; Mr. H. J. Jones, Ryecroft Nursery, Lewisham.

Gold.—Messrs. W. Wells and Co., Merstham; Messrs. H. Cannell and Sons, Swanley; Messrs. J. Peed and Son, West Norwood; Messrs. G. Bunyard and Co., Maidstone; Mr. P. Ladds, Swanley Junction.

Silver-gilt.—Messrs. R. E. Felton and Son, Hanover Square, W.; Mr. W. J. Godfrey, Exmouth; Agent-General of British Columbia.

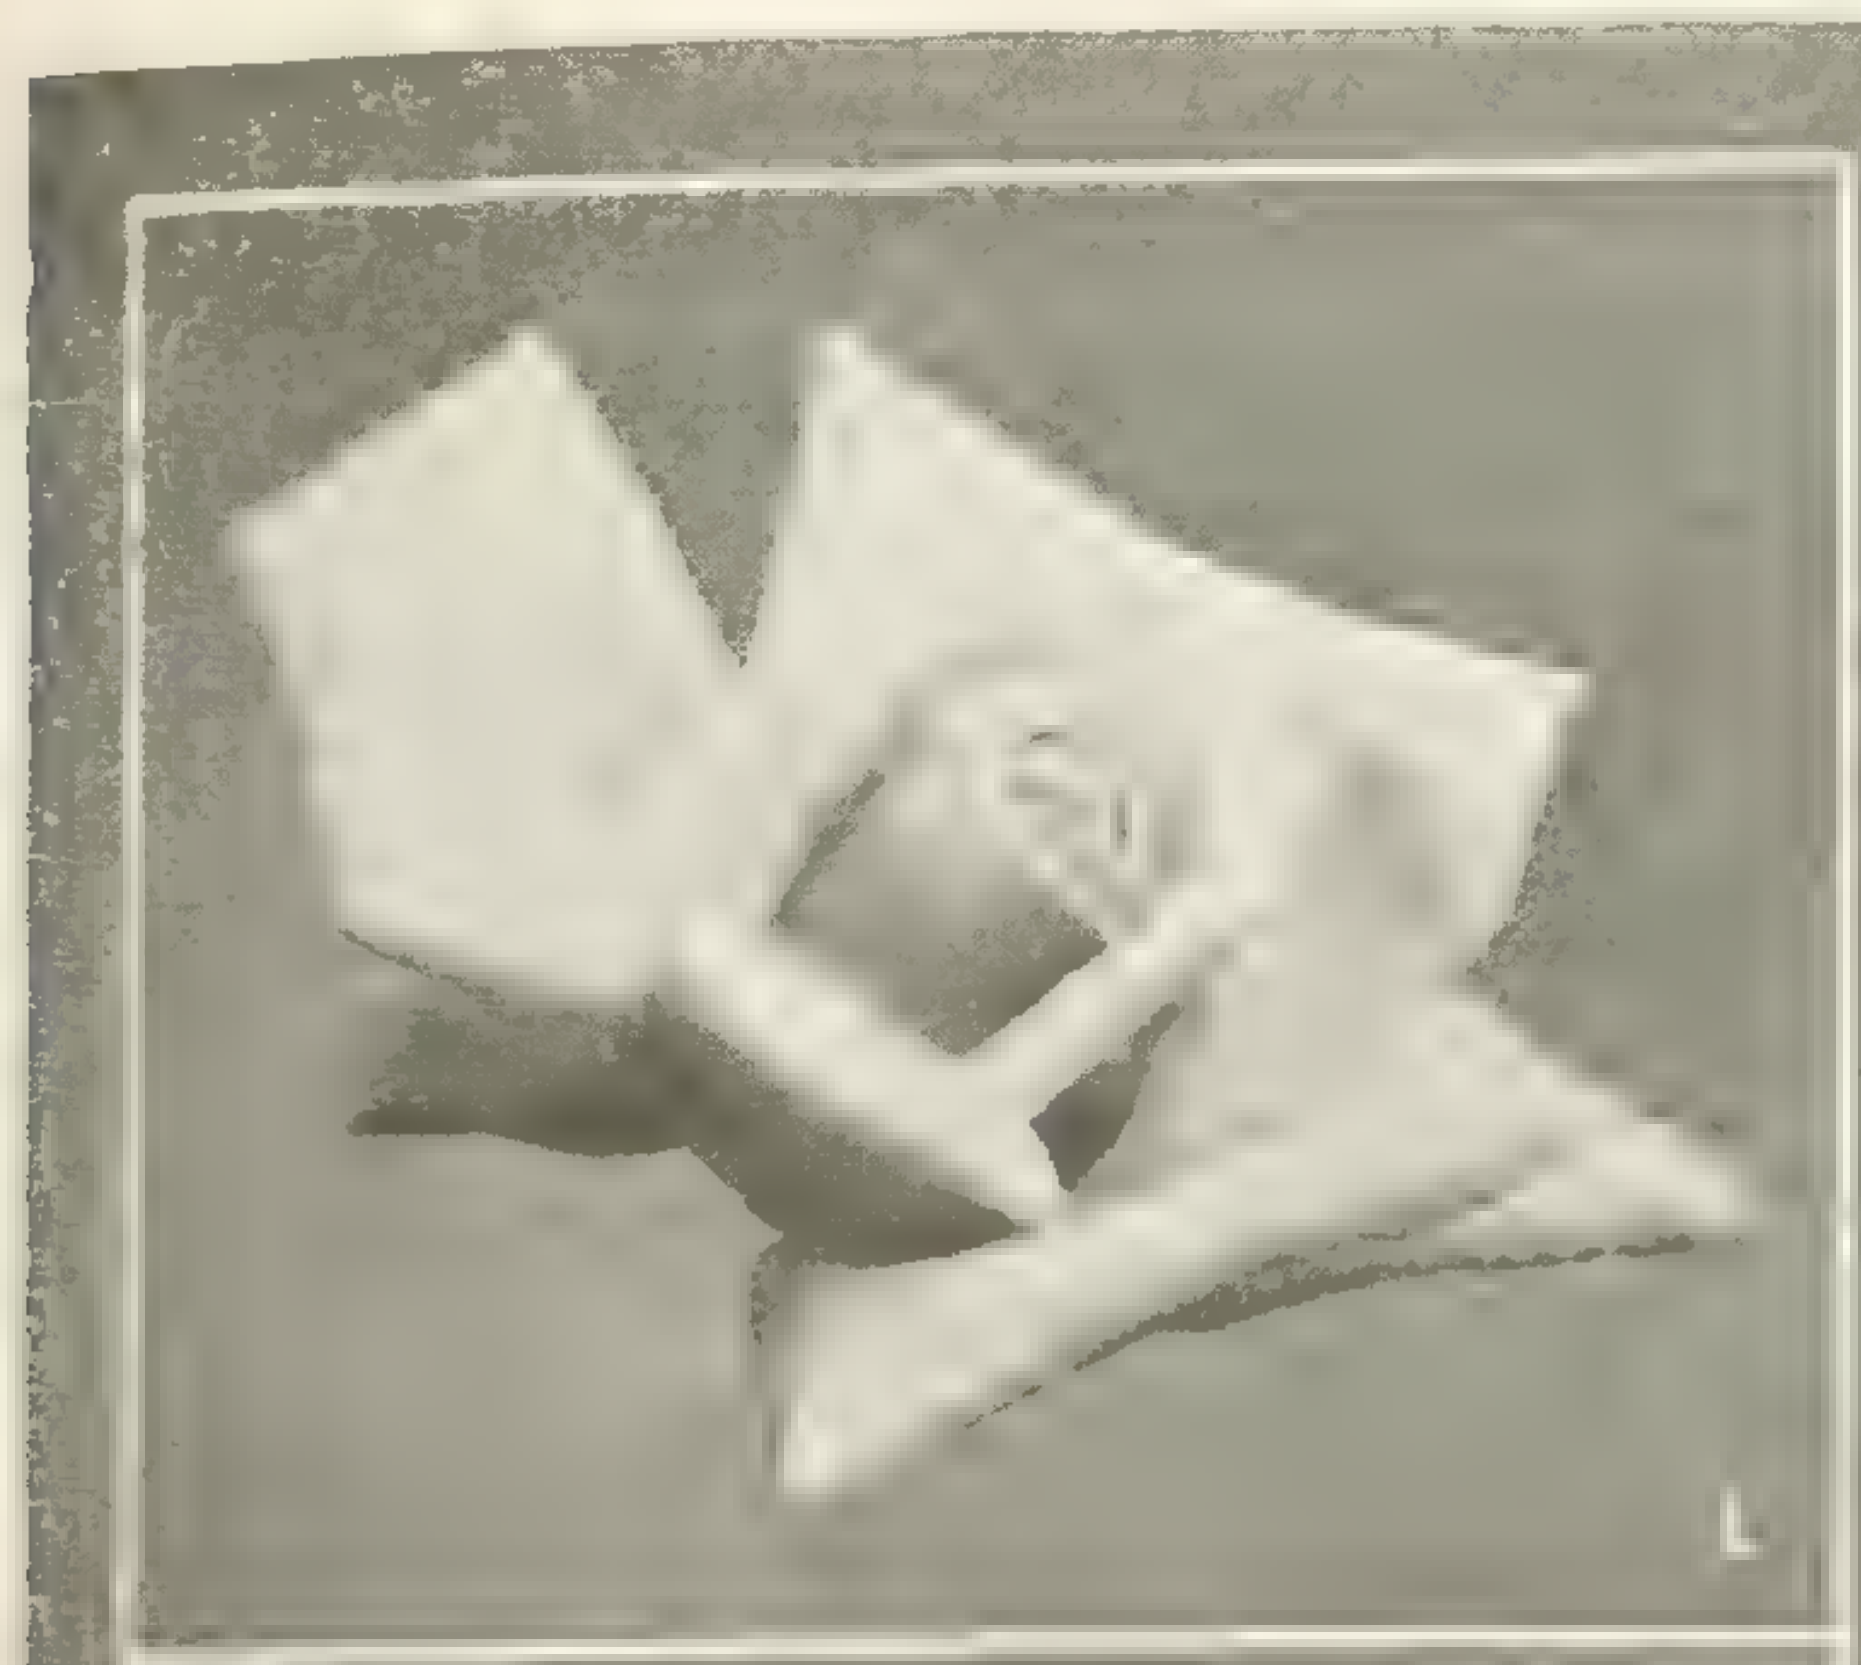
Large Silver.—Mr. G. W. Riley, Herne Hill; Messrs. H. Scott and Sons, Woodside, S.E.; Messrs. Hobbies, Lim., Dereham; Mr. C. J. Simpson, Chelmsford.

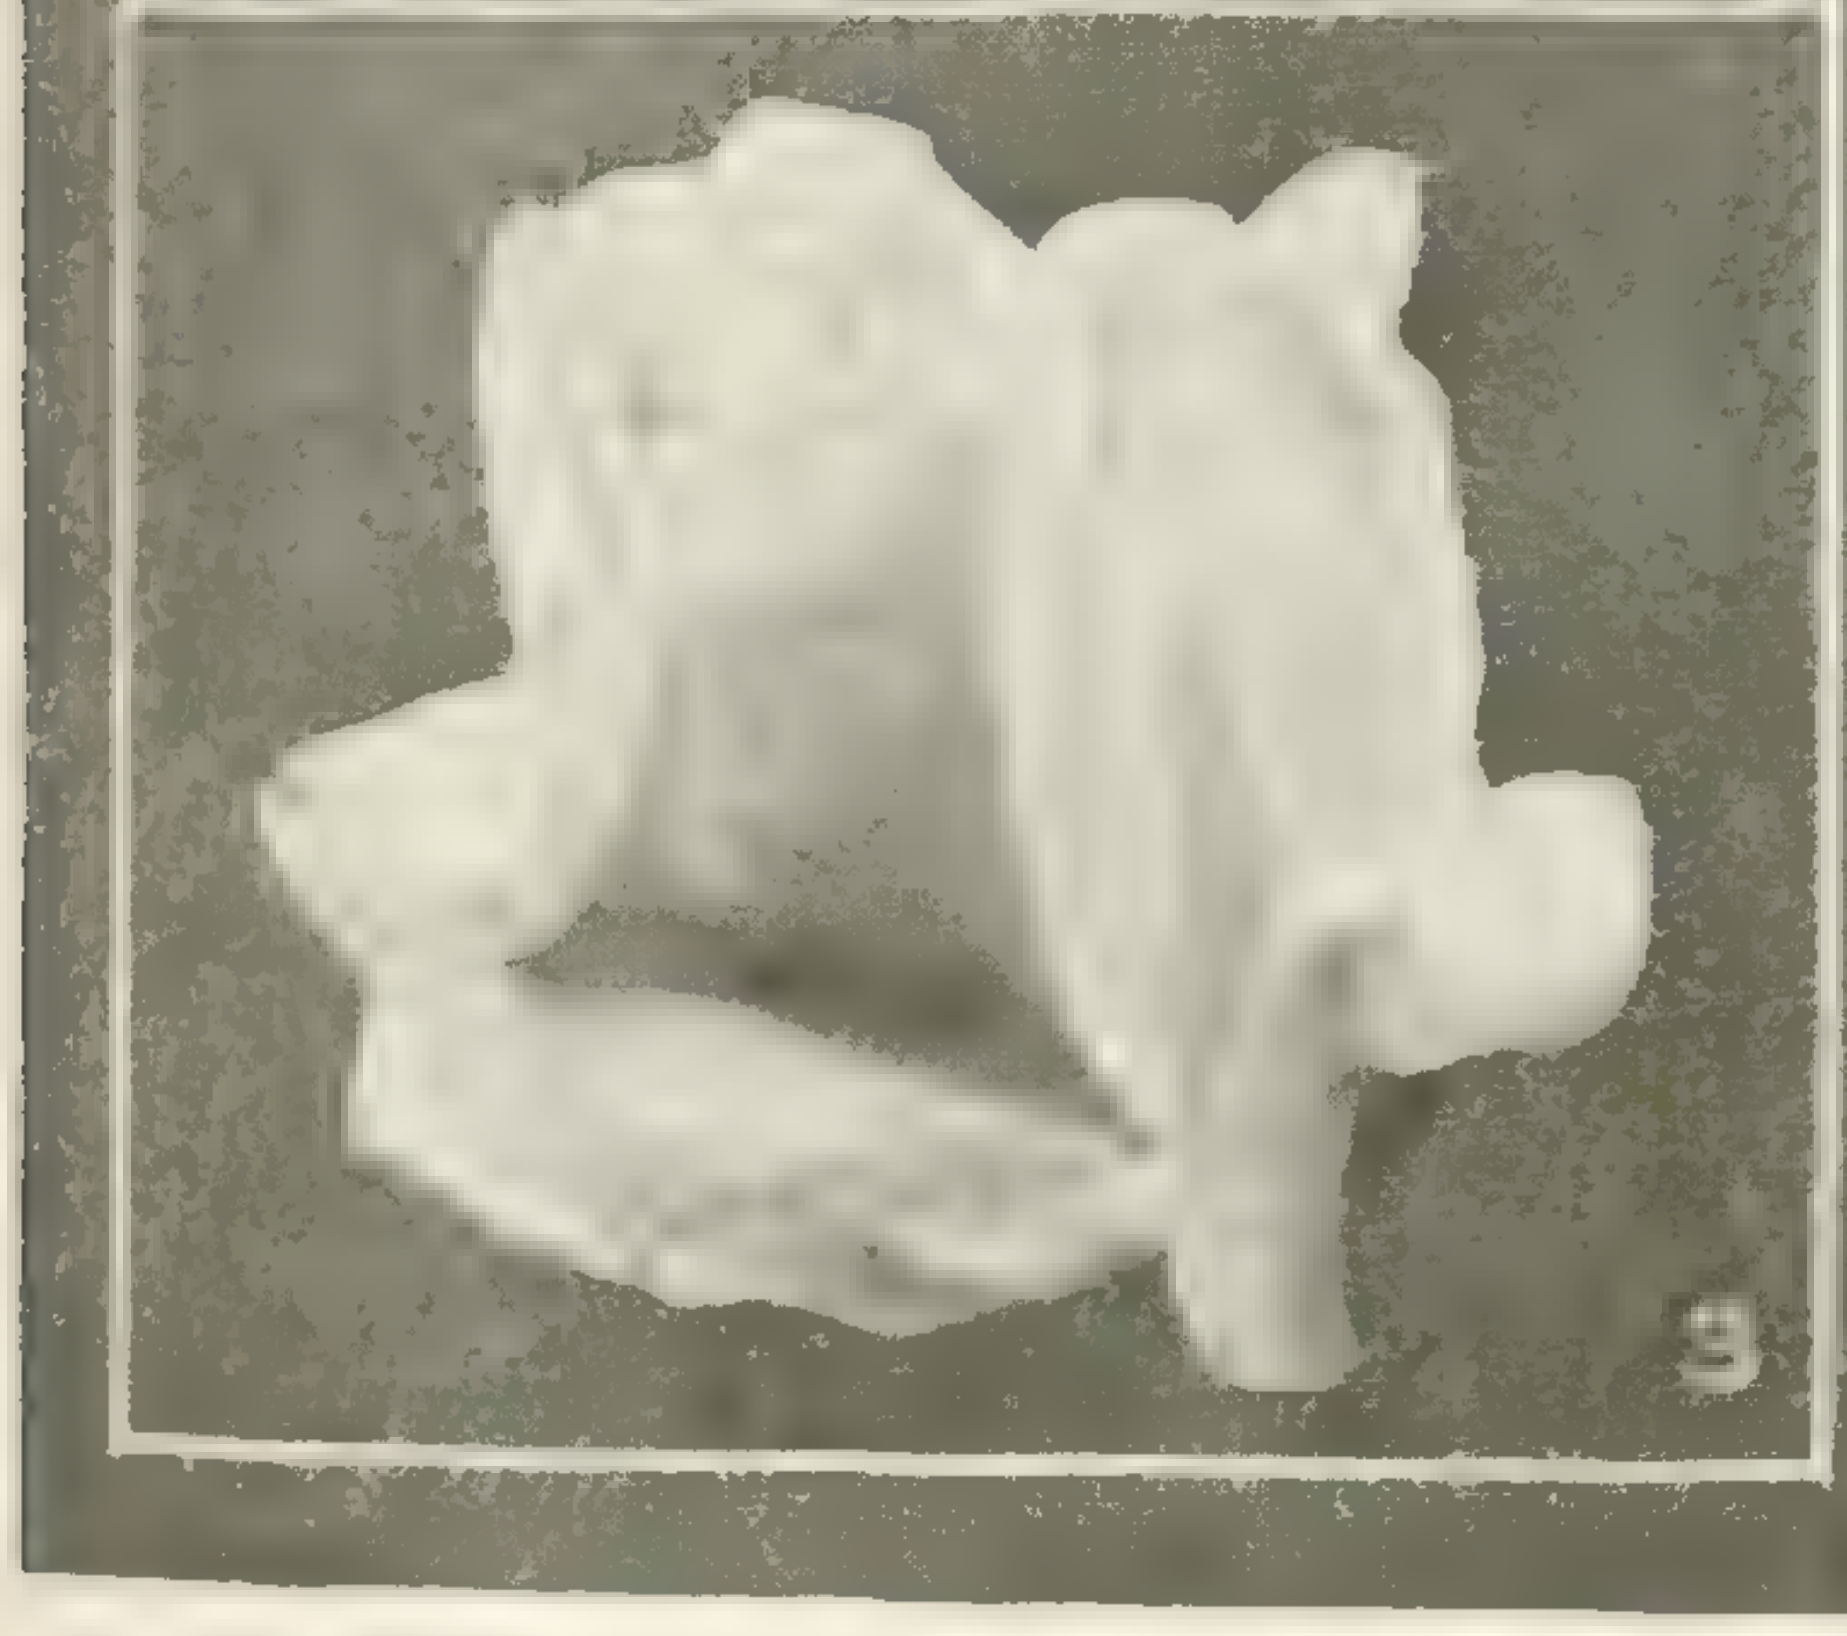
Silver.—Messrs. Duncan Tucker, Tottenham; Messrs. J. Laing and Sons, Forest Hill; Miss R. Davis, Upper Norwood; Mr. F. Brazier, Caterham; Mr. T. Williams, Oxford Road, Ealing; Mr. H. W. Thorp, Durrington, Worthing.

The Leamington Onion Show.

A very large competition was brought out on Saturday, October 24, in connection with Messrs. Rogers' valuable prizes for a single specimen of Leamington Giant Onion. No fewer than seventeen hundred bulbs were staged, and the first prize of £100 was secured by Mr. A. R. Searle, Castle Ashby Gardens, Northampton, who had a most perfect specimen of over three pounds in weight. Mr. S. J. Baker, Weir House Gardens, Exeter, who also had an exceedingly fine onion, was second; Mr. W. Turnham, Culham Court Gardens, Henley-on-Thames, third; and Mr. A. G. Gentle, Little Gaddesden, Berkhamsted, fourth. In addition to the first prize, sixty other prizes were awarded, and the majority of the bulbs showed excellent culture, being shapely and well finished.

The first prize of £100 for the single onion was handed to the winner on the afternoon of the show, and we understand that Messrs. Rogers propose to offer some equally valuable prizes next year. Mr. E. Beckett was the onion judge.





James Backhouse & Son, Ltd

HORTICULTURAL SPECIALISTS FOR TWO CENTURIES

Enthusiastic gardeners, more than any others, are always ready to pass on "a good thing." When this happens frequently there is usually "something in it." It has become quite a commonplace for us to hear "I am recommended to you by Mr. So-and-So, who is delighted with your Roses." Extreme hardiness, vigorous growth, perfection in size and colour of blooms, are the main points of superiority that have gained the goodwill of York Rose Tree purchasers. There never was a better opportunity than now for you to become acquainted with them.

Six Aristocrats in the Rose World :

No. 1. **Countess of Caledon,** pale rose with deeper centre.
,, 2. **Antoine Rivoire,** rosy flesh, shaded carmine.
,, 3. **Frau K. Druschki,** magnificent pure white.
,, 4. **La France,** silvery peach colour, sweet.
,, 5. **Mrs. Sharman Crawford,** deep rosy pink, shaded flesh colour
,, 6. **Madame Abel Chatenay,** fawn pink, shaded salmon.

Royal Horticultural Society.

SCIENTIFIC COMMITTEE, October 27, 1908.

Present: Mr. E. A. Bowles, M.A., F.L.S. (in the chair), Messrs. W. Hales, E. W. Holmes, G. Massee, G. Gordon, H. T. Güssow, J. T. Bennett-Poë, W. Cuthbertson, J. Douglas, W. C. Worsdell, L. Crawshay, G. S. Saunders, J. Fraser, and F. J. Chittenden (secretary).

ROSE LEAVES DISEASED.—Mr. Saunders showed rose leaves having white patches upon them, and evidently affected by a fungus, which Mr. Massee took for further investigation.

FASCIATION IN BEANS.—Mr. Worsdell remarked that though the cause of this well-known phenomenon was so far unknown, in many cases it appeared possibly due to an excess of nourishment directed to a given spot, but it was also partly constitutional. He showed numerous specimens of bean seedlings (Phaseolus multiflorus) in which he had, by removing the central shoot as soon as it made its appearance out-side the seed, induced fasciation in the shoots which arose in the axils of the cotyledons. A majority of the plants treated had behaved in this way, but not all. In P. vulgaris, in which the cotyledons are raised above the surface, he had failed to induce fasciation, as the long hypocotyl apparently took all the surplus nourishment from the cotyledons. Fasciated roots appear to be rarely met with in Nature, but he had been able to induce the formation of such in one case of Phaseolus vulgaris. After removing the radicle, an adventitious root had sprung from the hypocotyl, and this had become fasciated.

Mr. Chittenden, on behalf of a correspondent, showed a fasciated stem of Calystegia pubescens.

ADVENTITIOUS SHOOTS ON LEAVES OF CARDAMINE PRATENSIS. — Mr. Holmes showed leaves of Cardamine pratensis fl.-pl. bearing well-developed shoots arising from the tips and surface. The same phenomenon is frequent in the single form as well as in the double.

VIVIPAROUS GRASS.—Mr. Holmes also showed a specimen of Aira cæspitosa with numerous small branches springing from the nodes. Such growths are very common in some grass species, and are often found in the inflorescence, particularly after a period of wet weather. They normally occur in some species, as in Festuca ovina, in moist mountainous regions.

AERIAL TUBERS IN ACHIMENES GRANDIFLORA.—Mr. Hales showed specimens of this plant bearing numbers of greenish tubers in the leaf axils. These tubers easily fell away, and were produced by plants which had been grown on after they had finished flowering.

CROCUS CORMS DISEASED.—Mr. Massee showed corms of crocus which had been killed by the bacterium, Pseudomonas hyacinthi, which is the cause of the well-known disease of hyacinths. He wished to draw attention to this disease, for which there is no cure, and to warn against planting diseased corms. When cut the corms show the same yellow gummy exudation typical of the disease in hyacinths.

NEW CERTIFICATE. — Mr. Bowles announced that the Council had had under their consideration a new certificate which, it was suggested, should be designated Certificate of Appreciation, to be awarded for worthy exhibits of objects demonstrating the results of experimental cultures in gardens, with the object of encouraging individual effort in this direction. The Council suggested that this committee should undertake to consider such exhibits, a suggestion which the committee cordially agreed to carry out.

CURIOUS NARCISSUS BULB.—From the Rev. J. Jacob came a curious bulb of narcissus in which the axis of a lateral offset had elongated and produced at its apex a small bulb quite normal in structure, about 2in. above the other bulb.

POPPIES WITH BRACTS, ETC.—From a correspondent at Lincoln, who previously sent Shirley poppies with numerous bracts just below the flowers, came further specimens. In the accompanying communication he stated that these plants were undoubtedly hybrids, though unfortunately it was not known what the pollen parent had been, though the seed parent was the Shirley poppy. Little seed was produced this year. From the same correspondent came specimens of polyanthus having an enlarged calyx and no flower, and others with a rather less enlarged calyx and a small flower.

APPLES SHOWING "GLASSINESS." — Two specimens of the apple Lane's Prince Albert were sent, one from Harpenden, the other from Ross, both showing the peculiar greenish semi-transparency known as "glassiness." The appearance is due to the transfusion of the cell sap into the intercellular spaces, and it was suggested that this was due, perhaps, either to the very hot weather experienced during the beginning of October, or to the abundant rain following a period of drought. In the former case it was reported that every year from one tree some apples showing the same appearance were gathered, and that the affected spots rotted after a time, and in the case from Ross, twenty-four apples showed the trouble, the remainder of those upon the tree being quite normal.

Nottingham Chrysanthemum Show; two days.

ANSWERS TO CORRESPONDENTS.

DISEASED CHRYSANTHEMUMS.—S. H., Chippenham: There are considerable traces of the Rust fungus upon the shoots and leaves sent, but there is a further trouble that is largely answerable for the shrivelled leaves and general collapse of the plant. This may be caused by some cultural error that has seriously affected the leaves, or it may be due to bacterial or fungus attacks. We are having the matter investigated.

WINTERING CALADIUM CORMS.—R. J., Norfolk: The best way of keeping caladium corms during the winter is to leave them in the soil in which they were grown during the past season, and to lay the pots on their sides under the stages of the plant stove. The pots should not be placed near the hot water pipes, because in that position the soil would be made too warm and dry. The corms may be shaken out, put loosely in pots, and be covered with silver sand, but there is a risk of their being destroyed by dry rot.

WINTER SPRAYING OF FRUIT TREES.—H. G., Suffolk: The winter spraying of fruit trees should not be commenced until the whole of the leaves have fallen, and, speaking in a general way, this work should be done during December, January, and February, as the trees are then dormant. Mr. Spencer Pickering, F.R.S., the director of the Woburn Experimental Fruit Farm, recommends as the result of his experiments a wash prepared as follows for use during the winter. "The ingredients for ten gallons are:

Iron sulphate	½lb.
Lime	¼lb.
Caustic soda	2lb.
Paraffin	5 pints.
Water to make	10 gallons.

Dissolve the iron sulphate in about nine gallons of water, slake the lime with a little water, and then add a little more water to make it into a milk; run this into the iron sulphate solution through a piece of sacking, so as to remove any gross particles which might clog the spraying machine. The paraffin is then churned into the mixture, and the caustic soda added; it is not necessary to dissolve this separately in water before adding it, especially if in the powdered condition."

HEAVY v. LIGHT SOILS.—J. S. B., Morecambe: The point you raise is an interesting one, but it is thoroughly understood by every well-trained gardener. A heavy soil is heavy not because of its weight, but because of the heavy work entailed in cultivating it; likewise, a light soil is light not necessarily because it is of less weight per cubic foot than the "heavy" soil, but because it is more easily worked. Pure sand is the "lightest," and pure clay the "heaviest" of soils, from an agricultural or horticultural point of view, and yet a cubic foot of dry sand weighs considerably more than a cubic foot of dry clay.

THE STRAWBERRY-RASPBERRY. — P. W., Wrexham: You have been wrongly informed. A half-hearted attempt was made to persuade the general public that the strawberry-raspberry was a hybrid fruit, but it failed, in spite of the efforts of sensational daily journals. The so-called strawberry-raspberry is a variety of Rubus rosæfolius, and is not, as is often stated, Rubus palmatus, as the latter is a climber, whereas Rubus rosæfolius coronarius is a comparatively dwarf shrub.

SCIONS FOR GRAFTING.—C. B., Hinckley: It is an excellent plan, now that the leaves have fallen, to select suitable scions for grafting next spring. Growths produced this season, about a foot long, well ripened, i.e., firm, and amply provided with wood buds, should be selected, tied up in bundles, correctly labelled, and buried two-thirds of their length in the soil on a north border. In the event of very severe weather place an armful of dried bracken over the scions, removing it when the frost disappears. The scions will keep splendidly if thus treated.

THOMSON'S VINE, PLANT, & VEGETABLE MANURE

GROS COLMAN GRAPES

CUT FROM VINES AT

TWEED VINEYARDS, CLOVENFORDS.

As is well known our Vines, after bearing very heavy crops of the **Finest Grapes** for 35 years, are **Still Bearing** crops equal in quality and weight to those of their early years.

This Fact SPEAKS VOLUMES FOR THE SUSTAINING AND STIMULATING QUALITY OF OUR MANURE.

Is Unrivalled FOR **VINES, TOMATOES, FRUIT TREES, POT PLANTS, VEGETABLES, LAWNS,** &c., &c.

And is the result of many years **Practical Experience.**

Other Specialities: THOMSON'S STYPTIC for preventing the Bleeding of Vines, and for use in Budding and Grafting. Also **THOMSON'S "SPECIAL" TOP-DRESSING MANURE.** Perfect Plant Foods and Stimulants. BLACKENED CHRYSANTHEMUM LEAVES.—J. R., North Wales: We are not satisfied as to the real cause of the trouble, and would be obliged by your sending us a whole plant, simply washing the soil from the roots and sending it in a stout brown paper parcel to the Editor, Endsleigh, Priory Park, Kew, Surrey.

SCARLET SEEDED IRIS.—S. G., Romney: The scarlet-seeded iris is Iris fœtidissima, sometimes known as the Stinking Gladwyn. It is an easy plant to manage, because if planted in a moist spot not too much overgrown, it will take good care of itself. The foliage is pretty, and for this reason alone the iris should be grown where plants may be naturalised. The flowers are unattractive, but in the autumn, when the seed capsule opens and discloses three rows of brilliant scarlet berry-like seeds that do not at once fall out, and also retain their beauty for a long time, then the gladwyn is very attractive. Further, the cut stems, carrying the opened seed pods, are fine for associating with dried grasses, or with autumn-coloured foliage, for home decoration.

NAMES OF PLANTS.

A. S., Carmarthen.—Cratægus orientalis.

R. K. S., Woburn.—1, Jasminum nudiflorum; 2, Cypripedium Charlesworthi.

N. L., St. Albans.—1, Cryptomeria elegans; 2, Thuia Lobbi; 3, Chimonanthus fragrans.

M. T. S., Oxford.—1, Ligustrum ovalifolium; 2, L. vulgare; 3, Bignonia venusta; 4, Cypripedium Charlesworthi.

D. J. W., Orpington. 1, Saxifraga oppositifolia; 2, Meniscium simplex; 3, Abutilon megapotamicum; 4, Vanda Kimballiana; 5, Dendrobium formosum giganteum.

E. S., Beckenham.—We much regret being unable to name the specimens sent. The two tiny orchid flowers were smashed beyond identification in a wad of sphagnum moss, and the small maranta leaf sent is not in character.

J. O., Wicklow.—The labels were not attached to the specimens, hence there may be some confusion. The large blue flower is Pleroma macrantha; the yellow flower is Cæsalpinia sepiaria (japonica); the small spray of fine leaves represents Kochia scoparia; the variegated leaf is probably a Hoffmania; but the green leaf we do not recognise.

NAMES OF FRUITS.

F. E. F., Dunstable.—Ribston Pippin.

L. R. H., Chelmsford.—1, Ross Nonpareil; 2, Blenheim Pippin.

E. U. C., Bristol.—1, Uvedale's St. Germain; 2, Marie Louise; 3, Ribston Pippin.

H. E., Sandy.—1, Beurre Diel; 2, fruit rotten; 3, Beurre Superfin; 4, Beurre Baltet Pére.

T. P., Derby.—1, Yorkshire Beauty; 2, Golden Spire; 3, Waltham Abbey Seedling; 4, Peasgood's Nonsuch.

G. M. A., Harpenden.—1, Lord Derby; 2, Annie Elizabeth; 3, not recognised; 4, Mère de Ménage; 5, Court Pendu Plat.

V. L. J., St. Ives.—1, Lane's Prince Albert; 2, Round Winter Nonsuch; 3, not recognised, a poor specimen; 4, Yellow Ingestre; 5, Claygate Pearmain.

CATALOGUES RECEIVED.

R. HARKNESS AND CO., HITCHIN, HERTS.—A good rose catalogue, containing selections of varieties for certain purposes, and cultural hints.

DEVAES FRERES, WETTEREN, BELGIUM.—A general catalogue of fruit trees, shrubs, hardy plants, aquatics, and bulbs. Printed in French.

FISHER, SON, AND SIBRAY, LIM., HANDSWORTH, SHEFFIELD.—A very full catalogue of bulbs, sundries, etc.

R. SILBERRAD AND SON, SAVAGE GARDENS, CRUTCHED FRIARS, E.C.—A select list of French roses and clematis ready for delivery in November.

M. DRAPS, 30, CHAUSSEE DE FOREST, BRUSSELS.—A very comprehensive and useful catalogue of stove and greenhouse plants, orchids, and ferns.

J. PERNET-DUCHER, VENISSIEUX-LES-LYON, FRANCE.—A very useful rose catalogue, indexed, in English, and containing a coloured plate of a red H.T. rose named Chateau de Clos Vougeot.

W. ATLEE BURPEE AND CO., PHILADELPHIA, U.S.A.—List of three new sweet peas—King Edward Spencer, Mrs. Routzahn, and Queen Victoria Spencer.

V1 FLUID

THE WINTER SPRAY FLUID.

V1 FLUID CLEARS THE TREES OF MOSSES, FUNGI, AND LICHENS.

Easy to Mix. Easy to Apply. A Powerful Cleanser & Invigorator.

HAMPTON LOADE, NR. BRIDGNORTH. Sept. 1st, 1908.

Dear Sirs,—I may say your V1 Fluid has exceeded my expectations, foliage very dense and apples a lot larger, in fact I have some trees which only bore small ones but this season good bold fruit, which speaks for itself; trees very healthy. I may say I left some unsprayed, and it does not need pointing out which they are.

Yours faithfully, GEOFFREY BOOTH.

I Gallon of this Fluid makes 100 Gallons of Spray Mixture.

Prices and Descriptive Booklet on application to: **Wm. COOPER & NEPHEWS, BERKHAMSTED.**

THOMSON'S CELEBRATED MANURES.
For full advertisement see facing page 866.

TO-DAY! AND FOR YEARS AND YEARS PAST the XL ALL specialities are and have been the best on the market. Where is the Gardener who does not pin his faith to one or the other of these celebrated Insecticides or Fertilisers? XL ALL FERTILISER has pleased all who have used it this season. The Sales of XL ALL FUMIGATOR prove that it is more popular than ever. XL ALL LIQUID NICOTINE INSECTICIDE is always spoken of by gardeners and growers as the most deadly to Mealy Bug, Thrip, etc. XL ALL WINTER WASH for dormant Trees acts like magic, clearing the Trees and Bushes of all Insects' Eggs, Moss and Fungoid Growths. XL ALL LAWN SAND, a weed eradicator and fertiliser for weedy and poor lawns. XL ALL WEED KILLER used once a year. "No weeds can live." Please ask your Nurseryman, Seedsman, or Florist for a copy of my small pink list, giving particulars of these and many other XL ALL Preparations, which can be obtained from the Horticultural Trade throughout the World. G. H. RICHARDS, Manufacturer and Patentee, 234, Borough High Street, London, S.E.

Situations Wanted.

ADVERTISER seeks ENGAGEMENT as HEAD WORKING GARDENER, with Lady or Gentleman requiring the services of a thorough practical Man, in all branches (Inside and Out); highest references, extending over 19 years; 6 years as head; married; age 33. W. GUNSTON, Bridge Road, Itchen, Southampton.

A GOOD, all-round GARDENER seeks a SITUATION as Head, and would prefer a situation with someone who is really interested in their Garden. Kindly apply in first instance to HENRY ECKFORD, Seed Grower, Wem, Shropshire.

GARDENER (Head Working); life experience, all branches, gained at large establiehments, including Welbeck, Croxteth, Eden Hall, Stormont Castle, etc.; three and a-half years foreman here in gardens of the Hon. Lord Herbert Vane-Tempest; excellent character; age 31 years. H. KEMP, Plas Gardens, Machynlleth, N. Wales.

GARDENER (Head Working).—Mrs. E. LYON, Windlesham Hall, highly recommends her late Gardener; 16 years' experience all branches; 12 years under good (Scotch), large establishment; now disengaged; age 31; married, one child. A. STRICKLAND, Greenmoor, Boldre, Lymington, Hants.

GARDENER (Head), where not less than 3 are kept, six years present situation; leaving through employer giving up; age 36; married, two children, 12 and 8. CLUBB, The Lodge, Bowls, Chigwell Row, Essex.

GARDENER (Head Working), where more are kept; 25 years' practical experience all branches, Inside and Out, early and late Forcing, Vines, Cucumbers, Melons, Stove, and Greenhouse Plants, Herbaceous Borders; thoroughly reliable; highly recommended; married, without encumbrance. WOODHOUSE, Eastwood Road, Bramley, Surrey.

GARDENER (Head Working), age 47; good practical experience in all branches, Inside and Out; many years as Head; can have good references. H. TURNER, Fineshade, Stamford.

GARDENER (Head), where two or more are kept; thorough knowledge of gardening generally, both Inside and Out; life experience; good references; abstainer; age 31, married, no family. L. A. KETTEL, 33, Adelaide Road, Chislehurst, Kent.

GARDENER (Head Working) where three or more are kept; 28 years' practical experience Inside and Out; 13 years as Head in good establishments; good references. T. WALLIS, Clematis Cottage, Moorlands Road, Camberley, Surrey.

GARDENER (Head Working), where three or four are kept; life experience in all branches, both Inside and Outside; highly recommended; married, no family; 4½ years in last situation, 12 in previous. W. SKEET, Hurst Wood, Buxted, Sussex.

GARDENER (Head of three or four); good all-round experience; used to hardy garden; life abstainer; married 10 years, no family; age 32 years; can be well recommended. WALROND, Peppard Common, Henley-on-Thames.

GARDENER (Head Working, where two or more are kept); 16 years' good practical experience in all branches; thorough knowledge of grapes, melons, cucumbers, stove and greenhouse plants, flower and kitchen garden; age 30; married when suited; good ref.; 2½ years in last place. B. BROOKS, Minerva Cottage, Elm Grove, Worthing.

J. H. WHITE and CO., Nurserymen, Worcester, can confidently recommend an experienced HEAD GARDENER; married; capable of managing a good establishment. Particulars on application.

GARDENER (Head or good Single-handed); life experience in all branches, including landscape and re-modelling; aged 34; married; good character. W. P., 31, Oaksford Avenue, Sydenham, S.E.

GARDENER (Head Working or Single-handed); age 39; married, two children; good all-round experience Inside and Out; cows and poultry if required; good references. G. A., 49, Norman Road, Ilford.

£5 BONUS for information leading to Advertiser obtaining SITUATION as HEAD GARDENER in good establishment, where several men are kept. Advertiser has extensive knowledge in all departments of gardening. Highest credentials. Apply in first instance to R. C., Office of this Paper.

GARDENER (Single-handed or with help), 20 months' good character; 8 years' previous; age 33; abstainer. H. HUNT, 10, Herongate, Brentwood.

GARDENER (Single-handed or charge of Kitchen Garden); 1 year and 8 months in present situation; 8 years previous; good references; age 32; total abstainer. Apply GARDENER, St. Michael's Cottages, Ingrave, Brentwood.

GARDENER (Single-handed or otherwise); willing to be useful; 5 years' good reference from last place; life abstainer; age 26; married when suited. A. S., Tranmere, Sunbury-on-Thames.

GARDENER (Single-handed) seeks SITUATION; 6 years in present place; 4 and 2 years previous; married; age 35 years. F. CLARKE, 32, Parkhurst Road, Bengeo, Hertford.

GARDENER seeks SITUATION; single-handed or Second; 10 years' experience; good references; age 24; disengaged. A. RANDALL, 62, Sussex Road, South Croydon.

GARDENER (Second, where three or four are kept); Inside and Outside; life experience; 6½ years' character from last place; single; age 32. G. EUSTON, Shrubbs Hill, Sunningdale, Ascot, Berks.

FOREMAN (Outside or General), age 28; 12 years' experience; 18 months Moulton Paddocks, Newmarket; 2 years previously Drumlanrig Castle, N.B. W. H. HALL, Melchet Court, Romsey, Hampshire.

FOREMAN (Inside), age 26; 11 years' experience in good establishments; 15 months here as Foreman and Decorator. Address, E. ROBINSON, 78, Glovers Road, Small Heath, Birmingham.

FOREMAN or GROWER; middle age; married; life experience in London Market Nurseries; no objection to Grow, and Manage Shop; accustomed to Seed and Bulbs, Making Up, etc.; South Coast preferred; 10 years last place as above. A. B., 45a, Lindrop Street, Fulham, S.W.

GARDENER (Under), age 19, seeks SITUATION; five years' experience Inside and Out; three years' good character. A. WORSFOLD, Benenden, Cranbrook, Kent.

HEAD GARDENER wishes to recommend W. MULLINS as Under Gardener to anyone requiring a steady, willing, and industrious Young Man; chiefly used to Outside work. EASTAUGH, St. Botolph's Gardens, Milford Haven.

GARDENER, thorough good all-round Man; life experience in all branches, Land and Stock; married (age 40), son 18; highest references. GIBSON, The Gardens, Grayshott House, Hants.

M. DARCY WYVILL, Esq., Constable Burton Hall, Yorks, will be pleased to recommend his GARDENER to any Lady or Gentleman requiring the services of a thoroughly practical man, well up in all branches; age 36; present place seven years, previous 12 years. Address ROBT. SINCLAIR, The Gardens, Constable Burton; or as above.

IMPROVER, in Gentleman's Garden, age nearly 17; won Essex County Horticultural Scholarship, 1907; also Second-class Certificate R.H.S.; has had one year's training at Horticultural Gardens, Chelmsford; now disengaged. H. BRANSDEN, Stifford Lodge Cottage, near Grays, Essex.

STOKER or HANDY MAN, willing to be generally useful; 10 years' good character one situation; age 34; married. Apply STOKER, 48, Fifth Avenue, Bush Hill Park, N.

WM. NAPPER seeks CLERKSHIP or ASSISTANT CLERKSHIP; southern or western counties, where his long experience should prove valuable to employer; competent Bookkeeper. 43, Dacre House, Chelsea.

YOUNG MAN (22), requires SITUATION in Nursery; 7 years' experience in tomatoes, cucumbers, and bedding stuff; good references. JOHN HUGHES, The Gardens, Gwrych Castle, Abergele, N. Wales.

YOUNG MAN (22) requires SITUATION in Nursery; experienced; Tomatoes, Chrysanthemums, Ferns, General Bedding Stuff; in or near Liverpool preferred. F. E. PARK, 7, Radstock Road, Fairfield, Liverpool.

Situations Vacant.

WANTED, Young MARRIED MAN for Inside and Out. Wages 18s. per week. Cottage and garden. Apply, stating particulars, to HEAD GARDENER, Manydown Park, Basingstoke.

GREASE-PROOF BANDS
Grease, 7lbs. **4/6**; Bands, **3/6** per 100

NO MOTH, NO CATERPILLAR

ARCHANGEL MATS, Full size and weight

BIRCH BROOMS
In every variety, including new designs

GARDEN LEAF BARROW
Will carry large quantity of leaves, very light

YELLOW FIBROUS LOAM
Carriage paid. Quotations by return

OSMUNDA FIBRE
For Orchids—No dust—All fibre

CARBONATED FIBRE
For Growing Bulbs in bowls without drainage, send for special list of Bulbs

NEW SWEEPING MACHINE
Great saving in time and labour

FRUIT-STORING TRAYS
from **13/-** per dozen

WOOD WOOL, Soft and silky

WEED KILLER, Electric death to all weeds

LE FRUITIER, Gold Medal Manure

LAWN SAND-DAISY KILLER
Invigorates the grasses and destroys weeds

☞ Full Illustrated Catalogue of above, and **1,000 other Specialities,** post free, from—

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Vernation and Venation.

As these two very similar terms appear pretty frequently in conjunction where plant descriptions are concerned, it may not be out of place to explain the difference. Vernation implies the mode of growth of the foliage within the bud, which eventually determines the form and arrangement of the leaf and its parts, and the word is derived from ver, Latin for spring. This differs greatly according to the plant concerned, but is determined by regular laws in each case. Thus the future leaves may be packed one over the other like tiles or the scales of a fir cone, they may be folded up fan fashion, or in many other ways, while in ferns they are almost without exception rolled up in a spiral coil or into many coils, according to the extent of division of the future frond. When the bud of a tree or shrub bursts, the leaves emerge in perfect form, and attain full development by expansion of the cellular growth already duly arranged; but the fern frond can hardly be said to present as a bud proper, since it has no sheath, but commences as a terminal growing point on the embryo stalk, and this gradually builds up the coil, or coils, aforesaid by constant growth at the tip or tips, until, at the proper season, the main stalk lengthens, and lifts the still-growing coil to the proper height, when the minor stalks, if the fern frond be a divided one, also lengthen, and eventually the coils loosen and expand until the characteristic frond form is perfected. In ferns which grow shuttlecock fashion, i.e., with the fronds in a ring round a central crown, the fronds are really formed a long time before they rise, and can be seen tightly packed together in the centre the previous season. It is thus perhaps that they may best be regarded as approaching buds in their nature, especially as the protective sheathing common to most tree buds is then represented by more or less dense, but loose, overlapping scales. Their internal arrangement or vernation is, however, as we have seen, on quite peculiar lines. Venation, on the other hand, is quite distinct from this, as it refers to the arrangement of the veins in the leaves or fronds, that is, those harder parts which intersect the cellular structure, and form those skeletons with which we are familiar when the softer parts have rotted away and only the veins are left. These veins are mostly of a more or less woody nature, and their arrangement varies greatly in different plants. In most trees and shrubs they form networks of very beautiful design, and on examining these it will be seen that they graduate in size from main ones nearly as thick as the leaf stalks to very fine ones near the leaf edges, and that every projection on these edges or division of the leaf will have a vein reaching to the margin or tip, no great expanse of the green structure being left without its vein or veins. This is due to the fact that the veins perform two functions, they are, in fact, both veins and bones, so to speak, the bony or woody part forming a supporting framework for the tender cellular tissues, while the associated sap channels or veins are contrived to convey supplies to the growing cells from the roots, and to carry back to the general structure the formative materials elaborated in the cells to that end. In the embryo leaf, as the cells multiply to build it up, the vein system is constructed by them as they proceed, so that there is always a sap source in the immediate vicinity upon which the pioneer cells can draw according to their requirements. To a certain extent living cells can pass on nutriment from one to another by absorption through their walls, and in some of the lower orders of plants, especially water plants, they thus manage to fulfil their functions without any veins proper at all. There is not doubt, therefore, that in the process of evolution from simple plant life to more complex conditions, the system of venation was evolved to permit of more extended growth, and on more massive lines suitable to land conditions. Seaweeds, for instance, manage to do without a vein system, they are supported by the water, and are subjected to no drain by transpiration, and hence do not require, as a tree does, both strong supports for its foliage, and a liberal supply of water from the roots to the possibly far-distant leaves. Under dry conditions it is obvious that a vein system is an absolute essential to all vegetation of a higher grade than fungi or other low orders.

MR. HARRY J. VEITCH, V.M.H.

Chevalier of the Order of Leopold, Chairman and Treasurer of the Gardeners' Royal Benevolent Institution.

Mr. Harry J. Veitch, V.M.H.—Honours are so sparingly bestowed upon horticulturists in this country that it gives us pleasure of a quite exceptional character to announce that the King of the Belgians has conferred upon Mr. H. J. Veitch, V.M.H., the distinction of a Chevalier of the Order of Leopold, and that King Edward VII. has been pleased to grant by Royal license permission for Mr. Veitch to accept and wear the insignia thereof. We are quite sure our readers will share with us in the pleasure we have in making this announcement, for Mr. Veitch has not only contributed to the beauty and interest of our gardens large numbers of tender and hardy plants and of trees and shrubs of the most varied character, but has rendered splendid service in the cause of the gardening charities. We need not recount the successes which have been achieved by the firm of which Mr. Veitch has long been the head, in the introduction of orchids, of stove and greenhouse plants, or of trees and shrubs; or of the splendid results obtained in hybridisation and cross fertilisation. They are known to all who have taken a close interest in gardening. It is also known to a very large section of the horticultural community that while engaged in a business that must have imposed a heavy tax upon his time and attention, Mr. Veitch has constantly kept in mind the needs of the gardener and those who are dependent upon him. For nearly a quarter of a century Mr. Veitch has been the chairman and treasurer of the Gardeners' Royal Benevolent Institution, and it is fully acknowledged by those who have been associated with him in the management of that valuable charity that much of the remarkable success achieved by that institution is due to his occupying a leading position on the governing body. Mr. Veitch has given freely of his money as well as his time to the institution, and the high subscription lists on the two occasions on which he presided at the anniversary festivals, testified in no uncertain manner to the respect in which he is held by all who are interested in horticulture. Mr. Veitch has not been less generous in his support of the Royal Gardeners' Orphan Fund, in which he has taken a warm interest from its foundation twenty-one years since. For a long period Mr. Veitch has been a member of the Council of the Royal Horticultural Society, and it was owing to that fact his name was not included among the sixty horticulturists who received the Victoria Medal of Honour in Horticulture on its foundation in 1897. Subsequently, the rule to the effect that the medal could not be awarded to a member of the Council was very properly abolished, and in 1906 the medal was awarded to Mr. Veitch.

Birthday Honours.—The honours conferred on the occasion of the King's birthday included a knighthood conferred upon Mr. E. D. Walker, the head of the firm of Messrs. J. Burrell and Co., Cambridge. Sir Edward D. Walker is also senior partner in the wholesale newspaper firm of Mesrs. Walker and Wilson, and has been three times Mayor of Darlington. The Victorian Order of Merit was conferred upon Dr. Alfred Russel Wallace, the eminent naturalist, who has this year been awarded the Darwin medal by the Royal Society.

Stamping Out "Black Scab" of Potatoes.—Writing with reference to "black scab" in Ireland, Mr. Salmon, of Wye College, urges the Government to take drastic measures for the purpose of stamping out this enemy of the potato crop. He says: "In England and Scotland the Board of Agriculture should now be engaged in the pressing work of destroying the pest. The Board have procrastinated for seven years; any further delay is most dangerous, if not actually fatal. In infectious plant diseases such as the present half-measures are of no use. To save the potato crop in Great Britain from being gradually infected by this new and highly-destructive pest, the destruction of all diseased tubers is absolutely necessary. As a matter of equity this destruction could not be insisted upon without the giving of some compensation. This principle was, as a matter of fact, admitted in respect of the same crop in 'The Destructive Insects Act, 1877,' (now revoked). Under this Act the Colorado potato beetle was stamped out by the destruction of all diseased plants, compensation being actually paid by the Treasury. The Board have just announced that 244 outbreaks of 'black scab' have now occurred. In 1901 when the Board were first informed of the disease only a few cases were known; it was neglect of duty on the Board's part not to have dealt with the matter then. As a matter of fact those cases were not even investigated. But although now some thousands of pounds would be required for compensation, it would be for the protection of a crop worth several millions of pounds annually."

New Open Space at Birkenhead.—An additional area of twenty acres of land at Bidston Hill, Birkenhead, has been purchased and conveyed to the Birkenhead Corporation. The cost of the land was £10,500, of which £6,125 was provided by the Corporation. This addition increases the area of the public land on Bidston Hill and Thermopylæ to about ninety acres, and places the Corporation in possession of one of the most beautiful open spaces in the country.

Foliage of Violas.—Healthy leafage contributes so liberally to the charm and usefulness of flowering plants used in garden decoration that we are greatly interested in the specimens which Mr. William Cuthbertson has sent illustrative of the growth of certain of the violas, with notes on the finer varieties. It will be remembered that during the current year Mr. Cuthbertson has conducted a trial of violas on Messrs. Dobbie and Co.'s seed farms at Marks Tey, and that in the course of the summer we published a report of the trial. The trial was carried out with a view to determine the relative merits of the large number of varieties in cultivation for the production of colour effects in the flower garden. Special attention was throughout paid to freedom and continuity of flowering, and to the habit of growth. Freedom of flowering is an important point, but it is not less essential there should be a continuous display of bloom, and this can only be obtained when the varieties have a good constitution and the power of producing a succession of new growths from the base. This trial has brought into prominence the diversity in the habit of the varieties, and consequently in their value in the garden, and thereby rendered valuable service to the general body of cultivators. The specimens Mr. Cuthbertson has sent us show that a very considerable number of varieties have so good a constitution as to produce an abundance of new growths throughout the season, and to be as leafy in the late autumn as is usually the case during the summer.

A Conference of Fruit-Growers will be held at the South-Eastern Agricultural College, Wye, on Friday, November 27. Chairman, C. W. Radcliffe Cooke, Esq. (president English Cider Manufacturers' Association). The conference will commence at eleven a.m., there will be lunch at one o'clock, and the conference will be resumed at two o'clock. The subjects to be dealt with are "Insecticides," by S. Pickering, Esq., F.R.S.; "Spraying and Spraying Machinery," by E. S. Salmon, Esq.; "Grading and Packing Methods in British Columbia"; "The State and the Fruit Grower," by G. L. Courthope, Esq., M.P.

Sir Daniel Morris, K.C.M.G., V.M.H., etc.—The President and Council of the Royal Horticultural Society have unanimously appointed Sir Daniel Morris to be an Honorary Life Fellow of the Society in recognition of his valuable services to horticulture in various parts of the empire.

The Imports of Flowers for October were valued at £4,504, as against £3,180 in October, 1907, and £4,481 in October, 1906. The total value of the fresh flowers imported during the ten months now ended, is £187,625, or £421 more than the total for the corresponding period of 1907, and £10,124 less than the value for a similar period in 1906.

Fruit Imports During October.—The total value of fresh fruits, including nuts, imported into this country in October, was £1,222,320, or £73,083 more than in October, 1907, and £10,945 less than in the corresponding month of 1906. Apples formed the chief item, but quantity and value were alike lower than in October, 1907, and were respectively 582,863 bushels and £317,223. Bananas show an increase of 59,802 bunches for the month, and an advance of £12,441 on the total of £141,451 of the previous year. Grapes have been imported more freely than in 1906 or 1907, and the amount and value for the month were 340,916cwts., and £357,555, as against 288,306cwt. and £278,816 in October, 1907. Plums show a remarkable decrease in quantity and value; in October, 1906, we paid £57,231 for 91,799cwt.; in 1907, £3,765 for 5,374cwt.; and in 1908, £1,354 for 2,203cwts. Pears cost us £72,409 for 83,000cwts., and these figures indicate a steady decrease of imports and values. No cherries, currants, gooseberries, or strawberries were imported during the month, but apricots and peaches were much more largely imported than in the two previous years, the figures being 2cwt., valued at £4, in October, 1906; 295cwt., valued at £533, in 1907, and 1,006cwt., valued at £1,724, during the month just ended. Lemons cost us £31,737 for 64,393cwt., and oranges £28,915, for 55,801cwts., the former showing a decrease and the latter a comparatively small increase. For nuts we paid £227,534 for 151,568cwts.; there appears to be a steadily increasing importation of nuts, and the total value of the imports for the ten months now ended was £910,175, as compared with £883,670 in the same period of 1907, and £795,786 in 1906. Unenumerated fruits amounted to 29,277cwts., valued at £29,972, and here the figures are lower than in the preceding two years. During the month of October we paid £97,210 for 750,702 bushels of onions, rather less than last year. Tomatoes cost us £63,501 for 75,722cwts., as against £74,078 for 67,860cwts. in October, 1907. For potatoes we paid £19,120 for 117,333cwts., and these figures show a tremendous fall from those of £113,882 paid for 615,776cwts. in October, 1907. During the ten months ending with October we have imported £1,939,797 worth of potatoes, as compared with the £2,028,721 paid in a similar period of 1907.

Encyclopædia of Gardening.—A new edition of the "Encyclopædia of Gardening," by Mr. T. W. Sanders, is announced for publication on Monday next by Messrs. W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London. Useful as former editions of this popular work were, the present one will be found still more so, since, in addition to bringing the main cultural details up-to-date, adding new genera and supplementary facts, the names of species are now supplied with their times of flowering, colours of their flowers, heights and native countries. The facts are also presented in a more attractive way than in former editions, so that the reader can see at a glance the details he requires. Although the amount of information has been materially increased there will be no advance in price, which remains at 3s. 6d. net, from booksellers, or by post from the publishers 3s. 10d.

Presentation to Mr. J. Andrews.—An interesting little function occurred recently in connection with the Southend Chrysanthemum Show. For several years Mr. J. Andrews (well-known as hon. secretary, and now show superintendent to the Woodbridge Horticultural Society), has acted as judge in a honorary capacity at the Southend Chrysanthemum Show, and the committee took advantage of his presence on November 3 to present him with a beautifully engraved silver cigar case, and silver match box, as an expression of their appreciation of the services he had rendered. Mr. Andrews was completely taken by surprise when Dr. Jones, on behalf of the committee, made the presentation at the luncheon table.

Sprouting Seed Potatoes.—The practice has considerably increased in Ireland within the past few years of sprouting seed potatoes previous to planting. The results have proved satisfactory, and the Irish Department of Agriculture is endeavouring to induce growers generally to adopt it. A summary of the results obtained from carefully conducted experiments is given in the Department's monthly journal, and these fully support the views of those who regard sprouting as an essential part of potato culture. During the five years 1903-7 two hundred and seventy-one tests were made, and the average gain in yield due to sprouting was two tons three hundredweights per acre.

Fruits and Vegetables from the Canaries.—The returns relating to the exports of fruits and vegetables from the Canary Islands to this country are of much interest as evidence of the large supplies of these products we receive from these favoured isles. Eight years ago the exports of potatoes from Las Palmas to London were 34,039 cases, each case containing from 70lb. to 75lb. In 1905 the exports had increased to 173,108 cases, in 1906 they were 175,192 cases, and last year they were 244,931 cases. The shipments from Teneriffe have increased from 76,023 cases in 1900 to 212,742 cases last year, the most rapid increase during this period being within the past two years. The shipments of tomatoes from Las Palmas to this country increased from 138,309 bundles of 60lb. in 1906 to 409,467 bundles last year. Within this period there were considerable fluctuations in the supplies, there being, for instance, a drop of upwards of 50,000 bundles in the exports of 1906, as compared with the year previous. Bananas are grown in such enormous quantities that it is not surprising to learn from the returns that last year the shipments from Las Palmas to this country amounted to 1,271,459 crates, and from Teneriffe to [illegible]. In 1900 the shipments were [illegible] crates and 257,701 crates respectively. The shipments from Las Palmas reached the total of 1,814,123 crates, but in the next two years there was a material decrease, while from Teneriffe there has been a continuous increase in the shipments from 1900.

British Gardeners' Association at Haslemere.—On Saturday, November 14, a public meeting of professional gardeners will be held at the new hall of the Co-operative Society, Clay Hill, Haslemere, Surrey, when an address on "The Aims and Objects of the British Gardeners' Association" will be given by Mr. J. Weathers, the secretary of the association, who will be supported by Mr. E. F. Hawes, chairman of the association, and others. The meeting will commence at 7.30 p.m., and all professional gardeners in the district are invited to attend.

ROYAL HORTICULTURAL SOCIETY.

NOVEMBER 10.

The hall on this occasion was not so well filled as usual, though the groups of ferns, chrysanthemums, begonias, and carnations, with other subjects, made up a good show. The effect of the severe frost during the night was all too apparent on many of the tender plants, and no doubt kept several exhibitors away.

Messrs. J. Hill and Son, Barrowfield Nurseries, Lower Edmonton, occupied the entire end of the hall with a collection of specimen ferns, which contained one hundred and fifty species and varieties. Some of the specimens were huge, and, needless to add, all were beautifully grown. A few of the most prominent were Angiopteris evecta, Polypodium giganteum, Alsophila Moorei, Polypodium quercitolium, Platycerium Hilli, Nephrolepis Amerpohli, Davallia polyantha, Nephrolepis exaltata superba, and Davallia fijiensis robusta. The whole exhibit reminded one of the July displays rather than the month of November. The same firm also staged a fine plant of Nephrolepis amabilis, figured in this issue, which was awarded a First Class Certificate.

NEPHROLEPIS AMABILIS.
F.C.C., R.H.S., November 10, Messrs. J. Hill and Son, Barrowfield Nurseries, Edmonton.

From Messrs. James Veitch and Sons, Ltd., Chelsea, came an exceedingly bright exhibit of begonias, which occupied an entire table. The plants were blocked in separate colours. The varieties were Julius, Ensign, Mrs. Heal, a bright rosy red, and Agatha. The whole were in fine condition, and well displayed with palms and ferns.

Mr. W. H. Page, Tangley Nurseries, Hampton, sent a small exhibit of winter-flowering carnations, which were chiefly new varieties, the best being Sarah Hill, a very promising white form; also well-developed plants of Spiræas Queen Alexandra and Peach Blossom.

Messrs. H. B. May and Sons, Upper Edmonton, presented a fine display of nephrolepis in large variety, which were effectively arranged on a large space. The most striking forms were N. exaltata superba, N. todeaoides, N. rufescens Mayi, a superb plant; N. Whitmani, N. exaltata Scotti, N. superbissima, and N. Amerpohli. The same firm also sent carnations in pots, a nice collection of veronicas, and some well-grown plants of winter-flowering begonias, with a few well-berried solanums.

A large exhibit of single-flowered chrysanthemums came from Mr. C. J. Simpson, St. John's Nursery, Chelmsford. The flowers were arranged in large vases without any greenery. A few of the best were Edith D. Harling, Miss Jacky Bird, Exquisite, Elsie Neville, Annie Farrant, Mr. W. Jordan, and Mr. J. Carlisle, with several of the well-known forms. A few suitable decorative plants would have greatly enhanced the value of the exhibit.

A fine exhibit of cyclamens came from Mr. A. Shambrook, gardener to the Rev. H. Buckston, Sutton Hall, Elwall, Derby. The plants were in six-inch pots, and were undoubtedly well grown, the white, salmon, and red varieties being especially well done, while the development of the whole exhibited great cultural skill and care. The Misses Hopkins, Mere Gardens, Shepperton-on-Thames, displayed a collection of rock and alpine plants arranged naturally.

A fine exhibit of carnations came from Messrs. W. Cutbush and Son, Highgate. The flowers were particularly bright for the season. The arrangement consisted of tall vases and baskets, with a display of smaller vases as a groundwork. The most prominent were Britannia, Mrs. Burnett, Crimson Glow, Victory, The President, Winona, and Robert Craig. The same firm also arranged a display of retarded flowering plants, which included Lilium longiflorum, L. auratum, L. lancifolium, and L. rubrum, spiræas, Azalea mollis, and lily of the valley, surrounded with groups of well-berried pernettyas, Ardisia crenulata, and oranges.

From Messrs. H. Cannell and Sons, Swanley, came a gorgeous exhibit of zonal pelargoniums. The trusses were large throughout, while the individual pips were very fine, and some were truly wonderful. A few of the most notable were Cymric, Campania, Bombay, New York, and Paris; there were others equally beautiful, with clear bright colours.

Messrs. W. Wells and Co., Ltd., Merstham, staged a large display of chrysanthemums, which embraced specimen Japanese blooms on boards, singles, and decorative varieties. The large specimen blooms included W. Howe, Pockett's Crimson, Mary Donnellan, C. H. Totty, Leslie Morrison, and

Mr. W. Wells. The best decorative varieties were Foxhunter, Clara Vernum, and Freda Bedford. The singles comprised a good and varied collection; evidently this section is becoming very popular.

Mr. W. P. Horton, Cravenhurst, Seaford, Sussex, sent a group of chrysanthemums, with foliage plants in front, also a display of rock and alpine plants. A fine group of berried shrubs came from Mr. L. R. Russell, Richmond.

Messrs. J. Peed and Son, West Norwood, arranged a large display of chrysanthemums on the floor of the hall. The background was composed of tall kentias, while Japanese and single varieties were grouped in mounds and single vases, the whole being displayed with ferns and grasses. The single forms arrested attention at once, the most prominent being William Guix, Roupell Beauty, Felicity, Mrs. W. Buckingham, Crown Jewel, and Elsie Matthews.

A beautifully light group of plants came from Mr. P. Purnell, Woodlands, Streatham Hill. The chief features were well-flowered plants of Begonias Mrs. L. Rothschild and Turnford Hall, while primulas of the obconica type were good. Palms, dracænas, and other foliage plants were used to good effect. Mr. Smith, gardener to Mr. G. Fergusson, The Hollies, Weybridge, staged an interesting exhibit of single chrysanthemums with a central group of Japanese varieties; a setting of autumnal foliage and smilax was also used. The specimen blooms were large, fresh, and bright.

Mr. R. Bedford, gardener to Mr. E. H. Brown, Highwood, Roehampton, had a fine table of begonias and foliage plants. The former were well developed examples of the Gloire de Lorraine type, interspersed with decorative palms, ferns, crotons, and aralias, the whole being lightly displayed. Messrs. H. Low and Co., Bush Hall Park, arranged an exhibit of winter-flowering carnations in pots and vases. The colours were very bright for the season. Britannia, Fair Maid, Rose Pink Enchantress, and Victory were especially good.

A large number of floral studies came from Miss Grace Layton, Pirbright, Bournemouth. These were all of wild flowers executed in a natural way. Mr. E. Potten, Camden Nurseries, Cranbrook, Kent, exhibited a double form of the well-known bedding zonal pelargonium Paul Crampel, which did not appear so bright in colour as the single form. Mr. F. Lilley, St. Peter's, Guernsey, sent nine seedling single chrysanthemums in pots; the varieties Exclusive and Cinnamon appeared the most promising in the exhibit.

FRUIT AND VEGETABLE COMMITTEE.

A fine collection of fruit came from the Duke of Rutland, gardener, Mr. W. H. Divers, Belvoir Castle, Grantham. The chief portion was composed of dishes of apples and pears, but good examples of Black Alicante, Muscat of Alexandria, and Gros Colmar grapes were effectively staged in the background, while well-coloured crabs, with ampelopsis foliage and smilax formed the decorative features. The apples included well-coloured dishes of Bramley's Seedling, Peasgood's Nonsuch, Warner's King, Bismarck, and The Queen. The best dishes of pears were Glou Morceau, Beurre Rance, Beurre Diel, Pitmaston Duchess, and well-coloured Beurre Clairgeau. Messrs. H. Low and Co., Bush Hill Park, exhibited a collection of apples in baskets and dishes, with a few well-fruited plants of decorative oranges. The fruits were large and well-coloured, especially Cellini, Tyler's Kernel, King of Tomkins County, Charles Ross, and Cox's Orange Pippin.

ORCHID COMMITTEE.

Mr. H. A. Tracy, Twickenham, presented a small group of orchids, in which the cypripediums were prominent; odontoglossums were also numerous, but as they were not labelled it was out of the question to name them. A capital display came from Messrs. James Cypher and Son, Cheltenham, who had a nice group of cypripediums, and an attractive display of Dendrobium phalænopsis Schrœderiana, which were very varied in colouring. The cypripediums included fine examples of C. insigne Harefield Hall var., C. Fairieanum, C. Mons. de Curt, C. Niobe superbum, C. i. Sanderæ, and C. Leeanum giganteum.

A smaller group came from Messrs. H. Low and Co., Bush Hill Park, N, which included a fine plant of Cycnoches chlorochilum carrying three fully developed flowers; two fine examples of Dendrobium formosum giganteum, carrying plenty of blooms; Cattleya labiata Queen Maud, a beautiful pale form, white with a slight tinge of heliotrope in the lip; C. l. var Reedleyensis, whiter in the petals and sepals, but with similar colouring in the lip; also a few choice cypripediums. Mr. W. P. Horton, Cravenhurst, Seaford, staged a few cypripediums and oncidiums.

Messrs. Charlesworth and Co., Haywards Heath, sent a table of choice varieties, in which were noted Lælio-cattleya Cappei, Cattleya Vulcan marginata, a beautiful deep form; Brasso-lælia Iona Digbyana, a variety with a deep purple fringe to the lip. Oncidium prætextum was splendidly flowered, while a few choice odontoglossums were displayed.

Lieut.-Col. Holford sent a few choice specimens, notably Brasso-cattleya Mrs. J. Leeman Westonbirt var., a pale yellow form with a tinge of rose in the lip; L.-c. Golden Beauty, a deep orange variety, with a distinct purple blotch on the lip; also Lælio-cattleya Clive, var. Keswick. Sir Trevor Lawrence also sent a few interesting specimens, chiefly of a botanical character.

CERTIFICATES AND AWARDS.

First Class Certificate.—To Nephrolepis amabilis, from Messrs. J. Hill and Son, Barrowfield Nurseries, Lower Edmonton; Sophrocattleya Doris, from Mr. J. Gurney Fowler, South Woodford.

Award of Merit.—To Cypripedium magnificum, Mr. Alexander, orchid grower to Lieut.-Colonel Holford, Westonbirt, Gloucester; Cattleya Clarkia intensa, from Mr. Leopold de Rothschild, Gunnersbury, Acton; Cattleya Cooksonæ, from Mr. N. C. Cookson, Wylam-on-Tyne; Nephrolepis rufescens Mayi, variety ornata, from Messrs. H. B. May and Sons, Upper Edmonton.

MEDALS.

Gold.—Messrs. J. Hill and Son, Lower Edmonton.

Silver-gilt Flora.—Messrs. H. B. May and Sons, Upper Edmonton.

Silver-gilt Banksian.—Mr. E. Brown, Highwood, Roehampton; the Rev. H. Buckston, Sutton Hall, Elwall, Derby.

Silver-gilt Knightian.—The Duke of Rutland.

Silver Flora.—Messrs. Charlesworth and Co., Haywards Heath; Messrs. J. Cypher and Sons, Cheltenham; Mr. H. A. Tracy, Twickenham; Miss Grace Layton, Bournemouth; Messrs. W. Wells and Co., Merstham.

Grape, Prince of Wales.—This new grape is well figured on p. 816, and, what surprises me most, is the long time it has taken to become at all popular. I first saw it well shown in the Drill Hall, Westminster, by Messrs. J. Veitch and Sons, and at that time was much impressed with its many points of excellence. Since then the best examples I have seen were growing in the gardens at Stanmore, when Mr. J. Ellis was gardener there. The advantages it possesses over Mrs. Pince include size of bunch and berry, and, what is the most important of all, it is so easy to colour as compared with its parent. In the near future we shall no doubt see many good examples, especially after those so well shown from Wisley and Marden Park.—E. M.

THE YELLOW MUSK HYACINTH.

There are many who take pleasure in the muscaris or grape hyacinths, who would like to have some variety in the colour of the flowers in their gardens. To some of these the idea of a yellow grape hyacinth (Muscari moschatum var. flavum) appeals with some degree of force, and I know a few who have been induced by this desire to purchase bulbs of the pleasing variety of the musk hyacinth called flavum, but often known as Muscari macrocarpum. One cannot, however, call it a good yellow, and the most which can be said of it in this respect is that it is "yellowish," the colour definition given by good judges in the question of the hues of flowers. The teeth of the flowers are of a purple tint.

The blooms are in a rather loose raceme, about an inch and a-half in length, varying according to the strength of the plant. As a garden flower it cannot be said to compare favourably with the beautiful Muscari botryoides, and still less with the fine grape hyacinth known as "Heavenly Blue."

But the demerits of the yellow musk hyacinth do not lie in its colour weakness alone, but also in the fact that it is difficult in most gardens to persuade it to flower frequently, and in some places it does not stand severe winters. Imported bulbs usually flower the first year after their importation, but they generally do little good afterwards, so that this musk hyacinth cannot be recommended as a satisfactory plant.

One does not like to speak depreciatingly of any distinct flower, but all the same, it is well that readers should have the defects of plants which are offered for sale brought before their notice. S. Arnott.

A NOTEWORTHY MONTBRETIA.

Among the wealth of newer montbretias I have specially noted an exceptionally finely coloured variety in the Continental Maison Doré. A trial patch of this variety has given good results, and the general summary of its qualities goes far toward assuring a good future for it. One meets so many "novelties," which are little, if any, advance upon forms in general cultivation, that one must see such "novelties" in growth and blossom in order to pass an unbiassed opinion upon them. With reference to the variety under notice, I am justified in recommending it to the reader's notice as a sterling plant for garden adornment.

It is a notable, telling variety, with good stout stems of average height. The blossoms, which are freely produced, are well formed, and expand well, showing the colouring to advantage. They range about two and a-half inches in diameter, and the effect, at a distance, is of a warm touch of golden orange colouring. The buds and the reverse of the open petals present a glowing orange hue, while in the open flower there is a crimson eye relieved by a clear yellow centre. The larger portion of each petal is coloured orange, which deepens to a crimson shade at its conjunction with the clear yellow centre, and, taken altogether, one can only describe it as a most pleasing blend of colouring. Maison Doré should certainly receive attention, especially for grouping in the herbaceous border, for, though it may be eclipsed by larger varieties, yet its glow of colour and open, well-proportioned blossoms will contribute a pleasing addition to the garden beautiful.

P. S. Hayward.

ROSE GARDEN AT EASTON LODGE.

The enjoyment of the rose garden does not depend so much upon its design, provided it is in accordance with the canons of good taste, as it does upon the selection of varieties in which are combined freedom and continuity of flowering with high quality and attractive colouring, and good cultivation. The design may be more or less ornate, and include provisions for the display of the distinctive charms of all the sections, or it may be of the simplest description. Pleasure and interest may be derived from both ornate and simple rose gardens, but from what one sees in visiting gardens devoted to roses, it would appear that it is possible to derive the largest measure of satisfaction from those of which the design possesses breadth and simplicity. Why this should be so is not difficult of explanation.

The full enjoyment of roses depends upon a relatively vigorous development of branch and leaf, and a profusion of flowers, and harmonious contrast of colour, and nowhere is it possible to maintain roses in a robust state of health or to produce such charming contrasts of colour as where the design is free from an excess of detail. If we turn to the illustration given herewith of the admirably planned rose garden at Easton Lodge, the Essex seat of the Earl and Countess of Warwick, we shall at once see the importance of breadth, both as regards the health of the occupants and the colour effects. A few broad arches spanning the walk, and an intersecting pergola would probably have helped to make, photographically, a prettier picture, but they would not have done anything to enhance the great beauty of the scene during the season of roses, which, it may be added, is a long one. This garden is enclosed by a belt of shrubs, which serve the purpose of separating it from the other part of the grounds, and of sheltering the tender growth from the easterly winds that hereabouts sweep across the country with considerable force during the spring months. Beyond these belts there is nothing to interfere with the free circulation of air among the roses, and nothing to deprive them of a ray of light, and we need hardly say that air and sunshine are essential to the health of roses.

In a garden arranged on the lines of that at Easton Lodge each bed can be devoted to one variety, or be filled with a small selection of varieties that differ but little in habit, and produce flowers that harmonise in colour. Another point of importance is the facility with which the beds can be remade and replanted when a change of soil or varieties becomes necessary. The charms of the rambling and other climbing roses are not overlooked, numerous pillars are, as will be seen, provided for their support in the rose garden, and in another part of the grounds not far distant therefrom there is one of the finest rose pergolas in the United Kingdom. Roses are prominent in other parts of the garden, and the collection, which comprises over 7,000 plants, is managed with consummate skill by Mr. Lister, the head gardener, and forms one of the most attractive of the many fine features of the Easton Lodge gardens.

AUTUMN ROSES.

Formerly we had few late-flowering roses with the exception of Souv. de la Malmaison, Gloire de Dijon, Homer, and a small number of teas and noisettes. Now the names of such as are deserving to be called autumnal roses are legion. As a matter of fact, almost all the varieties of the great classes of teas and noisettes and hybrid teas afford us as good a display in the autumn as during the early summer months. If anything, more so. As a rule, too, we obtain a larger number of blooms upon the same plant. There is more growth to produce them, for almost every new shoot carries flowers. True, we lose greatly among the extra strong growers, and seldom obtain more than an occasional late flower from those upon walls, arches, or pergolas. The favourite Crimson Rambler, Dorothy Perkins, and others of like characteristics, throw their entire strength into one display, and that of gorgeous beauty.

Some few of these extra strong growers, notably Ards Rover, Aimée Vibert scandens, Mme. Alfred Carrière, Mme. Jules Gravereaux, William Allen Richardson, Wichuraiana Type (white), Gruss an Teplitz, and, of course, Gloire de Dijon, do not fail us from first to last; but we find the greater proportion of our autumn roses among the medium or free-growing varieties. The following have struck me as particularly good now, and are likely to keep so up to mid-October in ordinary seasons.

Mme. Abel Chatenay, with its deep salmon and carmine, always in good form, whether in bud or fully expanded, flowers upon every side growth, is one of the sweetest-scented roses grown, and has not a bad fault. I would say more in favour of this grand rose if I could think of it. It is par excellence one of the very best, and many so-called improvements have not ousted it yet.

Lady Battersea is always good late in the season. It is also one of the first to open. A very long and pointed bud, carried nice and stiff, flowering from every growth, good foliage, and, like Mme. A. Chatenay, a grand decorative rose when expanded. This is another very fragrant rose, and supplies one of the best deep cherry-crimson coat flowers for autumn.

Mme. Antoine Mari flowers till after the first frost. Very pretty in foliage, almost proof against mildew—one of our worst diseases in the autumn—and giving an enormous number of buds that are fit for any vase or coat. Flesh-white, with a distinct tinge of carmine on the edges, almost amounting to crimson during a late sunny autumn.

Etoile de France is usually better late than early, and this year is no exception. It is about our best dark hybrid tea for late blooms, and livens up a bed or bunch very much.

Fisher Holmes and Victor Hugo are still our best darks in the hybrid perpetual section, and two of the most reliable for autumn. These two are exceptionally free from red rust, a pest that affects their class very much at this season.

Frau Karl Druschki is unsurpassable in the autumn. It matters not what the weather may be, this grand and purest white rose we have remains unaffected. Last year, and the season previously, I cut really good blossoms after ice had formed in the petals, and for long after we were experiencing frosts. Hard buds that looked of no service whatever would expand into quite respectable flowers if cut and placed in the greenhouse for a time. It glories in a steady rain, and puts up with a storm better than any other rose I know. I wish we could get the same characteristics in some of the darks and pinks. Its foliage is invariably good, flowers are in large trusses, and carried as if they knew they deserved attention.

Conrad Ferdinand Meyer gives its heaviest crop early in the summer, but we also have a quite nice number of flowers now and later. This is a grand foliaged rose, especially sweet-scented, large and of good form; a silvery-pink, much deeper towards the centre. There is a so-called white sport of this named Nova Zembla. It is very good, but not to be compared to Frau Karl Druschki. It is no whiter than Margaret Dickson, but it possesses the sweetness of Conrad F. Meyer. This rose is free from mildew and red rust.

Lady Roberts is another that produces good late flowers, especially useful in the bud stage; and I fancy we obtain a greater proportion of the deep apricot and rosy-salmon flowers late than early. It is a very variable rose; good in whatever shade from yellow to copper, and lasts well.

Perle von Godesberg is a slight improvement upon Kaiserin Augusta Victoria, and a good one where lemon and creamy-white is wanted. I have seen some really good flowers lately, and think it more dependable than Duchess of Portland. It grows a little the better with us also.

Corallina is one mass of colour again, and will probably produce another good display after this; at all events, it is certain to give many blooms of its deep rosy-crimson buds. A very free-growing rose this, and if Warrior is much deeper in colour, longer in the bud, and a trifle the larger flower, it is not so free here as Corallina, and has more of Papa Gontier growth.

Mrs. B. R. Cant is one of my chief favourites for late displays. Handsome foliage and plenty of it; flowers upon almost every lateral, only stopped by decided frost, and as nearly evergreen as any rose we have. The colour is deep rose, inner petals a little lighter, and a touch of buff at the base.

Gustave Regis is one of the most reliable nankeen yellows. The buds are long and pointed, get lighter as they open, and are very effective for the coat.

Rhea Reid is a new rose, and most promising. Already it is really good in the open, although the plants were only brought over from America last April, and were lifted from the open ground then. It is a good red, much after the style of Richmond, very sweet-scented, and is undoubtedly a good grower and perpetual. It is claimed to be a better forcer than Richmond or Liberty, but it is too early to decide yet. At present I like it immensely.

Peace, a sport from G. Nabonnand, improves towards the autumn. The flowers last longer, and come fuller, probably because of more time to develop, as, like G. Nabonnand and some other comparatively few-petaled roses, a hot sun causes it to fly open before it is ready. The foliage of this is a deep bronze, the shoots upright, and the blooms carried in large spreading trusses, each flower having sufficient length of stalk to make it serviceable, independent of the whole truss. It is a lemon or primrose yellow, and fragrant.

G. Nabonnand is its counterpart in all but colour, which is a salmon-rose, shaded yellow. This variety does not carry quite such spreading trusses as Peace.

Grand Duc A. de Luxembourg is very showy in a large bed to itself. Rosy red, with the reverse of the petals bright lake. A very distinct rose this, and sweet.

Augustine Guinoisseau, of La France habit, but not quite so large a flower, is a good creamy flesh and white, while, of course,

La France is always good.

Mrs. Theodore Roosevelt is another flesh-white of great excellence. A beautiful rose this; bold in habit and size of bloom. Some really grand blooms have been out this week.

Betty is rather new, but has proved itself good both last year and this. The petals are large and of good substance, making up a grand flower, never better than when cooler weather allows the inner petals time to develop before those on the outside have faded. Clear bronzy-salmon.

Caroline Testout will not be denied, let the weather or time of season be ever so trying. Some of our plants have produced three distinct crops of bloom, and promise more yet. In colour it resembles a very deep La France, with globular instead of slightly reflexed petals.

Killarney, growing by its side, is also very pretty still. This rose stands the weather well, and, not being very double, opens better in the autumn than many. Flesh-white, suffused with pale pink, very large petals, making a good decorative display as they open.

Le Progrès also does well late, and produces a great number of flowers. A large flower, deep golden yellow, quite distinct, and, like the next one on my list, is exceptionally fragrant.

Madame Ravary flowers as freely as the last-named, has handsome bronzy foliage when young, and is a much freer grower, of a deep orange-yellow colour.

Mrs. R. G. Sharman-Crawford is one of our best late hybrid perpetuals, and equal to Mrs. John Laing in its colour. Both of these are conspicuous now, stand well against weather, and are good all the season.

Viscountess Folkestone must not be omitted, for it is one of the sweetest perfumed of all. A good grower, and a mass of creamy-white, shaded with salmon-pink.

Tom Wood is one of our earliest and also one of the latest in the hybrid perpetual class. A very strong and hardy rose, coming much brighter in the autumn, in which respect it resembles Ulrich Brunner. Both have foliage that is seldom affected with mildew.

There are very many more good roses in bloom besides the few I have named. Indeed, I seem to have merely touched the fringe of them, but those named can be depended on, and have, with the exception of the two new varieties, proved themselves so for several years.

We must not omit the dwarf polyantha or fairy roses, which are always good. At present there are White Pet, Gloire des Polyanthas, Leonie and Eugenie Lamesch, Mme. E. A. Nolte, and Georges Pernet, very showy. Mme. Norbert Levavasseur, Baby Dorothy, and Mrs. W. Cutbush are a mass of flower, almost as full as begonias and zonal pelargoniums. A. Piper.

RETARDING AND FORCING VEGETABLES.

By the middle of the month of November most of the tender vegetable crops will have been cut off by frost, or will have been used by the cook. From now the outside climatic conditions will not be suitable for their production. Consequently, for their further supply artificial means will have to be resorted to in forcing or retarding them out of their natural season. This part of the gardener's duty appears to be more exacting each year, as so much more is looked for in these days of luxury, and the season in which a crop can be naturally produced is not taken into consideration. Probably what has brought this about is the rapidity and ease with which produce of this kind can be brought into this country from abroad in a good condition. The better facilities of to-day, with lighter and more effectively heated glass structures, as compared with what could be done with dismally dark, small-paned and inadequately heated houses by brick flues, have also exercised considerable influence. Even with the aid of the greatly improved appliances, the demand for out-of-season vegetables by a large household during the winter months entails considerable anxiety. The preparation has practically to go on the whole year round to ensure having the quantities at command as they are needed.

The retarding system that has been developed of late years is of great advantage in the case of those vegetables that lend themselves to this process in maintaining an unbroken supply. Seakale is specially amenable to the system of retardation. For the first batches, say, from the beginning of November to the middle of January, the most satisfactory produce is obtained from last year's crowns that were properly matured and have been retarded. If placed in the mushroom house with a temperature of 60 degrees they will start into active growth more quickly than those just matured direct from the open garden. As time goes on it is quite probable that this system will be more generally adopted with the crowns of asparagus for early forcing, and so carry a supply over a longer period than is usual at present. This vegetable is much appreciated by most people, but unfortunately the time it takes to grow crowns for forcing makes it necessarily an expensive dish.

The method of retarding old potatoes in a cool position, and removing the growth that is made until September or later, and then starting them in boxes filled with a light compost has much to recommend it. If the tubers are placed in the mushroom house, or any structure with a temperature of about 50 to 60 degrees, they will give useful dishes of new potatoes. This process cannot be recommended for commercial purposes, but to supply the table to a limited extent.

Another system, and perhaps more reliable in giving better returns, is to lift a quantity of new potatoes from the open, before their skins are firmly set, and then placing them in boxes that can be made airtight. The boxes may be covered over with soil, each box upon the other or sunk in the soil of the garden till they are required. If this is done without bruising the tubers and care taken to prevent an undue amount of wet reaching them, it is almost impossible to detect these from the forced tubers produced in pits. Whatever may be said for or against these methods of dealing with vegetables, they form a means to an end, and are helpful in producing a substitute during the dormant and scarce part of the season till the spring months arrive with more light and sun when they can be naturally produced. Moreover, it is not often that we are asked how these are obtained so long as they are at hand when required, and they are in every way satisfactory.

Earnest endeavour should be made from now in having everything in readiness, such as the storing of manure and leaves, and all repairs to the pits and frames completed, so that the work may be efficiently and expeditiously carried out when they are required for the early forcing of crops.

C. Flack.

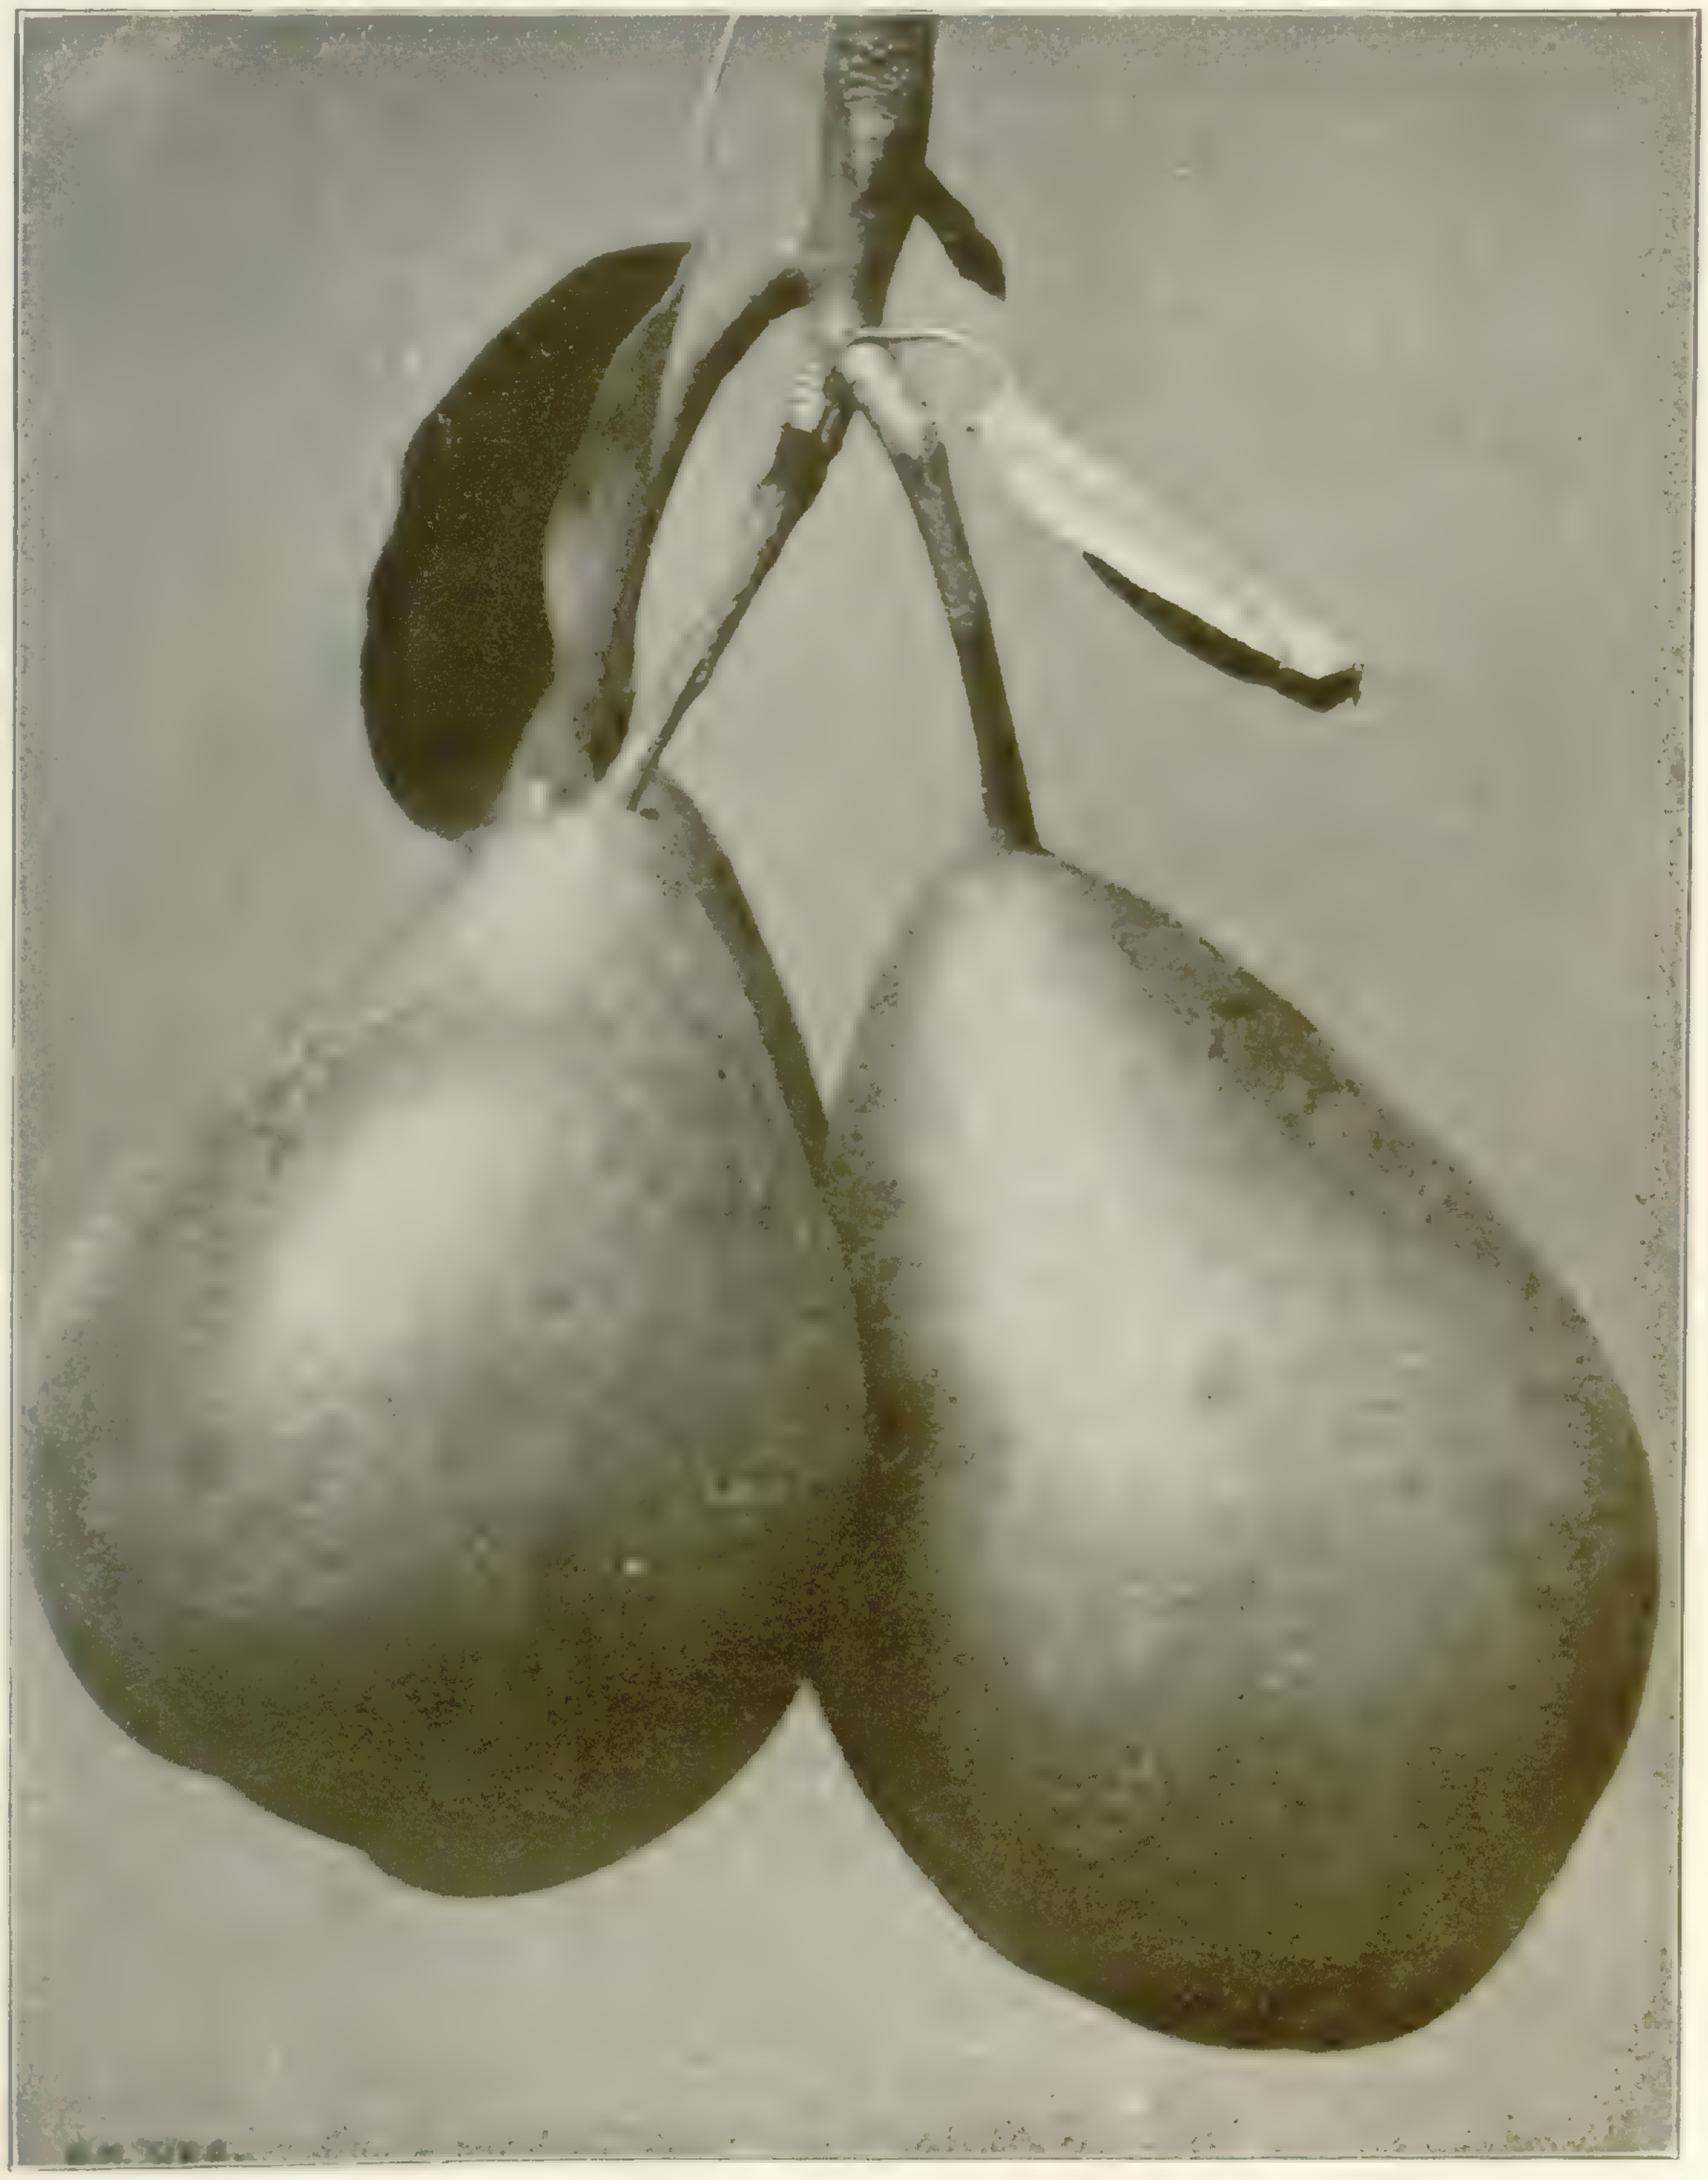
PEAR GENERAL TODLEBEN.

This useful pear, like so many others, is of Continental origin, and its title commemorates a famous soldier who was the defender of Sebastopol. Where it succeeds, and that is in most places where pears will grow at all, General Todleben is a very free-fruiting variety, and as it is of moderate growth it has much to commend it to owners of small gardens. The seed from which this pear sprung was sown in 1839, and the tree first fruited in 1855, after a lapse of sixteen years, when it was named General Todleben by Mons. Fontaine, of Gheling, in Belgium. Of pyriform shape, its thickness at the widest part often almost equalling its length, this pear usually has a stout stalk of fair length. The white flesh has a pink tinge, and is melting and juicy, sweet, and slightly scented. The skin turns yellow as the fruits ripen, but is always marked with patches of russet. In some seasons, notably in a long warm one, General Todleben is of finer flavour than in others. It is a good cordon pear for walls, and its fruits are ripe during December and January.

A Prolific Potato.—There are so many varieties of potatoes, and such very wonderful things happen with them that I am always very chary in writing on this subject. But I cannot refrain from making a note of the prolific qualities of a variety Messrs. Sutton and Sons have introduced named Superlative. Grown side by side with the well-known Satisfaction, itself an immense cropper, the yield was more than double that of the latter variety. The quality of Superlative is good and the quantity is really wonderful. I may say the seed or sets were large ones when planted.—W. M.

RAMONDIAS.

These much-admired rock plants are not grown so widely as their merits deserve, and yet they are of comparatively easy culture, given a right position. That in which they thrive the best is one on the north side of perpendicular rocks, in the fissures, and when planted in such position, where they receive scarcely any sun, they will thrive. They should be planted in a sharp, gritty mixture of peat, leaf-soil, and good maiden loam, and should be put in when rather small, as this permits them to develop at their own sweet will. The soil must be made quite firm, so that heavy rains do not wash it out, or even loosen it. In the summer, when the sun is at its greatest strength, it is well to shade ramondias a little by means of some evergreen branches stuck in at the top of the rocks.



PEAR GENERAL TODLEBEN.
A free-bearing useful mid-winter variety.

When once a stock of ramondias is established it is an easy matter to keep it going, as the plants seed very freely. The seeds should be collected from the largest and brightest flowers, and sown as soon as ripe in pans, which should be well drained and filled with a fine sandy mixture of peat and loam. Shade the pans until the little seedlings are up. A good method of shading is that of placing a thin layer of moss over the soil. The seedlings should be pricked off into other pans as soon as large enough to handle, taking care not to expose them to sunshine.

Ramondia pyrenaica produces bright purple flowers with an orange centre. R. p. alba is more rare, but is a gem, bearing pure white flowers on slender stems about five to eight inches high. R. Heldreichi has rosettes of silvery leaves with lilac flowers. R. Nataliæ, a Carpathian species, with very pretty foliage, produces large heads of bright purple flowers with orange stamens. R. Serbica has rosettes of very hairy foliage and violet flowers, but is only about four inches in height. All the ramondias require the same treatment.

Ramondias must not receive too much moisture, as an excess will cause them to decay, hence the need for planting them in a vertical position; when placing rocks or large stones in position for them, some good soil should be put down for the roots to reach through the fissures. It is quite surprising how large a plant will grow if it has plenty of soil for its roots to run in.

W. A. Cook.

Leonardslee Gardens.

"CHRYSANTHEMUMS AND HOW TO GROW THEM FOR EXHIBITION," by J. B. Wroe. Fifth Edition, revised to January, 1908, and including the new varieties.—Full details on timing and stopping for Northern, Southern, and Midland growers, selections of the best varieties, illustrated instructions on taking the buds, cuttings, staging, etc. Prices 1s. net, by post 1s. 2d.; cloth, 1s. 6d., by post 1s. 8d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London

NEW JAPANESE CHRYSANTHEMUMS.

Varieties of chrysanthemums, especially in the Japanese section, are so short-lived nowadays, owing to express culture, that new desirable varieties are always welcome. Indeed, it is the introduction of new varieties annually that keeps up the interest in large chrysanthemums. For the benefit of those readers of the Gardeners' Magazine who have not the opportunity of seeing the blooms at the various shows, I give a selection of those varieties that have come under my notice, and appear really good additions. In describing the colours it is at times difficult to make these correspond with the descriptions published by the vendors, as shades of colour vary under cultural differences and localities.

First on the list I place J. W. Molyneux, as it is so remarkable in colour, and quite the type in request, as we have had such a paucity of varieties of late years of this shade of colour. This variety was raised by Mr. N. Molyneux, of Rookesbury Park Gardens, and named after his elder brother, who has long been a keen amateur chrysanthemum lover. Full-sized blooms measure nine inches in diameter, and seven inches deep, fully built up in the centre, with half-inch-wide flat reflexing florets, which display the remarkable colour to the utmost. In this way it is superior to many varieties which incurve and show the under-colour, which often detracts from the full beauty of a flower. The colour is blood-red crimson, with an overlay of velvet. The habit of growth is dwarf.

The Hon. Mrs. Lopes (Silsbury) is one of the finest yellow varieties ever raised, and will eclipse the popular F. S. Vallis as it becomes better known. Full-sized blooms measure ten inches in diameter, and quite $8\frac{1}{2}$ inches deep. The reflexing florets are of medium width, gracefully twisting and curling at the points, and building up a full flower without an atom of coarseness. The colour is of that rich orange-yellow, comparable to the old Jardin des Plantes shade.

Marquis of Northampton is a sport from W. A. Etherington, and was raised at Castle Ashby by Mr. Searle, and named after his employer. It is very desirable, as its colour—buff yellow base, overlaid with bronze, is quite new among chrysanthemums. In size it is desirable, nine inches broad by seven inches deep, high in the centre, and with broad, gracefully reflexing florets.

NEW SINGLE CHRYSANTHEMUM HILDA LAWRENCE. (See New Plants).
Flowers large, colour rich rose with yellow disk.

Mrs. W. Iggulden is said to be a sport from Madame G. Rivol, but this is open to doubt, as in the new variety the florets naturally reflex, forming a full, handsome flower of a good type, while in the suggested parent there is seldom any tendency to do aught but incurve loosely. I cannot call to mind an instance of a sport having a different style of floret from its parent, when grown under similar conditions. Be this as it may, the newcomer is sure of a welcome to the rich yellow-flowered class, and it bears a worthy name

Mrs. G. F. Coster (Silsbury) grows fully nine inches in diameter, and seven inches deep. The broad, even florets reflex naturally, making a full-centred bloom. The ground colour is golden, mottled and lined with purple.

G. Mileham, 1908, is a good variety of the incurving type of Japanese, full and bold in its form. In colour it is a soft yellow.

Edith Jameson is not exactly new, but it is unique in colour, and deserves to be better known and more cultivated. The florets are long, drooping gracefully, yet not sufficient to spoil the centre of the bloom, which is fully built up. The colour varies with the bud development. At times it is pale pink, at other times it is a deep rosy-pink. In any shade it is distinct and desirable.

Mrs. D. Fairweather has broad florets, the tips of which incurve slightly, showing the golden reverse. In its surface colour it is yellow, with a rich red flush, making it quite a new type.

J. Lock has very broad, flat florets, which curl slightly at the tip. In colour it is chrome yellow, tinted at the base of the petals with chestnut.

Mrs. Arthur Lee (N. Molyneux) is a medium-sized flower, of graceful build and remarkable colour—rich crimson, with golden reverse, the latter being little displayed by the incurving tips of the petals. The florets are of medium width.

Master David (Perkins) is the nearest approach to Edwin Molyneux in colour yet raised, and therefore most desirable. It is a full-sized, well-built flower, with medium-sized florets, which reflex thoroughly, making a full-centred bloom of sterling merit.

Lady Crisp (Perkins) belongs to the yellow-flowered group. The broad florets reflex, and are slightly pointed; on the surface the yellow has a slight bronze suffusion; the reverse is paler. A desirable variety of easy production.

Master James (Perkins) is chestnut-red in colour, with a suffusion of rose on its flat, drooping florets; it is quite distinct from any other variety.

Mrs. Charles Penford is rich yellow, with long drooping florets, and full centre. It is large, and in every way worthy of attention, as its colour is always welcome, even from a decorative point of view.

Edwin Molyneux.

Swanmore Park.

Lilium auratum with Fasciated Stem.—Lilium auratum is apt to send up a fasciated stem, which, as a rule, is a great drawback to its beauty and elegance, but the subject of the enclosed photographs is about the worst offender in this way that I ever met with. It is one of several grown in pots by my cousin, Col. Hammond, near Ripon; they nearly all threw up stems more or less fasciated. There were altogether 54 flowers and buds on this particular one, and the extraordinary growth of the stem induced my wife to take two photographs of it, front and back view, so to speak.—S. G. Reid, Yalding, Kent.

Lily of the Valley.—Now is a good time to lift lily of the valley for forcing and for making new beds. If flowering crowns are wanted they must be picked out separately, and the weaker ones can then be replanted. This plant likes a light, porous soil, liberally dressed with well-decayed manure, or leaf-soil, but new or rank manure must not be used. Plant the crowns or clumps just beneath the surface. Various sites may be used to ensure a prolonged supply of blooms; put some at the front of a south wall, some in open borders or beds, and others behind a north wall, as they do equally well here in either position, and give a supply of flower for several weeks. Fortin's Giant is a very large and noble variety, well worth the extra price charged for it. Crowns for forcing can now be obtained at so reasonable a price that home cultivation for forcing purposes is not worth troubling about.—E. F. Hazelton, Knowsley Gardens.

NOTES FROM KEW.

Mussænda erythrophylla.

Most of the species of Mussænda are remarkable more for the beauty of their large, brightly-coloured floral leaves or bracts than for their flowers. One of them in particular, known as M. frondosa has been long grown in gardens; and that at the head of this note—M. erythrophylla—was distributed by the late Mr. William Bull, of Chelsea, just twenty years ago. It was described as bearing large scarlet bracts, and promised to be a good garden plant, but unfortunately it proved in this country at least to be very shy blooming, in fact, the specimen now flowering in the T range at Kew is the first that I have ever seen in bloom. It forms an upright-growing plant, furnished with oppositely arranged roundish ovate leaves, clothed, as indeed are the other parts of the plant, with a silky pubescence. The small and by no means showy blossoms are disposed in a terminal head, and surrounded by large floral bracts. These bracts are leaf-like, about four inches long, and half as much in width, while the colour is a kind of bright cinnabar-red. When distributed these bracts were described as of a dazzling scarlet colour, which can scarcely be said of the specimen in bloom at Kew, but the difference between the West Coast of Africa and England in the month of November will be quite sufficient to account for the variability in colour. This mussænda is of easy propagation and culture, but, as above stated, it does not flower freely.

Solandra grandiflora.

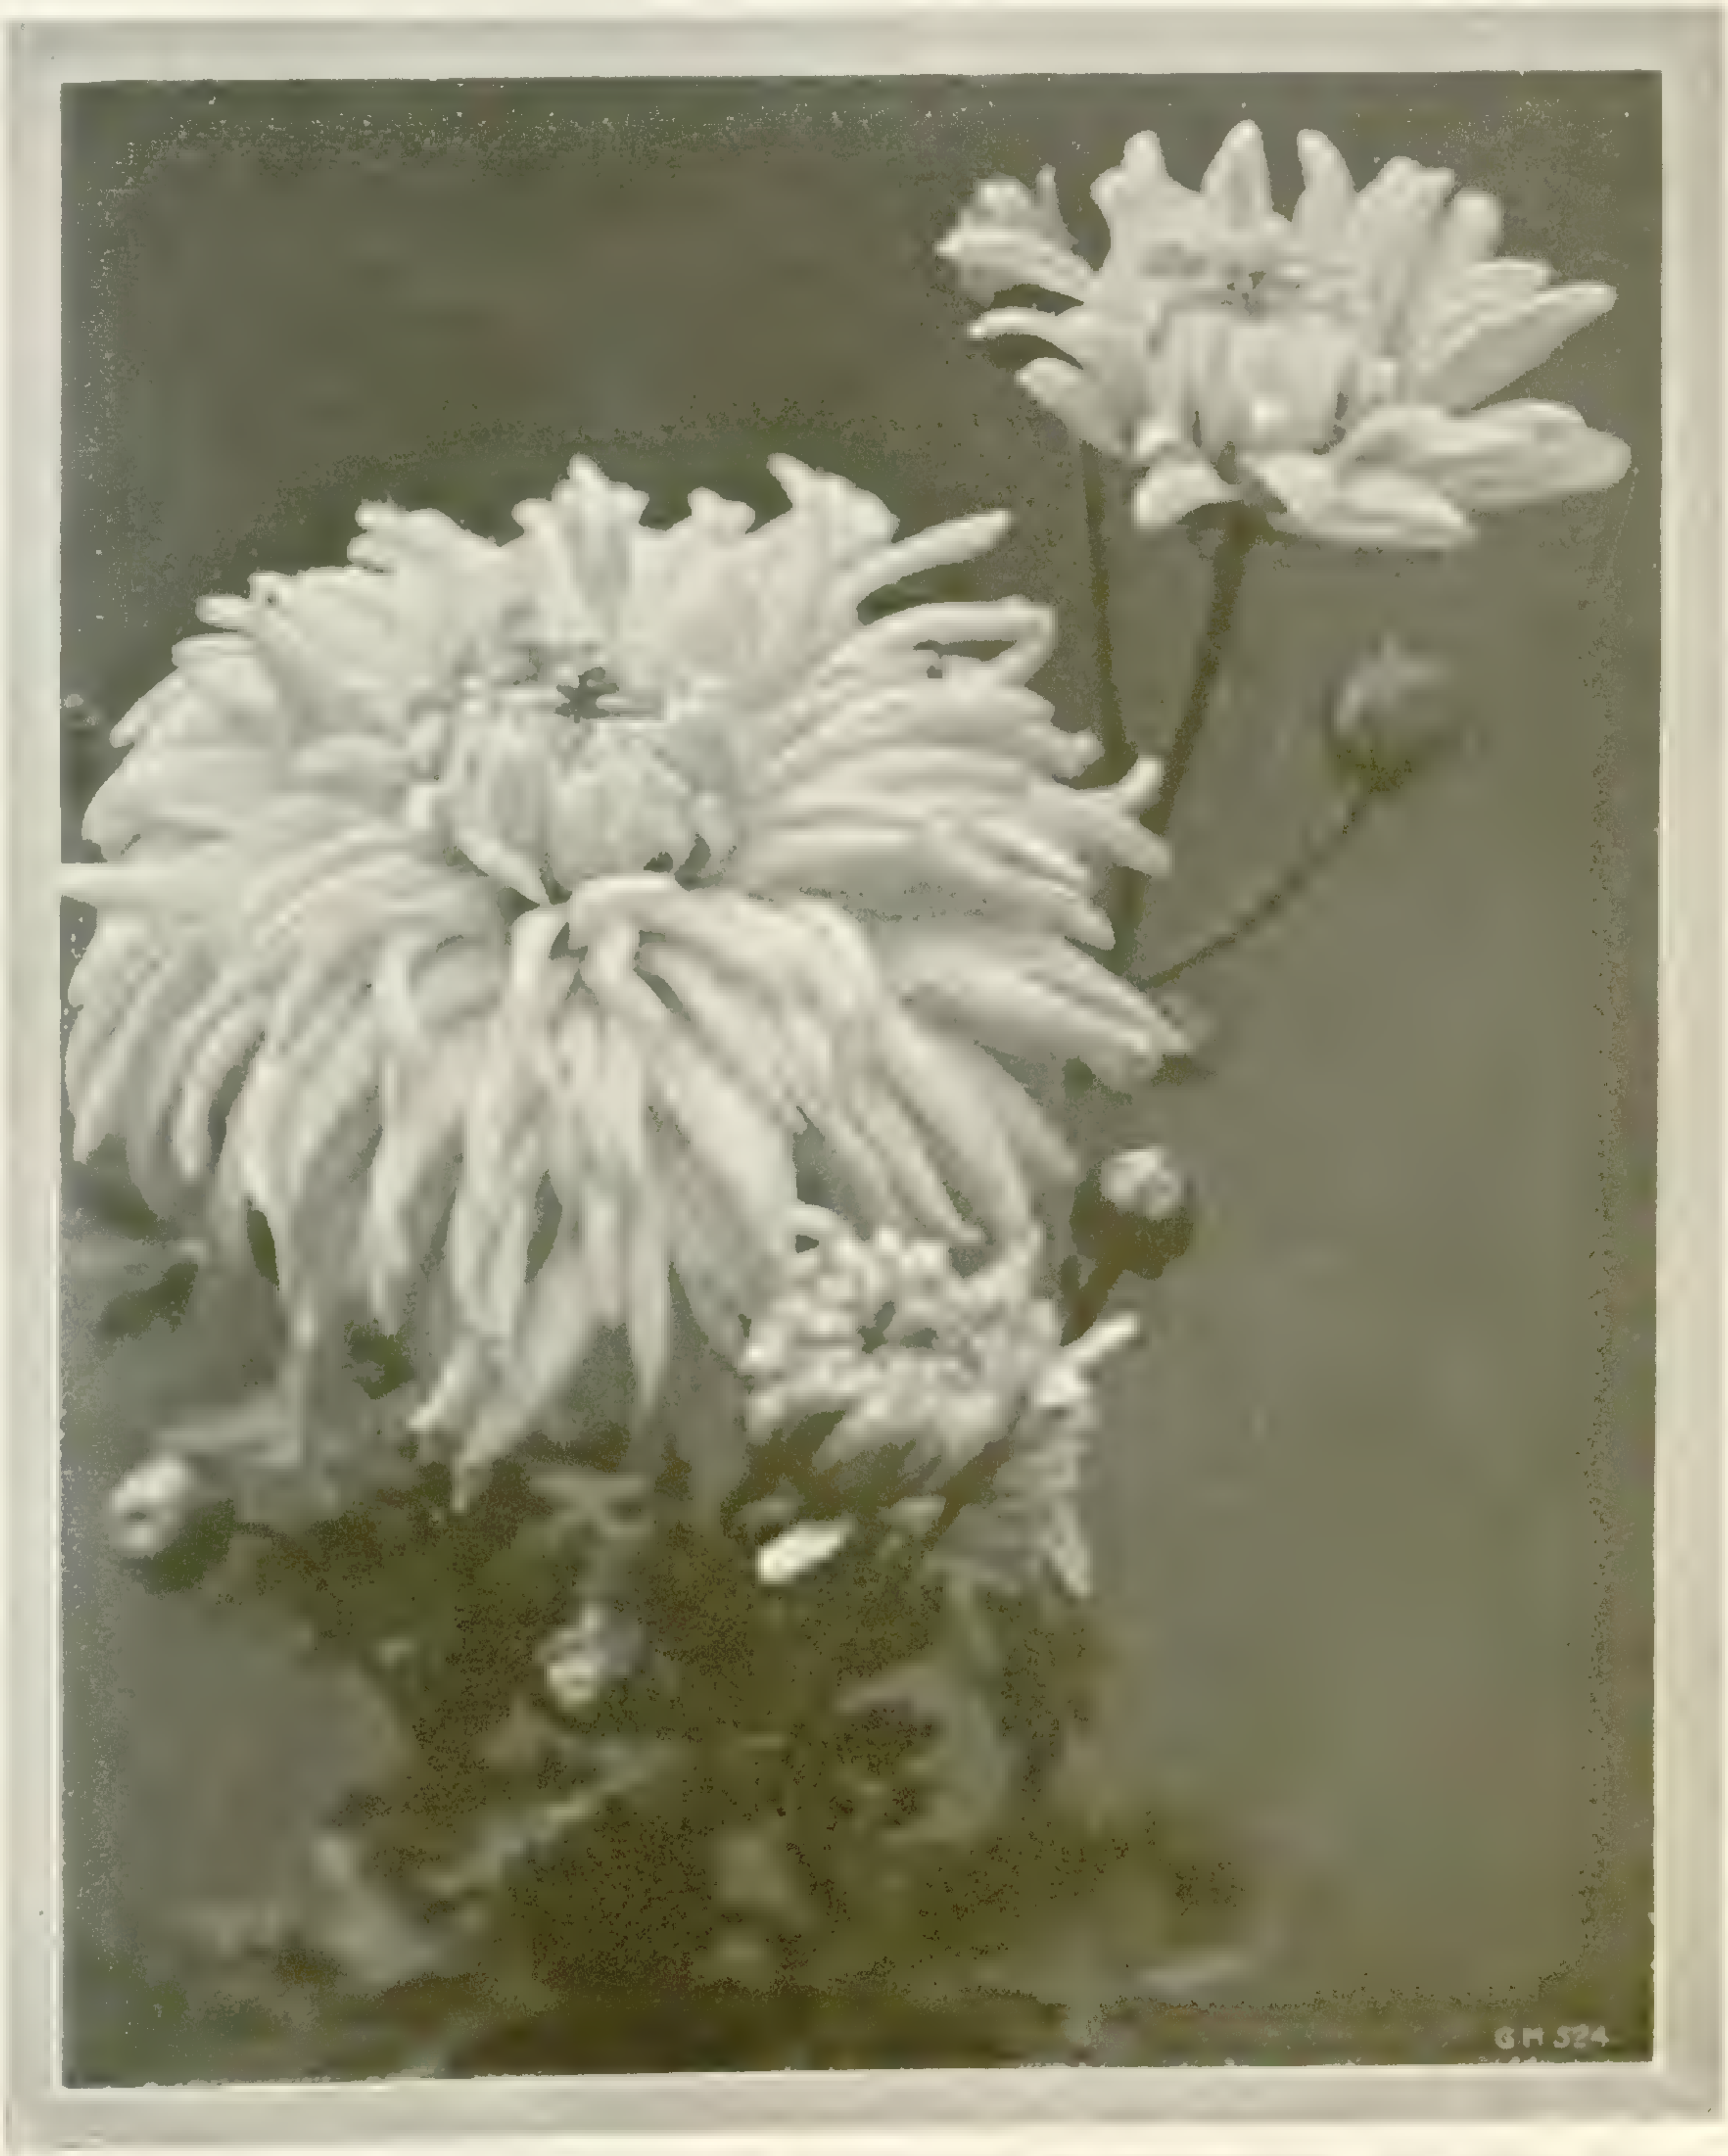
This exceedingly vigorous climbing plant is now, and has been for some time, flowering in the succulent house at Kew. It is trained to the roof, and covers a considerable space. This solandra, as suggested by its generic name, is a member of the potato family, and is therefore nearly related to the daturas, to the flowers of which those of the solandra bear a considerable resemblance. They are about nine inches long and five inches across the expanded mouth, and in colour ivory-white suffused with greenish yellow. The interior has a purplish tinge. Though, as above stated, the name of solandra suggests an affinity to the solanum, it really commemorates the name of Dr. Solander, the fellow traveller of Captain Cook and Sir Joseph Banks. In order to ensure a display of flowers the specimens need to be fully exposed to sunshine, and at the same time a dry atmosphere is essential. Root room, too, should be restricted, and it must be kept quite dry throughout the winter months. In the case of a large plant it should be spurred back when dormant in much the same way as vines are treated. A native of Jamaica, Solandra grandiflora was introduced as long ago as 1781.

Pinguicula caudata.

This showy member of the Butter Wort family has been long known as above, but at Kew it is called Pinguicula cordata. A group of flowering plants in the orchid house forms just now an exceedingly attractive feature, doubly welcome at this dull season of the year. This pinguicula forms a rosette of bright green fleshy leaves, and from its centre the flower spikes are pushed up. They are erect, and reach a height of eight or nine inches, being terminated by a single flower about a couple of inches across, and of a bright carmine rose colour. A singular fact in connection with this species is that it was given a first-class certificate by the Royal Horticultural Society in 1881 as P. Bakeriana, and a year later a similar award was bestowed upon it under the name of P. caudata. Now with the Kew name of P. cordata, one is puzzled to know which of the three names to use in referring to the plant.

Lilium sulphureum.

This charming Burmese lily shows well its value for greenhouse decoration during the autumn months, for in No. 4 it is well represented. At this season it stands almost alone except in the case of retarded bulbs, for Lilium neilgherrense, which also flowers now, though at one time readily obtainable, is very scarce. The long trumpets of L. sulphureum are in colour creamy white, with usually a ruddy tinge on the exterior, while the inside is suffused with rich yellow. This species is a native of Northern Burmah, and when first introduced, now about twenty years ago, was known as L. Wallichianum superbum. It has proved to be the most amenable to cultivation of all the beautiful lilies from that region.



NEW MARKET CHRYSANTHEMUM FELTON'S FAVOURITE. (See New Plants).
Blooms of medium size: creamy-white.

Montanoa mollissima.

Just about a year ago one species of Montanoa, viz., M. bipinnatifida was shown in good condition at a meeting of the Royal Horticultural Society. A second species—M. mollissima is now flowering freely in the greenhouse No. 4, and very pretty it is. It forms an upright, freely-branched specimen, six feet or so in height. The ovate-lanceolate leaves are rough in texture and whitish underneath. The flowers, which are freely borne, have a yellow disk, while the ray florets are white. They are a couple of inches or so in diameter. This montanoa is of easy culture, and may be given much the same treatment as chrysanthemums.

Ipomæa ternata.

This climbing species of ipomæa was first distributed under the name of I. Horsfalliæ alba, and was afterwards known as I. Thomsoniana. The name of I. Horsfalliæ alba well expresses its general appearance, for, though differing in many respects from I. Horsfalliæ, the effect is that of a white form of I. Horsfalliæ itself. It is now flowering freely in the T range.

Cytisus filipes.

This exceedingly graceful member of the Broom family is flowering freely in the Temperate House, and very pretty it is. When old it forms a rather tall specimen, from the upper portion of which the long bright green threadlike shoots hang down for a considerable distance. They are studded for the greater part of their length with small white pea-shaped blossoms, of which a succession is kept up for some time, and that, too, during the dull season. Cytisus filipes is a native of Teneriffe, and was introduced therefrom in 1838.

K.

CARE OF HOUSE PLANTS.

Of all the questions asked by the purchasing public, the one most frequently hurled at the unprotected plant seller is, says "The Weekly Florists' Review," "How often should I water this plant?" or, "How many times a day does it need water?" or, "Should I set it in a dish filled with water?"

This query is not more sensible than a question asking a doctor, "When should a person sleep?" or, "When should he eat?" If the reference in either case were to a plant that needed particular treatment or a person whose health was not up to the mark, it would be justifiable; but when it is attached to everything sold, it ceases to have any meaning.

If the purchasers used judgment in watering, they would know that practically all plants sold for indoor decoration are well established, and, if the conditions are at all favourable, they should be watered whenever they need it. This is the proper answer to give to all such queries, and whether the soil dries out once a day or once a week makes no difference if the plant is not allowed to get too dry.

The situation in which the plant is kept has the greatest influence on the moisture required. Draughty rooms, proximity to glass windows or doors, absence of light, quantity of gas burned, heat radiation from steam or other methods of heating, glazed plant-jars, and many other conditions, have much more effect on the health of the plant than the simple watering. Yet it is rare that anyone asks about any of these things, and it is only when the disgruntled customer drags the poor, suffering plant back to whence it came, or comes in to scold the plantsman for selling a palm that was "sick" when delivered, that a few of these salient points are brought out. The customer usually prefaces the remarks by saying, "I took care of the plant just the way you told me to. I watered it once a day, and it kept getting worse and worse all the time, until I have brought it back for you to see it. I guess it was sick when you sold it to me."

When the poor florist timidly inquires about the conditions in the lady's home, he always brings forth the information that the plant had been put into a fancy jardiniere, kept in a room in which gas had been burned every night, and in a dark corner or a draughty hallway, and he is really surprised that the misused specimen kept as long as it did.

The public should be made to understand, if possible, that plants are anxious to live as long as they can, and, if given just a fighting chance, will do their best to keep themselves as pretty as their surroundings. But, when the effort is too much, the plants will sadly droop their leaves, in a feeble protest against too great odds to be overcome, and, strange to relate, it is always the fault of the florist for having sold a "sick" plant.

Michaelmas Daisy Climax.—Good though the illustration is of this new aster, on p. 798, it really does not do justice to the variety. Of course, I do not expect to see its colour pourtrayed in the engraving. Looking at the picture one might easily say, "Well, what is the difference between Climax and Finchley White?" I saw this new aster growing last year at Aldenham, and again this year, and say that for decoration it is the finest variety Mr. Beckett has yet raised. In height it grows six feet, has round, bold looking leaves, quite unlike any other variety that I am acquainted with. The vigorous habit just fits it for the back of the herbaceous border or among shrubs, where, arranged next to a pure white variety, or Mrs. F. Rayner, for example, the effect it produces is quite pleasing. The blooms are fully two inches in diameter, each being well placed, showing itself fully and producing a striking effect. In colour it is soft blue, which, under artificial light, changes to a delicate pink. For cutting this variety has a great future before it, and certainly deserves the name which it bears.—E. MOLYNEUX, Swanmore Park.

RASPBERRIES.

There is no doubt that this fruit may be grown to advantage in almost any kind of soil, provided ample moisture is afforded in hot weather. Where grown largely for market the mode of cultivation differs somewhat from that adopted in private establishments, for, as a rule, no supports to the canes are given, but it should be borne in mind that the soil in gardens, as a rule, is far more fertile, therefore the canes grow much more rampant, in some places attaining a height of from seven to eight feet, and unless supports of some kind were afforded them they would be broken down in rough weather and much of the fruit spoiled.

When making new plantations select some of the strongest suckers and plant them a foot apart in the rows. If the canes are good ones they should be about four feet long and possess one or two good plump growths at their base. Such canes, when planted, should be cut back to within a foot of the ground so as to throw all the strength possible into the young growths springing up from their base. If liberally treated in the way of mulching after planting, and well supplied with water during the summer, not only will the young canes attain a fair size, but those cut back will break from the upper buds and give a supply of fine fruit a week or two later than those that had been planted a year or two previous.

At one time raspberries were planted in clumps about four or five feet apart, and four or five canes were tied to a stake at each, the old stools remaining in the same place for years, until they refused to send up canes. A more rational way is to plant a row or two each year, allowing a distance of about six feet between them. In the course of four or five years, according to how the ground is treated, the soil will have become fairly exhausted, so that the rows that have been the longest in existence can be destroyed, the young ones taking their place. By this method there will be an abundant supply of fine fruit. By planting in rows and allowing six feet between them, and thinning out the canes to a foot apart, they will have ample light and air to ensure strong growth. Canes of this class will break at nearly every bud, and produce a large quantity of fine fruit. As soon as this is ripe all the old and superfluous canes should be cut away that those left may have the full benefit of the light and air to ripen them.

It is a mistake to shorten the canes until early in the spring, for in mild winters the sap becomes active quite early, and if it is allowed to flow into the top buds these will swell and are often destroyed by late spring frosts. When pruning is deferred until spring it can then be ascertained if any of the upper buds are injured, and should this be so, the canes may be shortened to the top live one. In very severe winters I have known the canes killed down close to the ground, most of them having to be cut away, but, fortunately, this does not occur very often.

Varieties of raspberries are not numerous, but half a dozen is ample for a private establishment. Of red kinds Superlative and Baumforth's Seedling are amongst the best; and of the yellows, Queen of England and Yellow Superlative are the most desirable. The autumn-bearing varieties differ somewhat from the others, as they fruit on the young canes, but there is no difference in the mode of cultivation, with this exception, that one fruits on the canes made the previous year, the other on those made the same summer. Belle de Fontenay is one of the best. There are two or three new varieties said to be very good, but these I have not tested, therefore cannot speak from experience.

Buxted Park Gardens.

NEW PLANTS, ETC.

CHRYSANTHEMUMS.

Felton's Favourite.—A market variety of great promise; the blooms are of reflexing Japanese form, of fair size, and creamy-white in colour. A.M., R.H.S., October 27. Mr. Phillip Ladds, Swanley Junction.

Hilda Lawrence.—A large-flowered and free-blooming single chrysanthemum that grows about 3½ feet high. The colour is bright rose, with yellow centre. F.C.C., N.C.S., October 26; A.M., R.H.S., October 27. Mr. Lawrence, gardener to Mrs. Gregory, Shoreham.

J. W. Molyneux. — A large and brilliant crimson Japanese variety that has great beauty of form and colour to commend it. F.C.C., N.C.S., November 4. Mr. N. Molyneux, Rooksbury Park Gardens, Fareham.

Hon. Mrs. Lopes. — A shapely Japanese variety of clear canary-yellow colour; a useful addition. F.C.C., N.C.S., November 4. Mr. M. Silsbury, Shanklin, Isle of Wight.

Mrs. W. Iggulden.—This is another fine new yellow Japanese variety that promises to become popular. F.C.C., N.C.S., November 3. Mr. W. Iggulden, Lock's Hill Nurseries, Frome.

R. F. Felton. — A very fine new market variety of good shape and wonderful substance. It belongs to the reflexing Japanese section and its colour, deep and bright orange-yellow, makes most other yellow flowers look rather pale or dingy. F.C.C., N.C.S., November 4. Messrs. W. Wells and Co., Merstham.

White Pagram. — A splendid new single variety that is the counterpart of Edith Pagram in form, but is pure white. F.C.C., N.C.S., November 4. Mr. Norman Davis, Framfield.

Reginald. — A rich lemon-yellow single variety of considerable beauty; it is very elegant and fine for decoration. F.C.C., N.C.S., November 4. Mr. W. J. Godfrey, Exmouth

Mr. W. Buckingham. — A free-flowering single variety that produces elegant and useful sprays of bright pink blooms. F.C.C., N.C.S., November 4. Mr. Bullimore, Grove House, Roehampton.

Robt. Thorp.—Another very free-flowering single variety, giving useful sprays of white blooms. F.C.C., N.C.S., November 4. Mr. H. W. Thorp, Durrington Nursery, Worthing.

Mrs. W. Parker. — A pretty blush-tinted single variety. F.C.C., N.C.S., November 4. Mr. H. Redden, Manor House Gardens, West Wickham.

Miss Cora Stoop. — A shapely incurved variety of distinct silvery-pink colour. F.C.C., N.C.S., November 4. Mr. G. Carpenter, West Hall Gardens, Byfleet.

Freesias.—The chief point with useful winter and spring flowering bulbs, in order to secure a strong growth, is to bring them on very gradually at first, as if hurried in the least failure is sure to follow, flower stems not appearing, or, if they d being weak and puny. I find it a g plan to place the bulbs in a quite cool greenhouse as soon as potted, keeping them tolerably dry until growth commences, and then to remove them to an intermediate house. Freesias are generally potted up early, growers thinking that the bulbs are for late work, but if they are kept in a perfectly cool store they may be potted as late as March, with good results.—T. B. F

MORELLO CHERRIES.

When the leaves have fallen pruning and gulating the branches and shoots should be mmenced. I always like to push ahead th this work during mild weather; in fact, far as possible, all trees that occupy north d east aspects are dealt with before the y cold weather sets in. The work is done icker thus early, as those engaged in it e not benumbed with cold. In training shoots of the Morello cherry care should n to keep them straight, and the main evenly balanced, in much the same r as the peach trees. The young wood slender, and frequently every bud, ex- the terminal one, being flowering buds, uld not be shortened back. If the e large and have been somewhat neg- d, every branch ought to be unfastened washed with some approved insecticide, ecially the main branches; remove any can be spared, and then spread out ly those required to form a well-balanced d. Then proceed to fill in with the shoots, allowing ample space in the nd do not overcrowd. Keep the bot- the trees well furnished with young take the places of those becoming worn out. Much depends on this ng the trees in a fruitful condition. ng growths in a great many instances ied over the older wood with strips ng. Be careful when driving in not to bruise the bark with the because of the risk of important gumming, and, it may be, dying the trees have been well cared for, good condition, it may not be to unfasten the whole of the each year, but the ties and shreds thoroughly examined, and if found any way pinching the bark they removed and fresh ones substi- After the trees have been pruned syringe them a few times in fine with a solution of quassia, soft soap, lphur, or soapsuds, at a moderate th. This will destroy the insects with sometimes these trees are attacked.

H. MARKHAM.

ST. BRIGID ANEMONES.

In the moister parts of the kingdom the crown anemones, whether of the St. Brigid or Aldeburgh groups, are a great success almost all through the season, provided successive plantings are made. But in or close to large towns, where the atmosphere is dry, these charming flowers do not grow so freely. This fact, however, need not prevent the use of anemones altogether, for, fortunately, the curiously-shaped tubers are very cheap, and no great loss is experienced even if they are thrown away after they flower. For town and suburbs the spring display is the one to be relied upon, because the condition of the weather favours the plants. A capital method of using these anemones is that of planting them as a carpeting to hyacinths or daffodils, these bulbs being somewhat thinly planted. As a rule, the anemones will provide a carpeting of elegant leafage for the other subjects, and then follow on with their own display of flowers, thus, in the case of a bed, producing a continuous display over a fairly long period. This method has been adopted in some of the larger public parks and gardens, and the accompanying illustration of a bed in the Hampton Court Palace gardens, seen last spring, serves to show what a good effect can be produced with these bright and attractive flowers following after hyacinths. The colours may be mixed, or kept distinct, and there are pure white, bright and soft blue, purple, scarlet, scarlet and white, and pink shades to select from, so that there need be no difficulty in making a suitable selection. The tubers may be planted at the same time as the bulbs, but a method occasionally adopted is that of placing the tubers in boxes of soil, in a cold frame, and putting out the plants at the end of March or in April. Spring planting has much to recommend it where the soil of the garden is heavy and retentive of moisture.

K.

A BED OF ST. BRIGID ANEMONES AT HAMPTON COURT PALACE GARDENS.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

EAST INDIAN HOUSE.—The various species of vandas will by now have completed their growth, and as the points of the roots become sealed over they should be placed under strictly resting conditions, by affording only sufficient root and atmospheric moisture to keep the leaves plump. It is a very difficult matter to draw hard and fast lines as to the amount of moisture required, or desirable to be retained in the atmosphere. Under certain conditions it may be desirable to make two slight dampings down daily, instead of a single heavy one early in the day. The outside conditions must be taken into consideration, as well as the situations in which the plants are grown. The construction of the houses and facilities for retaining moisture in them are found to vary to such an extent that only those who have the growing of the plants and a proper interest in their work can have any idea of their own particular needs. The matter must, therefore, be left to those in a position best able to judge. Personally, I endeavour to reduce the atmospheric moisture in the houses according to the prevailing conditions outside, endeavouring, as far as possible, to have the moisture reduced to its minimum by the time the cool evening temperature is reached. A great deal depends on the treatment of vandas, ærides, and their allied genera at this season of the year, for if the plants are permitted to become shrivelled the possibilities are there will be a considerable loss of lower leaves during the winter and spring months. I find that during a prolonged period of cold weather it is well to keep the temperature near the minimum degree, and only use as much artificial heat as is necessary. Excessive ventilation should also be avoided at this season, and when air is given use the ventilators on the leeward side of the house.

THE FLESHY - LEAVED SACCOLABIUMS, which have any great depth of potting material, and the atmospheric surroundings are not of the best, will be benefited by having the bulk of the potting compost removed from about their roots, although the plants may then require a little more attention, especially where grown in baskets. But there will not be the danger of damp and spotting that there would be with any great bulk of potting compost about the plants. I have for some time been convinced that a good deal of the spot on the foliage of orchids is caused by having too much moisture-retaining material in the potting compost. I think it very possible that as we learn more of the requirements of certain plants we shall be induced to depart from certain orthodox methods, and be able to provide suitable compost substitutes which will be to the benefit of our plants.—H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

IVY-LEAVED PELARGONIUMS.—These beautiful plants have lately been conspicuous in the flower garden by reason of their blooming more freely late in the season than during the summer, when the ordinary zonals were aglow with colour. There are now so many beautiful ivy-leaved varieties that it is well nigh impossible to particularise the best. I do not think any of the newer varieties can surpass the old, well-tried Madame Crousse and Souvenir de C. Turner. For hanging baskets few plants can equal these two varieties. If cut flowers are in request I do not think anything is so useful at this time of the year as the back wall of the greenhouse covered with a mixture of ivy-leaved pelargoniums, for, having good long flower stalks, and forming such large trusses of bloom, they are just the thing for bouquets or filling vases. I find they flower most freely when planted in boxes or pots, with only a limited root run, than when grown in deep, rich borders. It is surprising what large specimens may be grown, and kept healthy for years, in pots of a comparatively small size, if only a little artificial manure is given with the water during summer.

SHRUBBY VERONICAS.—These are just now very bright and cheerful. As such they are very useful, and during the autumn and early winter, when little else but chrysanthemums are to be met with, a few neat bushes of veronicas afford a pleasing variety. The fact that they will keep in health and continue to bloom in a structure from which the frost is just excluded, is another point in their favour, for neither the blossoms nor leaves are liable to damp during the dull days of winter.

POT ROSES.—If Dorothy Perkins and other roses of this class are required to bloom about Easter some plants should now be procured in pots, or ground plants potted up would do, but they will need different treatment to those established. Newly-potted roses may be gently forced after the plants have made new roots, but these latter will not form in a very low temperature, so that if the plants are required by the time named they should be removed to a temperature of 45 degrees at night after they have been outdoors a week or two and are settled in their pots. Now is a good time to procure established roses in pots. Such plants may be pruned, and forced immediately, their pots being already full of roots.

CHRYSANTHEMUMS.—I doubt if any chrysanthemums are more useful or more appreciated than those grown expressly for mid-winter, as they are invaluable both for the conservatory as pot plants, and for all kinds of cut flower work. Plants still being retarded outside should now be taken into a cool orchard house and allowed to develop their blooms, which they will do at Christmas. These require a lot of feeding, as the pots are well filled with roots, and each plant carrying a large number of flowers. Black aphis is particularly fond of the succulent growth, and the plants will require fumigating about once a week to keep this in check.

CYCLAMENS.—For a succession of these plants another sowing should be made now. Keep the seedlings near the glass, and never allow them to suffer from want of water. Vaporise as a preventive rather than a remedy against aphis. The earliest of last year's seedlings are now in the height of their beauty, and as the pots are full of roots the plants will take almost unlimited supplies of water.—T. B. Field, Ashwellthorpe, Norwich.

THE FLOWER GARDEN.

LAWNS.—The prolonged mild weather has caused grass to make vigorous late growth, so that many lawns require another mowing, and where such is the case they should be at once attended to, and verges clipped, making all neat and tidy for the winter. Machines should afterwards be thoroughly dried, cleaned, and oiled all over before being stored away; this is one of the many jobs that may be done when weather does not permit of work being done outside.

HERBACEOUS BORDERS.—These have continued attractive later than usual, and no time should be lost in cleaning them over, and regulating or replanting, according to the conditions. Something requires to be done every year if the border is to be kept in good condition, and if planting is done now the plants will become established at once. Where a border has been planted long enough to become at all crowded, and the clumps are large, with bare centres, everything should be entirely lifted, the soil heavily dressed with well-decayed manure, and trenched, or very deeply dug. Should trees or large shrubs be near, many of their roots will doubtless be found in the border, and these should be cut off, unless the tree or shrub is a choice and very special one; such conditions, however, are not good for the occupants of the border. Divide or reduce large clumps or tufts, and replant them as soon as possible, only using the outsides of large clumps. Bulbs in herbaceous borders have a very pleasing effect in spring, but the inconvenience of them when working a border and replanting, largely outweighs their beauty, and their number should be strictly limited. Due care must be given to arrangement and blending of colours in herbaceous borders, and also to whether the display is to be general all through the season or at any given time of year, and selections must be made accordingly.

FOR GENERAL EFFECT early, midseason, and late-flowering kinds should be used, not necessarily as single plants, but in groups of one variety only in each. The latter kinds should be towards the back, not always in straight rows, but somewhat irregularly set out, with an occasional plant towards the front. The stately eremurus are specially suitable for use in this way, as dot plants, or in groups, but extra care should be taken in removing these, as their roots are spreading and brittle. If tree lupins are used, place these where plenty of room can be given or their growth in the second year will be largely spoiled. A late-flowering variety should be planted near the early ones, so that one may succeed the other.

FOR AN AUTUMN DISPLAY use doronicums, aquilegias, inulas, pæonies, lupins, incarvilleas, trollius, pyrethrums, campanulas, Chrysanthemum maximum, etc. The early phloxes should be quite omitted, and late phloxes in variety, helianthus, rudbeckias, solidagos, hollyhocks, lobelia (cardinalis type), Michaelmas daisies, heleniums, kniphofias, senecios, Eupatorium purpureum, Astilbe Davidi, Caryopteris mastacantha, and many others used instead. When planting in fresh, deeply-dug ground, always allow for settlement, and the more deeply dug the more allowance must be made, or oftentimes the crowns of plants will be too high above ground, and liable to be damaged. — E. F. Hazelton, Knowsley Gardens.

HARDY FRUITS.

YOUNG TREES.—When planting young trees let the drainage be thorough. Use a layer quite nine inches in thickness of old broken bricks, tile, or other suitable materials. The compost should consist of sweet loam, lime rubble, a little chalk, and wood ashes, with a moderate sprinkling of bone-meal. These should be well mixed, and made rather firm before planting the trees. Spread out the roots at various angles, previously cutting away any damaged ends. Shake amongst the roots a little fine soil, gently raise the tree once or twice, and then fill in, treading the soil as the work proceeds more or less according to its state and character. No pruning need be done till February, by which time the soil will have become consolidated.

GOOSEBERRIES.—The pruning of these may now be proceeded with. Some, however, prefer leaving this work till spring owing to birds, etc. Where the number of trees is large advantage should be taken of fine weather, and the work pushed forward. When pruning gooseberry bushes keep the heads well open, and endeavour, as far as possible, to give a nice even appearance to the bushes. All inside shoots may be spurred back to within a couple of buds from the stems, leaving some their full length at intervals where required to fill up spaces. Leading shoots may be shortened a little more or less according to the length of growth. A good and fruitful bush ought to contain plenty of new wood, for on this the best fruits are usually produced. Remove all suckers, and when the pruning is finished clear up the prunings, selecting a quantity and heeling them in for making into cuttings. Remove from under the bushes the upper portion of the soil. If the caterpillars of the magpie moth, etc., have been troublesome give a thorough dusting with lime and soot, and top-dress with a little fresh loam, etc. In making new plantations let the land, if possible, be well trenched and manured according to the richness of the soil; set the young bushes out at five feet apart, always keeping the varieties intended for dessert on one side, so that they can be better preserved from birds. The gooseberry is admirably adapted for cordons, both against walls and on wire trellises. Trees on the latter usually suffer less from red spider than those grown on walls.

RED CURRANTS.—These should be spurred well back after they have reached a suitable size, but young bushes may be allowed at each pruning from nine to twelve inches of young wood, as with the gooseberry, the heads are all the better if not allowed to become overcrowded. When grown on east or west walls the fruit will, if protected from birds, keep for several weeks.

BLACK CURRANTS.—As these fruit on the young wood the endeavour should be made to keep the bushes well supplied with shoots of the previous year, removing at each season's pruning whole pieces, or branches, to allow of the young wood springing up from the base. In cases where the bushes are old they may be cut down almost to the ground level, and in a couple of seasons they will produce good crops of fruit. In all gardens or fruit plantations a certain quantity of young healthy bushes should be coming along to take the place of those which show signs of weakness through old age. Black currants delight in deep, cool soil, and should be liberally fed on lighter land.—H. Markham, Wrotham Park Gardens.

Strawberries.—These should now be placed in frames to keep them from heavy rains, the lights being removed every fine morning. Frosts are very beneficial to these before forcing, and the best crop of strawberries that came under my notice was from plants laid on their sides, stacked up to about five feet high in ridges; the frost made great havoc among the pots, and the plants had to be taken down and thawed before they could be placed on the shelves. The crowns get thoroughly ripened by exposure, hence the good returns given. Equally good results may be had from plunging them in the open in a bed of ashes to keep the frost from the pots.—A. B. W.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Birmingham.

The Birmingham Society held its exhibition in the Bingley Hall, on November 10, 11, and 12. It was a big display, but there was a distinct falling off in the cut flower classes, though fruit classes were well filled with splendid produce. Plant classes were good, and the groups, notably Mr. Cryer's, were a distinct feature, while the trade displays and the vegetables were sufficient in themselves to make good exhibitions.

GROUPS AND PLANTS.

One of the finest groups of chrysanthemums arranged with foliage plants was the one to which first prize was awarded in the class for a display on a space of 20ft. by 12ft. The exhibitor was Mr. A. Cryer, who surpassed himself on this occasion. He had a high pyramidal background with lower mounds at the corner, and a quite low group in front, the intervening parts being carefully filled in with good blooms, bright crotons, and graceful palms, ferns, dracænas, etc. The William Butler Memorial Silver Cup, presented by W. Waters Butler, Esq., in memory of his father, was given in this class, in addition to the premier award; it was won in 1907 by Messrs. Sanford and Co., of Birmingham.

The best of three groups of chrysanthemums, arranged on a space of 14ft. by 10ft., was adjudged to be the one staged by Mr. R. Bullock, gardener to T. W. Piggott, Esq., Park Hill, Moseley, who had a bold sloping bank, with single varieties at the corners, and palms as a background; Mr. A. J. Davis, gardener to F. Mantle, Esq., Holly Lawn, Beech Lane, secured second place, but his group was much too flat; Mr. S. Gibbs, gardener to Mrs. H. Normansell, Bristol Road, Edgbaston, third.

Mr. C. H. Herbert, the Nurseries, Acock's Green, was first prize winner in the class for a group of decorative chrysanthemums, and he made an excellent display with very useful material, singles, and decorative varieties of the Source d'Or type figuring largely; Messrs. James Simpson and Son, Harborne Nurseries, Harborne, came second.

In the plant classes the competition was [illegible]ly good. For six large-flowering chrysanthemums, distinct, Japanese excluded, Mr. O. Brazier, gardener to E. Martineau, Esq., West Hill, Birmingham, was a good first with very fine examples of Fred Palmer, Mme. Ferlat, Buttercup, and Mrs. J. Brice; Mr. A. Cryer, gardener to J. A. Kenrick, Esq., Edgbaston, was second with fairly good specimens. First prize for six specimens of Japanese varieties was won by Mr. A. Cryer, who had Mrs. Knox, Lady Henderson, Col. W. B. Smith, and Marquis Venosta; Mr. O. Brazier came a close second, and he had Mrs. W. Knox (not yet at its best), Colonel W. B. Smith, Marquis V. Venosta, and the old favourite Viviand Morel.

The best three trained Japanese varieties were freely flowered, clean specimens of Col. W. B. Smith, and Mr. G. Mileham, shown by Mr. A. Cryer; Mr. O. Brazier came second with Mrs. H. Emmerton, Chas. Longley, and Chas. Davis, but the flowers were not yet fully expanded. Mr. Cryer led for one specimen, incurved, with Mdme. Ferlat, and Mr. Brazier followed closely with the same variety, Mr. Rowland coming third. For one specimen, Japanese, Mr. Brazier scored with a good Lady Hanham, with several flowers yet unexpanded; Mr. Cryer second, and Mr. Rowland third. Mr. Brazier's three specimens of single varieties were fine examples of the beauty and usefulness of these charming flowers, and he easily won first place with Metta, Constance Summers, and Mrs. H. J. Hampson; Mr. Cryer was second, but he was a long way behind.

CUT BLOOMS.

Six vases of Japanese chrysanthemums, three blooms in each, distinct varieties, formed a good class, and there were five competitors for the substantial prizes offered. Chief honours fell to Mr. H. Blakeway, gardener to Sir Albert Muntz, M.P., Rugby, whose leading varieties were H. Perkins, Mrs J. Dunn, Bessie Godfrey, Mrs. Eric Crossley, F. S. Vallis, J. H. Silsbury, Mary Inglis, and Miss E. Fulton; Mr. W. Iggulden, Lock's Hill Nurseries, Frome, second, but some distance behind the first set; and Mr. J. Deacon, gardener to the Rt. Hon. J. Chamberlain, M.P., Highbury, third. Six competitors entered in the class for four vases of Japanese blooms, in four varieties, and here Mr. W. Iggulden scored with massive flowers of F. S. Vallis, Mdme. G. Rivol, Mdme. P. Radaelli, and J. H. Silsbury; Mr. H. Blakeway second with J. H. Silsbury, F. S. Vallis, Reg. Vallis, and Mrs. E. Crossley in good form; Mr. J. Deacon third, and Mr. T. Grant, gardener to the Marquis of Exeter, Burghley House, Stamford, fourth.

First prize for a vase of pink Japanese chrysanthemums was won by Mr. W. Iggulden with Mdme. P. Radaelli, in fine condition; Mr. T. Grant second with W. A. Etherington, and Mr. Deacon third with Valerie Greenham. For a vase of a crimson variety Mr. Iggulden led with Magnificent; Mr. Deacon second with H. Perkins, and Mr. Grant third with J. H. Silsbury. The best vase of a white Japanese variety was Mr. Deacon's Mrs. A. T. Miller, big blooms; Mr. T. Grant second, and Mr. Iggulden third, each with the same variety. There were eight vases of a yellow Japanese variety, and here Mr. Iggulden scored with massive blooms of F. S. Vallis; Mr. H. Blakeway second with F. S. Vallis; and Mr. S. Cole, gardener to Earl Spencer, K.G., Althorp Park, Northampton, third with fine blooms of Lady Talbot.

Singles were fairly good, but the competition in the class for four vases was not so keen as it should have been. Mr. A. H. Hickman, Cookley, was placed first with good specimens of Edith Pagram, Bronze Pagram, Grace, and Metta; Mr. T. Parry, gardener to A. Hughes, Esq., Knowle, second, and Mr. Thos. Grant, third; six entries. For six vases of decorative varieties, Mr. T. Parry scored with fresh sprays of Lizzie Adcock, Mdme. Lucie Faure, Source d'Or, J. C. Lager, Market Red, and Viviand Morel; Mr. W. Newton, gardener to Major Everett, J.P., Knowle Hall, second, and Mr. A. H. Hickman third.

There were five contestants in the class for four vases of incurved blooms, distinct varieties, and here Mr. Silas Cole led, and his best flowers were of C. H. Curtis, Buttercup, Mrs. J. P. Bryce, Lady Isabel, and W. Pascoe; Mr. H. S. Foster, gardener to F. E. Muntz, Esq., Umberslade, second; and Mr. J. Deacon, third.

For four vases of incurved blooms, four varieties, three blooms of each, Mr. J. Deacon was a good first with full flowers of Buttercup, G. Hill, M. G. Denyer, and Godfrey's Eclipse; Mr. R. Bullock second; and Mr. O. Brasier third; this was a local class. The best two bunches of incurved blooms came from Mr. J. Deacon, who showed Mrs. G. Denyer and Buttercup; Mr. R. Bullock second, and Mr. O. Brasier third. In the local class for four vases of Japanese blooms, four varieties, Mr. Deacon scored with Algernon Davis, F. S. Vallis, Mrs. A. T. Miller, and H. Perkins; Mr. A. W. Young, gardener to R. Peyton, Esq., Edgbaston, second; and Mr. R. Bullock, third. For a pair of vases of Japanese blooms, Mr. Deacon was again first with Lady Talbot and Mrs. A. T. Miller; Mr. A. W. Young second, and Mr. T. W. Davis, gardener to H. F. Keep, Esq., Edgbaston, third. Mr. Rudge, gardener to G. Littlewood, Esq., Moseley; Mr. Corbett, gardener to Hume C. Pensent, Esq., Harborne; Mr. Payne, gardener to James Shuter, Esq., Pretoria Road; Mr. J. A. Ball, Erdington; Mr. W. J. Wakefield, Harborne; and Mr. W. J. Wild, Park Road, Harborne, were other successful competitors in the several local classes.

Mr. J. Deacon led in the class for twelve blooms of Japanese varieties, arranged in vases over a groundwork of foliage plants; he had good blooms of Algernon Davis, F. S. Vallis, Lady Talbot, Leigh Park Wonder, etc., and some pretty crotons; Mr. H. S. Foster second; Mr. O. Brasier third; and Mr. W. Teal, gardener to Mrs. Mellodew, Coventry, fourth.

There were twenty competitors in the class for a table decoration of chrysanthemums, and here the awards were made in favour of Mr. G. Winter, gardener to E. A. Palmer, Esq., Handsworth, who had cream and pink single varieties; Mrs. E. Winchester, Northfield, second; Miss G. White, Acocks Green, third; and Mrs. E. Pitt, Acocks Green, fourth.

A remarkably fine new single-flowered chrysanthemum was shown by Mr. H. Tribe, gardener to F. W. G. Greswold Williams, Esq., Bredenbury Court, Bromyard, Worcester. It was named J. H. Greswold Williams, is a large, shapely, broad-petalled flower of a clear yellow colour, and a seedling from Edith Pagram. A new yellow Japanese sport from Madame Oberthur, named Helena Williams, was staged by Messrs. Geo. Williams and Sons, Manor House Nurseries, Canton, Cardiff.

The fine class for a group of cut chrysanthemums arranged on a floor space of 30ft. by 8ft., and which was such a success in 1907, proved a tame affair on this occasion, and the first prize and challenge shield were withheld. The only exhibitors were Mr. W. Woolman, Shirley, Birmingham; and Mr. G. Hancox, West Bromwich, and these gained second and third prizes.

FRUIT.

Fruit was a strong feature of the show, and the leading class was for a collection of British-grown fruit arranged on a space of 40 sq. feet. Prizes of £7, £5, £3, and £2 were offered, but there were only two competitors. The premier award fell to Mr. J. H. Goodacre, gardener to the Earl of Harrington, Elvaston Castle, Derby, for a very handsome set of well-grown produce that included some very fine bunches of Muscat of Alexandria, Alicante, Madresfield Court, and Gros Colmar grapes, Conseiller de la Cour, Beurre Diel, Beurre Bosc, Doyenne du Comice, and Pitmaston Duchess pears, and Newton Wonder, Bramley's Seedling, Blenheim Pippin, Cox's Orange Pippin, Peasgood's Nonsuch, Cox's Pomona, Annie Elizabeth, American Mother, and Gascoigne's Scarlet apples, with figs and quinces; Mr. H. Cotton, gardener to Lord Biddulph, Ledbury, was awarded second prize for a collection of fine fruit, that included good Mrs. Pince and Gros Maroc grapes, and a good dish of Beurre Bachelier pears, etc.

An interesting class was the one for a collection of hardy British-grown fruits, arranged on a table 12ft. by 8ft., decorated with plants and foliage. Councillor H. S. Bevins, of Hall Green, offered a silver challenge cup to accompany the first prize of £5, and this was won for the second year in succession by Mr. C. W. Powell, Warham, who had splendidly coloured and finely grown specimens of Peasgood's Nonsuch, Cats Head, Charles Ross, Warner's King, Mere de Ménage, Bramley's Seedling, Annie Elizabeth, Cox's Pomona, Lady Henniker, Queen, Alfriston, Cox's Orange Pippin, Coronation, Blenheim Pippin, and Worcester Pearmain apples, as well as numerous dishes of good pears, medlars, and nuts. Second prize fell to Messrs. Pewtress Brothers, Hereford, who had finely coloured apples; Mr. G. R. Morris, gardener to Mrs. W. Hearne, Hanbury Hall Gardens, came third.

Mr. J. H. Goodacre led for six bunches of grapes with Muscat of Alexandria, Alicante, and Gros Maroc; Mr. H. Cotton, gardener to Lord Biddulph, Ledbury, second; and Mr. T. Bannerman, gardener to Lord Bagot, Rugeley, third. The latter was first for three bunches of black grapes, with Gros Colman, well coloured; Mr. F. Jones, gardener to Mrs. F. Need, Great Malvern, second, with large-berried bunches of Gros Colman; Mr. T. Parry third with Alicante. Mr. Goodacre was an easy first for three bunches of white grapes with fine clusters of Muscat of Alexandria; Mr. C. Harding, gardener to the Marquis of Hertford, Ragley Hall, second; and Mr. Thomas Sheppard, gardener to Charles Winn, Esq., Selly Hill, third. Mr. F. Jones, Great Malvern, led in the class for any other white grapes, and Mr. A. Ganderton, gardener to A. G. Buller, Esq., J.P., King's Heath, led in the local class for black grapes, while Mr. T. Sheppard scored in the local class for white grapes.

Apples were very well shown, and the premier award for six dishes of culinary varieties was won by Mr. C. W. Powell with handsome heavy fruits of Gascoigne's Scarlet, Peasgood's Nonsuch, Bramley's Seedling, Newton Wonder, Lord Derby, and Annie Elizabeth; Mr. H. Cotton second, and Mr. G. R. Morris, third; five entries. Mr. C. W. Powell had the best six dishes of dessert apples, and his varieties were Cox's Orange Pippin, Allington Pippin, Ribston Pippin, James Grieve, Wealthy, and Blenheim Pippin; Mr. H. Cotton a good second, and Mr. T. Grant third; seven entries.

Mr. Goodacre led for eight dishes of pears with clean, even examples of popular varieties. Mr. Cotton scored for four dishes of pears with heavy fruits of Pitmaston Duchess, Doyenne du Comice, Emile d'Heyst, and Beurre Diel; Mr. Goodacre second, and Mr. G. Haynes, gardener to Miss F. P. Mole, Edgbaston, third.

In the local fruit classes Mr. C. Kelland, gardener to E. Vaughton, Esq., Handsworth, had the best two dishes of culinary apples, and Mr. T. Sheppard was second. Mr. Kelland and Mr. Sheppard also held similar positions in the dessert class, while Mr. Haynes and Mr. Ganderton were first and second respectively for dessert pears.

VEGETABLES.

Vegetables were again a fine feature of this Midland show. In the class provided by Messrs. Sutton and Sons the premier award fell to Mr. Edwin Beckett, gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree, for splendid Ailsa Craig onions, Perfection tomatoes, New Red Intermediate carrots, Autumn Mammoth cauliflowers, Windsor Castle potatoes, Dwarf Gem Brussels sprouts, Tender and True parsnips, Solid White celery, and Prizetaker leeks; Mr. C. Haynes, gardener to W. C. Alston, Esq., Elmdon Hall, second; and Mr. G. Neal, Bampton, Oxon, third; Mr. E. Winchester, Northfield, fourth. In other classes provided by the Reading firm, premier awards fell to Mr. E. Beckett for carrots; Mr. G. Neal for parsnips; Mr. E. Beckett for onions; Mr. G. Neal for beet; Mr. E. Beckett for potatoes, celery, and cauliflowers; Mr. C. Haynes for turnips; Mr. T. Grant for tomatoes; and Mr. Beckett for kidney potatoes—Snowdrop.

There was a strong competition for Messrs. Webb and Son's prizes for a collection of eight dishes of vegetables, and here Mr. Silas Cole led with Ailsa Craig onions, Marrowfat parsnips, Pink Perfection celery, Autumn White cauliflowers, Sensation tomatoes, Empire potatoes, Prizewinner carrots, and Champion prize leeks; there were eight competitors; Mr. H. Folkes, gardener to the Right Hon. J. F. Halsey, Hemel Hempstead, second; Mr. J. Hudson, Leicester, third; and Mr. F. Barrett, Ellesmere, Salop, fourth. Messrs. Folkes, Barrett, Cole, J. Hudson, and H. S. Batson were winners in other classes provided by Messrs. Webb and Sons.

Mr. Edward Deakin, Hay Mills, led in the class for a collection of vegetables, provided by Mr. R. Sydenham, Birmingham; Mr. A. Cryer, second. In smaller classes provided by Mr. Sydenham Mr. Deakin scored for potatoes, turnips, onions, beet, parsnips, carrots, and for red cabbage; Mr. G. H. Johnstone for Brussels sprouts; Mr. C. L. Branson, gardener to Mrs. J. D. Wingfield Digby, Colehill, for celery; and Mr. Thomas Jones for cauliflowers. In another vegetable class provided by Mr. R. Sydenham Mr. W. Folkes, Ampthill, was the leading winner; Mr. T. Avery, gardener to J. Kerr, Esq., Loudwater, second; and Mr. Thomas Jones, Bryn Penylan, Ruabon, third.

NON-COMPETITIVE.

Non-competitive displays, chiefly from the trade, occupied a considerable amount of space, and not only added much to the attractiveness of the exhibition, but were a source of interest and educational value both to horticulturists and the local visitors.

One of the most attractive exhibits in this section was the fine table of vegetables and fruit put up by Messrs. Sutton and Sons, Reading. Onions, tomatoes, beetroot, carrots, all perfect, were displayed in admirable style, and on tall stands were placed many fine melons, the whole display being nicely decorated with flowers and foliage. A table of apples was shown by Mr. E. Burden, St. Agnes Nursery, King's Heath, which, we were told, were all grown within four miles of the centre of Birmingham. Residents in the Birmingham district should, therefore, be convinced that they may grow good apples. Messrs. Laxton Brothers, Bedford, put up a very fine lot of apples, the fruits being of good size, and richly coloured. The King's Acre Nurseries, Lim., Hereford, showed fruit in their usual good style. Messrs. Pewtress Brothers, Hereford, showed apples packed in boxes for transit; the fruit was good, and packing excellent.

A bold group of ornamental trees and shrubs from Messrs. John Waterer and Sons, Lim., Bagshot, Surrey, attracted much attention. Hollies were very fine, both variegated varieties and the red and yellow berried sorts. Several varieties of abies, yews, and retinosporas helped to make up the group. Mr. W. J. Robertson, Cowleigh Road, Malvern, had a nice group of shrubs, including brightly coloured eleagnus, euonymus, and ivies, with cedars, hollies, etc., in the background. Shrubs were also shown by Mr. Frederick A. Godfrey, Stourbridge, who also showed some fine young trees of the red-twigged lime. A fine group of shrubs was set up by Messrs. Bakers, Wolverhampton. Messrs. James Simpson and Son, Harborne Nurseries, Harborne, showed evergreen shrubs in variety, as also did Messrs. Hewitt and Co., Solihull.

Messrs. Gunn and Sons, Olton, Birmingham, arranged a grand exhibit in the form of a rock and water garden. Bold masses of rock were built up in a masterly manner, and alpine plants, dwarf shrubs, and elegant grasses were used with much taste. A cave with a dripping well was situated at the back of a lily pond, round the margins of which hardy ferns were planted. We congratulate Messrs. Gunn on this very fine piece of work. The Messrs. Gunn also showed a fine lot of artistic floral designs.

Mr. W. J. Godfrey, Exmouth, Devon, put up a bold display of cut chrysanthemums. Japanese and single-flowered varieties were alike superb. Some good zonal pelargoniums were also staged by Mr. Godfrey. The exhibit of fruit from British Columbia was very fine. The colouring of the apples was very rich, and the packed cases demonstrated the skill of our distant cousins in this important detail. Messrs. Richard Smith and Co., Lim., Worcester, had a remarkably good group of tall pyramid hollies, yews, cedars, and other trees and shrubs. The exhibit was arranged to good effect, and every plant was clean, and well grown.

Chrysanthemums were well staged by Messrs. W. Wells and Co., Lim., Merstham, Surrey. Large blooms of Japanese varieties on boards occupied the centre of the stand, with vases of single-flowered varieties at either end. Messrs. Young and Co., Hatherley, Cheltenham, had a fine lot of American perpetual-flowering carnations. Messrs. Clibrans, Altrincham, showed chrysanthemums. The incurved variety, Daisy Southam, and the single Renown were specially good; both are clear yellows. Messrs. Robt. Sydenham, Lim., Birmingham, staged a collection of vegetables, including well-grown leeks, onions, cauliflowers, etc., etc. The produce was of excellent quality. The same firm showed single chrysanthemums elegantly arranged in rustic table decorations.

Messrs. Webb and Sons, Wordsley, Stourbridge, staged a large assortment of vegetables, arranged in flat baskets, and interspersed with flowers and foliage. In the centre of the stand was a tall epergne, on which were displayed some fine melons. E. A. Wilson, Esq., Rockingham, Edgbaston Park Road, Birmingham, exhibited a capital selection of cactaceous and succulent plants. A grand piece of the Turk's Cap cactus, Mammillaria turbinata, was conspicuous. Mr. Vincent Slade, Staplegrove Nursery, Taunton, showed a collection of zonal pelargoniums in his usual first-class style. Cacti and succulents were well shown by Miss S. S. Thompson, Alfred Road, Handsworth.

A very attractive exhibit was the improvised rockery, furnished with a collection of alpine and kindred plants by Messrs. Bick Bros., Bicknell Park Nurseries, Olton, Birmingham. A fine patch of the Killarney fern, in robust health, was prominent in the centre of the rockery, and the many varieties of saxifragas and other favourite alpines were well arranged. Potatoes in many of the leading and newer varieties were well staged by Mr. R. W. Green, Wisbech. Messrs. Yates and Sons, Old Square, Birmingham, put up a large collection of well-grown vegetables.

The GARDENERS' MAGAZINE had a stand, upon which was shown a series of plates of flowers, demonstrating the process of reproduction in colours, together with books on horticultural subjects. Garden tools and sundries were shown by Mr. G. H. Richards, 234, Borough High Street, London. Chemical manures were exhibited by Messrs. Barnes and Son, Wyche, Malvern. Mr. H. N. Ellison, West Bromwich, put up a very nice lot of greenhouse ferns.

Messrs. Thomson and Co., Lim., Spark Hill Nurseries, Birmingham, arranged an effective display of well-grown chrysanthemums in the cut state. Good blooms of many varieties were put up en masse, backed up by lighter arrangements in bamboo stands. Messrs. W. H. Simpson and Sons, Birmingham, put up a collection of vegetables in good varieties, leeks and celery being well-grown examples.

MEDALS AND AWARDS.

Gold.—Messrs. John Waterer and Sons, Lim., Bagshot; Messrs. Richard Smith and Sons, Lim., Worcester; Messrs. Yates and Sons, Old Square, Birmingham; King's Acre Nurseries, Lim., Hereford; Messrs. Webb and Sons, Stourbridge; Mr. W. J. Godfrey, Exmouth; Messrs. Gunn and Sons, Olton (2); the Agent-General for British Columbia; Messrs. Sutton and Sons, Reading.

Small Gold.—Mr. R. W. Green, Wisbech.

Silver-gilt.—Messrs. Bakers, Wolverhampton; Messrs. Hewitt and Co., Solihull; Messrs. Laxton Brothers, Bedford.

Silver.—Messrs. J. Randall and Sons, Shirley; Miss Thompson, Chorlton Villa, Handsworth; Mrs. Thompson, Birmingham; Messrs. Pewtress Brothers, Hereford; Messrs. W. Wells and Co., Merstham; Mr. Burden, King's Heath, Birmingham; Messrs. W. H. Simpson and Son, Monument Road, Birmingham; Messrs. Bick Brothers, Olton.

Bronze.—Mr. W. J. Robertson, Malvern; Messrs. J. Simpson and Co., Court Oak Road, Harborne; Mr. F. A. Godfrey, 117, High Street, Stourbridge; Mr. Vincent Slade, Taunton; Messrs. Clibrans, Altrincham; Messrs. Young and Co., Hatherley, Cheltenham.

Certificate of Merit.—Mr. H. N. Ellison, West Bromwich.

Windsor, NOVEMBER 6.

The seventeenth autumn show was held in the Albert Institute, and was much the best of the series. The space at command is too limited to enable the committee to display the exhibits properly; three small rooms are requisitioned, in addition to the large hall, therefore the effect is spoiled. To this society belongs the credit of having the finest exhibit of Japanese blooms seen this season so far. Nothing at the N.C.S. show equalled the first prize set that won the King's cup here, and that is saying much. The arrangements, as usual, were perfect, under the able guidance of Mr. Keer, the hon. secretary, aided by an efficient committee, of which Mr. Arthur Turner is chairman.

Cut blooms demand a first notice. For six vases, five blooms of one variety in each vase, there were four competitors for the King's Challenge Cup and a cash prize, the cup to be won three times before becoming the property of the winner. In 1906 Mr. T. Stevenson, gardener to E. G. Mocatta, Esq., Addlestone, Surrey, was the winner; last year he lost the coveted prize to Mr. F. Bible, gardener to Prince Hatzfeldt, Draycot Park, Chippenham. The present year's winner was again Mr. Stevenson, with quite the best exhibit seen this season so far. The blooms were large, intensely coloured, and arranged most perfectly. The varieties were Duchess of Sutherland, Walter Jinks, F. S. Vallis (9½ inches wide by 9 inches deep), Reginald Vallis (9 by 9 inches), Lady Talbot, of perfect form and colour (9½ by 9 inches), and Leigh Park Wonder, intensely brilliant. Mr. J. Dymock, gardener to G. D. Faber, Esq., C.B., M.P., Rush Court, Wallingford, was a good second with exceedingly fine examples of J. H. Silsbury, F. S. Vallis, Mrs. Vallis, Bessie Godfrey, and Mrs. Norman Davis. Mr. Bible was third with much smaller flowers.

An interesting class was that for eighteen Japanese blooms, arranged in a space five feet by three feet, with the addition of any foliage plants or foliage. Five competed, making an imposing display. Mr. Stevenson was easily first with full, solid blooms of popular varieties, arranged lightly in undulating mounds interspersed with sprays of Spiræa Thunbergi, golden privet, bamboos, etc. Mr. Dymock was a good second. For twelve incurved, and the same number of Japanese, distinct, a silver challenge cup was added to the cash prize. Four competed, making a good display. Mr. C. Page, gardener to G. B. Fortescue, Esq., Dropmore, was the first prize winner, with full-sized Japanese, and especially neat incurved specimens. The varieties were: Incurved.—Buttercup, Sport, G. F. Evans, Mrs. J. P. Bryce, Nellie Southam, Mrs. G. Denyer, Pantia Ralli, Emblem Poitevine, Lady Isabel, Madame Vremkey, F. Palmer, and Godfrey's Eclipse. Japanese.—F. S. Vallis, Edith Smith, Splendour, W. A. Etherington, Mr. R. Felton, S. A. Marconi Bey, R. Vallis, Mrs. Eric Crossley, W. Jinks, Lady Talbot, Mrs. N. Davis, and Mrs. W. Knox. Mr. F. Bible was a close second.

For six incurved, any one variety, there were four competitors, Mr. C. Page, with Buttercup in good condition, won the premier place; Mr. Bible, with Frank Trestian, second. Six competed for six Japanese, any one variety, and Mr. Stevenson, with Lady Talbot in almost faultless condition, was first; Mr. Page, with F. S. Vallis, second. In the class for a basket or vase of twelve blooms, arranged with any natural foliage, five staged, making a pretty display. Mr. Page, with good Japanese and richly-coloured sprays of guelder rose, was first; Mr. H. Hearn, gardener to Mrs. Goodlake, second. Single-flowered chrysanthemums are always well shown here. For six varieties, five sprays of each, Mr. Page was the premier prizetaker, with such varieties as Mary Richards, Miss E. Roberts, and Eva as the best.

There was but one group of chrysanthemums and foliage plants, but Mr. W. Cole, gardener to Mrs. E. B. Foster, who arranged an effective group of well-grown plants carrying good blooms, was worthily awarded the leading prize. An interesting class was that for a group of decorative chrysanthemums, not disbudded. Mr. E. West, gardener to F. Ricardo, Esq., was an easy winner, with single-flowered varieties profusely flowered and effectively arranged; Mr. J. Barnes, gardener to Lady Dalton Fitzgerald, was second. In the class for a group of miscellaneous plants arranged for effect there were three competitors, and Mr. F. H. Beney, gardener to Lady Mary Currie, was first with an effective display of Oncidium varicosum Rogersi, cattleyas, cypripediums, foliage plants, etc.; Mr. J. Minty, gardener to Mrs. Moss Cocker, second. Gloire de Lorraine begonias are always a feature here, and for six plants Mr. G. West was an easy winner with charming examples of this showy subject.

Fruit and vegetables were distinct features of the show. Mr. Titt, florist, Windsor, had a pleasing exhibit of floral designs, including a wonderful lady's muff of real flowers. Messrs. W. Wells and Co., Merstham, had an interesting exhibit of new chrysanthemums, such as W. Mease, Pockett's Crimson, Clara Wells, Rose Pockett, C. H. Totty, Foxhunter, and the new single-flowered variety Sylvia Slade.

Brighton, NOVEMBER 2.

A bright, clear day marked the opening of the seventeenth annual exhibition of chrysanthemums, held in the Dome and Corn Exchange, by the Brighton and Sussex Horticultural Society. There was, however, a marked falling off in the competitive classes for chrysanthemums, and judging in several cases proved quite an easy task. Notwithstanding this, there was an excellent show, as may be gathered from the fact that 322 exhibits were staged.

CUT BLOOMS.

In the open class for thirty-six Japanese, not less than twenty-four varieties, the premier prize was secured by Mr. C. J. Dicker, gardener to the Exors. of the late Hon. Louisa Canning, Frant Court, Sussex, who staged some excellent blooms of Miss O. Miller, J. Roberts, Reginald Vallis, Splendour, Lady Conyers, Mr. C. Penford, John Peed, Mrs. Hooper Pearson, Leigh Park Wonder, C. J. Champion, Mrs. W. Knox, Bessie Godfrey, Walter Jinks, Mrs. N. Davis, and F. S. Vallis. In addition to the cash prize this exhibit was also awarded the president's challenge bowl and the society's medal, which Mr. Dicker has won for the second time. The second prize was secured by Mr. G. Hunt, gardener to Pantia Ralli, Esq., Ashtead Park, Epsom, with an even set of blooms. Mr. J. Harris, gardener to Colonel C. P. Henty, Avisford, Arundel, was third. The competition in this class was much below the average, only three collections being staged.

In the class for six incurved blooms, one variety, there were three entries, the first prize being secured by Mr. G. Hunt with good flowers of Buttercup; Mr. J. Harris followed as a good second with Emblem Poitevine, and Mr. Tourle, gardener to Captain J. R. Smiley, Horsted Place, Uckfield, obtained third. For six incurved blooms, distinct, Mr. J. Harris was first with well-finished blooms of Pantia Ralli, Godfrey's Eclipse, Mrs. Judson, Buttercup, Souvenir de Wm. Clibran, and Mrs. B. Hankey. Mr. W. Hill, gardener to G. W. Ryder, Esq., Broadhill, Keymour, second; and Mr. Tourle third. Mr. G. Hunt was first also for twelve incurved, distinct, and Mr. Tourle was second, only two entries being made. In the class for six Japanese blooms, one variety, any colour, Mr. G. Hunt was placed first with well-finished blooms of F. S. Vallis. For six Japanese blooms, distinct, Mr. Charles Earl, gardener to O. E. D'Avigdor Goldsmid, Esq., Somerhill Gardens, Tonbridge, took first honours, and was closely followed for second place by Mr. W. Furlong, gardener to A. Neall, Esq., Leyland's Park, Burgess Hill.

In the class for twelve Japanese, distinct, Mr. E. Jones had the only stand, and was awarded the first prize for an even set of flowers. For twenty-five Japanese blooms, as cut from the plant, not less than eighteen varieties, in five vases, Messrs. J. Stredwick and Sons, Silverhill Park, St. Leonards, secured the premier award, and in addition the society's silver medal. The blooms were good, and included some new seedlings; Mr. C. J. Dicker came second, and Mr. J. E. Hickson, gardener to the Rev. F. S. Sclater, Newick Park, Lewes, third. For three vases of pompons, any varieties, the first prize was awarded to Mr. G. H. Bennett.

The prizes for single varieties, arranged in three vases, were more keenly contested; the premier award was made in favour of Mr. G. Funnell, 22, Mount Sion Place, Brighton; he was closely followed by Mr. J. Davis, gardener to Major Thurlow, Buckham Hill, Uckfield, for second; and Mr. G. H. Bennett was third.

PLANTS.

In the class for a group of chrysanthemums, arranged with ferns or other green foliage plants, the first prize was awarded to Mr. E. Jones for a very pretty and effective exhibit. In the class for a similar group, open to amateurs and gentlemen's gardeners only, Mr. G. H. Bennett secured first place. For twelve bush plants of chrysanthemums, in pots not to exceed nine inches, a handsome silver cup, silver medal, and first prize was offered, and was worthily won by Mr. G. Lambert, 17, Bognor Road, Chichester, with some well-grown specimens. Mr. G. H. Bennett, second.

FLORAL ARRANGEMENTS.

The decorative classes are always a special feature at Brighton. The first honours in a keen competition, open to ladies only, was obtained by Miss Mabel Howell, Tower Lodge, Queen's Park, with a very prettily arranged table of yellow chrysanthemums and suitable green foliage. First award for mantelpiece decoration (open) was secured by Messrs. George Miles and Son, Victoria Nursery, Dyke Road, with a pretty display of chrysanthemums and foliage.

NON-COMPETITIVE DISPLAYS.

Prominent among these was the large group of miscellaneous plants arranged by Messrs. William Balchin and Son, of Hassocks Nursery. Messrs. W. Miles and Co. staged fruit, flowers, and foliage plants in variety. Messrs. Sutton and Sons, Reading, contributed a collection of fruit and vegetables. Mr. Hickson staged over sixty varieties of apples. Messrs. J. Cheal and Sons, Crawley, staged a collection of fruit. The Barnham Nurseries, Lim., contributed fruit, and Mr. Wollard chrysanthemums.

Southend.

A very pretty chrysanthemum show was held at the popular seaside resort of Southend on Tuesday and Wednesday, November 3 and 4. The show was held in the Winter Garden and adjoining rooms at the Palace Hotel. The competition was very keen in most of the classes, and fruits, especially apples, were shown largely and well. The Mayor performed the opening ceremony, and there was a good attendance at this function.

CUT BLOOMS.

In the class for two dozen blooms, Japanese, the silver medal and first prize fell to Mr. J. Burles, gardener to J. Tabor, Esq., J.P., Southend, who had a fine set of blooms, his best being Mr. F. S. Vallis, Lady Talbot, F. Penford, Bessie Godfrey, W. Gee, and Reginald Vallis. Mr. A. Epps, gardener to Mrs. Miller, Leigh-on-Sea, second, and Mr. R. May, Rochford, third. For twelve blooms, Mr. J. Burles was again first, and was followed in order by Mr. R. May and Mr. A. Epps. Mr. Burles was also first for six Japanese blooms, distinct, Mr. Steer coming second, and Mr. R. May third.

Mr. R. May scored for a dozen incurved blooms, and he had Lady Isabel, C. H. Curtis, and Buttercup in good form; Mr. J. B. Steer, gardener to J. S. Foster, Esq., 10, London Road, second; one entrant was disqualified as he had ten instead of the eight varieties required. For six incurved blooms the prizes fell to Mr. J. B. Steer, Mr. Epps, and Mr. May in order of mention.

The class for six Japanese blooms of one variety was a good one, and the first prize was won by Mr. J. Whiffen, gardener at the Queen's Hotel, Southend, with six good flowers of Mr. F. S. Vallis; the best bloom in the show was also in this stand, and the exhibit was regarded as the best one staged by a person who had not previously won a special prize; Mr. J. Burles second, and Mr. Epps third, the latter showing Mrs. A T. Miller.

Single varieties, six vases, made a good class, and here Mr. R. May led with clean, good blooms of Mary Anderson, Anna Farina, Mary Richardson, Mrs. Symms, Mrs. Ferguson, and Eureka; Mr. J. Burles second, and Mr. H. Blakely, Wimborne Road, Southend, third. For six vases of Japanese blooms, in as many varieties, three blooms of each, Mr. J. Burles scored easily with Mr. F. S. Vallis, W. Gee, Lady Talbot, F. Penford, Mrs. A. Miller, and W. A. Etherington; Mr. R. May second, and Mr. Epps third.

There was a very keen competition in the class for one vase of six Japanese blooms, one or more varieties, and here Mr. G. Wiseman, 65, Milton Road, Westcliff, led with lovely flowers of Bessie Godfrey; Mr. H. E. Campkin, 92, Boscombe Road, second with mixed varieties; and Mr. J. Oliphant, 30, Boscombe Road, Southend, third. In the class for eight vases of Japanese varieties Mr. Campkin was again first, and he had Mr. F. S. Vallis, Reginald Vallis, and Lady Talbot in excellent condition.

Leading winners in the smaller amateurs' classes were Mr. F. S. Belcher, Stanford-le-Hope, for twelve Japanese; Mr. H. E. Campkin, for six Japanese—fine flowers of F. S. Vallis, Mrs. A. T. Miller, Bessie Godfrey, Reg. Vallis, Mrs. Knox, and Pres. Viger; Mr. G. W. Heaton Armstrong, Vincent Road, Westcliff, for twelve Japanese blooms, distinct; and Mr. H. E. Campkin in another twelve bloom class, wherein he won the N.C.S. certificate and silver medal for the best amateur's exhibit.

FLORAL DESIGNS.

There was a famous competition in the decorative classes. Out of eleven entries, Mrs. H. E. Campkin led for a basket of chrysanthemums and autumn foliage, a fine design in large blooms; Mrs. H. Blakely second, and Miss H. Campkin third, the latter showing single varieties.

A very interesting and attractive class was the one for local florists and nurserymen, for a table of floral designs, to consist of a wreath, a cross, a bouquet, lady's spray, and three gentlemen's buttonholes. The premier award and silver medal was won by Mr. W. G. Harold, Prittlewell Nurseries, Southend, who had splendid designs worked in chrysanthemums and richardias, with cattleyas and violets to give colour to the bouquet and wreath; Mr. A. M. Barstow, Broadway Corner, Southend, was second, and his finest work was a wreath in bronze chrysanthemums, cypripediums, and croton leaves; Mr. W. Longman, Hamlet Court Road, Westcliff, third.

Eight dinner-table decorations were staged, but there was nothing of special merit among them. Miss M. Green, Great Wakering, was placed first for a pleasing design in small yellow flowers; Mrs. H. Blakely second with large single flowers; and Mrs. F. H. Barnes, Hornchurch, third, with small singles.

In the class for a group of chrysanthemums, Mr. J. Burles was the leader, and he was followed by Mr. J. Whiffen and Mr. Davey, Broadway, Leigh. The two former had conical groups of big blooms, while the last named had decorative plants that, had a little more time and skill been expended on them, might have occupied a higher position. Mr. Davey scored for a group of miscellaneous plants, and was followed in order by the Rev. P. Stuart King and Mr. Epps.

FRUIT.

Apples were grandly staged, and the competition was very keen. For six dishes of dessert varieties, Mr. H. B. Herbert, Eastwood, lead with Gascoigne's Scarlet, Duke of Devonshire, King of the Pippins, Red Reinette, Cox's Orange Pippin, and Allington Pippin; Mr. G. Marrell, Barking, a close second; and Mr. A. Epps third. For three dishes of dessert varieties, Mr. E. J. Elford, Seacombe Lodge, Old Leigh Road, Westcliff, scored with Chas. Ross, Cox's Orange Pippin, and Cellini; Mr. W. A. Voss, Rayleigh, Essex, a close second, showing a grand dish of Court Pendu Plat; Rev. P. Stuart King, Leigh-on-Sea, third.

For six dishes of culinary apples, Mr. G. Murrell, Barking, led with heavy, clean fruits of Wealthy, Peasgood's Nonsuch, Bismarck, Lane's Prince Albert, Warner's King, and Lord Derby; Mr. H. B. Herbert, Eastwood, second; and Mr. R. May third. For three dishes of culinary varieties, Mr. A. Green, Great Wakering, led with Peasgood's Nonsuch, Newton Wonder, and The Queen; Mr. W. A. Voss, a close second; and Mr. Elford third.

Miss J. C. Tutt, Cossington Road, Westcliff, showed the best single dish of apples—Emperor Alexander. Mrs. E. B. Francis, High Street, Rayleigh, had the finest single dish of pears—Pitmaston Duchess, very fine. Rev. T. O. Reay, Prittlewell Vicarage, Southend, scored for six dishes of pears, with Beurre Diel, Uvedale's St. Germain, Beurre Superfin, Marie Louise, General Todleben, and Winter Nelis; Mr. Epps second. Mr. R. Puling, gardener to Mrs. Baldwin, Victoria Avenue, Southend, led for three dishes of pears, Mr. Herbert second, and Mr. J. A. Brown third.

Exhibits of vegetables were not specially meritorious, and there is need for considerable improvement in the selection and arrangement of specimens. The leading prizewinners were Mr. W. T. Mukins, Little Wakering; Mr. Murrell, and Mr. J. Matthews, of Little Wakering.

Tours.

On November 3, in conjunction with the Horticultural Society of Tours, the French National Chrysanthemum Society held its thirteenth annual conference and exhibition. The show was held in a huge tent fixed up in the Place de la Gare, and for a provincial one was in every respect admirably arranged. Mr. Harman Payne was appointed honorary president of the jury, with Mr. Geo. Bruant, of Poitiers, as vice-president. There was a good schedule, and a very large number of entries, and the show was well attended both by members of the society from a distance and the townspeople. New seedlings were largely shown, Mr. Ernest Calvat having a fine group, five blooms of each, tastefully arranged with maidenhair ferns, etc. Other seedlings were shown by the Marquis de Pins, M. Alfd. Chantrier, M. J. Heraud, and M. Dolbois.

Cut blooms and pot plants were arranged in large beds on the ground level. We cannot in the space at our command do other than just briefly mention a few of the most important. M. Pinon had a capital collection of trained specimen plants of all shapes and sizes. There were numerous pyramids, fan-trained, and other quaint designs. M. Page showed trained plants which were excellent. M. Parrot staged some tall pyramids. M. Buret-Reverdy had a large group, mostly French varieties, and among them we noticed Madame Abel Chatenay, Paris 1900, Luzerta, Henry Second, Satin Rose, Belle L'Isloise, Tokio, and others. Another lot came from M. Leclerc. Messrs. Vilmorin, Andrieux, and Co. had two very fine groups, comprising plants well flowered and in good form; Algeceras, C. Schwartz, Hy. Weeks, W. Wells, Excelda, W. Duckham, R. H. Pearson, and Miss Alice Byron, were some of the best. Other exhibits of chrysanthemums came from Messrs. Lionville, Dupont, Firdefried, Allery-Aubert, Dallière, Queneau-Poirier, Morè Testu, Montigny (novelties of 1908), Barillet, Bernier-Meunier, and others.

There was an immense display of other flowers, such as begonias, heaths, cyclamen, dahlias, etc., a centre oval bed being filled with some fine lots, in addition to many others round the sides of the show. M. Aubert-Maille showed a white Anthemis Perfection in quantity, begonias, etc. Many other local exhibitors staged similar lots, viz., Messrs. Buret-Reverdy, Travouillon, Jutant, Parrot, and others. M. Guillerius showed Begonia Viadi in large pots, the plants 6 feet high. M. Dallière had Begonia Allery, a large group of fine plants. General de Benoist had Begonia semperflorens elegans. Dahlias were staged by M. Hauteville and by M. Bouchaud.

Vegetables were largely shown in big collections, and in great variety, and especially meritorious was the lot from Messrs. Vilmorin, Andrieux, and Co. Messrs. Berger, Sussier, the Syndicat Horticole de Touraine, Bouchaud, Robert, Boncord, Dupont, and Firdefried also staged good lots.

There was a large quantity of fruit, chiefly apples and pears, also trained fruit trees, the latter occupying the promenade leading to and around one side of the show. M. Pinguet-Guindon, for an immense collection of conifers, ornamental shrubs, fruit trees, and fruit was awarded the grand prix d'honneur offered by the President of the French Republic. M. Ploquin showed trained fruit trees, as also did M. Jouanneau.

Along the outside end of the show was a choice collection of pansies from M. Bouchaud.

The conference was held in the Hotel de Ville, a handsome building close at hand. M. George Bruant presided. Various matters were submitted for discussion, and in the evening an official banquet was given to the jury and members of the Congress. Among those present were the Mayor, the Prefect, the representative of the Minister of Agriculture, Messrs. Pinguet-Guindon, Bruant, Calvat, Harman Payne, Ph. Rivoire, Chantrier, Liger, Barbier, Choulet, Charvet, and many more. Several decorations were distributed, and the proceedings were of the greatest interest, and enjoyed by all.

In the afternoon of the following day a motor car excursion to see the various chateaux in the neighbourhood, the valley cf the Cher, and of the Loire, and other places in the environs was made.

Chelmsford and District Gardeners' Association.

On Friday, October 30, the president, E. H. Christy, Esq., F.R.H.S., taking the chair, Mr. Chas. T. Druery, V.M.H., F.L.S., gave a lecture to a very full audience of the members of this association on "The Wonderland of Ferns," illustrated by a large number of most interesting lantern slides. The lecturer dealt first of all with the immense debt owed by mankind to the ferns and their allies of the long distant Coal age, when they built up those wonderful stores of future fuel which practically formed the foundation of all our industries and comfort of the present day. He pointed out, too, that it was from the same source that all the flowering plants were evolved by slow gradations and modification of some of the members of the family, though, strange to say, the ferns of that period, which did not so diverge from the beaten track, are only differentiated in a minor degree from those of the present day, so that an inconceivably long period of evolution must have antedated coal formation to permit of the evolution of such highly developed types. The peculiarities of fern reproduction as distinct from that of flowering plants were then described and illustrated, and their wonderful capacity for "sporting"—the lecturer's special study—was exemplified by a number of slides showing some of his own discoveries, and a series of the finest forms extant. Selective culture as applied to these wild "finds" was then treated of, and examples of sudden and wonderfully marked advances in type so obtained were thrown on the screen, the pedigree slides on which the several steps of advance were shown side by side being particularly interesting. In conclusion, the lecturer strongly advocated the cultivation of these far more beautiful and yet equally hardy varieties in gardens and conservatories in preference to the common or "weed" forms usually grown; and, as evidence of their value as decorative plants, a view of his former British fernery at Forest Gate was shown, and acknowledged by a burst of applause as abundantly proving his case. A very hearty vote of thanks concluded the meeting.

Contractors to H.M. Board of Works, H.M. Admiralty, H.M. War Office, etc., etc.
Awarded Gold Medal of the Society of Architects and Six Medals of the Royal Horticultural Society.

For 50 years we have specialised in the construction of Glasshouses, and our name is now regarded all over the country as synonymous with all that is latest and best in Glasshouse construction.

Contracts are undertaken for the erection and heating of

CONSERVATORIES, WINTER-GARDENS, VINERIES,

and all kinds of Glasshouses.
The most recent improvements in Ventilation, Heating and internal fittings are introduced.
Plans and estimates will be sent free on receipt of particulars. Write for Illustrated Catalogue, post free.

Recent Contracts include the following:—

HIS GRACE THE DUKE OF BEDFORD, Woburn Abbey.
HIS GRACE THE DUKE OF PORTLAND, Welbeck Abbey.
HIS GRACE THE DUKE OF BUCCLEUCH.
THE RT. HON. THE EARL OF CRAVEN, Coombe Abbey, Coventry.
THE RT. HON. THE EARL OF PORTSMOUTH, Hurstbourne Priors.
THE RT. HON. THE EARL OF LATHOM, Lathom, Ormskirk.
THE RT. HON. THE EARL OF WIMBORNE, Merly House, Wimborne.
THE RT. HON. EARL FORTESCUE, Castle Hill, Devonshire.
THE RT. HON. LORD HILLINGDON, Hillingdon Court.
THE RT. HON. LORD ALDENHAM, Hilfield, Aldenham.
THE RT. HON. LORD DUNBOYNE, Knoppogue Castle, co. Clare.
SIR JOHN DENISON-PENDER, Biddesden House, Andover. (Quorn Boiler).
SIR J. B. ROBINSON, Dudley House, Park Lane, London (Winter Garden and Ballroom at Whynberg, South Africa).
SIR MARK COLLETT, Bart., St. Clare. Kemsing.
H.M. BOARD OF WORKS, Glasshouses in Hyde Park.
W. WALDORF ASTOR, Esq., Hever Castle, Kent.
GILBERT ROBINSON, Esq., Hinwick Hall, Wellingborough.
A. T. COOK, Esq., Sennowe Hall, Great Ryburgh, Fakenham.
COL. LE ROY LEWIS, D.S.O., Westbury House, Petersfield.
MAJOR MANN THOMSON, Sealford Lodge, Melton Mowbray.
SIR C. SWINFEN EADY, Oatlands Lodge, Weybridge. (Quorn Boilers)
MESSRS. BASS, RATCLIFF & GRETTON, Quorn Boilers for heating Offices at Burton-on-Trent; also heating to Ale Stores at Dixie and at St. Pancras.
CORPORATION OF BRADFORD, Conservatory for Moor Park; Glass houses for Bowling Park, Harold Park, and Horton Park.
CORPORATION OF OLDHAM, Conservatories, &c., Alexandra Park.
CORPORATION OF ASHTON-UNDER-LYNE, Conservatory at Stamford Park.
LEICESTERSHIRE COUNTY COUNCIL (Heating to Council Schools).

12 HOURS' STOVE SYNDICATE LTD.,
66, Victoria St.,
WESTMINSTER, S.W.

Why should Pests Plunder your Plants?

Whether your gardening merely consists of the care of a window box or potted plants—whether you have charge of large gardens or cultivate a farm, you know the way plants suffer from the ravages of insects, slugs and snails, beetles, woodlice, wireworms, etc. We wish to day to tell you of a way by which insect pests can be banished for ever.

Science has perfected an economical preparation called "KILOGRUB" which, sprinkled, distributed, and worked well into the soil will exterminate the wireworms, grubs, etc., that ruin fruit, vegetable and flower productions.

Two or three ounces worked into each square yard of soil is all that is necessary. Nor does it lose its efficiency at once, retaining its qualities for as long a period as 6 months. Try "KILOGRUB" now—most dealers stock it, and if you have any difficulty in obtaining a supply, write us for a sample tin, 9d., post paid; or, larger quantities at the following prices, cash with order, carriage paid;

14 lbs.	2/-	Carriage Paid.
¼ cwt.	5/-	
½ cwt.	7/-	
1 cwt.	11/6

Prepaid orders for 28lbs. and upwards, Carriage Paid. Circular, with full particulars, on application.

BARR and SONS,
11, 12, and 13, KING STREET, COVENT GARDEN, LONDON.

Liverpool.

NOVEMBER 4, 5, and 6.

The twenty-ninth exhibition of this society was held in St. George's Hall. The show hardly maintained its high prestige, either in quality or quantity, although many of the classes were highly satisfactory. The fruit display was never finer, the apples being splendid, and the ninety bunches of grapes staged were of excellent quality. The trained chrysanthemums were admirable, and the cyclamens were good, while begonias and salvias were in strong force.

CUT FLOWERS.

Only two sets were staged for the handsome silver challenge vase and prizes, and here the last year's winner, Mr. G. Haigh, gardener to Sir W. H. Tate, Bart., Woolton, was again well to the fore, his Japanese blooms being his strong section, and he had fine flowers of Leigh Hall Wonder, Mary Inglis, Mrs. W. Knox, W. A. Etherington, Mdme. P. Radaelli, E. J. Brooks, Miss Elsie Fulton, Dorothy Goldsmith, and Mrs. F. W. Cole; his best incurved were Boccace, Mrs. G. Denyer, Lady Isabel, Muelenare, Triomphe de Montbrun, Buttercup, Pantia Ralli, Romance, Chrys. Bruant, and Amber Beauty. Mr. C. Goves, gardener to Sir Gilbert Greenhall, Bart., Warrington, was second, his Japanese being his strongest section. For eighteen incurved, distinct, Mr. J. Young took the lead, having good blooms of Mrs. J. P. Bryce, Lady Isabel, Godfrey's Eclipse, etc. For twelve incurved, Mr. J. Clarke, gardener to Thos. Clarke, Esq., Allerton, took the lead, and for eighteen Japanese, distinct, Mr. W. Wainwright, gardener to R. Hobson, Esq., Bromborough, led with a strong set. For twelve Japanese, distinct, Mr. C. Taylor, gardener to R. D. Holt, Esq., M.P., was the winner. The best six vases, distinct varieties, three flowers each, came from Mr. P. Jakeman, gardener to Sir W. B. Forwood, Bart., Bromborough, who sent good blooms. For six vases of single varieties Mr. J. Rothwell led with pleasing blooms. The most tastefully arranged dinner table was one set out by Mrs. T. A. Vasto.

CHRYSANTHEMUMS IN POTS.

For four large-flowering trained plants, Mr. W. Wilson, gardener to W. Cunningham, Esq., won with beautiful examples of Mrs. Dixon and Mrs. E. Beckett. Mr. J. Pilkington, gardener to A. A. Paton, Esq., had the best single specimen. For three singles, trained, Mr. T. Hitchman, gardener to A. Earle, Esq., scored with fine plants. The best trained pompone, shown by Mr. W. Wilson, was a model Mrs. Westlake. For six staked plants Mr. E. Wharton, gardener to John Findlay, Esq., secured the chief award, and Mr. E. R. Finch, gardener to W. J. Lockett, Esq., led for three plants.

MISCELLANEOUS PLANTS.

Begonia Gloire de Lorraine was best shown by Mr. R. T. Bushell, gardener to L. Noblett, Esq. For four stove or greenhouse ferns, Mr. G. Eaton, gardener to W. Tod, Esq., was well to the fore with Davallia fijiensis plumosus, Nephrolepis Pearsonsi, Dicksonia antarctica,and Davallia Mooreana. For three orchids distinct, Mr. P. Jakeman led with Oncidium varicosum Rogersi, Cattleya labiata, and Odontoglossum grande, while for a single plant, the same exhibitor scored with a good Cattleya labiata, securing the award for one cypripedium with C. insigne. The best three palms or cycads came from Mr. G. Osborne, gardener to Dr. J. A. Cook. The chief awards in both classes for six cyclamen went to Mr. L. Noblett.

FRUIT.

In the class for six dishes of fruit, Mr. E. F. Hazelton, gardener to the Earl of Derby, Knowsley, secured the premier award with Muscat of Alexandria and Alicante grapes, Pitmaston Duchess pears, Royalty melon, and Mother and Cox's Orange Pippin apples; Mr. J. Skitt, gardener to Mrs. Bright, second. For two bunches of grapes, Alicante, Mr. J. Skitt led with fine bunches, and in the any other black class Mr. W. Evans, gardener to Mrs. Jerome Smith, led with Gros Colman. For White Muscats Mr. W. Wilson scored, and for two bunches of any other white, Mr. Skitt led with Golden Queen. For four bunches in two varieties, the same exhibitor scored with Muscat of Alexandria and Alicante.

Mr. E. F. Hazelton led for six dishes of dessert pears with fine fruits of Beurre Diel, Pitmaston Duchess, Durondeau, Marie Louise, and Beurre Clairgeau. Mr. W. Mackerall, scored for four dishes, and Mr. E. F. Hazelton had the best stewing pears.

In the classes for dessert apples Mr. J. Lee led for six dishes, Mr. W. Mackerall for three dishes, and Mr. A. A. Evans for a single dish. Mr. J. Lee scored for eight dishes of culinary apples with grand Peasgood's Nonsuch, Lord Derby, Mère de Ménage, Bismarck, Bramley's Seedling, Emperor Alexander, etc. For four dishes Mr. A. A. Evans led, and for a single dish Mr. J. Lee led with Peasgood's Nonsuch.

NON-COMPETITIVE.

The non-competitive exhibitors included Messrs. R. P. Ker and Sons, cyclamen; the Liverpool Orchid Company, orchids; Mr. W. Rowlands, carnations; Messrs. T. Davies and Co., liliums, begonias, and lily of the valley; Messrs. Dickson's, apples; Messrs. Clibrans, begonias; and Messrs. Moore and Co., orchids.

National Chrysanthemum Society.

At the luncheon held at the Crystal Palace on the first day of the recent show, Sir Albert Rollit, D.C.L., LL.D., president of the society, occupied the chair, and there was a large muster of judges, exhibitors, officers, and other members of the society. Considerable enthusiasm was aroused by the receipt of a telegram from the president of the French Chrysanthemum Society at Tours sending cordial greetings to their English brethren, and a reply was sent later reciprocating the good wishes of the French chrysanthemists.

The President proposed the joint toast of "The Judges and Exhibitors," and in doing so called attention to the educational work which the society was undertaking by encouraging the culture of the chrysanthemum. The toast was coupled with the names of Messrs. W. Wells and J. W. Moorman (for the judges), and Messrs. H. J. Jones and R. Cannell (for the exhibitors). The toast of "The Crystal Palace Company" was proposed by Mr. E. F. Hawes, and replied to on behalf of the company by Mr. C. O. Starr, the general manager.

Mr. T. Bevan proposed the toast of "The President," which was enthusiastically received with musical honours. In acknowledging the toast Sir Albert Rollit said that he felt a great personal interest in the National Chrysanthemum Society; he had already been successful in obtaining a number of new members, and he hoped to be able to introduce more. He had had pleasure in presenting special prizes in connection with the show which was being held, and he would indicate his interest in the same practical way again.

United Horticultural Benefit and Provident Society.

The monthly meeting of this society was held on Monday evening, November 9, at the Horticultural Hall, Vincent Square, Westminster, Mr. Thomas Winter in the chair. Eight new members were elected, making a total of 71 this year to date. The deaths of two members were reported, and the amounts standing to the credit of the late members were paid to the widows, being £25 7s. 4d. and £16 5s. 5d. respectively. Sick pay for the month was £36 4s. The trustees were requested to invest £300 in Corporation stock. The annual dinner, held on October 15 last, at the Waldorf Hotel, was a very successful function.

ANSWERS TO CORRESPONDENTS.

SUGAR BEETS.—W. A. J., Basingstoke: The three varieties of sugar beet that have given the best results in this country, i.e., at Essex, Hunts, and Cambridge, are Cooper's Selected, Vilmorin's Improved, and Kleinwanzleben.

PROTECTING FIG TREES.—H. B., Derby: It will be quite early enough to protect fig trees when the leaves have all fallen. Then loosen the branches from the wall or trellis, and loosely tie them up into bundles. Bracken is the best material for wrapping round these bundles of branches. After putting this protecting material into position, tie the bundles firmly to a support, and in such a manner that, should very severe weather be experienced, the further protection of a mat or mats may be readily provided.

BLOTCHED SYCAMORE LEAVES.—A. E., Tetbury: The black blotches on the fallen leaves are evidence of an attack of the sycamore leaf blotch (Phytisma acerinum). This fungus attack is usually first noticed in June or July, when the blotches and patches are yellow, but they soon turn black and have a wrinkled surface. The chief cause of infection is from the ascospores that are liberated in spring from these black portions, hence it is a matter of the greatest importance that all fallen leaves of sycamores, maples, and planes should be collected in late autumn and at once burned, so that infection the following spring may be reduced materially and, possibly, be entirely prevented.

NAMES AND SYNONYMS OF TREES.—C. R., Loughton: Betula corylifolia is a Japanese tree not yet, so far as we are aware, grown by the trade. Quercus heterophylla is catalogued, and its horticultural synonym is Q. aquatica nana. Sassafras officinale has many synonyms, of which the chief are S. albidum, Laurus sassafras, L. albida,and L. diversifolium, Persea Sassafras, and Tetranthera albida. Quercus imbricaria is sometimes known as Q. Castanea, Q. laurifolia, and Q. Phellos imbricaria. Pyrus Tschonoskii is from Japan, and we know of no synonym. Pyrus cratægifolia is variously known as Cornus florentina, Cratægus florentina, Malus cratægifolia, Mespilus florentina, and Sorbus florentina. Prunus (not Pyrus) Besseyi, is the Sand Cherry of the North-Western United States, and its one synonym is P. pumila Besseyi. Pyrus arbutifolia, and Sorbus arbutifolia. Berberis as Aronia pirifolia, A. arbutifolia, Azarolus arbutifolia, and Sorbus arbutifolia. Berberis polyantha and B. Yunnanensis we do not know, and they are not in the most recent Kew Hand List. Rubus Millspanghi is probably a comparatively recent introduction. Aronia floribunda is probably an Amelanchier or a Pyrus, as Aronias are largely merged into these two genera. Cratægus monogyna foliis aureis is correct, but C. mongyna is regarded as a sub species of C. Oxyacantha, the Common Hawthorn, and dozens of varieties are included under it. Ulmus campestris variegata nova and U. campestris latifolia variegata are good names of well-marked varieties of the common elm. Rubus thyrsoideus is a good name for a European plant, but we do not find it catalogued. Philadelphus Lewisi is from Western North America, and its horticultural synonyms are P. thyrsiflorus and P. sanguineus; it is seldom catalogued. As you are interested in these matters, we suggest you purchase the Hand List of Trees and Shrubs grown in the Kew Arboretum; you can obtain a bound copy for 1s. 7d., on application to the Curator, Royal Gardens, Kew, and you will find it very useful in determining the synonymy of trees and shrubs, and the correct spelling of names.

CHRYSANTHEMUMS.—For full instructions on the Culture of Early-flowering Chrysanthemums in beds or borders for garden or greenhouse decoration, read CHRYSANTHEMUMS FOR GARDEN AND GREENHOUSE, by D. B. Crane, price 2s. 6d. net; or by post 2s. 10d., from W. H. and L. Collingridge, 148 and 149 Aldersgate Street, London.

THE OLD AND THE NEW.

ENCYCLOPAEDIA OF GARDENING

Thousands and thousands of amateur and professional gardeners have testified to the sterling worth of "The Encyclopaedia of Gardening," by T. W. Sanders, as their guide, philosopher, and friend. The features which ensured its popularity in the past are still retained in the new edition to be published on Monday next, while the supplementary information—list of species, &c.—and thorough revision have rendered the work of infinite greater value without adding to its cost.

FROM THE OLD EDITION.

Strawberry-plant (*Fragaria vesca*)—see Fragaria.

Fragaria (Common Strawberry, Chili Strawberry, Hautbois' Strawberry, Alpine Strawberry, India Strawberry).—*Ord.* Rosaceæ. Hardy or half hardy perennial fruit bearing & orn. trailing plants. *Nat.* Britain, Europe, S. & N. America, India, Japan. *Int.* (foreign species) 1629. *Ht.* 6 in. to 1 ft. *Species* cultivated, about 6; varieties numerous. *Culture of Trailing species (F. indica): Compost*, two parts loam, one part leaf mould & sand. *Position*, pots in hanging baskets in cool greenhouse or window, or on sunny well drained rockery. *Pot or Plant*, Mar. *Water* moderately. *Apply* liquid manure occasionally in sum. *Culture of Strawberry: Soil*, deep rich sandy loam; clay unsuitable. *Position*, open plots or borders, trenched 2 ft. deep, alpine kind under shade of trees or on banks. *Plant*, Aug., Sept., or Mar. 18 in. apart in rows 2½ ft. asunder; alpines 6 in. apart. *Mulch* annually with manure in Mar., & a thin layer of straw in May. *Water* frequently during June. *Apply* liquid manure as soon as fruit changes colour. *Remove* runners when they appear. *No digging* between rows necessary. *Renew* beds every three or four years. *Pot culture: Compost*, two thirds calcareous loam, one third decayed manure, little bone dust. *Position*, on bed of cinder ashes outdoors Aug. to Oct.; frames Oct. to Jan.; greenhouses or vineries after Jan. *Pot* singly in 6 in. pots in Aug. *Water* moderately till Oct., very little till Jan., freely afterwards. *Fertilize* blossoms by means of camel hair brush. *Thin* fruit when set to a few on each plant. *Plant* out in garden after fruiting. *Temp. for forcing*: Jan. to Mar. 45° to 55°; Mar. to ripening period, 65° to 75°. *Propagate* by seeds sown 1/16 in. deep in light soil outdoors, or in boxes in greenhouse in Mar. or Ap.; by runners pegged on surface of soil in 3 in. pots in June or July, or by removing rooted runners in Aug. Runners rooted into pots best for pot culture.

FROM THE NEW EDITION.

Strawberry.—See Fragaria.

Fragaria (Strawberry).—Ord. Rosaceæ. Hardy & half-hardy perennial fruit-bearing & orn. trailing plants. Virginian Strawberry first introduced 1629.

CULTURE OF ORNAMENTAL SPECIES (F. indica): Compost, two parts loam, one part leaf-mould & sand. Position, pots in hanging baskets in cool greenhouse or window, or on sunny well-drained rockery. Pot or plant, March. Water moderately. Apply liquid manure occasionally in summer.

CULTURE OF STRAWBERRY: Soil, deep rich sandy loam; clay unsuitable. Position, open plots or borders, trenched 2 ft. deep, alpine kind under shade of trees or on banks. Plant, Aug., Sept., or March 18 in. apart in rows 2½ ft. asunder, alpines 6 in. apart. Mulch annually with manure in March, & a thin layer of straw in May. Suitable artificial manure, 1 oz. sulphate of potash, 2 oz. superphosphate applied in autumn, & 1 oz. of nitrate of soda per square yard, applied when fruit has set. Remove runners when they appear. No digging between rows necessary. Renew beds every three or four years.

POT CULTURE: Compost, two-thirds calcareous loam, one-third decayed manure, little bone dust. Position, on bed of cinder ashes outdoors Aug. to Oct.; frames Oct. to Jan.; greenhouses or vineries after Jan. Pot singly in 6 in. pots in Aug. Water moderately till Oct., very little till Jan., freely afterwards. Fertilize blossoms by means of camel-hair brush. Thin fruit when set to a few on each plant. Feed with liquid manure after fruit has set until it begins to ripen. Plant out in garden after fruiting. Temp. for forcing: Jan. to March 45° to 55°; March to ripening period, 65° to 75°. Propagate by seeds sown 1-16 in. deep in light soil outdoors, or in boxes in greenhouse in March or April; by runners on plants that fruit freely. Pegged on surface of soil in 3 in. pots in June or July, or by removing rooted runners in Aug. Runners rooted into pots best for pot culture.

MARKET CULTURE: Soil, loam overlying chalk or gravel. Position, open, not too dry or moist. Plant, Aug. to Nov., 18 in. apart in rows 2 ft. 6 in. asunder. Number of plants per acre, 11,000. Average cost per acre: Plants, £3; preparing land, £7; manure, £5; planting, 10s.; trimming, 15s.; gathering fruit, £8; annual manuring, £5; yield, 2 tons; gross returns, £42; net returns, £25. Manures: Farmyard dung, 20 tons; bonemeal, 5 cwt.; and kainit, [illegible] cwt. per acre, applied in winter; soot, 40 bushels per acre applied in spring.

SPECIES CULTIVATED: F. chiloensis (Chili Strawberry), white, May, 1 ft. [illegible] (Hautbois Strawberry), white, summer, [illegible] (Indian Strawberry), yellow, June, trailing, [illegible] suited for rockeries or hanging baskets; virginiana (Scarlet Strawberry), white, May, fruit scarlet, edible, United States, parent of the many forms of garden strawberries.

The Thirteenth Edition of "The Encyclopaedia of Gardening" will be ready on November 16. It has been entirely revised and rewritten, set in new type, and appears in a new style of binding.

ORDER FORM.

To the Publishers, "AMATEUR GARDENING," 148 & 149, Aldersgate St., London.

Please send me by post a copy of the New Edition of "THE ENCYCLOPÆDIA OF GARDENING," *for which I enclose remittance of* 3/10.

Name ....

Address ....

SCAB ON APPLES.—J. R., North Wales: The dreaded apple scab is one of the most destructive of diseases that attack apples and pears, and, as in the specimen sent, when it becomes prevalent, the fruits are worthless. Thorough winter washing with the caustic soda wash, collecting and burning all fallen leaves, and good cultivation, will materially help to rid the trees of this fungus pest. When leafless the trees should be carefully examined, and as growths are attacked as well as the fruits, the former, where diseased, should be cut out and promptly burned. But this will not entirely dispose of the trouble when the disease has become so widespread, and the winter cleaning and pruning must be followed by spraying the trees liable to attack three times with Bordeaux mixture, the first when the buds are beginning to open, the second when the petals of the flowers are falling, and the third when the fruits are of the size of small gooseberries. The Bordeaux mixture must be used in a dilute form because of the risk of injury to the tender foliage.

SPOTTED CABBAGE LEAVES.—J. R., North Wales: The leaves sent give ample evidence of a very severe attack of cabbage leaf spot at an earlier date. Spraying the young plants with a solution of sulphide of potassium or weak Bordeaux mixture would probably act as a preventive; but if the crop is all attacked as badly as the specimen sent, the plants are so badly infected that nothing can be done to save them, and the sooner they are pulled up and burned the better. You seem to have a great deal of trouble from plant diseases; let us know something about your garden and its surroundings, so that we may help you.

WOOD-BORING CATERPILLAR.—J. T., Henley: The caterpillar in the piece of apple wood sent is the larva of the Goat Moth (Cossus ligniperda). This is a pest on some occasions, and in some districts, as it penetrates almost any kind of wood, living or dead. The female moth deposits her eggs in the crevices of the bark, and when the grubs are hatched they at once set to work to eat their way through the bark into the wood, and right into the heart of the tree. The caterpillars take about two years to become full fed, and they then make a strong cocoon, assume the chrysalis state, and about June or July emerge as the perfect moth. A sharp look-out should be kept for the moths during June and July. Badly infested trees should be cut down and split up, and the caterpillars be found and killed. In other cases the holes should be found, and they can usually be discovered by the sawdust that works out of them, and strong wire should be forced into these holes so as to pierce and kill the grubs. It is probable that cyanide of potassium placed in the hole would kill the grub by means of its deadly fumes, but we have not seen this tried for the purpose, and the cyanide fumes are so deadly that we hardly like to suggest its use.

NAMES OF PLANTS.

S. R., Loughton.—Achimenes longiflora.

M. C. E., Bangor.—1, Abies nobilis; 2, A. Nordmanniana.

J. W., Handsworth.—1, Cryptomeria elegans; 2, Sequoia sempervirens.

F. B. G., Wellingborough.—1, Leycesteria formosa; 2, Cupressus Lawsoniana Allumi; 3, C. L. glauca.

S. N. B., Dorking.—1, Gautheria Shallon; 2, Viburnum Tinus; 3, Cotoneaster Simmonsi; 4, C. horizontalis.

F. B., Lynn.—1, Lygodium scandens; 2, Oncidium varicosum Rogersi; 3, Linum trigynum; 4, Jasminum nudiflorum.

E. H., Biggleswade. — 1, Mimulus glutinosus; 2, Maranta zebrina; 3, Asplenium Nidus-Avis; 4, a head of Gomprehna globosa.

NAMES OF FRUITS.

We are compelled to hold over numerous replies under this heading.

F. F. E., Ilkley.—1, Beurre Clairgeau; 2, Catillac.

S. T. C., Hertford.—1, Tyler's Kernel; 2, Court of Wick.

P. H., Saxmundham.—1, Mère de Ménage; 2, Lord Derby; 3, King of the Pippins.

K. J. W., Chester.—1, Court Pendu Plat; 2, Braddick's Nonpariel; 3, Ribston Pippin.

M. B., Rochester.—1, Gloria Mundi; 2, Dumelow's Seedling; 3, Adam's Pearmain.

C. H., Edgbaston.—1, Twenty-ounce; 2, not recognised; 3, Bellisime d'Hiver; 4, Beurre Diel; 5, probably a local seedling; 6, Lane's Prince Albert.

THOMSON'S CELEBRATED MANURES. For full advertisement see page iii.

TO-DAY! AND FOR YEARS AND YEARS PAST the XL ALL Specialities are and have been the best on the market. Where is the Gardener who does not pin his faith to one or the other of these celebrated Insecticides or Fertilisers? XL ALL FERTILISER has pleased all who have used it this season. The Sales of XL ALL FUMIGATOR prove that it is more popular than ever. XL ALL LIQUID NICOTINE INSECTICIDE is always spoken of by gardeners and growers as the most deadly to Mealy Bug, Thrip, etc. XL ALL WINTER WASH for dormant Trees acts like magic, clearing the Trees and Bushes of all Insects' Eggs, Moss, and Fungoid Growths. XL ALL LAWN SAND, a weed eradicator and fertiliser for weedy and poor lawns. XL ALL WEED KILLER used once a year. "No weeds can live." Please ask your Nurseryman, Seedsman, or Florist for a copy of my small pink list giving particulars of these and many other XL ALL Preparations, which can be obtained from the Horticultural Trade throughout the World. G. H. RICHARDS, Manufacturer and Patentee, 234, Borough High Street, London, S.E.

Address ROBT. SINCLAIR, The Gardens, Constable Burton; or as above.

SITUATION required; experienced in all Nursery Stock under Glass; 12 years' experience; 3½ years last place; age 26. C. MARSHALL. 15, Wrotham Road, High Barnet, Herts.

JOURNEYMAN (Inside, or Inside and Out). —Mr. FOWLES, Marcham Park Gardens, Abingdon, Berks, can highly recommend Young Man as above; age 22; 7 years' experience.

HANDY MAN seeks SITUATION; all kinds of Horticultural Repairs and Building; could fill up time in Outside Budding and Grafting and Knife work. M., care of Mr. Smith, 20, Cunningham Road, Broad Lane, Tottenham.

STOKER or HANDY MAN, willing to be generally useful; 10 years' good character one situation; age 34; married. Apply STOKER, 48, Fifth Avenue, Bush Hill Park, N.

YOUNG MAN, 22, requires SITUATION in Nursery; 7 years' experience in tomatoes, cucumbers, chrysanthemums, and bulbs, and bedding stuff; good references. JOHN HUGHES, The Gardens, Gwrych Castle, Abergele, N. Wales.

IMPROVER, in Gentleman's Garden, age nearly 17; won Essex County Horticultural Scholarship, 1907; also Second-class Certificate R.H.S.; has had one year's training at Horticultural Gardens. Chelmsford; now disengaged. H. BRANSDEN, Stifford Lodge Cottage, near Grays, Essex.

THE GARDENER, Denton House, Cuddesdon, Oxford, recommends strong, useful LAD for the Garden; one year's experience.

GIRL (18) as APPRENTICE to Lady Gardener, to live in; had some months' training; would give 2 years. Full particulars N., 49, Westbourne Park Road, London.

Situations Vacant.

AS GARDENER.—Wanted, capable MARRIED MAN, age 35 to 40; not afraid of work; must understand fruit, vegetable and flower garden, some glass. Wages, if wife undertakes laundry and care of poultry, 27s., with 5-room cottage. North Kent district. V. S. M., Office of this Journal.

UNDER-GARDENER WANTED, young, unmarried; Second of two; West Sussex district. Good knowledge of greenhouses and arrangement of flower beds, and generally useful. Write, stating age and qualifications, to Mrs. PINERO, 14, Hanover Square, London, W.

EVERGREENS AND CONIFERS:

5,000	Abies pungens glauca (Rocky Mountain Blue Spruce).
13,000	Box.
2,100	Box, Tree.
9,200	Cotoneaster.
5,000	Cupressus Lawsoniana.
1,600	Cypresses of sorts
20,000	Hollies.
1,300	Ivy "dentata."
1,450	Ivies, Tree.
164,400	Larch of suitable sizes for planting out.
1,228	Magnificent Specimen Trees.
31,000	Pines, Austrian.
24,000	Pines in variety.
16,000	Rhododendrons.
346,500	Privet (Oval - leaved, Evergreen and Golden.
65,000	Scotch Fir.
72,300	Spruce Fir.
4,400	Thujas.
34,360	Yew, English.
3,700	Yew, Golden.
45,600	Laurels of sorts.

DECIDUOUS TREES AND SHRUBS:

77,500	Ash.
30,000	Beech.
27,270	Chestnut, Horse.
4,000	Chestnut, Spanish.
74,000	Flowering Shrubs.
12,000	Hazel.
8,000	Hornbeam.
7,860	Limes.
1,500	Maples.
30,800	Oak, English.
8,500	Oak, Turkey.
6,500	Planes.
5,700	Poplars.
43,800	Sycamore.
130,000	Thorn, Quick
5,000	Willows.

Also enormous quantities of Stock from 4 ACRES of GREENHOUSES and PITS.

265,200 Roses. 127,000 Herbaceous, etc., Plants. 750,000 Fruit Trees

This is an exceptional opportunity for the Wholesale Trade, Estate Agents, and all who plant, of buying at almost unheard of prices. There is great range in variety and size. The stock is in superlatively fine condition, a Gold Medal having been awarded to a selection thereof at the Royal Agricultural Society's Show at Newcastle-on-Tyne, 1908.

INSPECTION BY INTENDING PURCHASERS IS EARNESTLY INVITED.

VOL. LI.—No. 2,873. SATURDAY, NOVEMBER 21, 1908.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

"French Gardening."

We have placed the heading to this note within inverted commas because it has reference, not to the many and varied aspects of horticulture in France, but to a branch of the market gardening industry around Paris, which some writers and speakers have of late been so freely describing as French gardening. In making this reference we have two objects in view. One, to again bring into prominence the advantage that would be derived from following as closely as may be practicable the methods that obtain around Paris in the production of winter and spring salads, and certain other vegetables that are in request early in the year. The other, to warn those of our readers who may have been influenced by the statements as to the enormous profits derived from this branch of market gardening against investing their capital in market gardens formed in accordance with the French system until they have had some practical experience thereof. The desirability of having liberal supplies of tender lettuces, crisp radishes, delicately flavoured cauliflowers, and succulent carrots and turnips of home growth from midwinter onwards will be readily conceded. It would be well were these vegetables to be had in abundance in the private household, and they should certainly be supplied to the home markets in liberal quantities, without having to depend almost wholly upon the French market gardens for such things. We have on more than one occasion directed attention to the immense value of glass in the production of winter salads and early spring vegetables, and have urged upon our readers the importance of private gardens being well furnished with frames, either unheated or provided with sufficient hot-water piping to maintain a genial warmth during periods of severe frost and wet, damp weather. The value of glass, without artificial heat, in the protection of tender vegetation, is so great that it would be difficult to overestimate it. This is known to practical men with some experience; but few owners of gardens are able to appreciate it, or they would make a more liberal provision of frames than is usually the case. To demonstrate the value of protection in the maintenance of a supply of lettuces during winter and spring one has only to put a few handlights or bell glasses over lettuces that have been planted in open beds to stand the winter. With but little attention those provided with shelter will, at the end of the winter, be of a size suitable for the salad bowl, and tender and delicate in flavour, and present a very different appearance to those which have been subjected to the unfavourable conditions characteristic of our winters. We might also follow the example, as far as circumstances will permit, that the French growers have set us in the use of shallow hot-beds and rich soil in the cultivation of salads and early vegetables. Unfortunately, the private gardens are not numerous wherein stable manure, otherwise than in comparatively small quantities, can be obtained. With regard to the production of winter salads and early vegetables for market, we have on several occasions suggested that there was no good reason why a large proportion of these products should not be grown at home, instead of being imported as for so many years has been the case. We have also expressed the opinion that market growers, whose land was favourably situated, and within a convenient distance of a town whence suitable manure could be obtained, would derive a good profit from the crops. Nothing has occurred that would justify a change in our opinion upon this point. But, and this word has much significance at this juncture, we have been careful to avoid suggesting that the profit, while large, would be greatly beyond what a skilful cultivator with advanced ideas would have a right to expect. It would have been well had a very large proportion of those who have been discussing the so-called French gardening in the newspapers shown a similar degree of moderation. One could hardly expect that, as moderation comes only from a knowledge of the subject under discussion. However that may be, those who are acquainted with the branch of market gardening under consideration cannot avoid a feeling of regret that some reserve has not been shown by certain writers in their estimate of the profits. One regrets this, because, after reading that many hundreds of pounds may be annually obtained from an acre or so of land cultivated in accordance with French methods, there is a danger of people utterly unfitted to the work taking up land, furnishing it with frames and cloches, and losing the greater part, if not the whole of their capital. In this view of the case we are fully supported by what was said by Mr. McKay, in the course of his address before the Horticultural Club the other evening. Mr. McKay has, during the past two or three years, devoted much attention to the introduction of the French methods into the market gardens in this country, and he conducted a party of

MR. T. H. SLADE.

market growers from the Evesham district through the principal market gardens in the vicinity of Paris. He was careful to explain that he was in no way responsible for the extravagant statements that had been made with regard to profits, and that there was a risk of those who had no experience of growing for market losing their money if they engaged in the industry. He pointed out that not only did the market gardener work, but that the wife, and every member of the family that was old enough and strong enough, helped him. Further, he stated, and of this we were well aware, that the work in summer is commenced with the dawn, and ended with the twilight, and in winter work is commenced long before the first streak of daylight is visible above the horizon. Notwithstanding this long and strenuous effort, market growers around Paris do not appear to do more than earn a comfortable living. There are other points upon which we should like to touch, but as we have said sufficient to show the great risk incurred in entering into French gardening, so called, without first having obtained experience, we need not pursue the subject further. There is no occasion to warn gardeners of the great danger incidental thereto, but we strongly advise those who contemplate leaving the workshop, the counter, or the counting-house for the purpose of embarking in this form of market gardening, to dismiss the matter from their mind, and thus avoid the loss that such a step would entail.

Mr. T. H. Slade, who for thirteen years has been head gardener at Poltimore Park, near Exeter, is one of the best-known of gardeners in the South-western counties, while his fame as an exhibitor, especially of hardy fruits, has extended throughout the country. Our readers also know Mr. Slade through his contributions to these pages, his notes on hardy fruits, winter-flowering carnations, and roses invariably finding appreciation. Mr. Slade has had a wide experience, and he was for many years at Cardiff Castle, where, under the late Mr. Pettigrew he helped to plant the famous Castle Coch vineyard. Mr. Slade was employed in Kent, Surrey, Sussex, and in the North of England before going to Poltimore, where, under his direction, many and important improvements have been made in the extensive gardens and pleasure grounds of Lord Poltimore's fine Devonshire seat. We may add that Mr. Slade has had considerable experience as a lecturer on horticulture for the Devon County Council, and he is much in request as a lecturer and judge.

National Horticultural Society of France.—This society, presided over by M. Viger, has of late years made very marked progress, owing largely to the fine position in which it has been able to hold its spring and autumn shows. It was founded in 1855, and has a fine hall and offices at 84, Rue de Grenelle. The annual subscription is 20 francs, and anyone interested in horticulture can join. A journal, published monthly, is supplied free to members. The library of the society is unequalled by any other society in Europe for the number and rarity of horticultural and botanical works it possesses. Altogether they amount to upwards of 15,000 volumes, and Mr. George Gibault, the librarian, has prepared and published a very useful classified catalogue of this unique and magnificent collection. The roll of membership, including affiliated societies, is now 4,203.

The Best Rose at the Bagatelle Gardens.—In the trials of roses held in the Bagatelle Gardens, Paris, and which have been judged, not once, but throughout the season, the new rose Rhea Reid, from Messrs. E. J. Hill and Co., Richmond, Ind., U.S.A., received the grand prize of a gold medal as the best variety out of eighty-four submitted by growers from all parts of the world. At the first judging the Lyon rose scored the highest, but Rhea Reid did well, and at the autumn judging the latter variety outdistanced its competitors, and gained the premier award.

Seedling Chrysanthemums are becoming increasingly popular, and it is a matter of some interest that they receive special attention at the exhibitions of the Reading Chrysanthemum Society. To the Reading show, held the other day, Messrs. Sutton and Sons contributed a large and beautiful display of flowers raised from seed sown at the end of January last. While noteworthy for its attractiveness, the display was of much interest as evidence of the high quality of flowers of seedlings when raised from seed obtained from first-class flowers. The large silver medal was awarded the firm for their exhibit.

Conservatory Flowers at Kew.—An inspection of the flowers arranged in the No. 4 house at Kew always proves interesting and instructive, but especially so in the dull season of the year. At present the Japanese, single, and decorative chrysanthemums continue to provide the bulk of the display, but besides these there are begonias of many kinds, including the Gloire de Lorraine and Veitchian types, primulas, cinerarias, heaths and epacrises, acacias, camellias, carnations, darwinias, correas, narcissi, Sparmannia africana, Aristia corymbosa, solanums, Calceolaria Burbidgei, fuchsias, Lycosis aurea, Cuphea micropetala, Lilium sulphureum, lily of the valley, zonal and ivy-leaved pelargoniums, eupatoriums, Perestrophe speciosa, ardisias, Jacobinea chrysostephana, Leonotus leonurus, arums, heliotropes, Cosmos bipinnatifolia, Chironia linoides, Plumbago capensis, and P. rosea, Phyllica capensis, Salvia splendens, Pleroma macrantha, Buddleia asiatica, cyclamens, Daedalacanthus nervosus, abutilons, etc., etc.

Italian Gardens will form the subject of a lecture to be given by Mr. Joseph Cheal, at the meeting of the Royal Horticultural Society on Tuesday next. The chair will, as usual, be taken at 3 p.m.

Potato Disease in Ireland.—In reply to a question in the House of Commons Mr. T. W. Russell stated that it was quite true that the disease of potatoes known as "black scab," had made its appearance in Ireland. He had received information that this particular disease had been reported from two centres in county Down. The inspector had visited the district and declared the disease in both cases to be "black scab." In one case the potatoes had been dug, and the inspector had ordered the immediate destruction of a portion of the crop, and his order had been complied with. In the other case the crop was still in the ground and notice had been served that the potatoes were to be left in the ground pending further instructions. He did not think that the department could be armed with greater authority than it possessed under their Acts of Parliament to deal with a calamity of this kind. Recognising it to be a calamity to Ireland, the department would leave nothing undone to stop the progress of the disease. Replying to further questions, Mr. Russell said that there was nothing whatever to prove that the disease originated from imported seed potatoes, and he had a great objection to issuing an order to stop their importation and thus raise the price of potatoes all over Ireland.

Trials of Fruit Tree Spraying Machines.—The Royal Agricultural Society of England intends offering prizes for spraying machines at its show to be held at Gloucester on June 22-26, 1909. In Class II., for the best machine worked by hand power, for use in commercial plantations, the prizes are £10 and £5; in Class III., for a movable plant for spraying large plantations, and to be worked by steam, petrol, or mechanical power, the prizes are £20 and £10. Entries must be sent to the secretary of the society, 16, Bedford Square, W.C., by March 20 next. The chief points to which the judges' attention will be directed are: Class II., For the best machine worked by hand—Efficiency in work and adaptability to different kinds of trees or bushes, and capability of throwing different kinds of sprays; portability, regard being had to different systems of planting; power and number of men required for working; durability; capability of withstanding chemical action of washes; prime cost. Class III., For the best movable plant, to be worked by steam, petrol, or mechanical power.—Efficiency in work and adaptability to different kinds of trees or bushes, and capability of throwing different kinds of sprays; adaptability to different classes of plantations; capability of withstanding chemical action of washes; economy of working; durability; prime cost.

An Encouraging Letter.—The staff of the Gardeners' Magazine, whether in editorial, publishing, or printing departments, consists of essentially human beings, and, therefore, an encouraging letter, and a recommendation of our work to others, comes as a very pleasant item in the daily rush of duty. We have many such pleasing letters and recommendations, and the following from a Midland friend is an example: "I take this opportunity of stating how very much I like the new and improved form in which the Gardeners' Magazine now appears. I have been a regular reader of the paper for nearly twenty years, and find it, now, as always, the most reliable and up-to-date of all gardening papers published."

"Le Jardin" Chrysanthemum Number.—On the occasion of the twenty-fifth annual chrysanthemum show in Paris, our French contemporary, "Le Jardin," blossomed forth into a special chrysanthemum number, inspired no doubt by the example of the Gardeners' Magazine some years ago. The number contains articles by most of the well-known French growers, viz., Messrs. Cordonnier, Nonin, Calvat, Baltet, Dubuisson-Foubert, Chantrier, Bruant, Rivoire, Cavron, Momméja, Vilmorin, Dolbois, besides others interested from a literary point of view. The number is profusely illustrated with portraits, some of which are reproductions of the originals in the Gardeners' Magazine Special Chrysanthemum Number of October 26, 1889. There is also a coloured illustration, half natural size, of the Japanese chrysanthemum F. S. Vallis, and some curious Japanese illustrations from the collection of M. Momméja, a well-known collector and amateur grower. It may be interesting to record that the portrait gallery consists of pictures of Capt. Blancard, Capt. Bernet, Pertusès, Joseph Sabiné, Robert Fortune, Nonin, De Reydellet, Simon Delaux, Louis Lacroix, Cordonnier. Calvat, Chantrier, Bruant, Rivoire, Cavron, Ph. de Vilmorin, Momméja, and Debrie-Lachaume.

Tobacco Culture in Ireland has so far proved successful that those engaged in the conduct of the experiments in connection therewith have obtained the sanction of the Government to continue them until the year 1913. Commencing in 1898 on a small scale the experiments steadily increased, and in 1903 the then Chancellor of the Exchequer gave permission for the area of cultivation to be increased to 100 acres, and this limit has now been reached. At the present stage of the experimental work the following historical sketch of tobacco growing, given by the "Times" in a comprehensive article on the subject is of much interest: The present experiments may, observes the correspondent of our contemporary, be said to date from 1898, when the plant was cultivated on Irish soil for the first time since its proscription in 1831. The earlier history of the industry had been lengthy but interrupted. According to a not improbable tradition, the "Indian weed" was cultivated by Sir Walter Raleigh at Youghal, when he first introduced it from the New World. It was certainly grown in Ireland, as also in England, in considerable quantities during part of the seventeenth century. Its cultivation was then prohibited by two Acts of Charles II.'s reign, passed for the express purpose of fostering the same industry in the American colonies. For the same reason, the cultivation of the plant which had been largely carried on round Cheltenham and Winchcombe, in Gloucestershire, had already been forbidden under the Protectorate. This prohibition lasted in the case of Ireland until 1799, when tobacco-growing was again permitted as one result of the rebellion of the previous year. Its continuance, moreover, was specially guaranteed by the Act of Union. Not much advantage seems to have been taken of the permission, however, until about 1820, when the industry was revived by the help of labour trained in the American plantations. By 1829, 500 acres were once more under cultivation in six counties, the chief centre being in Wexford and Waterford. The coarse variety grown at this time has perpetuated itself in Wexford as a casual weed until the present day. Two years later tobacco growing was again proscribed, this time apparently in deference to the convenience of the Excise department, which found it easier to concentrate this whole branch of its business at the seaports than to keep an eye on the various inland centres of the industry.

Richthofenia is the name of a new genus of the unique order Rafflesiaceæ discovered in Siam. The plants of this order, as "Nature" observes, are parasitic herbs, consisting of a vegetative structure reduced to a network of cellular threads ramifying in a host plant, and of flowers subtended by a few scale leaves. The new genus, Richthofenia, falls into the tribe Rafflesieæ, together with the genera Rafflesia, Sapria, and Brugmansia. It is similar to Rafflesia in the possession of a plurilocular ovary, but agrees with Sapria as regards its bilocular anthers. It thus forms a connecting link between the two genera. Its habitat, too, lies between the Malayan home of Rafflesia and the Himalayan locality of Sapria.

PARIS AUTUMN SHOW.

The annual autumn show of the National Horticultural Society of France was held on November 6 to 15, inclusive, in the large greenhouses on the Cours la Reine, Paris. It was the last of a series of very successful shows held there, as the authorities have decided to pull down these imposing glass structures, originally erected for the Universal International Exhibition of 1900. The fruit, flowers, especially chrysanthemums, and vegetables were shown in enormous quantities, and everyone seemed bent on doing their best towards making the show one of the best the society has ever held.

After passing through the entrance near the Alexander III. Bridge, and proceeding along the spacious promenade leading up to the show, we noticed many important exhibits of trained fruit trees, right and left, the chief exhibitors being Messrs. Croux and Sons, Nomblot-Bruneau, Moser and Sons, Lecointe A. Martin, George Boucher, A. Lievre, and Brochet. Some tastefully arranged groups of conifers and other ornamental shrubs lined the route, and came from Messrs. Alfd. Monnier, Lecointe, Brochet, Paul Lecolier, and others. Immense numbers of exhibits in the horticultural arts and industries were also staged in this part of the show ground.

Directly the visitor penetrated the first of these greenhouses he found, on his right and left, two rooms specially devoted to the orchids and stove plants. One of these was filled by Messrs. A. Truffant and Sons with a large and artistically arranged collection of azaleas, begonias, orchids, anthuriums, dracænas, and other plants in great variety. In the opposite room were many choice collections of orchids from well-known growers, such as Messrs. Beranek, Regnier, Lesueur, Maron, and others.

Passing from this room into the body of the greenhouse we noticed a fine display of chrysanthemums by Messrs. Vilmorin Andrieux, and Co. There were several ornamental shaped borders filled with dwarf pot plants in great variety. A few steps further brought us to a large sunken garden, with sloping grass sides, upon which were placed some gigantic trained specimen plants bearing large blooms. Loisseau-Rousseau, Papa Bie, Nivôse, Femina, and Polyphème were some of the finest.

On the right-hand side a well-known exhibitor, M. Leon Cavron, made a grand display of grafted and standard plants; we noted among them Chrysanthémiste Leroux, Swanley Giant, Surprise, Amateur, Rozières, and many others, principally popular French kinds. There was also a nice collection from M. Govignon, of dwarf pot plants, Phœbus, Oceana, Mrs. Barkley, Le Peyron, W. Tricker, Mrs. Ed. Roger, Pride of Exmouth, being only a few of the most attractive. Messrs. Cordonnier had four good beds filled with large cut blooms. Messrs. Leveque had several others, noteworthy for their dwarf plants in pots. M. Pinon had a huge border filled with all kinds of trained specimens in a multitude of forms. M. Lachaussée showed a long group of plants carrying three or four blooms on each, a good display. From M. Opoix, gardener at the Luxembourg Palace, came more chrysanthemums, prettily staged with a border of ferns, single chrysanthemums, and the decorative variety Baronne de Vinols. Other good lots of the popular autumn flower close at hand came from the Asile de Ville Evrard, M. Lecointe, M. Giblin, and others.

New seedlings came from many well-known growers, and a large number of prizes and certificates were awarded by the jury and the Floral Committee. We specially noted a grand lot from M. E. Calvat, who was awarded a grand prix d'honneur. Others from Messrs. Vilmorin and Co., M. Nonin, the Marquis de Pins, M. Chantrier, M. Heraud, and several less well known raisers.

In the corridor were more chrysanthemums. M Montigny showed four groups, chiefly novelties of the past two or three years. M. A. Nonin had several groups in the second greenhouse, choice exhibition and decorative kinds. We noted Tout Paris, W. Duckham, Duchesse d'Orleans, E. J. Brooks, Paul Randet, Sapho, Naples, etc. A good lot also came from M. E. Rosette, an old grower. M. Victor Gautier had also some excellent pot plants. Other exhibitors of chrysanthemums included Messrs. Pechou, Robillard, Masselin, Martin Durand, Guinle, Sourion, Feron, and the newly-formed Amateur Chrysanthemum Society, which had two groups of a high order of merit grown by members.

Other flowers were numerous. M. Aubert Maille sent cyclamens in quantity, and white Anthemis Perfection. M. Adnet staged in a corner a charming collection of hybrid gerberas. Messrs. Vilmorin, Primula obconica; M. Desiré Ramelet, hydrangeas. M. Ferard had several lots of cyclamen, Primula, obconica, nægelias, etc. Begonias were brilliantly staged in the usual Paris style by Messrs. Vallerand and Billard.

A grand floral trophy was set up by M. George Truffaut. It was arranged in splendid style, and consisted of a hugh pyramid of white lilac and foliage, standing on a circular bed. Around the base were many clumps of lily of the valley, and the whole design produced the most striking effect.

The grape classes were well filled, and here again were many competitors, one class alone, i.e., for Chasselas Doré de Fontainebleau, having twenty-one exhibitors. Among the grape exhibitors we noted specially fine lots from Messrs. Thibault Zeimet and Sons, Olida, Salomon and Sons, Mercier Depresle, Grapperie de Somain, Hamel Pigache, Sadron, Bergeron, Whir, Verrier, Paln, Gerbout, Chevillot, etc.

Vegetables always make a grand show at the Paris Exhibition. Messrs. Vilmorin and Co. had a fine collection on the flight of steps leading down to the promenade along the Seine. For variety and extent it was unsurpassed. M. Rigault had potatoes. M. Ferard, potatoes and tomatoes; Messrs. Angel et Fils, potatoes and carrots. In a border 27 yards long, the Ecole St. Nicolas had a wonderfully fine display of everything in season. M. Compoint had a grand exhibit of asparagus. The Establishment a la Pensée showed a collection 50 yards in length of every conceivable kind of vegetable grown in the French gardens, a really wonderful lot.

A literary section, and an art gallery also formed a part of the show, as usual. One of the most interesting portions of the exhibition was that devoted to the retrospective exhibition. Conspicuous on the wall was the original portrait of Captain Blancard, the introducer of the chrysanthemum into France in 1789, kindly lent by the family. In front of this, immediately on the arrival of M. Fallières, President of the French Republic, to make his official visit, a great granddaughter of Blancard presented to the President a handsome bouquet of chrysanthemums and made a little speech. Around the walls were pictures and engravings of old varieties, notably the original, the old purple chrysanthemum, which hung beneath Blancard's portrait. In glass cases running for some distance round this corner of the show were many curiosities—Japanese pottery, drawings, designs, engravings, photographs, rare books, and pamphlets, old catalogues, and every conceivable literary and artistic subject relating to the chrysanthemum. The chief exhibitors were M. Momméja, an enthusiastic French collector; and our correspondent, Mr. Harman Payne, an equally enthusiastic English collector, whose two collections far surpassed all the others put together. Exhibits also came from Messrs. Nonin, Lecollier, Rosette, Loizeau, Vilmorin, Baltet, and the Library of the National Horticultural Society of France.

High above the walls were panels containing the names, Blancard, 1789; Bernet, 1826; Fortune, 1846-1863; Calvat, 1891, with a brief record of their work in connection with the golden flower. It is only fair to add that the organisation of this very interesting retrospective exhibition was mainly due to our old friend, M. Geo. Gibault, the librarian of the society, and we offer him our hearty congratulations on the result.

THE BROAD BUCKLER FERN.

Amongst our beautiful hardy native ferns the Broad Buckler Fern (Lastrea dilatata) is particularly worthy of more extensive culture than it ordinarily obtains, both as a garden ornament and as a handsome pot plant in cool or cold conservatories. Its culture is of the simplest, good ordinary garden soil suiting it admirably, though a little peat may be added with advantage. In its natural habitats it affects moist situations, and in many places grows to a large size, with fronds a yard or more long, in large clumps on woodland slopes, under the moderate shade of trees. It crops up, indeed, almost anywhere where ferny conditions prevail.

In the form of its fronds it differs markedly from its related Buckler Ferns, or lastreas, the Male Fern, Lemon-scented fern, and L. rigida, or the Limestone Buckler Fern, by having its lower divisions long and re-divided, so that the whole frond is triangular instead of lance-shaped. In colour it is of a dark lucent green, with dark-coloured stalks and midribs, covered in the young stage with deep brown, almost black scales. It cannot, therefore, be confounded with any other fern, its nearest imitator, the charming L. æmula, or Hay-scented Fern being smaller, and having the sub-divisions prettily crimped and crisped, while those of L. dilatata are flat.

There are several sub-species associated with this one, named L. uliginosa, spinulosa, and cristata, which vary in the form of frond and small details, the last-named approaching nearest to the other lastreas by having somewhat lance-shaped fronds and no basal expanded ones. For the purpose of our note, however, we need not treat of these as they are more of botanical interest than horticultural.

Beautiful as the Broad Buckler Fern is in its normal form, it has, like most of our native ferns, sported into others of very distinct types, and it is certainly these which we would recommend for adoption, whether in the garden, rockery, or under glass, as they give no more trouble than the common form, and are certainly far and away more interesting. First of all we may mention L. d. lepidota, in which all the divisions are very much more slender, and more numerous, rendering the fern very distinct and pretty. There is also a variety of this which bears graceful tassels at all the tips. L. d. Howardi, found in Ireland, is a curio, but handsome; in this all the side divisions are long and narrow, and the sub-divisions form dense crosses or bunches, imparting a bead-like appearance. L. d. grandiceps Barnes has immense crests, and is the handsomest of the tasselled section. L. d. ramoso-cristatum is also very handsome; in this the fronds branch some distance from the soil, and finish up with dense vivid green balls of cresting, as do also the side divisions. L. d. cristata Oscroft also bears terminal tassels, but has the foliage prettily crisped. L. d. cristata Druery is a robust grower, with small tassels, found by the writer at Clovelly, while another form found by him at Campsie, in Scotland, L. d. stipitato laciniatum, has all the divisions on distinct stalks, and prettily cut. There are numerous other varieties of L. dilatata, but the above may be regarded as the choicest of our native varieties.

For those who have a little warmth in their conservatories during the winter there are two very handsome varieties of the same species, but of foreign origin, being found in the Azores; these are L. d. folioso-cristata and L. d. f. digitata, which, under warm conservatory treatment, make grand specimens, but cannot, like our native varieties, stand frost with impunity.

Here then we have ten distinct forms of L. dilatata, which we can highly recommend to anyone who grows hardy ferns at all. Nothing is viewed with more regret by the British fern connoisseur than the thousands of British ferns which figure in suburban gardens, one and all of the common weed type, and, as a rule, of only two or three species, when he knows what a grand variety of diversely beautiful things could be displayed in their stead, and grown with the same absence of trouble, throwing up their fronds year after year, and incurring no expense save the few shillings which the first acquisition involves. Fortunately, the British public is becoming wiser in this respect, but the knowledge spreads but slowly.

Chas. T. Druery, V.M.H., F.L.S.

FERTILISERS FOR GARDEN VEGETABLES.

(Concluded from page 794.)

On soils containing a fair quantity of lime, the cheapest form of phosphate manure to use is superphosphate. On light soils bone-meal may be preferred, especially if the dunging has not been too liberal. On soils poor in lime, basic slag may be used or superphosphate mixed with slaked lime. The quantity of phosphatic fertiliser to be sown with the vegetable crops previously mentioned must vary according to climate. In the South of England where superphosphate is used, about 3 or 4 cwts. per acre are usually found sufficient. As we go North the dressings in vogue become larger and larger. In the Midlands we find 5 or 6 cwt. per acre used; further north 8 to 10 cwt. per acre, while in Scotland we find 10 to 12 cwt. per acre, and even sometimes more.

If basic slag is employed to replace superphosphate for vegetable crops, at least one-quarter as much again by weight should be used, and bone-meal from 3 to 4 cwt. per acre may be employed.

Manure versus Artificials.

It is now known that nitrogen in the organic matter of the soil, which we term humus, or the organic matter of farmyard manure, is slowly converted into the nitrate form by the growth and action of a minute organism. The micro-organism cannot grow and propagate if the soil is too cold, or too wet, or too dry, or in the absence of available lime or potash. As a general rule there is in most fertile soils a sufficiency of lime for the needs of the organisms, but potash may be lacking. The other conditions necessary for the conversion of the organic nitrogen into the nitrate form are warm weather and a moist soil in good physical condition.

When the organic nitrogen is thus slowly converted into soluble nitrate during warm weather the plants take it up and grow rapidly.

It is found, however, that 200lbs. of nitrate of soda will furnish more soluble nitrogen to the young vegetable crops early in the spring months than the gardener can get from 20 to 25 tons of well-rotted farmyard manure. The stable manure may furnish soluble nitrate for the late crops, because the action of the bright sunshine during the summer months has an invigorating effect on the nitrate-forming organisms, but for early crops or crops grown out of their regular season, the gardener who fails to use some kind of nitrogenous artificial manure does not take full advantage of his opportunities.

Potato Crops.

The potato yielding capability of a soil, according to Dr. Bernard Dyer, depends more on its mechanical condition than on anything else, except, of course, climate. A point is easily reached, apparently on every soil, beyond which manuring for potatoes is of no use.

On some soils a very moderate manuring is enough, on others three or four times as much will pay. This does not seem to have to do so much with the richness of the soil as with its warmth, good drainage, and soft, crumbly texture.

It is probably a mistake to use too much manure for potatoes. Too much manure produces an over-luxuriance of growth, which in some way seems to make the crop more subject to attacks of disease; and no crop of the garden is more liable to be affected by disease than this one.

The general advice, therefore, is to manure but moderately and rather for the sake of maintaining the warm, moisture-holding properties of the soil than for the sake of merely feeding the plant, which can better be done by the aid of artificial fertilisers.

Nevertheless, in some years, the advantage, even from an economical point of view, has been decidedly with a heavy dressing of manure for early potatoes; and as the value of this crop very often depends upon its earliness, as in Jersey, for example, this seems to be a case in which the extravagance of heavy dunging is, on the whole, probably justified.

When, however, we come to the late or main crop potatoes, no advantage seems to lie with a too heavy dressing of dung; none certainly on such stiff or heavy soil as in the experimental gardens at Hadlow, or in the fields at Rothamsted.

The average crop of potatoes produced at Hadlow by 25 tons of manure per acre over eight years is no greater than that produced at a considerably less cost by a light dressing of manure (12½ tons), in conjunction with a dressing of kainit, superphosphate, and 2 cwt. of nitrate of soda per acre. The addition of 2 cwt. more of nitrate of soda per acre, making 4 cwt. in all, still further increased the average yield of potatoes, and has increased in considerably greater ratio than the extra cost of manure.

Potash has throughout increased the crop, but the increase due to it on the dunged plots has been much less in the case of early potatoes than in the case of late or main-crop varieties; in fact, the application of potash for the early varieties has not paid when a dressing of manure has been used. In the case of the late or main-crop varieties, the good effect of potash has been very great. The well-known need of potatoes for potash is strikingly brought out in both early and late varieties on those areas to which no dung has been used.

In a recent experiment it was found that the addition of nitrate of soda at the rate of 200lb. per acre, in combination with superphosphate and potash, made an increase of 80 bushels of large potatoes per acre over an unmanured plot. It is also worthy of note that the chemical fertilisers produced 43 bushels of large potatoes more per acre than 20 tons of farmyard manure. On another area the addition of 200lb. of nitrate of soda produced 103 bushels per acre more potatoes than superphosphate and potash alone, proving the fact that potatoes must have nitrogen, and that in greater quantities than can be supplied by manure alone if maximum crops are to be obtained.

THE FOLIAGE OF VIOLAS.

About a year ago I planted a large collection of violas in our grounds and allowed them to stand exposed to all weathers last winter. On June 13 a party of horticultural pressmen visited Marks Tey and inspected the collection when in full bloom. A detailed report of this inspection appeared in your columns on June 20. I decided to allow the plants to grow on undisturbed to discover which of the varieties had more of a perennial habit than others. Now, in November, it has occurred to me, after several careful inspections of the plants, that it would be interesting to report as to the condition and appearance of the foliage of some of the sorts. We are apt to lose sight of this view of our favourite plants. Flowers may be very fine in summer, yet the foliage may be very miserable in the off-season. This is not so with some varieties of violas, but on the other hand many which give charming flowers mostly of the exhibition standard in early summer either die outright when winter comes, or appear discreditable. The following varieties at present are beautiful clumps, the colour of the flower in brackets follows the name:

Christiana (white with yellow centre), dwarf, dark green foliage, medium-sized clumps.

Duchess of York (white, XXX. in June), healthy, dwarf, dark green foliage.

Pencaitland (white with yellow centre, XXX. in June), perfectly matted tufts of dark green foliage.

Snowflake (XXX., best rayless white in June), rather tall, but perfectly healthy foliage, still carrying a number of flowers.

Virgin White (white), rather tall, but perfectly healthy foliage.

Redbraes White (white), upright, medium height, medium green colour, still a few good flowers.

Sylvia (cream, XXX. in June), spreading, tufted, dark green, a few flowers.

White Beauty (white), very dwarf and compact, dark green.

Kingcup (yellow, XXX. in June), spreading medium dark green.

Klondyke (yellow), medium, compact and upright, medium green colour.

Primrose Dame (primrose, XXX. in June), tall, upright, healthy, medium green colour.

Bullion (yellow, XXX. in June), moderate, rather light green foliage, in bloom.

Sulphurea (primrose, XXX. in June), dwarf, upright, compact, medium green colour

Ardwell Gem (primrose, XXX. in June), perfect mat of spreading dark green foliage.

Redbraes Yellow (best rayless yellow in June), compact and upright, dark green.

Lilacina (bedding pansy, light blue, flushed), dwarf, spreading, dark green, and a few flowers.

Ariel (lavender), dwarf, spreading, pale green.

Royal Scot (dark blue, XXX. in June), medium upright, dark green, showing a few blooms.

Blue Cloud (fancy, XXX. in June), medium, compact, dark green.

Blue Duchess (light blue, XXX. in June), dwarf, spreading, dark green.

White Duchess (fancy), dwarf, spreading, dark green.

William Neil (rose, XXX. in June), dwarf, upright, dark green

[illegible] (dark blue, XXX. in June), dwarf, upright, dark green.

I have only noted those whose foliage is in excellent condition. I have always observed that varieties which are prone to "set seed" are naturally less perennial in character than e.g., those like Ardwell Gem and White Duchess, which rarely ever produce a pod of seed. I send small bunches of the foliage of each of the varieties enumerated for your inspection. It may be interesting to report again as to their condition, say about February.

Dobbie's Seed Farm,
Marks Tey, Essex.

THE HORSE CHESTNUT AND ITS VARIETIES.

Among large growing trees which are hardy in the British Isles the horse chestnut (Æsculus Hippocastanum) occupies the unique position of being the only one that can be called really ornamental when in full flower, and would be cultivated largely for the sake of its flowers alone. True, there are other hardy trees to which a certain amount of praise is due; for instance, certain of the acers are conspicuous when in flower, the tulip-tree is interesting, and the catalpas are first rate. Neither of these, however, can be considered in the same category as the horse chestnut, for the blossoms of the acers are conspicuous only on account of their profusion, individual flowers being inconspicuous; the flowers of the tulip-tree are more curious than ornamental, and, although the inflorescences of the best of the catalpas are, if anything, more beautiful than those of the chestnut, the trees, except under very favourable conditions, attain no great height, and they can only be successfully grown in some parts of the country. The chestnut on the other hand can be grown all over the coun-

A MAGNIFICENT SPECIMEN OF THE HORSE CHESTNUT, BUSHEY PARK

Tree Carnations.—The general stock should be housed at once. Although our plants have been in frames, we prefer placing them in the houses in good time. This might not be altogether necessary in some districts, but it is desirable where the atmosphere is moisture-laden, buds just bursting are quickly spoilt if moisture hangs about them long, and any variety subject to "rust" should be given well-ventilated quarters. Tree varieties planted in the open borders should be looked over every afternoon, and those blooms fully open should be cut because of the risk of their being damaged by frost or wet. Many a good flower is spoilt if left to be cut in the morning.—T. H. Slade.

try except where tree life is rendered uncertain on account of an impure atmosphere, and it rarely fails to provide a rich display of its large, upright panicles of white, yellow, and pink blotched flowers during April and May.

Introduction and History.

Although the tree is now such a general favourite for ornamental planting, it was unknown to our earliest horticulturists, and was a great rarity in the days of Cole, Parkinson, and Gerard. For many years it was considered to be a native of Persia, the Himalaya, Thibet, and other parts of Asia, and it is only within comparatively recent times that its natural habitat has been accurately located. This is the wild, mountainous regions of Greece, and the tree is stated to grow at high elevations in crevices on inaccessible precipices. It appears to have been introduced into Western Europe from Constantinople, where it has always been widely grown.

THE HIGHEST POINT IN THE NEW ALPINE GARDEN, GENEVA.

Clusius is stated to have been the first person to obtain a living example away from eastern Europe and W. Asia, and he had a small tree at Vienna in 1576, which was raised from seeds imported from Constantinople. He published a description of the tree in 1601 in "Rariorum Plantarum." hist., lib., 1, p. 8, and described it as a vegetable curiosity. Early in the seventeenth century trees were raised in France from seeds received from Constantinople, and it is probable that seeds were received in England about the same time. In 1636 Gerard (Johnstone's edition) records it as growing in Mr. Tradescant's garden at South Lambeth, whilst with his description a rather curious illustration of a flowering shoot appears which he attributes to Clusius.

When first described it was considered to be a species of castanea, and appeared as Castanea equina. Parkinson, in "Theatrum Botanicum," ix., p. 1401, published in 1640, describes it under this name, whilst Cole in 1657, "Paradise of Plants," says: "There are four especial sorts of chestnuts, 1. The ordinary chestnut; 2. The horse chestnut; 3. The dwarf chestnut; 4. The chestnut of America." In his description of the second he says, "the second groweth naturally in Turkey, and is entertained in divers of our gardens that pretend to rarities, and, indeed, it is a stately plant."

Several explanations have been advanced as to the origin of the common name. One which obtains much credence in the North of England is that during the progress of Christ's triumphal entry into Jerusalem, the ass on which he rode struck a chestnut tree with its hoof and left the marks of the shoe and the impress of the nails, a mark which has been perpetuated in the cicatrice left on the bark by the fallen leaves, and from this the name of horse-hoof chestnut arose. Other people in other countries have ascribed the name to the marks resembling a horse's hoof which appear on the bark. The true reason, however, is that the fruits were used extensively in eastern countries as a medicine for horses suffering from coughs and broken wind.

In "Trees of Great Britain and Ireland," Messrs. Elwes and Henry, give much interesting information about the horse chestnut, and incidentally mention a number of very fine examples, some of which are as follows: Trees growing at Colesborne in a high, sheltered place, on cold, damp soil, 105 feet high in 1902. Tree at Dynevor Castle probably the largest in Great Britain, 109 feet high and 17 feet 9 inches in girth. The largest in the famous avenue in Bushey Park, in 1906, was 100 feet high and 16 feet 5 inches in girth. One recorded by Mr. Farquharson, of Invercauld, growing at an elevation of 1,110 feet, was, in 1864, said to be 177 years old, and was 8 feet 7 inches in girth. The largest tree in Norway is stated to be in the botanic garden at Christiana. In 1903 this was 28 metres high and 3 metres in girth.

The accompanying illustration is a reproduction of a photograph of one of the fine trees in Bushey Park.

Cultivation and Uses.

The horse chestnut is easily raised from seeds, which may be sown out-of-doors as soon as ripe. It grows rapidly in both light and heavy soil, and is an excellent subject for planting in places where a quick effect is desired. Its value may be said to be purely decorative, and it is useful for planting in small groups, as isolated specimens, or to form avenues. For plantation work there are many more useful trees, for when the trees are cut down the timber is not of much value. When felling is done during autumn and winter the wood is very clean and white, if, however, the trees are cut down whilst the sap is rising, the wood is yellowish and dirty. The timber is soft and of very little use commercially. In some countries the nuts are used for cattle and sheep food. As previously stated, the nuts were at one time used as a medicine for horses, and Cole avers that the powdered nuts mixed with wine or water formed a useful medicine for coughs and spitting of blood. He also goes on to say: "The powder of the nut kernels being dryed and applied with barley meal and vinegar doth cure unnatural blastings and swelling of the breasts, and being damped with honey and salt, and applied to the biting of a mad dog, it freeth it from doing harm and healeth it."

The general appearance of the tree is so well known as to need no description; appended, however, are short descriptions of the varieties. These varieties are increased by budding them on to stocks of the type, the less prominent buds being used for the purpose.

Æ. H. crispum.—A variety of rather dwarf habit with crisped, rather unhealthy looking leaves. It is not worthy of general cultivation.

Æ. H. flore pleno.—This is a counterpart of the type in every respect, except that the flowers are double.

Æ. H. foliis aureis variegatis.—Some of the leaves of this variety are variegated with yellow. The variegation is not, however, constant, and the variety is not recommended.

Æ. H. laciniata. This differs from the type by having the margins of the leaflets deeply cut.

Æ. H. Memmingeri.—A strong growing variety with softer leaves than the type which frequently have a yellowish hue.

Æ. H. pyramidalis.—This is one of the most distinct varieties of all. Its chief peculiarity lies in the fact that its branches assume a stiff, upright character, whilst those of the type usually assume a more or less pendulous habit with age. It is worthy of cultivation for its distinct appearance.

W. Dallimore.

Royal Gardens, Kew.

THE GENEVA BOTANICAL GARDENS.

Photographs, taken in the early spring, of the new alpine garden at Ariana just outside of Geneva, may be interesting to the readers of the Gardeners' Magazine, for it must be remembered that Geneva was not only the place where Calvin lived and where Rousseau and several other celebrities were born, but the town will ever be associated with the two names, famous in the botanical world, of De Candolle and Boissier; while in the lake-side city there are other botanists fast ascending the ladder of fame who bid fair to carry down to posterity their own names in continuation of the great work accomplished by their celebrated forerunners.

The Conservatoire Botanique at Geneva, situated opposite the Botanical Gardens, and being also under the directorship of Dr. John Briquet, is important, for last winter the magnificent European herbarium of Mons. Burnat, of Vevey, was incorporated therein. Now, the herbarium in the Conservatoire Botanique comprises what are probably the finest collections of European plants in the world; but, as is often the case in the great public Continental Herbaria, British plants are not well represented, a fact which might perhaps be remembered by some generous collector of dried plants in the British Isles.

The Conservatoire Botanique is a large rectangular building of three floors and basement, splendidly arranged for the purpose and kept in fine order, but it must be confessed that it is not an elegant building any more than the two factory-like erections which contain the Herbarium at Kew are. However, at Geneva, the head gardener's house adjoining adds somewhat to the picturesqueness of the scene.

The Botanical Gardens occupy about 16 acres of land overlooking the beautiful Lake Leman, and with glorious views of Mont Blanc 50 miles to the south-east. Visitors to Geneva in autumn and early winter should not fail to take a tram to the pretty village of Chambézy and walk home, first noting the house and park where Edmond Boissier lived, now occupied by his daughter and her husband, Mons. and Mdme. Barbey-Boissier; then passing the picturesque house called Les Jordils, where the famous l'Herbier Boissier and library is installed, and then, before reaching the Botanical Gardens belonging to the town, the visitor in the late afternoon will enjoy one of the finest views of a distant snow-clad range lit up in golden light that it is possible to see in the Alps.

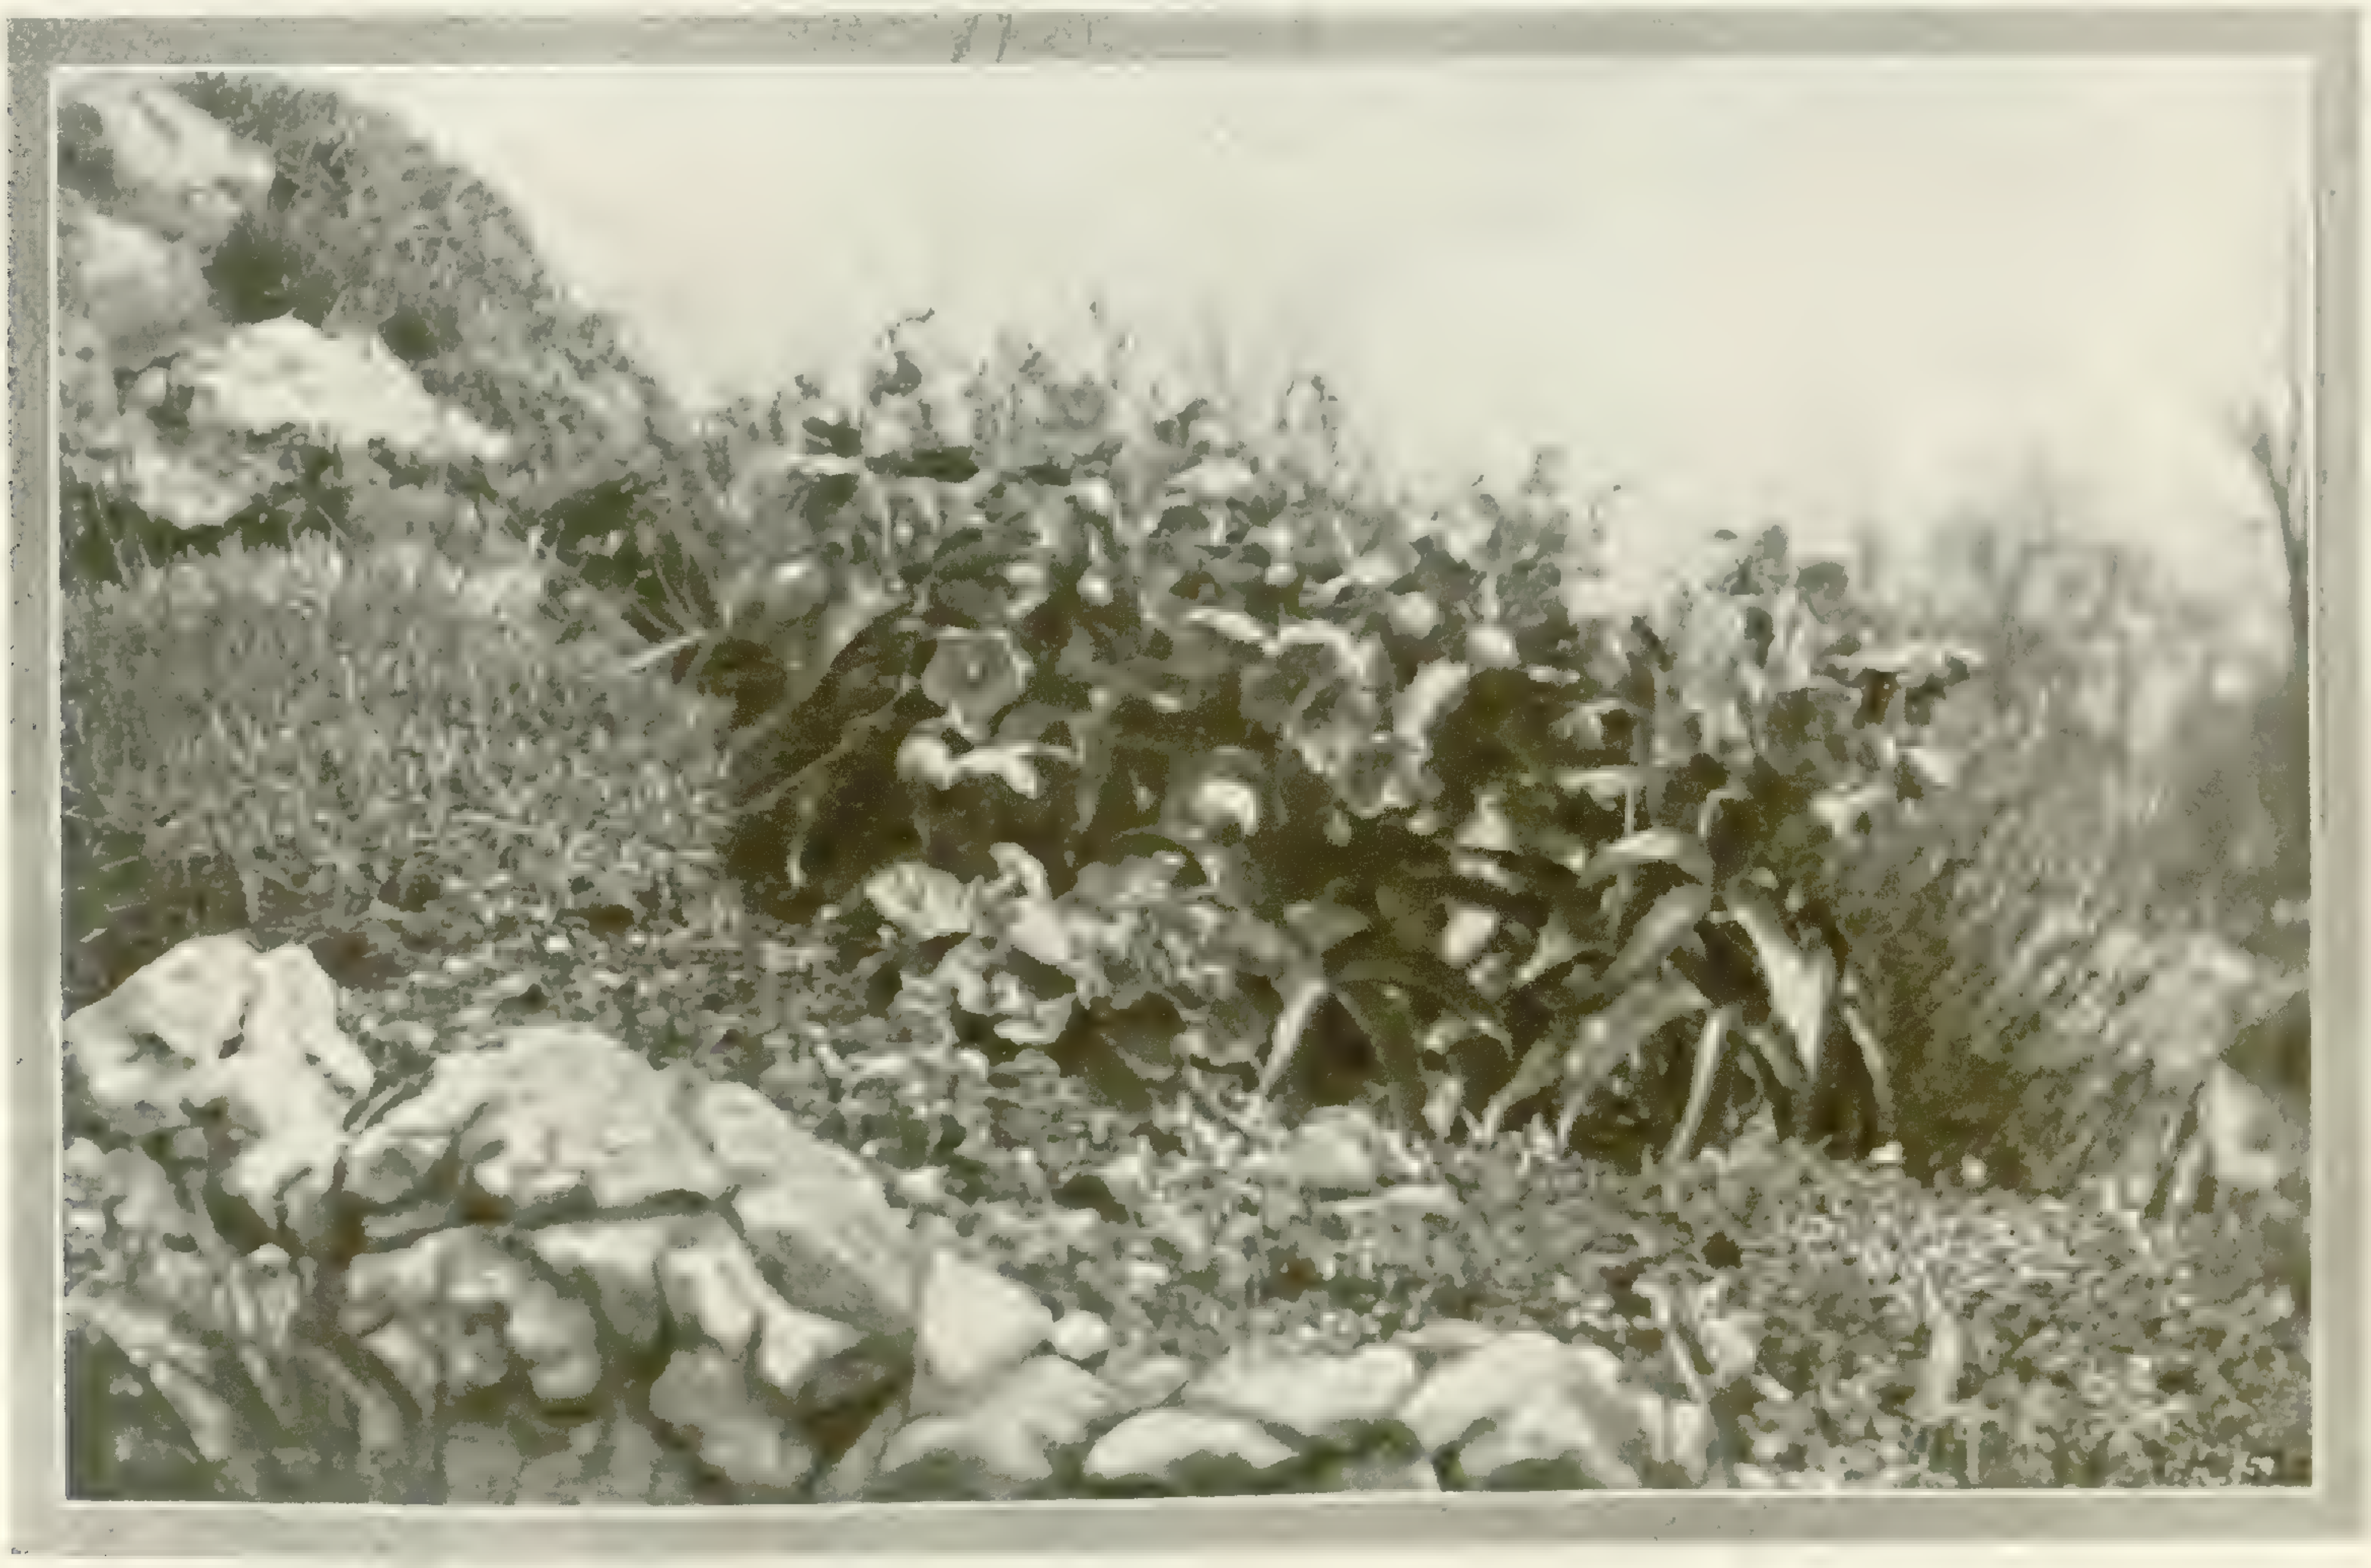
The chief characteristic of the Alpine Garden is its clever arrangement into geographical divisions, and we know no garden where this is carried out so thoroughly. The highest rocks, herewith illustrated, are those of the Swiss Alps, three groups being devoted to a limestone flora and two are of granite. The Western Alps of Savoy, Piedmont, and Dauphiny have several rockeries devoted to their treasures. The Maritime Alps and the Pyrenees have each a good rockery, and they both contain some plants peculiar to those mountain ranges, including several endemic saxifrages. Then come the Spanish Peninsula with its immensely rich alpine flora, the Atlas Mountains, the Eastern Alps, Carpathians, and Balkans. From the Caucasus we photographed the handsome Helleborus caucasicus with its large prickly leaves. Other groups are those of the Orient, Himalaya, Altai, and Siberia, Thibet and China, and Japan. The pretty Primula sibirica was in bloom the first week in April, and so was the yellow Siberian Adonis amurensis. A splendid collection of plants figures from the Jura, including Anemones pulsatilla and Halleri, Potentilla macrantha, etc. Less important groups are those of the Central Plateau of France, the Vosges, Cevennes, the Apennines, and Sicily, Corsica, and Sardinia.

Students of geographical botany have a good chance of pursuing their favourite study at Geneva; and the designer of the Alpine Garden has shown great skill not only in the conception of the garden but in the arrangement and disposition of the rocks, so that the result is both natural and pleasing, and in a few years when the present crudeness has been rubbed off the gardens will look better.

It is arranged that a stream of water shall emerge from a grotto in the highest rocks, which continues in a sinuous course and forms a small lake, where various aquatic plants are grown.

With the exception of some of the modern alpine gardens such as those at Bourg St. Pierre and the Rocher de Naye, laid out under the able guidance of Monsieur Correvon, it is not often on the Continent that the rocks are arranged with any attempt either at ornamental landscape gardening or with due respect to the natural stratification of the rocks themselves; too often the stones are dumped down anyhow, as we find them in a London suburban garden, with a root of Lastrea filix-mas between each stone; but it is obvious that some geological knowledge and foresight were shown in the planning of the Geneva garden, and the same applies to the older but much smaller alpine garden at Zurich.

H. Stuart Thompson.



THE CAUCASIAN HELLEBORE (HELLEBORUS CAUCASICA) IN THE NEW ALPINE GARDEN, GENEVA.

BULBS FOR BOLD EFFECT.

It is only by the lavish use of bulbs that large gardens can be made at once sufficiently gay and sufficiently diversified in spring, but, fortunately, owners of fine estates do not grudge some outlay upon the creation of beautiful colour effects that can be renewed year after year without further expenditure. The beloved charm of our English woodlands, palest gold in primrose season and later blue with nodding scillas, the glory of commons that are each

> "a world of heather,
> Purple of foxglove, yellow of broom."

are due to the superabundance of blossom rather than to the loveliness of individual flowers, and it is when we humbly imitate Nature's lessons, though not as servile coypists, that we gardeners achieve our best successes. Any noble glade or opening in a tree-shaded portion of the grounds should be so planted with daffodils that the eye cannot see the end of the masses of spear-like gray-green leaves and golden trumpets; any shrubbery glade, not actually tree-overhung, may be coloured a wondrous rose by congregating there by hundreds such a hardy tulip as Gesneriana rosea; banksides can flush mauve, violet, or amber with crocuses, and shadowed stretches of grass may be snowed over by myriads of alliums; even then we have but hinted at a few of the colour triumphs possible, for are there not Cottage and Darwin tulips of scarlet, carmine, lemon, orange, white, cherry, claret, cream, and salmon; hardy narcissi of such dazzling white that the sight almost tires of gazing, and have we not pale and deeper pink, also white bluebells, and a yellow allium that thrives anywhere?

It is often by growing too vast an assortment of bulbous plants that we err; undoubtedly collections of different varieties and species are valuable and interesting in special borders, but the decorative use of the plants should be most considered in other places where a general effect is more desirable than a series of minor ones. There are also ways in which a variety of flowers can be chosen to give a self effect, and this is a point not often regarded; the gold of the crocus can be matched both in narcissi and tulips, so that a sunny bankside or woodland opening may boast of tall as well as dwarf bulbous plants, and yet present the appearance of a sheet of one gorgeous hue: purple crocuses and purple tulips may not match as exactly, but will combine with perfect results, and, as for white bulbous flowers, those can be obtained of an infinite variety of heights, shapes, and sizes.

It is not necessary to keep slavishly to flowers of one hue in a given spot; there will be no loss of effect, for instance, if two or three groups of white Poet's narcissus rise up out of the yellow vista formed by tulips and crocuses, or a clump of white tall tulips breaks the flat expanse of pink hyacinths.

Perhaps hyacinths are not more handsomely employed in large gardens because they involve the after work of removal, but it should be realised that these flowers give us peculiarly vivid shades to work with in the blues and pinks, just as tulips are unique providers of vermilion. There is scarcely any blossom more gay than that of Hyacinth Robert Steiger, a rose-carmine of fine spike, and the same kind of hue is obtainable in cheaper varieties, though not, perhaps, in such richness. Banksides absolutely covered by hyacinths arouse the greatest enthusiasm among observers, and this method of using them is highly advisable in exposed gardens.

Rock gardens of great extent may well be chosen as localities for the yearly display of bulbous flowers of those species the bulbs of which are lifted; directly the floral show is over the plants can be removed, for they will take no harm if put into earth elsewhere to continue their development, and in this way the summer alpine occupants of the rockery are uninjured by the companions of the earlier season. There are very few bulbs that will not thrive upon sunny rockeries, and the exceptions, such as fritillaries of the lesser kinds, and Dog's Tooth violets, can be saved for shaded rock gardens.

The Crown Imperial is a majestic bulbous plant, of which insufficient use is made; to keep it for centre-pieces in lawn beds is not according it the place it deserves in garden landscapes. Bold borders filled with it, against a background of ivied walls or fences, groups on lawn edges, plantations on sloping ground overlooking water, and glades formed between shrubberies of evergreen, will well repay the gardener by their unrivalled beauty. Lilium croceum, the old-fashioned Orange Lily of the cottage garden, can be used in the same spots, if wished, so as to repeat in July and August something of the colour show that was provided in spring.

A satisfactory method of making room for generous bulb-planting is the cutting of a border all round a lawn, a foot or so from the edge, as wide as space can permit, and shaped, of course, just as the turf is shaped. This never looks as well on a stiffly outlined lawn, of course, as on one of elegant rounds and curves; upon one of the latter type the wonderful colour line of the bulbous flowers will appear like a shaded ribbon wound gracefully about the green of the grass. Mixed bulbous plants should be employed in such a border, the taller subjects in groups at irregular intervals, the earth entirely covered by a carpet of

> "The broderie rare of starlike forms
> And myriad hues."

M. H.

NEW WINTER-FLOWERING BEGONIA CLIBRAN'S PINK.
Received A.M., R.H.S., November 10. Flowers freely-produced; colour, rich rose-pink.

Plants in Tubs.—Should tub specimens of summer-flowering plants still be out, place them at once in their winter quarters; a moderately light shed will do for a number of them. Hydrangeas, aloysias, agapanthus, and fuchsias may be further protected in case of severe frost by light protecting material, straw, hay, or bracken being packed between and over them. Sweet bays may be put in the same place and their tops protected with mats or other wrappings, though a moderate amount of frost will not damage these. Tubs of aquatics that may have been used about the grounds should also be placed where frosts cannot reach the roots. Pelargoniums and other bedding plants should be placed in winter quarters where a suitable temperature can be maintained; if they are sufficiently rooted, and time and space permit, they may with advantage now be potted off singly into small pots, but do not give sufficient heat to start them into active growth.—E. F. Hazelton, Knowsley Gardens.

WHITE ROSES.

There are a great number of white roses, and even to name the best of them would take up considerable space. Recently I requested several rose-growing friends to name their choice of one from each class or section, and the result is that the majority selected the following:

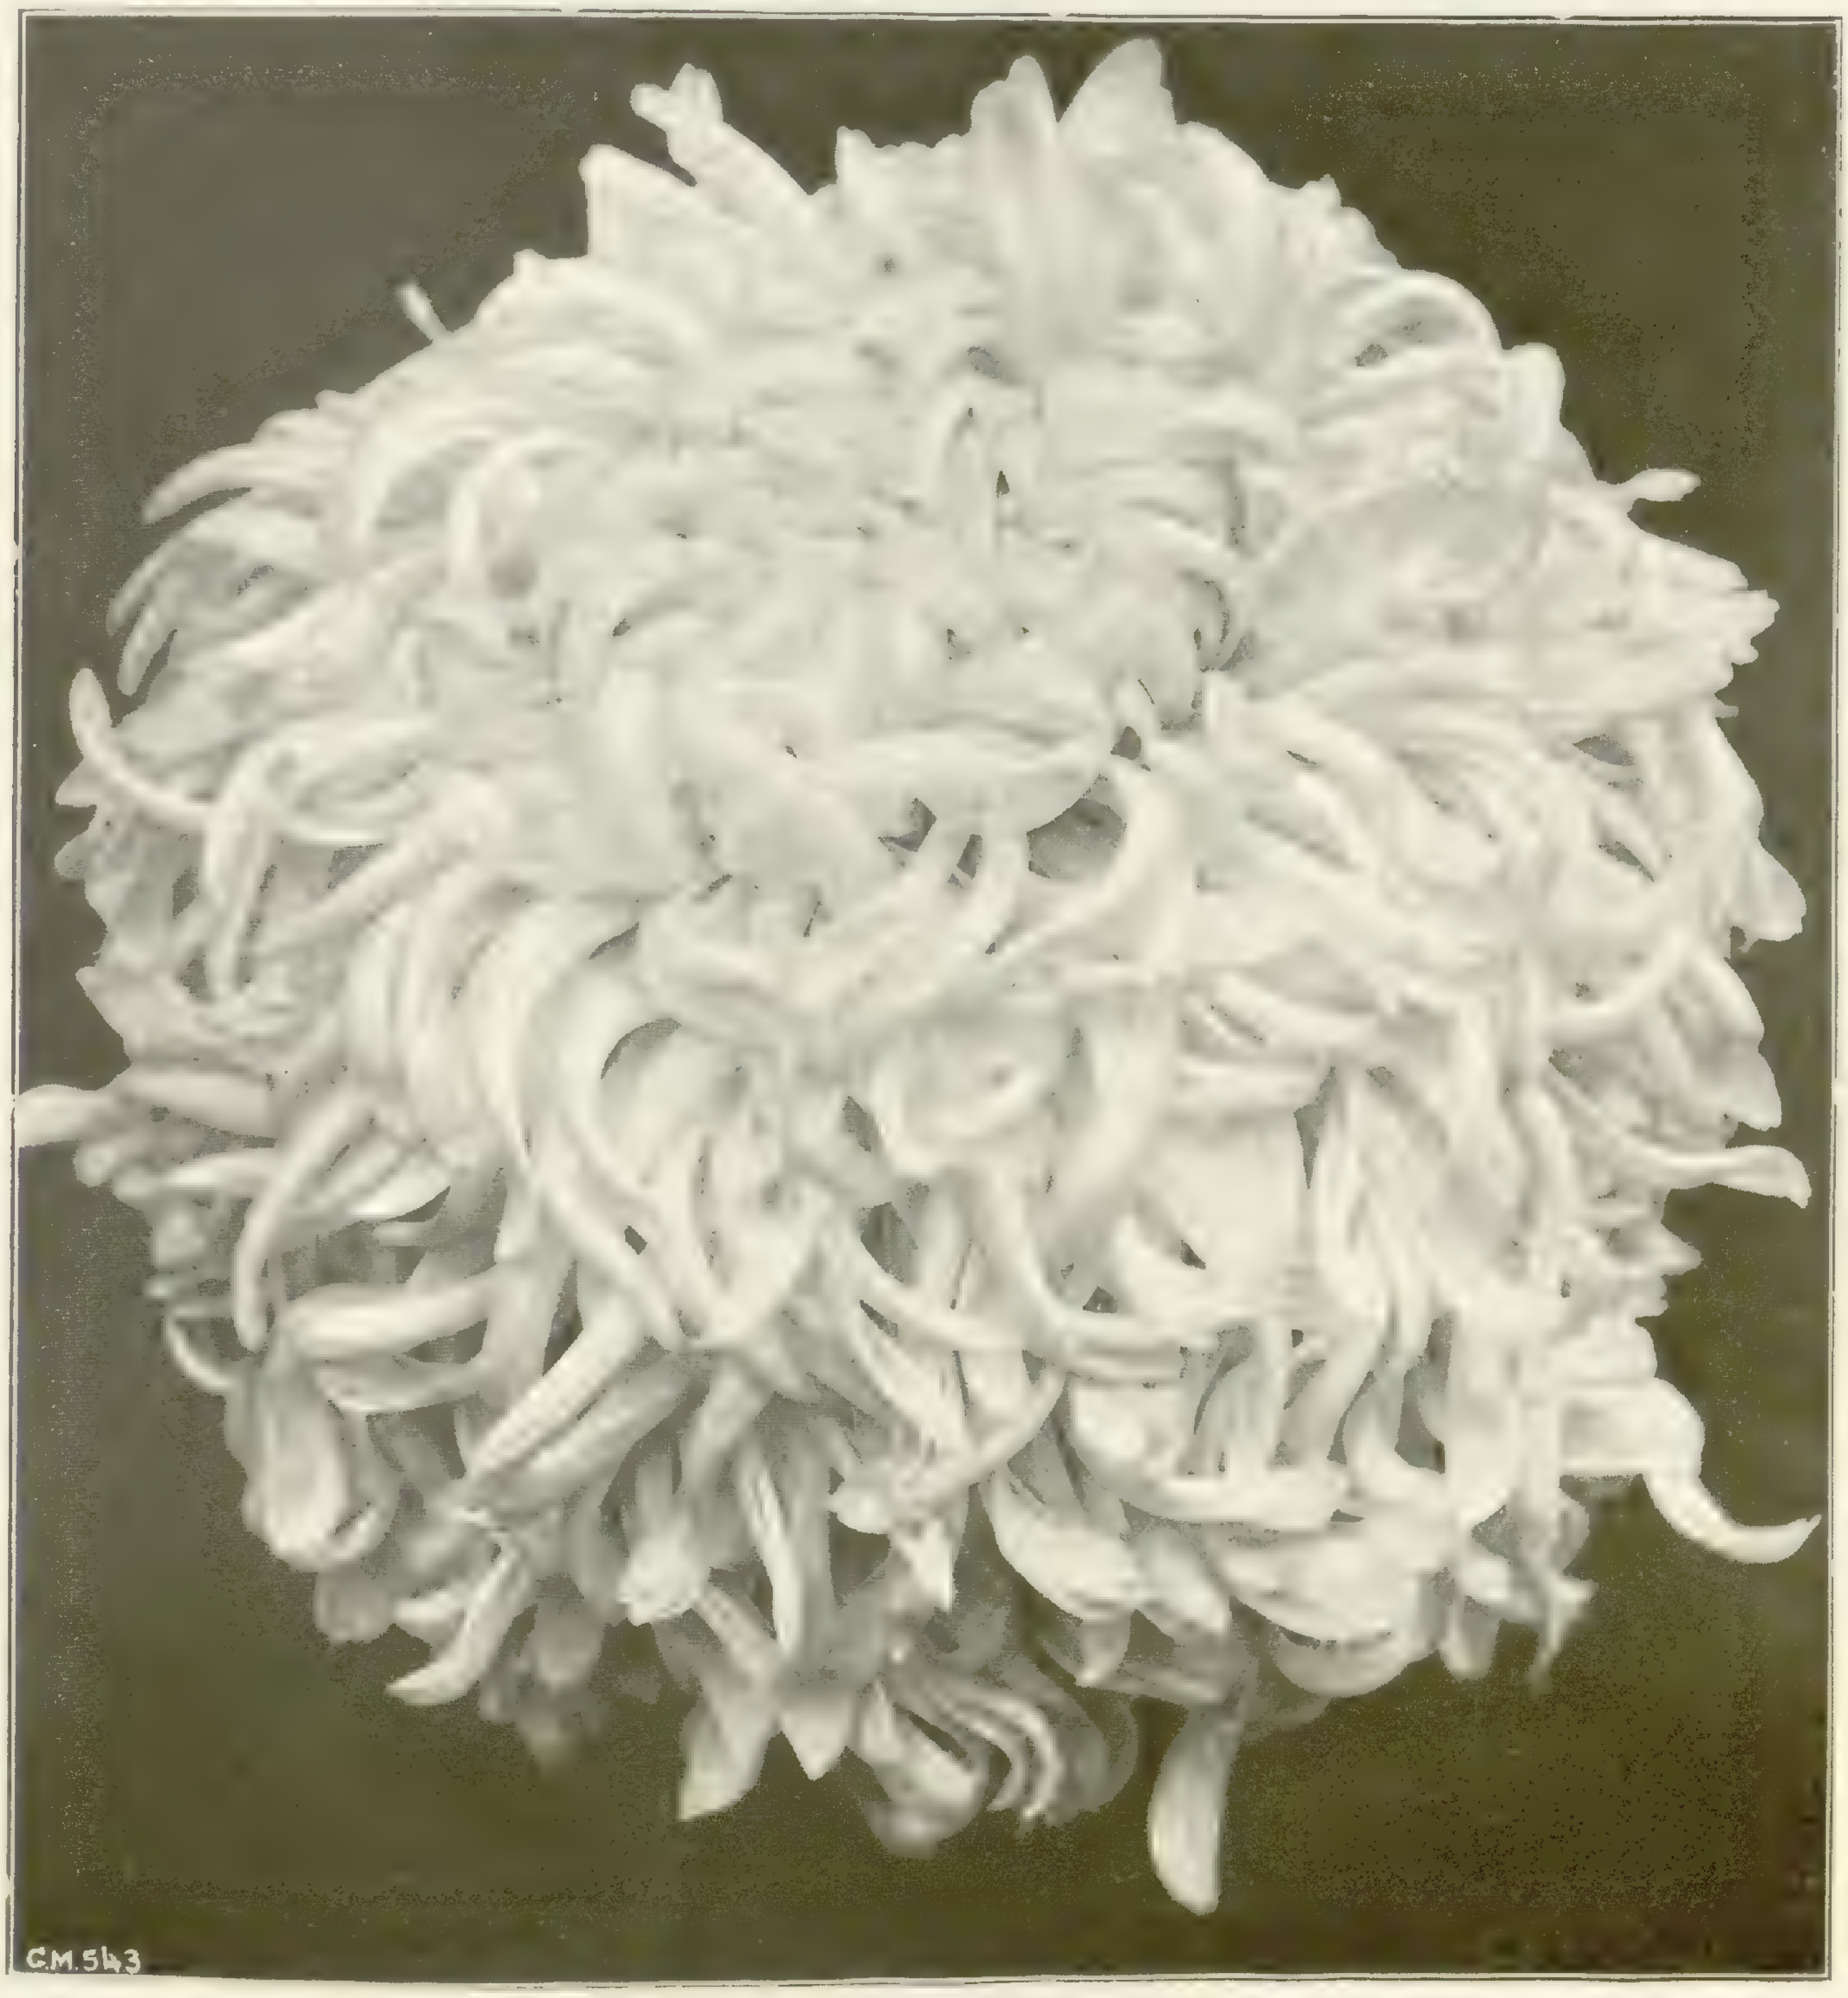
Among hybrid perpetuals, Frau Karl Druschki, a rose brought out in 1901, was unanimously placed first. This is not at all surprising, for it is the purest white from any class. A good grower, suitable for almost any purpose, unaffected by weather—a great point this among white flowers—and one of the most perpetual bloomers we have. Size, form, and substance of petal are good; but it has one fault, there is no scent. Niphetos was the one selected from the tea-scented section. A grand old rose this, and one that has been first for sixty-five years; a very great honour when we consider the number of new roses brought out year by year. But perhaps the most useful place for Niphetos is under glass, where it is unrivalled. It is only in a very favourable season that we find it presentable in the open, and this is just where Frau Karl Druschki beats it in every way. Niphetos is a poor grower and tender; it is the reverse with Frau Karl Druschki.

Boule de Neige, another old rose (1865), was selected from among the hybrid Noisettes. Sometimes this is classed as a hybrid perpetual. A good habited rose, deep green foliage, seldom touched with mildew or red rust. The flowers last well, and the reverse of the petals is slightly touched with soft rosy pink on the outside before opening, but become a pure white when fully expanded. Aimèe Vibert was an easy first among the Noisettes (1828); a rose that has given us pleasure for eighty years, and still the selected one of its class! There is a climbing form of this known as A. Vibert scandens, and this is perhaps our best white climber. Almost always in bloom, large trusses, last well, and retains clean foliage up till the end of the season.

Coming to the mosses we find an even older variety taking the lead. This is White Bath (1817). A beautifully crested or mossed rose, and a pure paper white in petal; never seen better than when half expanded. Free in growth and flowering; one is bound to acknowledge this as being the best white in its section. White Pet was first among the dwarf polyanthas, and deservedly so. Immense trusses, perfectly rosette-shaped flowers, scarcely resting a week during the whole rose season but what it is a mass of blossom, and only then because the succeeding trusses have not had time to open. They are there, and eager to occupy the space as soon as they can find it. Monsieur Joseph Combet is apparently the best white Hybrid Tea. I looked for a better one in this growing and extensive class, but cannot improve upon the variety selected by my friends. There are many creamy whites, but that was not my point. This is a good and erect grower; free in bloom, especially when established; it lasts well and is sweet scented. A sport from Souvenir de la Malmaison, named Kronprinzessen Victoria is an easy first in the Bourbon class. I think it considerably more free in blooming than its parent, but with me there is a distinct tinge of lemon at the base of petals; otherwise it has the same habit and characteristics as our old favourite of 1843.

Of course, there are many other good white roses, but the above were those selected from each class, and truth compels me to say I cannot improve upon it.

A. Piper.



NEW JAPANESE CHRYSANTHEMUM PURITY.
Received A.M., R.H.S., November 10. Flowers, pure white; reduced in size.

NEW PLANTS, ETC.

NEPHROLEPIS RUFESCENS MAYI VAR. ORNATA.

A new form of Mayi, the fronds being equally erect, but more plumose and tripinnate than in that fine variety. Should prove of much value for decorative purposes generally. A.M., R.H.S., November 10. Messrs. H. B. May and Sons, Upper Edmonton.

CATTLEYA FABIA COOKSONIÆ.

A beautiful variety with large, finely-formed flowers; the sepals and petals pure white, the lip rosy-purple, with a gold-lined throat. A.M., R.H.S., November 10. Norman C. Cookson, Esq., Wylam-on-Tyne.

CYPRIPEDIUM DANTE MAGNIFICUM.

A fine variety of the handsome hybrid obtained from a cross between C. Euryades and C. Charlesworthi. A very fine variety, the dorsal sepal pure white, heavily marked with chocolate. The petals and lip yellow, curiously shaded with dull brown. A.M., R.H.S., November 10. Lieut.-Colonel Holford, Westonbirt, Tetbury.

SOPHRO-CATTLEYA DORIS.

A beautiful hybrid between Sophronitis grandiflora and Cattleya Dowiana aurea. A very distinct form, crimson red, the lip veined with gold. The flowers are about three inches in diameter. F.C.C., R.H.S., November 10. Mr. J. Gurney Fowler, Glebelands, South Woodford.

CATTLEYA CLARKIA INTENSA.

A charming hybrid obtained from a cross between C. bicolor and C. labiata; the sepals are pale rosy-lilac, with a rich purple lip. The plant was carrying six finely-developed flowers. A.M., R.H.S., November 10. Leopold de Rothschild, Esq., Gunnersbury House, Acton.

NEW JAPANESE CHRYSANTHEMUM, R. F. FELTON.
Received A.M., R.H.S., November 10. Flowers large, valuable for decorative purposes; colour golden-yellow.

NEPHROLEPIS AMABILIS.

An exquisitely beautiful and valuable addition to the already numerous varieties of nephrolepis, so popular for decorative purposes. It has a loose, free character of growth that gives it a graceful appearance. The pinnæ are crested and frilled, making it more compact than N. exaltata superba. It is quite distinct from the many beautiful nephrolepis introduced of late, as will have been seen from the illustration published in our issue of the 14th inst. F.C.C., R.H.S., November 10. Messrs. J. Hill and Son, Barrowfield Nurseries, Lower Edmonton.

BEGONIA CLIBRAN'S PINK.

A fine addition to the winter-flowering class. The flowers are large, deep rosy-pink, with petals nearly an inch across. The foliage is large and bold, while the habit of the plant is good. A.M., R.H.S., November 10. Messrs. Clibran and Sons, Altrincham.

CHRYSANTHEMUMS.

Sylvia Slade.—Already described. A.M., R.H.S., November 10. Messrs. W. Wells and Co., Merstham.

Purity. — A pure white Japanese variety with blooms of the largest size, and superb in form and finish. The flowers are broad and deep, while the florets are long and curling at the tips. A.M., R.H.S., November 10. Mr. Martin Silsbury, Shanklin, Isle of Wight.

Hetty Wells. — A bronzy-buff decorative variety, exhibited as disbudded flowers, reflexed in form; will make a good market variety. A.M., R.H.S., November 10. Messrs. W. Wells and Co., Merstham.

R. F. Felton.—A fine Japanese decorative variety with large golden-yellow flowers. A.M., R.H.S., November 10. Messrs. W. Wells and Co.

Hon. Mrs. Lopes.—A Japanese variety of the largest size and superb form. The flowers are deep yellow, well built, with long, deep florets. Should prove a valuable addition to the exhibition varieties. This was staged at the N.C.S., under the name of Glory, but was altered owing to there being a decorative variety of that name. A.M., R.H.S., November 10. Mr. Martin Silsbury.

BEGONIA CATHAYANA.

A handsome stove species, attaining a height of about eighteen inches. The leaves cordate, green on the upper surface, marked with red nerves, the under surface and stems clothed with crimson hairs; flowers pink. Bot. Mag., t. 8,202.

COLCHICUM SPECIOSUM ALBUM.

Our native Meadow Saffron, Colchicum autumnale, is prized by many, largely for the beauty of its double varieties, which are more lasting and more beautiful in the garden than the single varieties. These double varieties, C. autumnale fl.-pl. and C. autumnale fl.-pl. alba, have no competitors among the forms of other species but the singles are far eclipsed by these, especially by such fine things as Colchicum Bornmuelleri and the varieties of Colchicum speciosum.

The noble Colchicum speciosum, which is variable in colouring, is one of the most beautiful of all, its large tulip-like blooms being delightful indeed, when fully expanded in the autumn sunshine. It is, as indicated, variable in its colouring, and some of the best coloured forms are really superb in their hues. What is generally known as the type has ruby cups, of a yellowish ivory towards the base, and with the long tube of the same colour. C. speciosum rubrum is finer still, the base of the flower and the tube being suffused with a deep ruby. There is, however, a still finer form, called by some C. speciosum superbum, or maximum, which has its blooms of a wonderfully deep, yet vivid ruby, and which, when well cultivated in good soil, is superb indeed both in size and colour.

But one of the most beautiful of all, and one which has commanded universal admiration since its first appearance before the public, is the white variety, Colchicum speciosum album, three flowers of which are portrayed in the accompanying illustration. This noble and delightful flower was introduced by Messrs. James Backhouse and Sons, Lim., of the York Nurseries, and was first sent out at the high price of £5 per corm, or "bulb." Its constitution is, however, so good that it is now plentiful, and the present price brings it within the reach of the modest purse of the amateur not too well endowed with this world's goods; and for a few shillings it is brought to his garden to give annual pleasure and beauty. It is equal in size to the coloured forms, but the flowers are of a most beautiful ivory-white, and are so sturdy and of such substance that they stand bad weather much better than those of the ordinary meadow saffron. It can confidently be recommended to all lovers of bulbous flowers, and the writer's experience of it is so favourable that he can unhesitatingly commend it to them. Like other meadow saffrons, the white variety of C. speciosum prefers a good, rather heavy soil, especially one inclined to be moist in its character, but it will do quite well on one of a lighter nature, and in such it may be planted rather deeper than on the heavier medium. Planting may be effected in autumn at a depth of from three to six inches from the surface to the top of the corm, but it will be found that a depth of six inches will give finer flowers. Such a fine autumn-flowering bulbous plant is worth the notice of all who desire autumn flowers of its class.

S. ARNOTT

LOCAL APPLES.

I wonder how many varieties of apples there are in cultivation? The named sorts offered in nurserymen's catalogues run into hundreds, and a visit to the autumn fruit show of the Royal Horticultural Society conveys some idea of the extent of the apple family. But when we have done with the apples which claim the distinction of being recognised, there are others, some of which are known by local and peculiar names, and yet others which never possessed a name at all, but they all help to swell the number of varieties grown. Among the local apples which are to be found principally in old orchards, some are good, others are moderate, and others again are as poor and valueless as they well could be, and yet for some reason or other they are allowed to remain.

Let us consider briefly the two extremes among local varieties of apples—the bad and the good, taking the former first. I do not think there need be any fear of too many really first-class varieties, but I believe it would be a veritable blessing if by one great sweep the whole of the small, scrubby, and inferior apples could be done away with, particularly if they could be replaced by something better, because experience teaches that in seasons of good crops the price of the best is adversely influenced by the preponderance of rubbish which floods the market. There is little probability of this happening, however, because there is a peculiar sentiment which protects an apple tree that bears fruit, even if the latter is of little value. In short, it takes more courage than the average human being possesses to cut down an apple tree that bears; and while some will go so far as to take the heads of the unprofitable specimens and graft them with better varieties, others leave them in peace to bring forth their second or third-rate fruit as long as they live.

The weeding out of worthless apples is a task that time alone will accomplish. Fortunately there are few of them propagated, because the old-time method of raising trees from seed is obsolete, and anyone who plants an apple to-day takes care to get a recognised variety of some merit. But Nature's process of eradicating worthless varieties is slow, these local seedlings have long lives, and some, like Tennyson's brook, seem as if they would "go on for ever."

But while we deplore the presence of so many poor local apples, and regret that growers are so reluctant to replace them, we must not forget that the method which produced these also gave us some of the best apples in cultivation. No man was responsible for the raising of Bramley's Seedling, Newton Wonder, Blenheim Pippin, and many another high-class apple, but Dame Nature herself, and these varieties were merely discovered and then distributed. Growing to-day in many a secluded garden and out of the way orchard are apples which are infinitely superior to many that are in commerce, and yet their merits are unknown outside the district in which they are grown. In short, these good local apples have not been discovered, as it were, and the fruit-growing public knows them not. In most cases they are seedlings, and are usually associated by name with the men who raised them, though the latter may have been gathered to their fathers years and years ago. It is no loss when a tree of an inferior local variety is blown down, or dies through sheer old age, but unfortunately the good ones often share the same fate. They are unknown to commerce, and nobody locally cares to propagate them, which is a pity, because when an old tree of a really good local apple dies the variety passes away as well, and is lost for ever. Strange though it may seem, I know instances of good local apples growing in orchards, and though the owners prize them as favourites, when they want a young tree they go to a nursery for it, and get a catalogued variety. They admit preference for the local apple, but they rarely take the trouble to perpetuate it by means of buds or grafts, and when the veteran at last drops out they mourn it as they would an old friend, for once gone it is gone for ever.

COLCHICUM SPECIOSUM ALBUM.
Flowers reduced in size: ivory white.

It may be urged that there is no need to trouble about the loss of the good local varieties, as there are plenty of apples in commerce to choose from; but I do not agree with this view, as we do not wish to lose anything that is really good, and it may be observed that local varieties often flourish in the district where they were raised better than others that are imported. Perhaps in the far away future, when—(when?)—horticulture has a Government department of its own instead of being tacked on to the Board of Agriculture and Fisheries, and pomology receives the attention from the state that it deserves, some scheme will be devised for hunting up these good old local apples, and propagating them on experimental stations supported by the State to test their real worth under other conditions, and prevent the best of them from dropping out of cultivation. I say this may be done, that is to say, if all the old trees which would supply the buds or grafts have not dropped out of cultivation under the hand of Father Time before a department or sub-department is formed in the interests of horticulture, with the power and means of doing something. Be that as it may, there are plenty of local apples in the country that we can ill afford to lose.

G. H. H.

Everyone interested in a garden should obtain a copy of the ALPHABET OF GARDENING, by T. W. Sanders. Thoroughly practical information is given as to soils, manures, seed sowing, planting, potting, budding, pruning, grafting, forcing, hybridising, etc., with explanatory diagrams. Price 1s. 6d. net, by post 1s. 9d.; cloth, 2s., by post 2s. 3d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

GENERAL WORK in the orchid houses will, for the next few weeks, be particularly directed to cleaning the plants from insect pests and dirt deposits. At this season the majority of orchids have either entered upon or are reaching the dormant stage, and the best opportunity is thus offered for cleansing them, and such opportunities should not be neglected. Scale insects are the worst pests to be contended with. After a season like the present, when the outside conditions have been so favourable to black thrips, these have found their way into our houses, and if not observed for a short space of time will have laid their eggs, generally on the undersides of the leaves of the plants, and it is no easy matter then to remove them. When cleaning the plants it is well to have all the pots washed, and if the glass is carefully wiped down with a clean cloth any obstruction to light is thus easily removed.

WASHING DOWN the outside glass, even in districts where there is little or no fog, will be necessary at least once or twice during the winter months. It is a good plan to remove any obstruction to light that may be caused without delay, for it is advisable that the plants should have the full benefit of all available light to enable them to mature developing growth and properly ripen growths that are developed. In the neighbourhood of large towns, where the fog deposit is so great, washing the roof is frequently necessary. When situated in the neighbourhood of London, I used to find it necessary to wash down weekly during the four winter months, and there can be no doubt a considerable advantage was obtained for the plants by keeping the glass clean.

SECURING LEAVES.—Where leaves are used in the potting compost the present is a favourable time for securing any quantity that is necessary to supply the year's demand. We gather large quantities of oak and beech leaves as they fall from the trees, selecting the spots for getting them where they may be swept or raked up free from other vegetable matter, such as grass, etc., taking care to harvest them as dry as possible. We put them in a covered shed where ample air can reach them, as they are thus kept in a crisp, whole state. The leaves are thus within reach when required; but before using we place them in bags and dip them in a copper of boiling water to destroy insect life; they are then again dried before use.—H. J. Chapman, Oakwood Gardens.

STOVE PLANTS.

ALOCASIAS.—These have now completed their growth, and should be kept somewhat drier at the roots until the whole of the foliage has died away, when little further attention need be given them if they are stored in a dry position, where the temperature does not fall below 65 degrees. A. Sanderana succeeds best if the foliage is retained and the plants kept steadily growing throughout the winter.

ANTHURIUM SCHERZERIANUM, when cultivated expressly as a winter-flowering subject, is valuable, the intense scarlet spathes commanding appreciation throughout the winter. For this purpose plants raised from seed sown in the autumn, or early spring propagated, are kept steadily growing throughout the year, and the undeveloped spathes are removed until September. During the flowering period the atmosphere is kept somewhat drier, with sufficient ventilation to keep the blooms always dry. When the spathes are used for house or table decoration, they are found most useful, as they last from two to three weeks in water. The ornamental foliaged species must now have a season of rest, and this should be brought about by a reduction of water and temperature, but I do not consider it advisable to subject them to a lower temperature than 60 degrees.

EUPHORBIA JACQUINÆFLORA.—These are now developing their blooms freely, and the bright scarlet flowers command attention. As soon as the first batch of flowers is over the plants may be removed to a warm house, and be allowed to push up more shoots, which will develop a display of bloom early in the New Year.

POINSETTIAS.—The bracts of these beautiful winter-flowering plants are now developing, and more care will be needed in watering than previously. At this stage, should too much water be applied, the foliage will drop, in which case the beauty of the plants is lost. As soon as their flowering season is over the stems may be shortened back a little, and water gradually withheld from the roots until the foliage has thoroughly ripened off, when they may be removed to a dry position, where the temperature does not fall below 55 degrees.

REARRANGEMENT of the plants in the stove from time to time is generally greatly appreciated, but in carrying out this work care and tasteful effect must be considered; any unsightly plants should be removed to the propagating house.—John Donoghue, Bardon Hill Gardens.

FRUITS UNDER GLASS.

POT VINES.—As previously advised, the heat derived from fermenting material placed in the pit or house will be sufficient at the commencement. If the heat is very brisk the pots should be plunged to one-half their depth, or placed on the surface till it has declined. Tie the rods down in a horizontal direction to ensure the buds breaking regularly throughout their length. Very little water will be required at the roots for some time, syringe the rods and also the walls and other parts of the house twice a day, or according to the weather. The house should be ventilated every day, if only for an hour or two, for the purpose of maintaining the atmosphere in a pure state. When this course is followed the vines will grow away freely, and the leaves will be firm and in a condition favourable to their performing their functions satisfactorily. Black Hamburgh and Foster's Seedling are still the best grapes for early forcing.

LATE GRAPES.—Temperature should be reduced at night to 45 degrees, or even less will suffice, provided the berries do not damp. The bunches must be looked over every week, and berries showing signs of decay be removed. If the vinery is required for plants the bunches should be cut and placed in the grape-room with the end of the stalks in bottles filled with water. White glass bottles are preferable, as the water can then be seen. The room should be fairly dry. Give the house a good syringing, and if the border is dry give a moderate watering. If any of the vines require lifting the work should be done at once.

CUCUMBERS.—If these are still required a steady temperature of 75 degrees by day and from 65 to 70 degrees at night must be maintained. The growth made should be kept well to the light; the shoots must not be stopped much as the stopping only tends to make the succeeding growth weak. Allow only one or two fruits to a joint; a little sheep manure may be given occasionally. The syringing should be done early in the afternoon, and with dull weather it must be of the lightest.

EARLY PEACHES AND NECTARINES.—If grown in pots for early supplies these may now be brought into the house, but no fire heat should be given, and the house kept aired for some weeks to bring them on gradually. Only those severely root pruned should be started. If the height of the house will allow the pots should be stood on the border or slates till they are set or swelling. For early supplies the trees are perhaps best without plunging, as watering can then be done more carefully. Syringe moderately, regulating the amount by the weather.

EARLY FIGS IN POTS.—The pit or house to be devoted to these will be in readiness to receive them; the oak or beech leaves will have been placed in the pit to stimulate the roots into activity. An artificial bottom heat will be required when the heat in the leaves declines to the proper temperature. The young fruits now to be seen should not be rubbed in any way with sponge or brush, and only trees that are healthy and well-rooted should be used for early forcing. Syringe them on bright days, and at other times according to conditions of the house.

EARLY VINERY.—The vines may now be pruned, cleaned, and the border top-dressed. Much scraping of the rods should not be done, but if insects abound they should be frequently washed. If the border has not been made out to the required width, this should now be done, provided, of course, the roots have not properly filled the soil. It is better to encourage the roots to near the surface of the border than to add too much fresh soil in bulk.—A. B. Wadds, Paddockhurst Gardens.

THE KITCHEN GARDEN.

HORSERADISH.—This crop should now be lifted, and all the thick, straight pieces should be selected and laid in a trench, covering them over with soil. The smaller thongs being kept separately and planted again on trenched ground, using a bar for making the holes. Some prefer to plant in the spring, but, as there is always such a rush of work then, it is much the best plan to plant at once.

CELERIAC.—Lift the crop as soon as possible, and store the roots in a fairly dry place in readiness for immediate use. Frost would soon spoil these roots.

LATE CAULIFLOWERS. — If there are any more "heads" fit for use they should be cut immediately, and those that are not so forward should be lifted and transplanted in cold frames. They do not suffer such a check now as they would do during hot summer weather. Young seedlings pricked off in frames should have abundance of air daily, so that the plants may be kept sturdy and strong.

WINTER CUCUMBERS.—To maintain a supply during the next three months taxes the grower to the utmost, for the short, dull, sunless days are not at all favourable to the production of fruits. Apply frequent top-dressings of nice rich soil, so as to encourage root action as much as possible. The compost must be warmed through before use. Keep the young shoots thinly trained. If the roof glass can be covered outside on frosty nights with mats or roller blinds, the temperature may be kept up to 68 deg. without overheating the pipes. It is advisable to keep a few young plants in pots, so that if one or more of the permanent plants fail they can easily be replaced.

BROCCOLI.—This crop seems to be in a forward condition, owing, no doubt, to the very warm weather we had in October. So it will be wise to lay the plants down with their head to the north, as a protection from severe weather. The stems should be covered well with soil, as it is generally the part nearest to the heads which mostly suffers first. The early broccolis should be watched daily, for they soon spoil.

TURNIPS.—Where these are still on the ground it will be the safest plan to get them off as quick as possible, and put them into a pit, making them secure from frost, and keeping each sort separate.

CARROTS.—The crop sown late in July has made nice little roots which can be lifted now and stored, as recommended for turnips. They will prove useful later on.

EARLY POTATOES. — Where these are forced early the "sets" should now be placed in shallow boxes and put on a shelf in a light house in a temperature of 50 deg. When the tubers have sprouted the growths should be thinned out, leaving about two of the most promising and strongest. Where frames are not plentiful potatoes can be successfully grown in pots, and brought on in an early vinery or peach house that has been started. In fact, my best early potatoes were from pots last season.—T. W. Birkinshaw, Hatley Park Gardens.

NATIONAL CHRYSANTHEMUM SOCIETY.
EARLY WINTER EXHIBITION
at the
CRYSTAL PALACE, December 2nd and 3rd, 1908.

EXHIBITIONS AND MEETINGS.

◆

Sheffield.

The Sheffield Society's exhibition, held on November 13 and 14, once more made the big Corn Exchange look bright and warm. There was a capital show, and the entries were about sixty more than in 1907. In some classes the competition was not very keen, but in the local and amateurs' and cottagers' classes for cut blooms the entries were very numerous. The group classes were not a success, and some means should be taken to increase the competition and improve the displays. Pot chrysanthemums were not of a high standard, but the cut blooms were good, especially in the leading classes.

CUT FLOWERS: OPEN CLASSES.

In the Lord Mayor's vase class for eight vases of Japanese blooms, eight varieties, three blooms of each, there was three competitors, and the premier £10 prize was well won by Mr. G. Hall, gardener to the executors of Lady Ashburton, Melchett Court, Romsey, with grand specimens of Lady Talbot, Magnificent, Madame G. Rivol, J. H. Silsbury, F. S. Vallis, Edith Smith, Marquis of Northampton, and Madame P. Radaelli, all large, fresh, and bright. Mr. G. W. Drake, Cardiff, second, his set including Bessie Godfrey, Pres. Viger, and Valerie Greenham in fine condition. Third prize fell to Mr. W. Iggulden, Locks Hill Nurseries, Frome, Somerset.

The best twenty-four incurved blooms, not less than eighteen varieties, came from Mr. G. W. Drake, Cardiff, whose best examples were of Lady Isabel, May Phillips, Duchess of Fife, Boccace, Mrs. G. Denyer, and G. W. Matthews; Mr. C. Jennings, gardener to F. W. Jameson, Esq., Aston Hall, second, with a stand that contained a preponderance of yellow and buff varieties; Mr. J. Harrison, third. Six competitors entered in the class for two dozen Japanese blooms, not fewer than eighteen varieties, and the competition was very keen, and here Mr. G. Hall was again first, winning with large bright blooms of F. S. Vallis, Bessie Godfrey, Maud Jefferies, Thomas Stevenson, Madame P. Radaelli, Lady Talbot, Annie Hamilton, and J. H. Silsbury; second prize fell to Mr. G. W. Drake, Cardiff,; third to Mr. C. Jones, gardener to Sir Edward Evans, Bromborough; fourth to Mr. W. Iggulden.

Mr. Hall was also first for a dozen blooms, distinct, and here he had magnificent F. S. Vallis, Madame G. Rivol, Edith Smith, and Madame P. Radaelli in fine form; Mr. W. Iggulden second. The only exhibitor of twelve incurved blooms was Mr. G. W. Drake, who was awarded first prize for a heavy, but rather rough set.

DISTRICT CLASSES.

In the district vase class for four vases of Japanese blooms there were four moderately good entries, and here premier place fell to Mr. W. Fletcher, sen., for F. S. Vallis, Mrs. Knox, Mrs. A. T. Miller, and J. H. Silsbury; Mr. J. Harrison second; and Mr. C. Fletcher, Stannington, third. Mr. W. Spencer, gardener to Miss Roberts, led for two vases of three blooms each, and Mr. J. Harrison was second, with Mr. W. Redmill, gardener to S. Milner, Esq., third.

Mr. J. Harrison led for a dozen incurved, distinct, but his blooms were rather rough; Mr. W. Fletcher, sen., second. Mr. Harrison also scored for six incurved, and was followed in order by Mr. C. Fletcher and Mr. W. Redmill, in order of mention. Mr. W. Fletcher, sen., scored for six Japanese blooms, on boards, with a very nice but unlabelled set that included a capital Algernon Davis; Mr. C. Fletcher second, and Mr. J. Harrison third. The latter led for six incurved, and he had Mrs. J. Hygate, Mrs. G. Denyer, Chrys. Bruant, C. H. Curtis, Romance, and Madame Ferlat, all very good; Mr. C. Fletcher second, and Mr. W. Fletcher third.

There was an interesting class for twelve Japanese blooms, arranged on a space of 3½ft. by 3ft., with a decoration of plants in pots. Mr. S. Redmill was first, Mr. W. Fletcher, sen., second, and Mr. W. Spencer third, but in neither case did the competitors rise to the occasion and make this a really fine class.

There was a splendid competition in the class for six vases of single chrysanthemums, and here first place was won by Mr. D. Lewis, gardener to W. A. Milner, Esq., who showed seedlings of his own raising, i.e., White Chief, Seagull, white; Peveril, red-bronze; Totley Yellow, golden; White Swallow, and Totley Pink—a fine set of good flowers; Mr. W. Topham second, and Mr. Agar, third. Mr. Topham scored for six vases of pompones, with Rosenante, Angelique, White Cedo Nulli, Lilac Cedo Nulli, Brown Cedo Nulli, and Sœur Melaine; Mr. Agar second, and Mr. J. W. Pitt, third.

The class for two blooms each of Mr. G. Glenny, Mrs. G. Rundle, and Mrs. Dixon, incurved varieties, is always an attractive one, because these varieties are rarely seen elsewhere; there were ten competitors, Mr. W. Fenwick leading, and Mr. E. Crawshaw coming second, and Mr. J. W. Pitt third.

In the affiliated societies' class the Nether Hallam Society won the chief award for six Japanese and six incurved blooms.

In the cottagers' classes there were some very fine exhibits, and the competition in the cut bloom section was very keen. In some classes as many as eight prizes are given, and this notwithstanding, many competitors have to go prizeless. Mr. W. Green, Mr. C. Hopkinson, Mr. C. Gibson, Mr. J. Sellars, Mr. W. Fletcher, sen., and Mr. C. Fletcher were the leading prizewinners.

Mr. W. Donaldson had the best table decoration of chrysanthemums, using white single varieties, and Mrs. Blake, Mylnhurst, scored for a table of other flowers than chrysanthemums, with Begonia Gloire de Lorraine and Cypripedium insigne. The best pair of vases of chrysanthemums were those shown by Mr. Agar. Mr. J. W. Pitt led for a vase of single blooms, and Mr. W. J. Carnall had far the best single vase of chrysanthemums and foliage, a handsome display; Mr. J. Sellars second, and Mr. J. W. Pitt, third.

GROUPS AND PLANTS.

The silver challenge cup presented by S. Roberts, Esq., M.P., for the best group of miscellaneous plants, including chrysanthemums, arranged on a space not exceeding 100sq. feet, was won by Mr. R. C. Baker, gardener to Alderman George Senior, who set up a bold and pleasing display, in which single chrysanthemums and crotons figured well; Mr. W. Packard was second with a rather dull group. In the amateurs' class for a group of chrysanthemums and foliage plants Mr. G. Fellowes led with an arrangement of decorative material; Mr. H. Freeman second. Mr. W. Spencer had the best specimen single-flowering variety, scoring with a very fair Altrincham Yellow. Mr. Agar led for three specimen plants of Japanese varieties, but neither here nor in the other specimen chrysanthemum classes were the plants of a very high standard.

Mr. Topham, gardener to S. R. Flowerday, Esq., had the best six specimen ferns, winning with a big asplenium, Adiantum formosum, nephrolepis, lomaria, and pteris; Mr. R. Agar, gardener to S. Roberts, Esq., a good second. Mr. R. C. Baker, gardener to Alderman George Senior, had the best pair of large palms,and Mr. Topham scored for six table plants.

VEGETABLES.

In the open class for a collection of ten kinds of vegetables the only exhibitor was Mr. Edwin Beckett, gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree, who was awarded first prize for a fine exhibit, in which Ailsa Craig onions, Perfection tomatoes, Prizetaker leeks, Sutton's Black beet, Tender and True parsnips, Autumn Mammoth cauliflowers, Dwarf Gem Brussels sprouts, and Superlative potatoes were the varieties shown. In the local classes Mr. J. T. Hardwick and Mr. J. Shaw were the leading prizewinners.

NON-COMPETITIVE.

Messrs. Fisher, Son, and Sibray contributed an interesting collection of ornamental evergreen shrubs, the variegated eleagnuses and ivies showing up well among the conifers. The latter included Abies Engelmanni glauca, Cupressus Lawsoniana lutea, Cedrus atlantica glauca, Abies canadensis, Cephalotaxus Fortunei, etc. Mr. R. Upstone, Rotherham, put up a large collection of vegetables and fruits. Messrs. W. Artindale and Son, Sheffield, filled one corner of the Exchange with tasteful floral arrangements finely set up. The vases of Chatenay roses, and Mrs. Burnett carnations,the screen of roses, a fine cross, and some very beautiful chaplets, wreaths, and crescents, all gave evidence of fine skill and taste.

Messrs. W. Wells and Co., Merstham, showed a selection of single and decorative chrysanthemums set up in vases, the former attracting a good deal of attention; there were also a dozen or two of big Japanese blooms of Rose Pockett, J. H. Silsbury, Magnificent, W. Mease, Mrs. H. Perkins, etc. Begonia Gloire de Lorraine, in small 48-sized pots, were capitally shown by Messrs. Brook, Bray, and Sons, Greystones Nurseries, Sheffield; the plants were splendidly flowered, and in the pink of condition. Messrs. Fisher, Son, and Sibray also had an exhibit of apples that included good samples of Belle de Boskoop, Sandringham, Bismarck, Gascoigne's Scarlet, Bramley's Seedling, Paroquet, Allington Pippin, Chelmsford Wonder, Charles Ross, and Christmas Pearmain.

Messrs. Seagrave and Co., Market Hall, Sheffield, had a wonderfully attractive exhibit, filling a big corner with tall elegant pyramids of Japanese, incurved, and decorative blooms, pleasingly associated with suitable foliage. The foreground of the display was filled in with specimen crotons, fine hydrangea heads, forced spiræas, cyclamens, Primula obconica, Azalea mollis, and Lilium longiflorum. The same exhibitor set up a smaller group of floral designs that gave evidence of considerable taste in colour combination. Mr. W. Howarth, Pitsmoor, showed a group of cut flowers, cyclamens, heaths, etc.

Hitchin, NOVEMBER 12.

The best autumn show ever held in this Hertfordshire town was the one that filled the Town Hall and Gymnasium on the above date. The group and plant classes were good, and the cut flowers were especially attractive, notably the vase classes for big blooms and for decorative and single flowers, while the quality was excellent. Fruit was also a splendid display, and, though vegetables were good, we think they have been better on previous occasions. Table decorations were a really fine feature and attraction.

Four groups of miscellaneous plants were arranged along the front of the stage, and here premier position was won by Mr. W. Munt, gardener to W. Bailey Hawkins, Esq., Stagenhoe Park, Welwyn, who had a bright exhibit, in which were Cattleya labiata, C. Bowringiana, calanthes, tuberoses, and bouvardias. Mr. A. Titmus, gardener to W. T. Lucas, Esq., Foxholes, Hitchin, second; Messrs. Abbiss Brother, Hitchin, third, and Mr. Chas. Green, Hitchin, fourth.

In the large group class for chrysanthemums, only Mr. E. Orsman, gardener to S. Lucas, Esq., Hitchin, scored with a very pleasing, but rather formal arrangement of good blooms. Mr. W. G. P. Clark, 4, York Road, Hitchin, second. In the amateurs' class Mr. W. G. Willmott, Chiltern Road, Hitchin, led with a group, over which great pains had been taken; Mr. S. C. Taylor, Silehouse Street, Hitchin, second; and Mr. F. A. Wheeler, gardener to Dr. Foster, Hitchin, third.

There were three entries in the class for three specimen plants, and in each case a good set was brought forward. Premier place fell to Mr. W. Robinson, who had grand examples; Mr. A. Titmus second, and Mr. E. Orsman third.

In the plant classes Mr. Crockford led for one orchid with a bright Cypripedium insigne; several plants were shown by other growers, but all had some defect in flower or growth. Mr. Hartless was a fine first for six cyclamens, leading with specially good examples in a keen competition; Mr. Munt was second, and Mr. Crockford third. Mr. Hartless was also first for six table plants, with a neat, bright set. Mr. Crockford was a capital first for three specimen begonias of the Gloire de Lorraine type, Mr. Hartless and Mr. Munt following with plants a little past their best. Some large, freely-flowered and very bright zonal pelargoniums were shown, and the awards for three specimens were made in favour of Mr. Munt, Mr. Pateman, and Mr. Crockford, in the order given.

CUT FLOWERS.

There were two competitors in the class for eight vases of Japanese blooms, three blooms of one variety in each class; Mr. T. J. Hartles, gardener to T. Fenwick Harrison, Esq., King's Walden Bury, Hitchin, led with excellent bright blooms of Mr. Norman Davis, Magnificent, F. S. Vallis, Valerie Greenham, Mdme. Paolo Radaelli, W. R. Church, Mdme. G. Rivol, and Sapho; Mr. T. Pateman, gardener to Montague Price, Esq., The Node, Welwyn, second. Four competitors entered in the class for four vases of Japanese varieties, three blooms of a variety in each vase. Here the premier award was won by Mr. T. C. Sadler, gardener to Mrs. Cotlow-Browne, Walkern Hall, Stevenage, who had Mrs. W. Knox, Reginald Vallis, F. S. Vallis, and Magnificent; Mr. R. H. Crockford, gardener to C. Poynter Stewert, Esq., Chesfield, Stevenage, second; and Mr. A. E. Creswell, gardener to the Rt. Hon. the Earl of Lytton, Knebworth House, Herts, third.

The best dozen Japanese blooms, distinct, came from Mr. T. J. Hartless, who had even specimens of Reg. Vallis, Bessie Godfrey, J. H. Silsbury, Florence Penford, Viola, Miss D. Oliver, Sapho, Mrs. Eric Crossley, Lady Hopetoun, Splendour, Mdme. Paolo Radaelli, and Duchess of Sutherland; Mr. T. Pateman, second; and Mr. W. Munt, third. The best six Japanese, distinct, were shown by Mr. R. N. Crockford, who was followed in order by Mr. T. C. Sadler and Mr. Orsman.

There were two classes for incurved blooms on boards, and in the one for six blooms of one variety Mr. Munt led with very neat examples of C. H. Curtis; Mr. Sadler, second, with large specimens of Mrs. G. Denver, and Mr. Hartless third with Buttercup. For six incurved distinct, honours fell to Mr. Hartless, Mr. Sadler, and Mr. W. C. Modral, gardener to Colonel Shuttleworth.

Three vases of decorative chrysanthemums formed a splendid class, and the competition was again very keen, and here Mr. Chas. Green was first, Mr. Munt second, and Mr. Wilson third. The competition was very keen in the class for three vases of single chrysanthemums, and here Mr. F. C. Sadler was first with fine sprays of Rose Pink, Bronze Pagram, and Roupell Beauty; Mr. Munt second, and Mr. Robinson, gardener to F. Romaine, Esq., The Chilterns, third. For three vases of pompones, six sprays in each vase, Mr. Titmus led with very fresh flowers, and he was followed in order by Mr. Munt and Mr. Sadler.

Table decorations were first-rate, and almost filled the gymnasium. There were two classes, each for ladies only, and one was for a chrysanthemum decoration, and in the other any flowers, except chrysanthemums, could be used. In the former class there were nine competitors, and the chief award was won by Miss Armstrong with a charming design in yellow and bronze single varieties; Miss Cooper, Sun Street, Hitchin, came second with yellow flowers, and Mrs. Orsman was third. Miss Minnie Harkness, Hitchin, secured the chief award for a table decoration of other flowers than chrysanthemums, with a beautiful design in Mdme. Abel Chatenay roses; Mrs. Dan Hall, Offley, Hitchin, second with pink and blush carnations, and Sister Ernestine, Warrenhoe, third, with pink carnations, a trifle formally arranged.

FRUIT AND VEGETABLES.

Mr. Pateman was a good first for black grapes, with Alicante; Mr. Haskenouth, gardener to J. Flack, Esq., The Paddock, Stevenage, second, and Mr. Millard, Fairfield, third. For white grapes Mr. Pateman was again first, with handsome bunches of Muscat of Alexandria, and he was followed in order by Mr. Hartless and Mr. Munt. In the class for nine dishes of apples, six culinary and three dessert varieties, Mr. Pateman led with excellent Cox's Orange Pippin, Gascoigne's Scarlet, Ribston Pippin, Sandringham, etc.; Mr. R. Smith, gardener to E. E. Pearson, Esq., Buckendenbury, second, and Mr. J. Booth, Baldock, third. For three dishes of dessert pears Mr. Pateman was to the fore with Chas. Ernest, Doyenne du Comice, and Beurre Alexander Lucas; Mr. J. Creasey, gardener to L. Thompson, Esq., second, and Mr. Parker, gardener to Captain Low, Frogmore Hall, Hertford, third. Mr. R. Parker had the best three dishes of culinary pears.

In Messrs. J. Carter and Co.'s special class for a collection of vegetables, Mr. H. Bates, gardener to Miss C. Robertson, Sele Grange, Hertford, was a good first, Mr. Munt and Mr Hartless taking second and third places respectively. In the society's class for nine kinds of vegetables, Mr. Hartless was first prize-winner, and Mr. Munt second. Messrs. Sutton and Sons also provided a class for a collection of vegetables, and here the awards fell, in order, to Mr. Crockford, Mr. Munt, and Mr. Hartless.

Manchester.

NOVEMBER 12, 13, and 14.

This Manchester exhibition was held in the White City; the entries were satisfactory, and were generally of high merit. Manchester has been long noted for the production of staked plants carrying fine blooms, and this show was no exception to the rule. Mr. Smith, gardener to James Brown, Esq., Heaton Mersey, sustained his high reputation by winning all along the line, his nine large-flowering plants and his six Japanese being marvels of cultural skill, nearly four feet in diameter, and with nearly three dozen fine blooms on each plant. His three pompones were well grown, and carried plenty of bloom. Mr. J. Royle, Sale, was second in the large-flowering class, and Mr. A. K. Kelly, Fallowfield, for pompones.

In the class for the group arranged for effect, Mr. J. Brown was the only competitor, and he set up a fine combination, his palms, ferns, crotons, grasses, etc., adding a finish to his chrysanthemums.

For forty-eight blooms, distinct varieties, Japanese and incurved, Mr. Hunt, gardener to Pantia Ralli, Esq., Leatherhead, occupied the premier position, his finest blooms being Incurved — Buttercup, William Biddle, Duchess of Fife, Embléme Poitevine, Amber Beauty, Mrs. B. Hankey, Mdlle. L. Faure, Mrs. J. Judson, and G. F. Evans. Japanese —F. S. Vallis, Valerie Greenham, Duchess of Sutherland, Magnificent, Bessie Godfrey, Marquis of Northampton, Pockett's Crimson, Thomas Stevenson, Lady Talbot, Rose Pockett, George Mileman, and Mdme. P. Radaelli. The remaining prize-takers were Messrs. E. Ellis, Heswell, and G. Haigh, gardener to Sir W. H. Tate, Bart., Woolton.

For twenty-four incurved, not less than twelve varieties, Mr. G. W. Drake, Cardiff, led the way with a strong stand, followed by Mr. Hunt, and Mr. E. Ellis. For twelve incurved, distinct, the prizes went to Mr. Hunt and Mr. J. Stoney, gardener to Lieut.-Colonel J. B. Gaskell, Woolton. For thirty-six Japanese, not less than eighteen varieties, Mr. Hall, gardener to the Exors. of Lady Ashburton, Melchett Court, Romsey, held the premier place, having strong blooms of F. S. Vallis, Duchess of Sutherland, J. H. Silsbury, Marquis of Northampton, Algernon Davis, Maud Jefferies, Mdme. P. Radaelli, and Mrs. J. F. Coster; Mr. G. W. Drake and Mr. W. Iggulden took the remaining awards. For eighteen Japanese the prize men were Mr. Hall, Mr. W. Iggulden, and Mr. J. Stoney. Prizes for twelve Japanese, distinct, fell to Mr. Hall, Mr. E. Ellis, and Mr. G. Haigh, and for thirty-six miscellaneous blooms the prizes went to Messrs. J. Stoney, G. Haigh, and J. Faulkner, Cheadle Hulme.

The best dozens of incurved, distinct, came from Mr. J. Brown, Sir Gilbert Greenall, Warrington, and Lady Pollitt, Altrincham, and for a like number of Japanese in another section, the prizes went to Sir G. Greenall, Messrs. J. Brown, and J. Royle. For twenty-four Japanese, incurved blooms, Mr. J. Stoney secured leading honours, and for six vases Mr. J. Brown led with moderate-sized blooms.

Corn Exchange Show, Mark Lane, NOVEMBER 11.

The Corn Exchange exhibition, consisting chiefly of chrysanthemums, was held on the above date, and the result was a pretty display. At the close of the exhibition the whole of the exhibits were sold on behalf of the Corn Exchange Benevolent Society.

The class for twelve Japanese blooms, distinct, was of considerable importance, for two challenge cups were allotted it, in addition to the cash prizes. The premier position was occupied by Mr. T. Stevenson, gardener to E. Mocatta, Esq., Woburn Place, Addlestone, with a very strong stand of blooms in good condition. Mr. F. King, gardener to W. R. Clarke, Esq., Debden Hall, Loughton, secured the second prize, which included a challenge cup.

For six Japanese, distinct, and shown on boards, Mr. C. B. Gabriel, Eardale, Horsell, obtained first, and was closely followed by Mr. F. King. The keenest competition was in the class for six Japanese to be shown in a vase. Some good blooms of F. S. Vallis secured the first place for Mr. C. B. Gabriel, who was closely followed by Mr. Wickham Jones, Norwood, and Mr. T. Stevenson for second and third places. For a vase of single chrysanthemums, Mr. T. Stevenson was awarded first; Mr. B. F. Smith second; Mr. J. Sismur, gardener to G. M. Edwards, Esq., The Cedars, Addlestone, coming third.

Mr. T. Stevenson secured first prize for four dishes of apples. For a basket of apples, Mr. Alfred Bovill, Bigod's Hall, Dunmow, obtained first, and for three bunches of black grapes, Mr. H. Haskell, gardener to F. W. Smith, Esq., Duneevan, Oatlands Park, occupied the premier position.

Sandhurst Gardeners' Association.

At the meeting held on Tuesday, November 3, Mr. M. Goddard presided, and Mr. J. Crook, The Avenue, Camberley, gave a lecture, entitled "Jottings about Apples." The lecturer was fully master of his subject, which was presented in a very pleasing and interesting manner. In the discussion the Rev. F. G. Coleridge, Messrs. Evans, Townend, and C. W. Goddard took part, and, on the proposition of the Chairman, a hearty vote of thanks was accorded Mr. Crook for his paper.

A feature of the meeting was the fine exhibit staged by Mr. Townsend, of Sandhurst Lodge Gardens, which comprised forty dishes of apples and six dishes of pears, and some fine cattleyas. The apples were remarkably good samples, and well coloured, and compared very favourably with those seen at the recent British Fruit Show of the Royal Horticultural Society. Mr. Rendrey, Yateley, staged several varieties of apples and pears, and Mr. Dupond, Crowthorne Nurseries, sent chrysanthemums in pots. The thanks of the meeting was passed to the exhibitors.

York, NOVEMBER 11 and 12.

In the Exhibition Building the twenty-ninth annual autumn show was held, and was a distinct success. The entries were fully equal to those in past years, and the general quality of the exhibits was up to the usual high standard seen in the ancient city. The building, being high and spacious, is well adapted for the production of bold features, such as are here formed by the groups arranged for effect. With these York worthily maintains the Yorkshire reputation of having some of the finest groups of chrysanthemums associated with foliage plants that are now to be seen in competition.

Plants are here an important feature. The leading class is that for a group of chrysanthemums interspersed with foliage plants, arranged for effect, on a space of 100 square feet. The leading prize is ten guineas, for which four competed. Mr. L. Hanchant, gardener to the Fredericks Hotel Company, Harrogate, was distinctly first with an almost faultless arrangement of well-grown chrysanthemums, palms, and other foliage plants. They were not too stiffly arranged, as is too common an occurrence in such groups. The chrysanthemums in the groups were at least 12ft. high at the back, over which towered an exceedingly fine specimen of Kentia Fosteriana, the group from that point graduating down to the front in an irregular mound edged on the front with ferns, etc. Mr. J. G. Pettinger, gardener to S. Spencer, Esq., Granby Croft, Harrogate, was second, with a rather too flat arrangement of good chrysanthemums and suitable foliage plants. Messrs. R. Simpson and Sons, Selby, were third.

In the class for a group of chrysanthemums occupying a space of 80 square feet, with a margin of ferns, there were six competitors, and an exceedingly fine display they made. The premier award went to Mr. J. W. Fields, Acomb, York, who is by occupation a railway signalman, for one of the finest exhibits seen this year. The plants ranged from 2ft. to 7ft. high, and carried very fine exhibition blooms of such varieties as F. S. Vallis, J. H. Silsbury, Mdme. G. Rivol, Mrs. Mileham, and Bessie Godfrey. The arrangement was, perhaps, a trifle too flat. Mr. W. Barnes, gardener to W. Talbot Agar, Esq., Brookfield Hall, York, was a close second with a better arrangement of slightly inferior blooms; Mr. Hanchant third.

For a pillar group 17ft. high, with a width here of 6ft., of decorative chrysanthemums, interspersed with green foliage plants, there were five competitors, making a very fine display down one side of the building. Messrs. Theakstone, The Nurseries, Hull Road, were distinctly ahead with a bright arrangement of single-flowered and the ordinary decorative varieties, like Source d'Or, and La Triomphante, just a little too flat near the base, perhaps. Mr. G. Cottam, Alma Gardens, Cottingham, Hull, second with an attractive exhibit, not quite so well finished off at the base; Mr. J. Key, Clifton Nurseries, York, third.

Specimen plants were not numerous, but the leading collections were of good quality. For three incurved varieties, Mr. H. Wheatley, gardener to J. Hopkins, Esq., Leak House, Malton, was first with Charles [illegible], Topaze Orientale, and Mrs. J. P. Bryce. The second prize trio had no name. Mr. Wheatley also led with three Japanese, distinct, showing in good order Nellie Pockett, F. S. Vallis, and President Nonin. For the same number of single-flowered varieties the name of the winner was not obtainable. The plants were of excellent quality, freely-flowered, the colours bright and attractive. The varieties were Mrs. R. N. Parkinson, Mrs. M. Bird, and Miss Beattie Rowley.

Cut blooms were numerous and good. The leading class was for thirty-six Japanese in not less than twenty-four varieties, and the first prize was ten guineas. Four competed, and the best set, consisting of medium-sized even blooms of good quality and rich colour, came from Mr. A. R. Searle, gardener to the Marquis of Northampton, Castle Ashby, Northampton. The leading varieties were Mdme. G. Rivol, Edith Smith, May Inglis, Maud Jefferies, Lady Henderson, J. H. Silsbury, Algernon Davis, Leigh Park Wonder, Viola, Reginald Vallis, Magnificent, General Hutton, W. Jinks, Beatrice May, and Mrs. W. Duckham; Mr. W. Iggulden, Frome, was second with less even flowers, the best being the new Mrs. W. Iggulden, F. S. Vallis, Mrs. T. Dalton, Mdme. G. Rivol, and Rose Pockett; Mr. Musk, gardener to Captain Laycock, Wiseton Hall, Nottingham, third with smaller flowers.

In the class for eighteen Japanese there were four entries, the best stand, comprising an even, richly-coloured set, came from Mr. D. Williams, gardener to the Earl of Feversham, Duncombe Park, Helmsley. Mrs. A. T. Miller, Bessie Godfrey, Edith Smith, J. H. Silsbury, W. Beadle, Lady Talbot, Mrs. Barkley, O. H. Broomhead, and Mrs. G. Mileham, were the most noteworthy. Mr. Searle was second; Mr. Iggulden third. Mr. Williams also won for twelve Japanese with a bright heavy set of blooms, including a handsome specimen of Mrs. A. T. Miller, to which was awarded the prize for the premier bloom in the show; Messrs. Iggulden and Musk were second and third in the order here given.

In the class for six blooms any one white variety, Mr. Williams, won with Mrs. A. T. Miller in exceptionally fine condition.

Mr. Iggulden, with F. S. Vallis in prime condition, was first for six any one yellow variety; Mr. C. Jennings, gardener to F. W. Jameson, Esq., Aston Hall, North Ferriby, Hull, second with deeply-coloured blossoms of Duchess of Sutherland. For six, any one variety, except white and yellow, Mr. Musk won with richly-coloured examples of Mrs. W. Knox, showing the rosy-bronze hues distinctly. Mr. Williams came next with J. H. Silsbury in good order.

Incurved varieties were not numerous, but they were of fair average quality. For eighteen, in not less than twelve sorts, Mr. Searle had neatly-finished medium-sized blossoms of Mrs. Judson, Triomphe de Montbrun, Mrs. Hankey, C. H. Curtis, Frank Trestian, Mrs. Crooks, W. Pascoe, Ialene, Godfrey's Eclipse, Romance, Pantia Ralli, and Devonshire Hero, as the best. Mr. Folkard, gardener to Mrs. Symonds, Sand Hutton Hall, York, was second with larger, irregular, somewhat rough blooms. Mr. Searle also won first for six incurved, with neat examples of popular varieties.

Single-flowered varieties were numerous, as they invariably are here. For six vases, three sprays of each variety, Mr. Alderman, gardener to the Hon. H. W. Fitzwilliam, Wigganthorpe, Malton, was first with a charming exhibit of shapely bright-coloured varieties, as Mrs. B. Parkinson, Netta, Edith and Bronze Pagram, Stella, and Albatross. Mr. Everard, gardener to Mrs. Gutch, Holgate Lodge, York, second, also staging attractive varieties. For twelve decorative varieties, three sprays of each, in vases, Messrs. Theakstone won the premier award for the fourteenth year in succession, with a distinctly interesting collection of such sorts as Soleil d'Octobre, Moneymaker, Tokio, La Pactole, Source d'Or, and Market Red, Mr. Alderman a close second. For a table group of any section of chrysanthemum blooms, arranged for effect in a space of 6ft. by 4ft., with any kind of foliage, there were nine competitors. Messrs. Theakstone won with an effective arrangement of small-flowered varieties, arranged in bamboo stands and vases, Mr. J. M. Petch, St. John Street, Bridlington, second. Baskets of chrysanthemums are always a feature here, Mr. C. E. Simpson, 21, Spurriergate, York, was first with a mass of Mary Richardson, single, and the green Mdme. E. Roger, neatly blended. Messrs. Theakstone second, Mr. Folkard third. Ten competed in the class for one vase of chrysanthemums and any foliage tastefully arranged, suitable for a drawing room table. Mr. Alderman was first with yellow Source d'Or, tamarisk shoots and sprays of Ampelopsis Veitchi.

For the best floral arrangement of a dessert table, laid for six persons, with fruit, etc., Miss Whitehead, Deighton Grove, York, was first with a mass of pale yellow single-flowered variety, all too crowded; Mrs. Rowson, 8, Blossom Street, York, second with a table showing the same fault.

Fruit and vegetables were plentiful and good. A gold medal was awarded to Messrs. Kent and Brydon, Darlington, for a handsome exhibit of apples and pears. To Messrs. J. Backhouse and Son, The Nurseries, York, a silver-gilt medal was given for flowering plants, tastefully arranged. A silver medal was awarded to Messrs. Clibran and Son for chrysanthemums, and to Messrs. Batchelor for a group of Nephrolepis Amerpohli.

Chelmsford, NOVEMBER 2 and 3.

The annual exhibition of the Chelmsford Chrysanthemum Society, which was, as usual, held in the Corn Exchange, was in every way a great success. Chrysanthemums in a cut state were largely shown, and the blooms were on the whole of good quality, but many of the stands were less effective than they might have been owing to their containing but few, if any, highly-coloured blooms. Fruit was well represented, and there was a brisk competition in the classes for vegetables.

The most successful of the large number of exhibitors in the chrysanthemum classes were Mr. T. Brazier, Mr. A. Edwards, Mr. W. Reed, Mr. A. Edwards, Mr. W. D. Felton, Mr. W. A. Hurst, Mr. J. R. Magness, Mr. P. Linn, and Mr. P. E. Wiseman. Mr. T. Brazier was successful in winning the silver cup offered by the President in the class for a group of chrysanthemums, and Mr. P. Linn won Mr. Cook's Cup, offered in the amateurs' division. The certificate of the National Chrysanthemum Society, offered for the best stand of blooms in the open classes, was awarded to Mr. Edwards, and in the classes limited to amateurs a similar certificate was awarded to Mr. P. E. Wiseman. The prize for the best Japanese bloom in the show was awarded to Mr. Edwards for a fine example of Mrs. A. T. Miller, and the best bloom of an incurved variety was C. H. Curtis, shown by Mr. J. A. Bull.

Fruit was well shown by Mr. C. E. Searles, Mr. J. G. Bond, Mr. Grant, and the majority of the exhibitors mentioned as having been successful in the chrysanthemum classes. The principal prizewinners in the vegetable classes were Messrs. C. E. Searles, F. G. Freeman, G. Diggons, P. Linn, D. Felton, C. J. Linn, and A. Edwards.

Birmingham Gardeners' Association.

The third meeting of the session, November 2, was presided over by Mr. Thos. Humphreys, curator of the Botanical Gardens, Edgbaston. The evening was devoted to the reading of essays on "Hardy Perennials Suitable for Villa Gardens," by under gardeners only. The competitors were Mr. Albert Wright, of the Botanical Gardens, Mr. Percy Catt, Berrow Court Gardens, and Mr. Frank Harvey, of the former establishment. The prizes were offered in book form, subject to the selection of the winners. The essays were, considering the limited practical experience of the contestants, highly creditable, especially taking into consideration the all too limited time allowed for the reading of each paper, i.e., only a quarter of an hour, this precluding lengthened details of culture.

Mr. W. Spinks (one of the censors) was previously delegated to read the essays, and in the discussion that ensued, it was opined by more than one or two of the discussionists that, from an educational point of view, it would have been more appropriate had each essayist read his own paper. At the conclusion of these proceedings the Chairman led off with a pertinent résumé, and gave instructive advice regarding the preparation of essays, which was endorsed by Messrs. W. Spinks, A. D. Christie, Wm. Gardiner, and Geo. Gibbs, the latter also suggesting the desirability of encouraging young gardeners to improve themselves by writing descriptive notes of public and private gardens, exhibitions, etc.

Oxford, NOVEMBER 10.

The Oxford Society held its forty-sixth annual show in the Town Hall, and, favoured with fine though severely cold weather, was well attended. Entries were fewer than last year, exhibitors complaining that many of their finest blooms had "damped" off. There were four groups and two dozen specimen plants, a few double and single primulas, and a grand display of winter-flowering begonias. Cut blooms were represented by 540 specimens, not including the pompons, baskets, epergnes, and other classes in competition.

The principal exhibitors of plants were Messrs. J. Holton, gardener to Rev. the Provost of Worcester College, who led in the classes for a 60ft. group, and six specimen Japanese plants, the second awards in these classes falling to Mr. S. Mold (foreman cooper), Buckingham Street, who was premier for one specimen and nine Japanese blooms.

Great interest centred in the class for nine varieties of Japanese, three of each, in vases, the premier cash prize and silver challenge bowl going to Mr. D. L. Macfarlane, gardener to Harvey du Cros, Esq., Howbery Park, Wallingford, who set up magnificent flowers of F. S. Vallis, Leigh Park Wonder, Mary Inglis, President Viger, Mdme. R. Obertheim, W. R. Church, Mrs. W. Knox, Miss Miriam Hanky, and Algernon Davis. The class for six blooms of one variety is always attractive, and well contested. For six incurved, Mr. E. Lazenby, gardener to W. H. Fox, Esq., Bradwell Grove, Burford, led with Mrs. J. P. Bryce; Mr. J. L. Burgess, Maisey Hampton, Fairford, second with high-coloured examples of Pantia Ralli; Mr. Macfarlane, third with Mrs. Clibran. For six Japanese, white, Mr. Macfarlane led with Mdme. R. Obertheim; Mr. Lazenby second with Mrs. A. P. Miller; Mr. G. H. Bonner, gardener to Z. Merten, Esq., Wallington Park, third with excellent forms of Miss E. Felton. For yellow Japanese F. S. Vallis proved first and third, being staged by Messrs. Lazenby and Macfarlane, the second prize card resting on a very level six of Algernon Davis, staged by Mr. Bonner. For six of any colour (other than white or yellow), Mr. Bonner led with A. H. Bromham; Mr. Lazenby second with Mdme. P. Radaelli; the third prize going to Mr. Macfarlane for Australia. Mr. Geo. Phillips, gardener to Vernon J. Watney, Esq., Cornbury Park, secured premier prizes for a dozen incurved, and a like number of Japanese; he was likewise premier in the classes for a table of fruit and flowers and black grapes. Pompons are beautifully grown in the district, the principal prizes going to Mr. Holton for twelve and nine triplets, Mr. Burgess taking the second cards.

Mr. W. T. Mattock, Barton End Nursery, Headington, led in the classes for a group of autumn-flowering and foliage plants, epergne, and basket of chrysanthemums; Mr. D. Curtis, Iffley Road Nursery, Oxford, being awarded second in each case. Primulas (double) are generally better than the single forms; Mr. R. Wadham, gardener to Mrs. Bradshaw, Steeple Aston, led for the former, Mr. Mattock taking the high card for six singles. Begonias made a fine show, the two dozen specimens forming a line between the boxes of blooms, the six Gloire de Lorraine, from Mr. J. S. Chidlow, gardener to Mrs. Herbert Monell, Headington Hill Hall, being equal to anything seen in the county.

Fruit comprised some 1,700 specimen apples and 340 pears; of the latter, Pitmaston Duchess was largely staged, the competition in this section being very keen. Some twenty classes are provided for sets of dessert, twelve, nine, six, three, and single dishes of apples, and six, three, and single dishes of pears.

Non-competitive exhibits included an assortment of plants and cut chrysanthemums from Headington Hill Hall Gardens, which secured an Award of Merit, a gold medal being accorded to the remarkably fine display of floral devices set up by Messrs. Field and Jacob, The Market, Oxford, who had a background of neat palms and Bermuda and speciosum lilies. Specially noticeable was a large mirror braided with rich autumn leafage, and set with sprays of Oncidium Rogersi. A very handsome harp, five feet high, had a framework of small white chrysanthemums relieved by blooms of Cattleya Harrisoni, variegated bamboo, and asparagus plumosus foliage, the strings of narrow mauve ribbon producing a pretty effect.

The show, which was formally opened by Mrs. Harvey du Cros, is the fortieth exhibition arranged by the secretary, Mr. W. Greenaway.

Leeds.

The twentieth annual chrysanthemum show of the Leeds Paxton Society was held on November 13 and 14 in the Albert Hall, Leeds. This building is by no means suitable for a show, as many of the exhibits are in a basement room, and the display is therefore not effective. There were some good groups and tables of plants, but their value was small, simply because of lack of proper room. Cut blooms were fairly good as a whole, while the single varieties were excellent. Cannot the Paxton Society secure better accommodation for its show?

GROUPS AND PLANTS.

In the leading class for a miscellaneous group of plants, arranged for effect, Mr. J. Donoghue, gardener to T. Pickersgill, Esq., Bardon Hill, Leeds, was easily first prize winner with a charming design in which some splendid crotons were a fine feature. The flowering plants were chiefly Oncidium varicosum Rogersi, odontoglossums, cyclamen, and Begonia Gloire de Lorraine. Everything was good and well arranged. Mr. J. Harrison, gardener to F. H. Fulford, Esq., Heddingley Castle, Heddingley, was placed second. Mr. J. Marshall, gardener to H. A. Watson, Esq., Ashwood, Heddingley, led for a table of plants in the local class with an elegant arrangement of oncidiums, odontoglossums, calanthes, and Roman hyacinths; Mr. J. Donoghue second, with oncidiums, crotons, etc., prettily arranged.

Chief award for a big group of chrysanthemums was won b y Mr. A. Lupton, gardener to E. O. Simpson, Esq., Oaklea, Adel, with a broad, sloping bank of good blooms arranged up under the gallery; Mr. J. Donoghue was second with a rather better arrangement, but scarcely such weight of blooms. There was a pretty class for a table group of chrysanthemums, arranged on a space 6ft. by 3ft., any foliage allowed. First prize fell to Mr. D. H. Aldridge, for some good flowers pleasingly arranged; Mr. Coates was second.

Mr. T. Preece, gardener to the Hon. E. C. Kitson, Weetwood, led for a table of Begonia Gloire de Lorraine, cut chrysanthemums, and foliage plants, and he had well-grown begonias, but only about four sprays of single chrysanthemums, and two big blooms of Mrs. A. T. Miller; Mr. Donoghue came second with a much lighter arrangement, and Mr. A. Lupton third. In the plant classes Mr. G. Gregory had the best orchid, an odontoglossum; Mr. Norman led for Roman hyacinths; Mr. C. Shaw had the best six Begonia Gloire de Lorraine; Mr. J. Donoghue the best cyclamens; and Mr. Crossfield the best six primulas.

CUT BLOOMS.

Mr. A. Chandler, gardener to A. James, Esq., Coton House, Rugby, won the cup outright in the class for eighteen blooms, distinct, of both Japanese and incurved varieties. The best of his Japanese were Valerie Greenham, F. S. Vallis, Algernon Davis, Lady Talbot, Ethel Fitzroy, Dorothy Goldsmith, Bessie Godfrey, and Duchess of Sutherland, and his best incurved were W. Biddle, W. Pascoe, Le Peyron, Buttercup, Souv. de la Wm. Clibran, Fred Palmer, and C. H. Curtis. Mr. C. Shaw, gardener to J. Boyle, Esq., Asket Hill, Roundhay, Leeds, came second. In the local cup class for twelve Japanese and twelve incurved, distinct, the chief award fell to Mr. C. Shaw, with Reginald Vallis, G. Mileham, Lady Talbot, F. S. Vallis, J. H. Silsbury, Duchess of Sutherland, Mr. B. Hankey, Buttercup, Frank Trestian, Margery Shields, W. Pascoe, and J. Agate. Mr. J. Donoghue was a good second, and he had Ethel Fitzroy, President Viger, F. S. Vallis, Mrs. A. T. Miller,Madame Ferlat, Duchess of Fife, and Frank Trestian as his best.

Mr. Coates, gardener to S. C. Haldane, Esq., Colton Street, Hull, led for a dozen vases of single varieties with a grand lot of Bertie, Bronze Pagram, Metta, Mrs. Parkinson, Altrincham Yellow, Doris, and Miss Roberts; second place fell to Mr. W. H. Aldridge, gardener to Mrs. Constable, Otley. There was only one exhibitor in the class for a table of eight vases of Japanese varieties, three blooms per vase, and this was Mr. W. H. Aldridge, who had F. S. Vallis, Mrs. Knox, Mrs. A. T. Miller, and Magnificent in fine form, and associated these with useful table plants.

Mr. Preece led for six vases of decorative chrysanthemums, and he was followed by Mr. Norman. In the local class for half-a-dozen vases of single varieties Mr. R. B. Gilchrist, gardener to W. Mathieson, Esq., was the first prize winner, and Mr. T. Preece was second, with Mr. Talbot, gardener to J. Nicholson, Esq., Heddingley, third. Mr. C. Shaw had the best six vases of stove or greenhouse flowers, and here he had Anthurium Andreanum, eucharis, camellias, white azaleas, Cattleya labiata, and Dendrobium chrysanthum.

FRUITS AND VEGETABLES.

Mr. F. Norman, gardener to A. Teynett Walker, Esq., The Elms, Weetwood, led for two bunches of white grapes in the local class, and he was also first for black grapes with finely berried Gros Colman. In the open classes for grapes Mr. A. Blakey, gardener to C. H. Shaw, Esq., Howden, led for white grapes with fine Muscat of Alexandria, and he was also first for black grapes with Gros Colman. Mr. Blakey had the best six dishes of baking apples, the best six dessert pears—Pitmaston Duchess; and Mr. W. N. Hague, gardener to W. D. Cliffe, Esq., Meanwood Towers, Leeds, had the best six dishes of cooking apples in the local class.

Mr. J. Groundwell and Mr. A. Blakey led in the vegetable class for Messrs. Sutton and Sons' prizes, and Mr. W. M. Hague, Mr. F. Norman, and Mr. J. Talbot were placed in the order of mention for Messrs. Webb and Sons' prizes.

Chester, NOVEMBER 11 and 12.

The Paxton Society had a brave show of fruit, arranged in a pleasing manner in the Town Hall. The advantage to the visitor at this exhibition is that he has the means of judging the effect of stock and soil, as these particulars are noted on each exhibitor's card.

The names of the first prize-winners can only be given in section A, although fruit of good quality was staged in section B. Dessert apples: Ribston Pippin, Mrs. P. Campbell; Cox's Orange Pippin, Mr. G. Fritz Hugh; King of the Pippins, Mrs. Rolt; Allington Pippin, Mr. P. Yorke; Gascoigne's Scarlet, Rev. Canon Garnet; Blenheim Pippin, Mr. F. B. Summers; American Mother, Mrs. P. Campbell; Dutch Mignonne, Mr. B. C. Roberts; James Grieve, Mrs. Rathbone; any other variety, Rev. Canon Garnet, with Adam's Pearmain; any new variety, Mr. C. Sprackling with Charles Ross. Dessert pears: Marie Louise and Pitmaston Duchess, Rev. Canon Garnet; Doyenne du Comice, Mr. J. Thompson; Glou Morceau, Mr. E. P. Jones; Beurre Diel, Miss Nowell; Winter Nelis, Mrs. P. Campbell; Easter Beurre, Mr. P. Yorke; any other ripe variety, Mr. J. Thompson; any other late variety, Rev. Canon Garnet. Kitchen Pears: Mr. W. Pilgrim with Catillac.

Kitchen apples: Peasgood's Nonsuch, Mr. W. Pilgrim; Newton Wonder, Rev. Canon Garnet; Mère de Ménage, Mrs. P. Campbell; Lane's Prince Albert, Colonel T. Gee; Dumelow's Seedling, Mrs. Parker; Warner's King, Mr. J. Stuart Goole; Bramley's Seedling, Colonel T. Gee; Alfriston, Mr. B. C. Roberts; Lord Derby, Colonel T. Gee; any other variety, Mr. T. B. Summers with Heavy; any other late-keeping variety, Mr. J. S. Goold.

For six dishes of dessert apples, Mr. J. Sanderson led with bright fruits. For twenty-four dishes, eighteen of kitchen and six of dessert apples, Mr. J. Weaver scored with good examples. The best twelve kitchen varieties came from Messrs. L. Ledsham and Sons; the best six varieties from Mr. J. S. Goold, and the best six dishes of dessert pears, distinct, from Mr. T. Gibbons Frost. For a group of chrysanthemums, both Japanese and incurved varieties, Mr. E. Staples, gardener to F. B. Summer, Esq., scored, and also led for the group of single varieties with a pleasing array of colour. For a group of naturally-grown plants, Mr. T. G. Frost scored.

In the cut bloom section, Colonel T. Gee led for eighteen blooms; for twelve varieties in two vases, Mr. G. Aitken scored; for five Japanese, distinct, and for three Japanese, distinct, Mr. J. Thompson led; for five incurved, distinct, Mr. P. Greene was the winner, and for twelve Japanese, not less than nine varieties, on a board, Mr. T. Herbert won first place.

Contributions, not for competition, were staged by Messrs. Dicksons, chrysanthemums; Mr. F. W. Dutton, cut flowers; Mr. R. Moss, oncidiums, cypripediums, and odontoglossums; Messrs. Clibrans, chrysanthemums; Mr. W. Hayes, Begonia Gloire de Lorraine; Messrs. W. Owen and Co., Cypripedium insigne montanum.

Reading, NOVEMBER 11.

The Reading Chrysanthemum Society held its 25th show in the Town Hall on the above date, and this was of a high standard of merit. Primarily of interest were the groups arranged on an area of 60 square feet, and the challenge cup and £5 were awarded to Mr. F. Johnson, gardener to S. B. Joel, Esq., Maiden Erleigh, who won by the weight of bloom, the most tasteful arrangement was that of Mr. A. Galt, gardener to C. E. Keyser, Esq., Aldermaston Court, who was second. Mr. Galt led in the class for three specimen plants.

Seedling chrysanthemums were largely staged. Messrs. Sutton and Sons had a charming display, and were awarded a silver medal. In the competitive class Mr. H. Perkins, gardener to W. F. D. Smith, Esq., M.P., Greenlands, Henley, was first with plants raised from seed sown in March.

Cut blooms generally were magnificent examples of cultural skill. For two dozen Japanese the contest was keen, and Mr. T. [illegible], gardener to A. C. Hammersley, Esq., [illegible] End, was first, and Mr. W. Mease, gardener to A. Tate, Esq., Downside, Leatherhead; and Mr. T. Coote, gardener to [illegible] Taylor, Esq., The Rocks, Marshfield, Chippenham, second and third. In the class for twelve varieties there was a strong competition, and awards were made in favour of Mr. [illegible] Wilson, gardener to Miss Christie, [illegible], Windlesham; Mr. C. Page, gardener to [illegible] Fortescue, Esq., Dropmore; and Mr. [illegible] Sherlock, gardener to G. W. Tyser, Esq., Oakfield, Mortimer. Extra prizes were awarded to Mr. Galt and Mr. F. Ashman, gardener to C. T. D. Crewe, Esq., Billingbear [illegible]. For twenty-four blooms, distinct, of incurved varieties, Messrs. Wilson, Mease, and [illegible] secured the awards; and for twelve Mr. [illegible]an led; Mr. J. W. Euston, gardener to [illegible] Heydeman, Stanlake Park, Twyford, [illegible]; and Mr. Galt third. For six vases, Mr. [illegible] Waller headed the list, and Mr. J. Gard[illegible], gardener to Col. H. Walpole, Heckfield Place, Winchfield, secured the only other award. For a dozen vases of singles, Mr. A. G. Nichols, gardener to the Duke of Wellington, Strathfieldsaye, was a good first, followed by Mr. Sherlock and Mr. Page. Half-[illegible] Japanese, one variety, made a show [illegible], each contributor putting up F. S. Vallis, the prizes falling to Messrs. Sherlock, Waller, and Page.

There were good exhibits of cyclamen and [illegible] begonias, some half-dozen specimens [illegible] Maiden Erleigh gracing the orchestra.

Carnations also formed a good feature, the Messrs. B. and V. Haig, Castle Hill Nurseries, Maidenhead, being strong with three vases of two dozen blooms each, the firm also contributing a display as an extra. Epergnes and baskets were pretty; the best table-centre was arranged by Miss K. Ratcliffe, Westfield, Reading; the premier basket hailing from Maiden Erleigh.

Fruit had two dozen classes provided, and Mr. A. G. Nichols, Strathfieldsaye, figured largely in the list of awards, he also being the winner of Messrs. Sutton and Sons' prize for a collection of vegetables.

Stirling.

In seasonable autumn weather the nineteenth annual show of the above society was held in the Albert Hall, Stirling, on November 12 and 13, when a good all-round display was forward. The entries exceeded those of last year by eighty. The opinion was freely expressed that better blooms and pot plants would not be seen at Edinburgh. Competition was keen, the classes being well filled. Some new competitors came forward, Messrs. Stewart (winner of the Hon. President's Cup) and Waddell, who gained first place for the dinner-table decoration, being notable instances.

CUT BLOOMS.

These made a meritorious display. In the premier class, which was one for eighteen blooms, six varieties, three of each, six exhibitors staged, Mr. Stewart, Dunkeld, beating last year's winner, Mr. Morton, Cullen House, Banff; while Mr. D. Carmichael was third with good examples. Mr. Stewart's blooms were: Eric Crossley, Reg. Vallis, Miss O. Miller, Mrs. Geo. Mileham, Mrs. J. C. Neville, and Bessie Godfrey. Mr. Jenkins, Aberdeen, was first for twelve on the board; this competitor gained a like position in the amateurs' classes for twelve blooms, shown in vases. In addition to some of the above-named varieties, he also showed capital blooms of Lady Talbot, and Victoria and Albert. Mr. McKenzie, Kippenross, was first for six whites, also for six yellows, Mr. Stewart securing premier place for six distinct.

POT PLANTS.

These were a great show, being accommodated around three sides of the hall, while the lesser hall was requisitioned for the amateurs' classes.

Mr. R. Jenner, Newhouse, won the Corporation Cup for four bushes, his varieties being John Shrimpton, Lady Conyers, President Nonin, and Soleil d'Octobre. This competitor led in all the amateur classes. In the other open classes Mr. Henry Gray was the most successful competitor, showing clean, healthy, well-developed specimens. In the supplementary pot plant classes Mr. D. Carmichael was most successful, having fine primulas, his P. Kermesina being very fine; this variety will oust P. obconica without a doubt. Mr. C. Palmer, Alloa, had good table plants, his Dracæna Princess May, and crotons Aigburth Gem and Prince of Wales being specially fine. R. McDonald, The Elms, showed well-conditioned palms.

FRUIT AND VEGETABLES.

Here Mr. Ritchie, Polmaise, had four firsts and a third. Mr. Trotter was first for four bunches of grapes; Messrs. Morton, Blacklock, and Ritchie being first respectively for dessert apples, kitchen apples, and pears. The dessert apples were King of the Pippins, James Grieve, Worcester Pearmain, and Charles Ross (good examples).

Vegetables were a large and meritorious class, strong competition prevailing. Mr John Ogilvie, Larbert, was first for a collection of ten varieties. Other leading competitors were, Messrs. Birrell, Braco, Wood, Dunmore; Russell, West Plean; G. McIsaac, Stirling. Messrs. Carrighan and Jenner shared the leading places in the amateurs' section.

BOUQUETS AND TABLE DECORATIONS.

Seven entered in the table decoration class, this producing a great amount of enthusiasm and interest amongst competitors and visitors alike. Mr. Waddell, Bishopriggs, was first, followed by Mr. Wood, Dunmore; Mr. Russell coming next; Mr. Trotter, Carbrook, being placed fourth. In the bouquet classes, etc., Messrs. Palmer, Wood, and Trotter secured leading positions.

HONORARY EXHIBITS.

These came from Messrs. Drummond, Stirling, who had sixty named varieties of apples; Mr. John Craig, table flowering and foliage plants, also floral decorations; Mr. Rodger, decorative plants; Mrs. Tasker, Stirling, forty varieties of early-flowering chrysanthemums, all grown outside; Mr. R. Jenner, huge specimen plant of single-flowered chrysanthemum (Ladysmith).

The Horticultural Club.

On Tuesday, the 10th inst., after the monthly dinner of this club at the Hotel Windsor, Mr. G. Monro taking the chair, a very interesting paper on "French Gardening" was read by Mr. C. D. McKay, and subsequently discussed by the members. The lecturer at the outset declined to accept any responsibility for the very glowing descriptions of French methods and results which had appeared in the daily press, as if inspired by him. There is little doubt that these have led many people to start the French system without the requisite experience, the inevitable result being failure and consequent discouragement of enterprise, which, properly conducted, would be beneficial, not merely to the grower and the consumer, but to the country generally, by involving the better utilisation of the land. The lecturer explained that he had been induced to advocate the introduction of these methods into England after visiting France, and also Belgium, and seeing what could be done there under conditions of climate and soil which are in no way superior to those obtaining in England. The usual daily importation of French salad produce into this country is 4,000 to 5,000 crates of lettuce, 500 crates of early carrots, 100 of asparagus, 100 of French turnips, and 50 of celeriac, the whole of which, he contended, could be profitably grown on this side of the Channel, with the contingent advantages of saving of freight and greater freshness when delivered to the consumer, to say nothing of the increased employment of labour on the land involved. It, however, by no means follows that any market grower could adopt the French system of cloches and frames and manuring by merely reading directions.

The French system is the outcome of long experience, and one very material point is that the eight-hour labour system, or any approach to it, is unknown in France in this connection, and the grower, assisted probably by his wife, devotes his whole time to culture, and is prepared at any hour to do what is needful. He has, moreover, acquired the knack of rearing successional crops of different things on the same area so as to keep his land always profitably occupied. It is to be feared that this plodding "intensive" culture of both the French and Belgian growers is hardly likely to find favour in the eyes of the British labourer; a very material point in the problem.

In the subsequent discussion, participated in by Messrs. T. W. Sanders, A. Pearson, G. Gordon, C. Foster, and G. Monro, some statements in the lecturer's book on the subject were challenged, and the difficulties involved and standing in the way of the large prospective profits shown were fully discussed, but it was generally conceded that, despite all the possible drawbacks, the thanks of the public were due to the lecturer for ventilating the matter, and Mr. G. Monro, in his summing up, pointed out that with tomatoes, cucumbers, and beans, which at one time were mainly imported from abroad, our growers here, by adopting better cultural methods, have entirely turned the scale, not merely fully supplying our own needs, but actually exporting immense quantities to the Continent. This fact, he considered, spoke volumes in favour of success with the salad vegetables mainly concerned, and proved that with intelligent methods of culture our climate presents no such adverse conditions as compared with France, as has hitherto been assumed. A very hearty vote of thanks to Mr. McKay concluded the meeting.

National Chrysanthemum Society.

The Floral Committee met on Monday, November 16, at Essex Hall, Strand, when there was a very interesting set of exhibits.

Messrs. W. Wells and Co., Merstham, again showed some very fine single varieties, and these included the beautiful large-flowering Merstham Jewel, a charming bronzy-red single variety, with yellow zone round the disc and with some yellow colouring shining through at the tips and bases of the florets; Merstham Tints, yellowish; Marguerite Pink, pinkish yellow; Doris Stevens, brilliant crimson-scarlet; and Peter Pan, a wonderful light fawn-yellow variety that opens flowers in long raceme-like sprays. Besides these Messrs. Wells and Co. showed several useful decorative or market varieties of Japanese type, and the best of these were Olive Muriel Smith, old rose; Noreen Jay, vivid crimson-scarlet, rather loose; and November Gold, a fine golden-yellow form.

Mr. J. Wynn, Ledgewood Hall Gardens, King's Lynn, sent a loose blush-tinted, incurved variety, named J. Wynn. Mr. George West, The Friary Gardens, Old Windsor, showed a group of new single varieties, among which Sunrise, bronze, red, and yellow was the prettiest. Mr. G. Carpenter, West Hall, Byfleet, sent a large Japanese single variety, named Naomi, and a broad-petalled white Japanese named Mrs. Godsalm Ward.

A general committee meeting was held at Carr's Restaurant, Strand, in the evening, Mr. Thos. Bevan in the chair.

On the year's working, so far, there is a balance of £115 8s. 3d. on the right side, the receipts amounting to £408 16s. 10d., and the expenditure to £293 8s. 7d. Of course, no prize money has yet been paid, and this will not be paid until all the shows for the season have been held. The Chairman urged the members to do their best to make the annual dinner to be held at the Holborn Restaurant on November 26, a great success. It was decided to hold the Floral Committee dinner at Carr's on December 7. Six judges were elected to make the awards at the December show, viz., Messrs. Prickett, Wells, Howe, Witty, Felton, and H. J. Jones. Thirteen new members were elected, being one at 21s., one at 10s. 6d., and eleven at 5s. subscription.

Ascot, NOVEMBER 3 and 4.

The twenty-third annual exhibition was held in the Grand Stand, and groups were the chief feature of this show.

The president, Sir Edward Durning-Lawrence, Bart., was awarded first prize in three of the group classes, and also firsts in the three vegetable classes. The hon. secretary, Sydney H. Clement, Esq., who manages this show so well, took first prize for six pots of violets; the best exhibit of its kind seen at this show. The weather was fine, and the attendance good, and there were sixty more entries than last year. This show is gaining favour, but there should be more exhibits from the larger gardens of the neighbourhood. The secretary and president are both very popular at Ascot.

In the open class for twenty-four Japanese, distinct, Sir Charles Swinfen Eady, Oaklands, Lodge, Weybridge (gardener, Mr. J. Lock), put up a very even lot of F. S. Vallis, H. Perkins, Duchess of Sutherland, Arthur Mileham, Mrs. A. T. Miller, Reginald Vallis, Mrs. W. Knox, W. E. Beadle, Mrs. G. Mileham, Mrs. F. W. Leaver, W. King, George Mileham, C. Becket, and Lady Talbot; Mrs. Christie, Ribsden, Windlesham (gardener, Mr. W. Wilson), second; C. Arthur Pearson, Esq., The Place, Farnham (gardener, Mr. C. Moore), third; and Miss Langworthy, Holyport (gardener, Mr. F. J. Broom), fourth. For eighteen incurved and eighteen Japanese, distinct, Mr. W. Wilson was first with a very grand lot. For eighteen incurved Mr. W. Wilson was very fine again, his being the only entry. For twelve Japanese, distinct (single-handed gardeners), C. H. Austen, Esq., Englefield Green (gardener, H. C. Worsfied), was first with heavy flowers; Mrs. J. Lillington, Rosewood, Ascot (gardener, Mr. W. G. Haines), second; and T. B. Rendle, Esq., Torwood, Ascot (gardener, Mr. G. W. Pearce), third. Mr. J. Lock led for a dozen Japanese, distinct.

For six vases, three blooms in each, Mr. W. Wilson led with grand blooms; A. F. Walters, Esq., Bearwood, Wokingham (gardener, Mr. W. Barnes), second; and Mr. F. J. Broom third. For six blooms of one variety Mr. Wilson led with beautiful specimens of Embleme Poitevine, and the best incurved in the show was selected from this stand. Mr. C. Moore had the best Japanese bloom with Mrs. A. T. Miller.

For a circular group of 8ft. diameter, chrysanthemums and foliage, Mr. W. Lane won first with a nice arrangement; Sir A. C. Lucas, Bart., Harewood, Ascot (gardener, Mr. J. Sargent), second. For a group of chrysanthemums Mr. W. Lane, gardener to Sir Edward Durning-Lawrence, Bart., King's Ride, was first; Mr. F. Capp, gardener to E. Iveson, Esq., The Charters, Sunninghill, second. For undisbudded plants in a group Mr. F. Capp was first with plants packed much too closely together; Mr. W. Neat, gardener to Miss Thacker, Ascot, second, with a splendidly arranged group. For a group of miscellaneous plants Mr. W. Lane put up a very pretty arrangement, and gained first prize.

Mr. E. Young, gardener to Mrs. F. Morrison, Farm Wood, Ascot, was first for six pots of cyclamens; Mr. Sargent first for Begonia Gloire de Lorraine; Mr. W. Lane first for table plants; Mr. J. Lock first for two bunches of black grapes; Mr. Lane first for Muscats; Mr. W. Barnes first for dessert apples and for culinary apples; Mr. W. Lane first for nine dishes of vegetables, and also for Messrs. Sutton and Sons' and Messrs. Webb and Sons' prizes.

Eccles and Pendleton.

NOVEMBER 6 and 7.

The twenty-second annual exhibition was held in the Town Hall, and proved a decided advance on previous functions, especially in the plant section. Cut blooms were present in great quantity, and up to average quality.

In the class for a semi-circular group, arranged for effect, Mr. J. Ashley, gardener to Lady Annette de Trafford, held the leading position with moderate blooms, but staged much too flatly; Mr. J. Beswick, gardener to the Misses Heywood, using single varieties chiefly, came second. For six plants, three incurved and three Japanese, Mr. J. W. Smith, gardener to James Brown, Esq., won with grand plants; Mrs. Bryce, Cheltoni, and Viviand Morel carrying fine blooms of good colour; Mr. Ashley followed. For three plants, single varieties, Mr. Smith was again to the fore with Emily Clibran and Emily Hills in splendid form, and the same exhibitor took the lead for three plants, not disbudded, which included a fine Ladysmith and Source d'Or. For six dinner table plants Mr. G. Haigh led in a strong competition; Mr. Ashley had the best Roman hyacinths, and Mr. W. Foster, gardener to S. Petrocochina, Esq., won for primulas and for begonia Gloire de Lorraine.

For twelve incurved and twelve Japanese cut blooms, not less than eight varieties of each, Mr. G. Haigh, gardener to Sir W. H. Tate, Bart., won the coveted position, thus winning outright the silver challenge cup presented by the late F. H. Gossage, Esq. The flowers were even and fresh throughout, the best blooms being F. S. Vallis, Miss Elsie Fulton, Leigh Park Wonder, Mdme. P. Radaelli (which gained the N.C.S. certificate as the best bloom), Magnificent, W. King, Mrs. W. Knox, Godfrey's Eclipse, Marjory Shields, Buttercup, Lady Isabel, Mrs. G. Denyer, Mrs. B. Hankey, J. E. Bryce, Muelenare, Boccace, and Pantia Rilli; Mr. J. George, gardener to T. Henshaw, Esq., was second with good blooms. Mr. G. Haigh also led for twelve incurved, dissimilar; twelve Japanese, dissimilar; six incurved and six Japanese, dissimilar; six incurved, six Japanese, six reflexed, and six anemones.

For eighteen large blooms in six varieties, three in each vase, Mr. W. Holmes, gardener to W. Scott Forbes, Esq., led the way, and he also won for eighteen sprays in six vases, and for six Japanese and six incurved, dissimilar, and for three Japanese and three incurved, dissimilar, staging well throughout.

For three bouquets Mr. A. Adshead led with designs in oncidiums, chrysanthemums, cattleyas, and odontoglossums. Mr. G. Haigh had the best bouquet, and also the best six sprays. Mr. A. Porter had the best epergne, Miss Lightburn the best basket, and Mr. Adshead the best buttonholes. The amateur classes were well filled. Mr. J. H. Counsel winning the silver challenge cup for eighteen blooms. Mr. Woodhams was successful in four classes, gaining the N.C.S. certificate for the best bloom in the section. Mr. J. B. Wroe took three firsts in section two, and in section three Mr. J. B. Wroe secured the silver challenge cup, and Mr. Woollams gained the silver medal for the best bloom with Bessie Godfrey. Other first prizemen were Mr. J. J. W. Holton, Mr. J. W. Counsel, Mr. S. Parkinson, Mr. J. Beswick, Mr. D. Slater, and Mr. J. E. Hamblett.

British Gardeners' Association.

LONDON BRANCH.

On Thursday last, the 12th ult., the third monthly meeting of the session was held at Carr's Restaurant, Strand, Mr. E. F. Hawes presiding over a large gathering. It was unanimously decided by the general meeting that all members of the London branch should contribute one shilling yearly to the journal fund, to assist in the expenses of publication, which have been very considerable owing to its free distribution to members.

Mr. J. Harrison Dick gave a lantern lecture on "Famous Old-time Gardeners." The subject was well illustrated by portraits of several of the most famous gardeners of the past, and their work was briefly explained in a clear and lucid manner. The evening proved a most instructive and elevating one, and, perhaps, may be the means of inducing others to take a greater interest in the work. A cordial vote of thanks was proposed by Messrs. Barnes and J. Wood, and carried with acclamation.

OBITUARY.

MR. MARTIN R. SMITH.

Horticulturists generally, and carnation-lovers in particular, will learn with regret of the death, on November 8, of Mr. Martin R. Smith, of Warren House, Hayes. Mr. Martin R. Smith, whose portrait we gave on p. 205 of our issue of March 30, 1907, was a great carnation enthusiast, and a clever raiser of seedlings. He practically made the yellow-ground picotee group, and he increased the usefulness of border carnations in a most remarkable manner. He also raised many splendid new Malmaison carnations, and had, latterly, been devoting attention to raising a new race of flowers of the old flake and bizarre types. For many years Mr. Martin Smith was president of the National Carnation and Picotee Society, and he contributed liberally to its funds, and exhibited largely at its exhibitions. A member of a well-known banking firm, Mr. Martin Smith found plenty of recreation in his garden, and took such a keen interest in the flower that most appealed to him, that his name will long continue to be associated with the improvement of carnations. Mr. Martin Smith's death causes a vacancy in the roll of the Victoria Medal of Honour in Horticulture.

Your "lead"—York Roses.

Start the planting season right. Lead off with York Roses. Take a hand NOW in the production of the most beautiful garden subjects. Here are reasons why you should.

Hardy York Roses will flourish anywhere in any garden, yours included. They do not quarrel with the weather, and are too big and strong to require any "nursing." Their one object in life is to provide you with more and better blooms than ever before—and they do it.

Dwarf Hybrid Perpetuals for Beds or Borders. Colours: white, rose, red, scarlet, or velvety black. 12 for 6s. 50 ,, 22s. 6d.

Fragrant Dwarf Hybrid Teas for Beds or Borders. Colours as above, with addition of yellow shades. Bloom continuously till frost. 12 for 8s. 6d. 50 ,, 31s. 6d.

Tea Roses, same price as H.T.'s.

Strong vigorous Climbers for Walls, Arches, Pergolas, etc., in all colours. 12 for 8s. 6d. 50 ,, 31s. 6d.

Leading named varieties in each case. Packed free and carriage paid for cash. Send along your order to-day. Art Catalogue free from

ANSWERS TO CORRESPONDENTS.

MARECHAL NIEL ROSE. — A. A. B., Morden: Provided your little house has a sunny aspect, you have no need to worry about the behaviour of your Marechal Niel rose; indeed, the rose appears to have grown splendidly. Afford plenty of ventilation, just keeping frost out of the structure, and then, in the spring, slightly shorten back the extremities of growth, remove some of the secondary growths, if they appear to be too numerous, and the rose will break from the eyes all along the canes, and flower freely. Of course, warmer conditions must be provided at that season.

AUTUMN-TINTED FOLIAGE.—T. A. G., Norwich: There are numerous trees and shrubs that present a fine appearance in the autumn when their leaves assume varied and beautiful hues. The common beech and lime must not be forgotten, and Acers provide several fine subjects, notably A. palmatum, A. p. atropurpureum, A. p. sanguineum, A. rubrum, A. saccharinum, A. platanoides Schwedleri, A. Colchicum rubrum, and A. circinata. Others are Amelanchier canadensis, Amydalus persica purpurea, Andromenda arboret. Azalea mollis, Berberis Thunbergi, B. aquifolia, B. vulgaris,and B. v. atropurpurea, Betula purpurea, Cerasus Avium, Cotoneaster Simonsi, Cratægus prunifolia, Euonymus europæus, E. e. augustifolius, and E. latifolius, Kolreuteria paniculata, Liquidambar styraciflua, Parrotia persica, Rhus cotinus, R. glabra and R. g. laciniata, R. typhina, Ribes missouriense, Stephanandra flexuosa, Vaccinium pennsylvanicum, Viburnum Opulus, Quercus american coccinea, Q. americana rubra, and Q. palustris.

EXPORTATION OF POTATOES TO IRELAND.—J. J., Wisbech: In view of the fact that Black Scab on potatoes has not yet been found in Ireland, the Irish Department of Agriculture has issued an order making it compulsory on every person having potatoes affected with disease to notify the fact to the Department. It also prohibits, under heavy penalty, the landing in Ireland of diseased tubers. In connection with this order, the Irish Department suggests that seed potatoes should not be purchased from Great Britain unless the vendors are prepared to give a guarantee that Black Scab was not known to exist on the farm on which the potatoes were grown.

[Since the foregoing was put into type we have been informed that Black Scab has been found in Ireland.—Ed. "G.M."]

CATTLEYA DOWIANA AUREA. — D. B. W., Cattleya Dowiana aurea flowers more freely than the type, and there is rather more yellow in the lip of the flower. This orchid thrives in the cattleya house, and, as it loves abundance of light, it should be suspended near the roof glass, but not so near that it will suffer harm from cold during the winter, either from frost or cold winds. The careful encouragement of early growth, and plenty of light and sunshine to ripen up such growth, are the points to remember, because the flowering season is late summer or early autumn, hence the need of ripening the growths early in the season. In and near towns it is almost impossible to properly manage Cattleya Dowiana aurea, but out in the country, where there is plenty of good light during winter and spring, there should be no real difficulty in flowering this handsome plant. During the bright hot days of summer only a very thin shading is needed for this cattleya.

CONTINENTAL ROSES FOR FORCING. —T. S., Bristol: We are glad to have been of service to you, and deeply regret that any Continental nurseryman should act so unscrupulously. We should be glad to learn from you, not for publication, the name of the firm that supplied newly-lifted plants for such a purpose.

VIOLETS IN FRAMES. — D. C., Craven Arms: We have been expecting specimens of the leaves showing the spotting you refer to. It is probable that late planting, followed by a close atmosphere produced by keeping the frames close so as to establish the plants as quickly as possible, is the cause of the trouble. During cold nights the frames should be shut down closely and covered with mats to keep the frost out. Give plenty of air on all favourable occasions, pulling the lights right off on bright mild days. Soot should be sparingly used, but a very light dusting of old soot, gently stirred into the surface soil, will help to deepen the colour of leaves and flowers. The spraying is correct. Remove all badly-damaged leaves, and burn them promptly.

NAMES OF PLANTS.

C. G., Bideford.—Epigæa repens.

T. P., Norwood.—Ligustrum Quihuoi.

G. R. E., Epsom. — 1, Abies grandis; 2, Picea pungens; 3, Veronica decumbens; 4, V. arborea; 5, Ligustrum lucidum.

F. G. H., Rotherham. — 1, Hedera Helix conglomerata; 2, Acer campestre; 3, Juniperus communis; 4, Thuia orientalis.

NAMES OF FRUITS.

T. B. P., Enfield.—1, Catillac; 2, not recognised.

J. A., Diss.—1, Northern Greening; 2, Lemon Pippin.

M. R., Wareham.—1, Waltham Abbey Seedling; 2, Cellini; 3, Peasgood's Nonsuch; 4, Gloria Mundi; 5, Chas. Ross; 6, Beurre Diel.

W. C., Bridgewater.—1, Lady Henniker; 2, Waltham Abbey Seedling; 3, Cellini; 4, Rosemary Russet; 5, not recognised; 6, King of the Pippins.

H. R., Scratby. — 1, resembles Yorkshire Beauty, but may be a local form; 2, Northern Greening; 3, Peasgood's Nonsuch; 4, Golden Reinette; 5, Flemish Beauty.

G. W., Stoke.—1, not recognised, probably a local variety; 2, Emperor Alexander; 3, Ringer; 4, Braddick's Nonpareil; 5, Bedfordshire Foundling; 6, Stirling Castle.

L. Q., Sussex.—1, not recognised; 2, Swedish Reinette; 3, Bismarck; 4, not recognised; 5, Malster; 6, Hubbard's Russet Pearmain; 7, not sent; 8, Yorkshire Beauty; 9, not recognised.

F. D., Kettering.—The apple is a pleasant one, but we think it is not of sufficient merit to put on the market as distinct. It very much resembles American Mother in appearance, but not in flavour, and we should like to see well-grown fruits from a young tree growing in a good position. Graft one or two trees next year, and see what the apple is capable of. It is certainly attractive in colouring, but too small to become popular, as at present grown.

V1 FLUID

THE WINTER SPRAY FLUID.

V1 FLUID CLEARS THE TREES OF MOSSES, FUNGI, AND LICHENS.

Easy to Mix. Easy to Apply. A Powerful Cleanser & Invigorator.

HAMPTON LOADE, NR. BRIDGNORTH. Sept. 1st, 1908.

Dear Sirs,—I may say your V1 Fluid has exceeded my expectations, foliage very dense and apples a lot larger, in fact I have some trees which only bore small ones but this season good bold fruit, which speaks for itself; trees very healthy. I may say I left some unsprayed, and it does not need pointing out which they are.

Yours faithfully, GEOFFREY BOOTH.

1 Gallon of this Fluid makes 100 Gallons of Spray Mixture.

Prices and Descriptive Booklet on application to:— Wm. COOPER & NEPHEWS, BERKHAMSTED.

"Brevity is the Soul of Wit."

IF time be worth money, and the possession of knowledge be equal to power, then it naturally follows that brevity is the source of wisdom. Hence those who write briefly or express themselves briefly, or go the shortest way to seek information, must inevitably save both time and money and store the mind more rapidly with information than those who fail to observe these golden rules of life. "Be brief," for it is with words as with sunbeams, "the more they are condensed the deeper they burn."

"The Busy Man's Garden Oracle."

THE busy man who regards time as of vital importance and who seeks knowledge about his garden need not waste precious hours in wading through ponderous volumes in search of the facts he requires. He has only to expend the modest sum of "Three and Six" to secure a copy of the New and Revised Edition of that marvellously concise book called the

ENCYCLOPAEDIA OF GARDENING,

By Mr. T. W. Sanders, F.L.S.,

to find that his wishes in the above direction have been fully anticipated.

THE book is, indeed, a model of brevity. Every tree, shrub, plant, fern, orchid, vegetable or fruit that *can be grown* in Great Britain in the open air or under glass, has its cultivation and propagation explained in as few words as possible, yet with sufficient fulness to enable the merest tyro to understand clearly all the details essential to command success. He is moreover supplied with the names, colours, time of flowering, height and native country of every species, the latter being arranged under the respective heading of hardy, tender, greenhouse, hothouse, and so on, so that the reader may at a glance obtain the information he requires. No other book has been issued from the press which supplies so much information in such a concise form.

Your Bookseller will supply a copy for 3/6 net, or the Publisher will send it on receipt of this Order Form and remittance of 3/10.

ORDER FORM.

THOMSON'S CELEBRATED MANURES.
For full advertisement see page iv.

TO-DAY! AND FOR YEARS AND YEARS PAST the XL ALL Specialities are and have been the best on the market. Where is the Gardener who does not pin his faith to one or the other of these celebrated Insecticides or Fertilisers? XL ALL FERTILISER has pleased all who have used it this season. The Sales of XL ALL FUMIGATOR prove that it is more popular than ever. XL ALL LIQUID NICOTINE INSECTICIDE is always spoken of by gardeners and growers as the most deadly to Mealy Bug, Thrip, etc. XL ALL WINTER WASH for dormant Trees acts like magic, clearing the Trees and Bushes of all Insects' Eggs, Moss, and Fungoid Growths. XL ALL LAWN SAND, a weed eradicator and fertiliser for weedy and poor lawns. XL ALL WEED KILLER used once a year "No weeds can live." Please ask your Nurseryman, Seedsman, or Florist for a copy of my small pink list, giving particulars of these and many other XL ALL Preparations, which can be obtained from the Horticultural Trade throughout the World. G. H. RICHARDS, Manufacturer and Patentee, 234, Borough High Street, London. S.E.

TEN POINTS

IN FAVOUR OF THE NEW EDITION

...OF THE...

ENCYCLOPAEDIA OF GARDENING.

By T. W. SANDERS, F.L.S., Editor of "Amateur Gardening."

1. Entirely new type.
2. New binding.
3. The inclusion of the species and hybrids in general cultivation, with description of their respective colours, height, time of flowering, native country, etc. This is a most valuable addition.
4. The breaking up of the solid nature of the text so as to make each cultural feature distinct.
5. The cultural notes have been considerably added to, especially those relating to vegetables and fruit and market culture.
6. The nomenclature of the genera has been thoroughly revised and brought up-to-date.
7. The cultural details are now given under the generic name only.
8. All the common names in general use have been included in alphabetical order.
9. There is no dictionary in existence which gives so much information on gardening in so small a space and for so little money.
10. It conveys in a nutshell all that the busy man requires to know about the cultivation and nature of any flower, fruit, vegetable, plant, tree, or shrub.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Jack Frost.

Although it is with a pang of regret that we see our tender garden plants, dahlias and others, cut down ruthlessly in full bloom by the first keen frost of the season, there is a vast deal to be said on the other side to make up for it. Mild winters are by no means without their drawbacks. Plants are like human beings, in the fact that without a good rest from time to time they become worn out, weakly, and may even perish outright. Without Jack Frosts's drastic narcotic many plants seem unable to stop growth so long as any stimulus of warmth persists, and since, sooner or later, a sharp snap is bound to come, not only are their efforts wasted and their unseasonable growths destroyed, but they suffer for it the following season in a marked degree. The normally latest efforts of many plants is to fashion and ripen buds for the following year, and if these are induced to grow prematurely, they are in all probability killed. Frost, too, is a potent agent in breaking up and aerating the soil. The hardest and toughest clods in the very act of freezing are broken up into minute fractions, and though the ice for the time being may cement these into rock-like masses, they fall asunder when the thaw comes like a house of cards. Doubtless, too, a hard frost kills many grubs and other insect pests which would otherwise escape the winter, to resume their ravages in the spring, and multiply their kind ad libitum. Frost, too, brings the snow, which though by no means a blessing to the town dweller, and in excess plays havoc with such shrubs and trees as have not had the wisdom to imitate their deciduous brethren, and so retain their foliage at the wrong time, is a good friend to many plants, which, under its protecting blanket, are saved from the rigour of the winter blasts or the destructive alternations of warm sun, hard frosts, drying winds, or drenching rains, which are so fatal to many of our alpine gems when exposed to lowland conditions, and are thus deprived of their natural shelter. The changes of the seasons, indeed, have been material factors in the process of plant evolution, and the inevitable result is that the healthiest conditions for plant existence are those in which the seasons are seasonable, when winter is really winter, and not a compromise in the shape of long spells of mild, or even warm weather, interspersed with spasmodic attempts to be what it ought to be. Of late years this has appeared to be the rule rather than the exception. Just as the English summer has been calumniously defined as three bright days and a thunderstorm, so our winters have been too frequently a series of three white frosts and a period of mugginess. The Christmas card of deep snow-laden landscapes, with a scarlet-breasted robin inserted as a necessary bit of colour, has become almost an anachronism, for we get such anomalies as the keenest frost of the winter in early October, and all the snowfall proper to the winter season in April. Jack Frost, too, in recent years has been but a fickle friend to winter sports, tantalising the skater with just sufficient ice to tempt a purchase of the needful footwear, and then retiring to make room for southerly zephyrs and a general thaw. In winter time, indeed, happy are those who, gifted with robust constitutions and sufficient cash, can visit those regions where true winter conditions prevail, and Jack Frost reigns supreme from autumn to spring. It is practically only such who know the true beauty of the season where the snow is deep and spotless, the hoar frost builds up its wonderful arabesques on the windows, not superficially, as here, but in accumulating masses of feathery scrolls, like glorified selaginellas piled one upon the other, while in the open it builds up, night after night, upon the snowy layers deep beds of lucent ice-moss of inconceivable delicacy, like diamantine plumage. With the thermometer at zero, or even far below it, a brilliant sky above, and these wonders at one's feet, one learns at any rate what winter can be when Jack Frost does his duty.

MR. C. HARMAN PAYNE.
Hon. Foreign Secretary of the National Chrysanthemum Society.

Mr. C. Harman Payne is well known at home and on the Continent as a keen lover of florists' flowers and an enthusiastic chrysanthemist. His knowledge of the history of the Golden Flower is probably unique, and his fine library of florists' works tells at once how earnestly he has sought for, and found that knowledge. It is just about five and twenty years ago that Mr. C. Harman Payne contributed his first article to the GARDENERS' MAGAZINE, and this appeared in our issue of December 22, 1883; from then until now, not a single season has passed without Mr. Harman Payne's signature appearing below chrysanthemum notes from his pen. For twenty-one years our friend has been Foreign Corresponding Secretary of the National Chrysanthemum Society, and he has taken a prominent part in the production of the literature published at various times by that body. In 1896 Mr. Harman Payne received from the French Government the decoration of Chevalier du Mérite Agricôle, given for his journalistic work upon chrysanthemums and his regular references to the new varieties raised by the various members of the chrysanthemum industry in France. In 1902 the higher honour of

Officer of the same order was conferred upon him. Mr. Harman Payne is a persona grata at Continental flower shows, and has been invited to act at almost all the leading exhibitions since the Ghent Chrysanthemum Show of 1889. He is also a corresponding member of the National Horticultural Society of France, and London correspondent for several foreign horticultural papers. Quite recently Mr. Harman Payne secured the blessing of every horticultural journalist by publishing a "Bibliography of Florists' Flowers," a work long needed, and one that he was specially fitted to compile.

The Gardens Around Bristol are numerous, interesting, and variedly beautiful, and our readers will remember we have published illustrated accounts of one group of these western gardens. We now propose to publish, on Dec. 12 and 19, descriptions of such well-known establishments as Tyntesfield, The Holmes, Clifton Zoological Gardens, Henbury Hill, Henbury Hill House, and Blaise Castle. Numerous illustrations representing beautiful scenes and distinctive features will accompany the text.

Chrysanthemum Souvenir de Scalarandis, of which we give an illustration in this issue, has strong claims upon the general body of cultivators, for with large, finely formed blooms are combined an excellent habit and abundant flower production. The form of the blooms, which are necessarily much reduced below the natural size, is admirably shown in the illustration, and it will suffice to say that they are rich golden yellow. Mr. Ladds, of Swanley, to whom we are indebted for the blooms figured, regards it as of much value for market culture, and we consider it likely to become highly popular for decorative purposes generally.

Potato Crop in Great Britain. A preliminary statement has been issued by the Board of Agriculture showing the estimated produce and yield per acre of the potato and root crops in Great Britain in the current year in comparison with last year. According to this statement the area under potatoes this year was 391,083 acres in England, against 381,891 acres last year; 143,692 acres in Scotland against 138,888 acres; and 27,330 acres in Wales against 28,141 acres. The area for Great Britain was 562,105 acres, as compared with 548,920 acres. The estimated total produce was 2,719,539 tons, or an average yield of 6.95 tons per acre in England; 1,048,559 tons, or an average yield of 7.30 tons per acre in Scotland, and 151,700 tons, or an average yield of 5.55 tons per acre in Wales. The total produce for Great Britain is estimated at 3,919,798 tons or an average yield of 6.97 tons per acre, as compared with 2,977,485 tons, or an average yield of 5.42 tons per acre last year. The average yield for the ten years 1898-07 was 5.78 tons per acre. It will thus be seen that the crop of potatoes harvested this year has been an exceptionally good one.

Co-operative Afforestation.—At the meeting of the Royal Commission on Coast Erosion on Tuesday, Lord Lovat suggested a national scheme of co-operative afforestation between landowners and the State. His lordship said the State should find the money, at a low rate of interest, and the landowner should find the land at its unimproved rate of value at the same rate of interest. The work of tree planting should be done locally, subject to State supervision. The landowner should not exercise sporting rights to the detriment of the woods. At any period the landowner should be able to buy out the State, repaying the capital sum spent, with compound interest, subject to the condition that he should replant to keep up the supply of timber. If a landowner did not buy, the profits on the State forest should be divided between him and the State pro rata. He was opposed to any thing in the nature of compulsory acquirement of land because of the opposition it would raise. What they feared in Scotland was a scheme of compulsion which would enable a man to take the eyes out of a farm.

R.H.S. Colonial Fruit Show.—The exhibition of Colonial grown fruits and bottled fruits, which was opened by Lord Strathcona and Mount Royal on Thursday last, is extensive and of a most interesting character. The British Columbia Government is evidently making strenuous efforts to capture the apple trade, and the fine display of apples from British Columbia indicates the possibilities of the colony in fruit production.

Chrysanthemum Tokio, one of the oldest of the Japanese section, and a variety introduced by Salter at a period when Japanese chrysanthemums were beginning to take the popular fancy, is still one of the very best for conservatory decoration. From an exhibitor's point of view, and judged for size of bloom, Tokio is beneath contempt, but grown in bush form, undisbudded, it is a splendid plant, producing large sprays of rather small but brilliant crimson scarlet flowers that provide a warm touch of colour so pleasing and necessary during November. Now that decorative and single chrysanthemums promise to take their rightful place in gardens, Tokio ought to become popular. At Kew it is grown each year in some quantity, and it is very bright at present in the No. 4 house.

The New Aquatic Tanks at Kew, in course of erection, promise, as we have already indicated, to become a handsome and distinct new feature in the coming year. The site, just outside the old museum, is a good one. A large oval, sunken pool will occupy the central position, and it is proposed to heat the water slightly so that sub-tropical water lilies, nelumbiums, etc., may be cultivated successfully in it. The four corner tanks are raised well above the surrounding level, and these are of triangular shape. Two other tanks will probably be built, one on either side of the big central one, but these will be much smaller. Flights of steps at either end of this Aquatic Garden lead to or from the walk around the central pool.

A Lancashire Willow Farm.—In the current issue of the "Kew Bulletin." Mr. W. Dallimore, arboretum foreman at Kew, gives a very interesting account of a willow farm at Mawdesley, a village about midway between Liverpool and Preston. It appears that the cultivation of various willows for basket making is the chief industry of Mawdesley, and has been for upwards of half a century. There are several willow farms, and Mr. Dallimore describes Mr. Cowley's, the largest, consisting at first of $23\frac{1}{4}$ acres, and developing into about 500 acres. Selected forms of Salix purpurea, S. viminalis, S. rubra, and S. Smithiana are the kinds of willows mostly grown. The willow industry at Mawdesley had its origin through the chance visit of a basket maker to the neighbourhood. He noticed a patch of willows growing in an out-of-the-way corner of a field and offered the farmer a price for them that seemed more than the land was worth. This led to the first idea for a willow farm.

The School of Forestry in the Forest of Dean has progressed satisfactorily during the year 1907-8. It is worthy of notice that of the nineteen passed students, four are now Crown woodmen, one each in Dean Forest, New Forest, Windsor, and Tintern, one is assistant inspector of poles, Postal Department, five are employed as foresters or woodmen on private estates, one is working in a large public nursery, eight are employed as Crown workmen in Dean Forest; thus no such student is out of employment. An additional area of four acres has been planted up in the experimental plots at Abbotswood. The museum has been improved by the addition of a collection of twenty-six species of injurious insects, showing their life histories and the damage they do to the forest trees, and by a collection of the seeds of 250 species of trees and shrubs.

Fertilisation of Tomatoes.—Within the past fifteen years or so, much attention has been devoted at the experimental stations in the United States to the fertilisation of tomatoes. Attention was first given to this matter at the Cornell station, where it was found that the amount of pollen used had an important influence on the form and size of the fruit. Much the same results have recently been obtained at the Michigan station. In carrying out the experiment four plants of each of six varieties were used to determine the effect of using varying amounts of pollen. All the flowers on one plant of each variety were emasculated and fertilised on one side of the stigma only. These invariably produced lop-sided and small fruits. All the flowers of one plant of each variety were fertilised with from one to five pollen grains. These produced very small solid fruits, with an average weight of about 1oz., and having no seeds or but one or two. All the flowers on one plant of each variety were fertilised with a large amount of pollen, spread all over the stigma. These produced fruits that were smoother and heavier than those produced from flowers that received but a small amount of pollen. The conclusions deduced from these experiments are that when pollen falls on one side of the stigma only, a one-sided tomato always results, and the larger the stigma the greater the irregularity. The amount of pollen applied determines to a great extent the size and smoothness of the tomato, but after applying a certain amount no further increase can be obtained. The small, irregular tomatoes grown under glass are caused largely by insufficient fertilisation. In the course of the experiment conducted with a view to determine the relative value of cross and self fertilisation in crop production, it was found that there was no appreciable difference in the number of fruits, but there was a slight gain in weight.

Single Chrysanthemums.—It is curious, considering the popularity of the single chrysanthemum in England, that our neighbours on the other side of the Channel should, in spite of their artistic sense in matters floricultural, be practically unacquainted with it. Of late years great advance has been made by some of our English raisers, and every season sees new additions to the already lengthy list. Among those met with in Paris in good form recently, Nellie Riding, golden-chestnut; Alice Crate, rose; Annie Stevens, rose; Mrs. H. J. Empson, yellow; Kitty Bourne, yellow; Narcissus, pure golden-yellow; Doreen, yellow; Mrs. E. Roberts, pale lilac-mauve; Pyrethrum, reddish-crimson; Miss Gunn, blush-pink; Perfecta, rosy-purple; and Yellow Ring, pure yellow, were attractive examples of this type.

Sports in Papaver Rhæas.—W. G. Smith, Esq., of Dunstable, wrote to the R.H.S. Scientific Committee in reference to the Shirley poppies with bracts at the base of the flowers and otherwise varying from the normal, saying that he had noticed similar forms at Dunstable in Papaver Rhæas, and he found that these came true from seed, at any rate for several years. He had also noticed forms with several flowers growing from just below the flower in its normal position, reminding one of the "hen and chicken" daisy, where inflorescences behave in a similar manner.

Certificates for Chrysanthemums at Paris. Certificates are always freely awarded by the Floral Committee at the Paris Autumn Show, and at the one recently held there was no exception to the general rule. Sixty-eight First Class Certificates were awarded to the following exhibitors of new seedling chrysanthemums: M. Calvat, eighteen; Vilmorin Andrieux, and Co., eight; M. Nonin, eight; Marquis de Pins, seven; M. Chantrier, five; M. Heraud, five; M. Traisnel, five; M. Durand, four; M. Montigny, three; M. Martin, two; M. Perret, two; and M. Maurice Martin, one.

Phylloxera vastatrix.- In an interesting communication to the "Daily Telegraph," on aphids, Sir Ray Lankester, K.C.B., writes as follows with reference to the phylloxera, which was introduced to Europe from Colorado about the year 1864, and did much damage in the Continental vineyards, and some injury to grape vines in this country: The introduction of this deadly parasite to Europe was a mere chance part of the blind mixing-up of the freely-adjusted products of all parts of the earth which civilised man is always bringing about with disastrous and terrifying results. In twenty years France lost 400 million pounds in consequence; three million acres of vineyards were destroyed. Other countries Germany, Italy, and the Cape also suffered. All sorts of remedies were suggested and tried, such as the application of poisons to the roots and the sinking of the vineyards under water. Gradually the only effective method of dealing with the case has been established. The old European vine stocks or standards have been grubbed up in all but the very choicest vineyards, and American vines have been planted in their place. On to these have been grafted cuttings of the local French vines, and they have taken kindly to their new conditions. The produce of the French vineyards is now greater than it has ever been. It had fallen from an annual yield of 1,300,000,000 gallons to [illegible] but in 1900 it had risen again to a yield of more than 1,400,000,000 gallons. This history is a striking instance of the vast importance to civilised communities of a knowledge and control of even such minute living things as the plant lice, and of the extraordinarily large results which obscure living things may produce. It must tend to convince reasonable men of the importance of accurate knowledge as to living things, and the necessity of expending public money in constantly improving and extending that knowledge.

Macrobiotic Seeds are those that maintain their vitality for a lengthy period. Leguminous seeds, and those of the mallow and myrtle orders, are especially long-lived. One reason for this longevity is found in the impermeable coat the seeds possess. Dr. A. J. Ewart has made numerous tests in relation to the germination of macrobiotic seeds, and he finds that the best method of inducing germination is that of steeping the seeds in sulphuric acid for a few hours.

RETROSPECTIVE CHRYSANTHEMUM SHOW IN PARIS.

Under the above title one of the most remarkable and instructive exhibitions connected with a flower show was held in conjunction with the recent Paris Chrysanthemum Show. It is due to Monsieur George Gibault, the librarian of the National Horticultural Society of France, to say that the idea originated with him, and that all the arrangements were left in his hands. The result was all that could be desired, for exhibitors, visitors, and officials were alike pleased with the show.

A large portion of the corridor connecting the two large greenhouses on the Cours la Reine was set apart for the Retrospective Show. There was ample wall space provided for hanging framed prints and pictures on, besides tables on which were arranged closed glass cases containing literary and artistic treasures too valuable to lie about without some such precaution. The French are too keenly appreciative of the help they may get by taking care of the exhibits than to allow them to lie about, as has been the case in this country.

On approaching the show the first sight that met us was a series of panels high up on the walls, containing the names of the most important men in the history of the flower, with a brief mention of their achievements. The panels, arranged in order of date, were as follows, the names being written in large capitals, and thus easily seen at a long distance from the actual spot, viz.,

Blancard, 1789.—Introduction of the chrysanthemum from China to France, followed by the introduction of various other varieties.

Bernet, 1826.—First seedlings raised in France.

Fortune, 1846.—Introduction of the pompon section.

Fortune, 1863.—Introduction from Japan of seven large-flowering varieties.

Calvat, 1891.—Raiser of the very large varieties.

In the middle of the central wall was an original oil painting, kindly lent by the family, a portrait of the introducer of the first large-flowering chrysanthemum into Europe in 1789. It was that of Captain Blancard. Underneath it was a coloured plate from the "Botanical Magazine" of the flower itself, which was known here in England as the Old Purple. In front of this portrait a great granddaughter of Blancard, in the presence of several members of the family, made a presentation of flowers to M. Fallierès, the President of the French Republic, when he paid his official visit to the show on the opening morning.

Around this picture were others in oil and water colours depicting many varieties of old chrysanthemums long since discarded by growers. There was a portrait of Louis Pelé, a name well known in the history of the flower, staged by M. Lemaire. There was also a series of photographs of old-time growers and raisers, and other objects of interest.

A handsome collection of bibliographical and art treasures came from M. Mommeja, a well-known French enthusiast. His contribution was exhibited in a large glass case running nearly half-way round the show, and comprised many illustrated Japanese books containing some very fine coloured figures of chrysanthemums, and Japanese engravings of specimen flowers of great artistic merit, besides some views of Japanese chrysanthemum gardens and exhibitions. Curious silks, brocades, also several Chinese coloured drawings on the wall bearing chrysanthemums on them, and Japanese lacquer ware and porcelain of the seventeenth and eighteenth centuries, all decorated with the same flower, formed an important part of the display. The same exhibitor had a large collection in another large glass case, of books and pamphlets and other rarities of literary interest.

On the walls were a large number of coloured engravings of old incurved flowers shown by Mr. Harman Payne, who also sent his album of coloured engravings, in which are contained some hundreds of pictures of old varieties, dating back for over a century. Literary curiosities, in the way of old Salter's and Forsyth's catalogues, pamphlets, etc., were also included. Another glass case of ample dimensions contained a series of large photographs of old chrysanthemums and other rare catalogues, some old portraits, a ticket of invitation to the chrysanthemum fête annually held in the gardens of the Emperor of Japan, etc.

From the Library of the National Horticultural Society of France there came quite a number of old French books containing early references to the flower and some rare pamphlets, unknown to us, by Moreau, Chevalier Soulange-Bodin, Desbordes, and others. M. Charles Baltet had an effective exhibit of several pictures of Japanese flowers, and engravings of some curious views in Japanese chrysanthemum gardens. There was also a good display from other sources of literary exhibits of great rarity and interest. We noted the two special Chrysanthemum Double Numbers of the Gardeners' Magazine, 1889-90, and other books, pamphlets, and old catalogues from the exhibits of Messrs. Vilmorin, A. Nonin, Loizeau, Rosette, Lecollier, etc.

ROSES AS STANDARDS.

Given a healthy stock and a wise selection of varieties, few subjects please more than standard roses. Indeed, there are a considerable number of roses that never show themselves to so good advantage in any other form of culture. It is necessary they should be strong, or at least exceptionally free in habit, otherwise their life is too short, and they soon dwindle away. A clean stock, neither old nor young when worked, and with the suckers at the roots carefully eliminated, will often be pleasing for many years. Always stake the stems. This need not be unsightly, and the only object is to keep them from swaying in the wind. A good-headed standard receives a lot of wind, and is by no means so secure as the same growth would be when close to the ground. Therefore, never plant standards in exposed positions.

As single plants upon the lawn, or in the centre of small beds, standards have a good effect. They are very showy when planted in shrubbery borders, and the protection thus afforded is what they need. A good plant in this connection gives double the furnishing effect of a dwarf. When they can be had upon extra tall stocks nothing can surpass the beauty of our weeping roses, such as the Wichuraianas, ramblers, and extra-strong varieties from other classes. One of the chief charms of standards is their clean flowers, free from dirt splashes; each bloom or truss showing to the best advantage. Not a few of our most beautiful varieties are never better than when on short standard stems Maman Cochet and its white counterpart, Mrs. Edward Mawley, The Bride, Viscountess Folkestone, Grace Darling, and many more that have a tendency to droop as their flowers become heavy, are extra pleasing when cultivated in this form. As a rule we find more perfectly developed blooms upon short standards. The plants, apparently, being capable of taking more stimulants without the tendency to coarseness often found in dwarfs when highly fed.

As for the most suitable varieties, these are now so numerous that one can have any colour or size. They may be compact, free, or of weeping character. The only point is to select sorts full of vitality and of good constitution, bearing in mind for what object you are planting, and choose accordingly from any good list.

A. Piper.

CIDER ORCHARDS.

(Concluded from page 812.)

◆

Method of Selecting Varieties.

Coming now to the varieties themselves, it follows from what has been said above that at least nine different sorts of types are required, viz., a "sharp," "sweet," and "bitter-sweet" for early, mid-season, and late orchards, To these might be added those varieties which yield a good cider without blending; but since they can be also included either among the "sweets" or the "medium sharps," it is hardly necessary to deal with them separately here.

Necessary characteristics.—In making a selection of the best varieties of each type, not only must the usual characters of growth, cropping qualities, resistance to disease, and so on, be taken into consideration, but there are also special characters of vintage importance to be estimated. One of the chief of these is the characteristic flavour of the variety, a factor which is frequently sufficiently pronounced materially to affect the value of a cider. Two kinds of apples may have approximately the same chemical composition, and may yield the same type of cider, and yet the values of the two ciders may be widely different, owing solely to the difference in flavour of the two sorts. This feature is usually much more strongly marked in the case of sharp varieties than with other kinds.

Another most important factor is the rate of fermentation of the juice. Owing to a number of causes this differs to some extent even with the same variety, but, generally speaking, the whole of the available evidence points to the conclusion that under normal conditions some varieties yield slowly-fermenting juices, others give juice fermenting at a moderate rate, and others again produce juices capable of rapid fermentation. The general experience of cider-makers goes to show that members of the latter class are undesirable, since a dry cider only can be obtained from them by natural means. The flavour also is usually coarse. The other two classes are useful, the slowly-fermenting juices being naturally adapted for the production of sweet ciders, and those fermenting at a moderate rate being suitable for the preparation of dry, medium, or moderately sweet ciders.

Varieties which yield juices subject to an excessively slow fermentation should not be planted too extensively, since the ciders made from them are particularly liable to certain disorders, as, for example, cider sickness. If, however, a supply of more rapidly-fermenting juice is available for blending, such varieties may be utilised with safety.

Other important points in connection with the selection of varieties are: (a) The yield of juice, which frequently varies by as much as 10 to 15 per cent. of the weight of the fruit in the case of different varieties; and (b), the degree of firmness of the flesh, hard-fleshed varieties being less easily bruised in gathering and handling than soft-fleshed kinds, and therefore less liable to decay and to the consequent taint in flavour, while they are more suited for storage when that is necessary.

Grouping Varieties in a Series of Orchards.

In cases where it is proposed to plant a series of orchards, the idea of grouping the varieties, not only by their ripening periods, but also by their relative rates of fermentation, would be worth consideration. Thus there might be orchards, the produce of which would yield either a sweet or a dry cider, whether consisting of early, mid-season, or late varieties. Some arrangement of this nature would certainly tend to simplify matters for the cider maker, and would probably add to the value of the orchards from the growers' point of view, since a definite idea of the quality of the produce of such orchards for cider making purposes could be formed, and better prices for the fruit would be obtainable, just as at the present time better prices can be obtained for fruit of known value than for mixed fruit about which little is known.

Useful Varieties.

Concerning individual varieties which can be recommended for propagation, any list which is given must be regarded as provisional only. The experimental work at the National Fruit and Cider Institute on the vintage qualities of different varieties of repute has shown that many kinds have been rated hitherto above their real value, and that there are in existence several comparatively or absolutely unknown sorts which appear to be of superior quality, so far as can be judged from the limited experience of them which it has been possible to gain since the commencement of the work three years ago. A very large number of varieties have been tested, and the most promising kinds are being propagated at the institute. Conclusive results cannot be arrived at for several years, but meanwhile growers may be glad to have some guide as to the most suitable varieties to plant. The following list has therefore been drawn up, and contains representatives of each class required. All of the varieties named are not necessarily the best of the kind which are to be found, but every variety mentioned has been tested at the National Fruit and Cider Institute, and is decidedly above the average of its class in quality. Superior varieties will no doubt be found after further research:

Varieties Recommended for Propagation.

—	Sharp Varieties.	Sweet Varieties.	Bitter-sweet Varieties.
Early	Backwell Red.	Belle Norman. Horners. White Jersey. (All mild bitter-sweets.)	Cherry Norman. Major Knotted Kernel.
Mid-season	Cap of Liberty. Dufflin. Foxwhelp. Frederick. Kingston Black.	Sweet Alford. Woodbine.	Masters Jersey. Strawberry Norman.
Late	Lambrook Pippin. Red Soldier. Yellow Styre.	Bell.	Chisel Jersey. Dabinet. Royal Jersey.

Many of these kinds are not at present obtainable from nurserymen; but all are being propagated at the institute, and, in due course, the trees will be available for distribution. The best plan for those who wish to grow them at once will be to graft such sorts on the heads of young standard trees of other varieties; and it is probable that this method should be regularly adopted for weakly-growing varieties, such as Kingston Black, a strong-growing variety being selected for the standard.

Replanting Old Orchards.

The question of replanting old orchards needs careful consideration. It is customary in many districts to fill up gaps in old orchards by planting young trees in the place of the old ones which have died off. In some instances, when an old orchard is worn out, the trees are grubbed up and their places filled with young standards. This plan cannot be recommended. In the first place, the young trees rarely, if ever, make such good growth as they would if planted in new land, even although all the old trees have been removed. Striking examples of this may be seen where two adjoining orchards of young trees have been planted at the same time, the one on new land and the other on the site of an old orchard. After a few years' growth the development of the trees in the latter case cannot be compared with that in the former. If this is so, where the old trees have been entirely removed, how much greater must be the prejudicial influence on growth in those instances where a young tree is planted among old ones to fill a gap caused by the death of one of the latter. It is to be expected that the soil during the life of an orchard would become impoverished of the elements of food which are needed for the growth of apple trees, and that a second orchard planted on the same site would suffer accordingly. There is also a possibility of the soil becoming "apple-sick."

A second, and most important, reason against the replanting of old orchards is the risk of infection of the young trees by insect and fungoid pests. Most old orchards are hot-beds of pests of various descriptions, and although all old trees may be removed, the soil will certainly remain laden with the pests. Particularly dangerous are root fungi, such as Tree Root Rot, Armillaria mellea, also known as Agaricus melleus, This fungus spreads in the soil, and there appears to be no adequate means of eradicating it. In most old orchards one can find trees attacked by it, and although it may be unable to attack healthy unwounded roots, it can, sooner or later, find an entry into the tree through a damaged root, and eventually cause its death.

The whole question of the extension of orchard planting is thus reduced in the end to one of finding fresh land available for the purpose. The matter is one in which both landlord and tenant are concerned, and without entering here into a discussion of the points involved, the hope may be expressed that, in future, no obstacle to a satisfactory arrangement may arise, as it has done in the past, owing to inattention and want of care of the young trees after planting.

NEW PLANTS, ETC.

◆

CHRYSANTHEMUMS.

Hetty Wells.—A good decorative Japanese variety, with fine long stems and stout petals. The blooms are graceful and of a pleasing orange-buff shade. F.C.C., N.C.S., November 16. Messrs. W. Wells and Co., Merstham.

Frank Payne.—A beautiful and refined Japanese variety of very pleasing light blush-pink colour. The florets are of moderate width, and they curl lightly and prettily. F.C.C., N.C.S., November 16. Messrs. Wells and Co., Merstham.

Noreen Jay. — A Japanese decorative or market variety with broad-petalled, rather loose flowers of a very brilliant crimson-scarlet hue with bronzy reverse. F.C.C., N.C.S., November 16. Messrs. W. Wells and Co., Merstham.

November Gold.—A beautiful rich golden-yellow Japanese decorative or market variety. The blooms are deep, substantial, borne on long stems, and of fine substance. F.C.C., N.C.S., November 16. Messrs. W. Wells and Co., Merstham.

Merstham Jewel.—A very beautiful single variety, large-flowered, and of good form. The colour is bright reddish-bronze with a yellow zone round the disc. F.C.C., N.C.S., November 16. Messrs. W. Wells and Co., Merstham.

Peter Pan.—A very distinct single variety, rather small-flowered, and with the flowers opening in long sprays. The colour is bright yellowish-fawn. F.C.C., N.C.S., November 16. Messrs. W. Wells and Co., Merstham.

Albert Williams.—A solid yellow incurved variety in the way of C. H. Curtis, but with rather broader florets. It closely incurves, and, apparently, keeps well. F.C.C., N.C.S., November 16. Mr. H. W. Thorp, Darrington, Worthing.

Roses may be grown to perfection by following the instructions given in Roses and Their Cultivation, by T. W. Sanders. A selection is given, with description of all the best varieties, and full details for culture outdoor and under glass. Price 2s. 6d. net, by post, in box, 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

GERBERA NOTES.

How seldom it is that one comes across a really first-rate group of gerberas in this country! It would assuredly be worth while for those who grow them (particularly G. Jamesoni) to make themselves a little better acquainted with their requirements.

The ordinary type of Gerbera Jamesoni has probably entered an enormous number of private gardens, and it would have been well for the future of the showy South African if a greater success had attended its culture. As it is, the cult of the gerbera seems already on the decline, and it would be a thousand pities if it were allowed to dwindle in public favour, and finally be lost to English gardens. It is interesting to note that G. Jamesoni, or the Barberton daisy, is only to be found in a wild state at the De Kaap Valley, near Barberton.

CHRYSANTHEMUM SOUV. DE SCALARANDIS.
A fine market variety with golden-yellow flowers.

It was undoubtedly the vivid orange-scarlet colouring which first aroused interest in this gerbera, and it is this form which has made its way into our gardens. But in addition to the scarlet, which may be taken as the type, there are many varieties found in a similar wild state in the De Kaap Valley. These include the white (which is known amongst the Colonists as the silver daisy), the yellow, and the pink forms, and there are several intermediate shades, which are doubtless the result of natural crosses. Of these latter collectors have definitely defined salmon, terra-cotta, maroon, buff, white with rosy suffusion, and blush varieties. The fact that there is such a potential wealth of colour in the race should do much to bring them once more before the public.

Possibly the half-hardy character of G. Jamesoni has been against it, and the habitat and the special character of the Barberton daisy have not been taken into consideration. Granted that the daisy is a true perennial, and that the rhizomatous rootstock guarantees the display of the next flowering season, it will be realised that a resting season is necessary, and also that the rhizomes be fairly well ripened to undergo the period of rest. Now, in order to secure this, the gerberas must be grown in a warm, sunny, and well-drained position, where they can have, as nearly as possible, the conditions that prevail in the Barberton district. The rocky, well-drained soil, which is baked during the hot, sunny periods, conduces to the necessary ripening and keeping of the plants, which, with the advent of the early rains break into new life, and rapidly put forth foliage and blossoms, the latter of which create quite a long successional display.

In making a suggestion for gerbera culture in this country, I may be justified in following natural conditions as far as possible. The warm, sunlit, well-drained positions in the rock garden should be chosen for planting spots. Well-hardened plants should be selected, and should be put out in sandy loam (to which has been added some decayed manure), in April. One will have the season's blossom outside, and the summer sun will be assisting in the display, and preparing the rootstocks for the colder season. But during the autumn rains shelter must be given, and I would suggest the use of a sheet of glass, wedged into position, to throw off the rainfall from each group. When rigorous winter weather sets in it is my idea that further protection should be afforded, and to ensure this, I consider that a little rough dried hay or leaves, or similar material, should be pressed in firmly between the glass cover and the plants. This will protect from biting wind and gripping frost. With the spring, glass and covering could come away, and the spring showers be allowed to permeate the soil, which should still be fairly dry.

I have endeavoured to generalise in these notes, and doubtless many south-country growers will find a glass covering almost sufficient in an ordinary winter, but this is a matter for individual trial. In the colder districts I should fancy that the Japanese species, G. Anandria, would prove more suitable for outside culture, as it is much more hardy. It has bright red flowers, so would provide the touch of brilliancy desired. Where one desires the Barberton daisy, and yet fails altogether to keep it out of doors during winter, I would advocate growing it in pots in a frame, thus giving winter protection, and then plunge, or plant it out in late spring. For this purpose one could, if necessary, raise a batch of seedlings every year.

It would be interesting to learn whether the varieties raised at the Cambridge Botanic Garden by Mr. R. Irwin Lynch, are in any degree hardier than natural varieties, which furnish the seed in South Africa for our gardens. But perhaps the plants raised have not been subjected to any such trial. It is just possible, however, that if one obtained seed from plants which had been successfully wintered out of doors in England, these might produce plants more fitted for our climate than the South African.

There are other species of gerbera in cultivation, including some Himalayan forms, but as these are little known, and of no great value, they are really outside the scope of these notes. P. S. HAYWARD.

GLAUCOUS CONIFERS.

When seen at their best the various glaucous leaved conifers present a very attractive group of trees and shrubs, and each particular example forms an excellent subject for a specimen lawn plant. Unfortunately, people whose gardens are situated in the neighbourhood of large cities or towns, are often unable to cultivate these subjects well, as they are very impatient of an impure atmosphere, and it is impossible to get the best from them when the air is laden with soot or chemical fumes. In more salubrious localities, however, especially where the atmosphere is humid and the ground naturally damp, but not water-logged, these conifers often thrive amazingly and form very beautiful specimens.

BLUE ATLANTIC CEDAR AT EAST BURNHAM PARK.

The accompanying illustration represents a glaucous or "blue" cedar, Cedrus atlantica glauca at East Burnham Park, the residence of Mr. H. J. Veitch, V.M.H. It is a fast-growing tree, and has a rich bluish tint. It is often grafted on to the type, but a certain number may usually be selected from a batch of seedlings. There is also a glaucous form of the deodar, Cedrus Deodara, the former, however, is the best for general planting.

Amongst the spruces there are two or three with glaucous foliage. The best is Picea pungens glauca. P. pungens is a North American spruce of vigorous habit with strong, sharp needles or leaves. The variety is quite as strong growing as the type, and the leaves are of a lovely glaucous hue. It is known under the common name of "Blue Spruce." Another variety of the same species with glaucous leaves is called Kosteriana. Picea Engelmanni is another North American spruce of which a glaucous variety is known. It resembles the above-mentioned plant to some extent.

Among the firs or abies we find several with bluish or glaucous leaves. The best coloured of all is Abies nobilis glauca. This, under favourable conditions, forms a large tree, and is of an extremely ornamental character. Unfortunately, however, it is not often seen at its best, for it is frequently attacked by a disease which causes curious gouty swellings all over the branches which often result in the death of the trees. A magnifica is closely allied to A. nobilis, and both it and A. amabilis have greyish leaves. A. concolor and A. Lowiana have a somewhat bluish appearance, whilst of the former there is a pretty variety with silvery foliage called argentea Wallezi. The Douglas fir offers a glaucous variety, whilst there is also a glaucous-leaved form with pendulous branches. The Hemlock spruces or Tsugas are all ornamental conifers, and one or two of the best have glaucous foliage. Possibly the most showy of all is T. Pattoniana glauca. T. Pattoniana is a native of California, where it inhabits the mountainous regions. Unfortunately it is not particularly hardy, and can only be grown successfully in the milder parts of the country. Several pines exhibit a more or less greyish appearance, which is due more to silvery lines on the leaves than to glaucousness. There are, however, several species which are very glaucous in a young state. One of the best is P. canariensis. This, during the first year of its life, forms excellent little table plants when grown in small pots. It is not, however, a hardy species.

Cupressus Lawsoniana includes a number of glaucous forms amongst its varieties. Some of the best are glauca, Silver Queen and glauca pendula. The yellow cypress, Cupressus nootkatensis, gives us a glaucous variety, as also does C. thyoides. The tender Cupressus funebris or C. Cashmiriana, as it is sometimes called, gives us one of the most beautiful tender conifers we possess in the variety glauca. This is of particularly graceful outline, the leading shoot being erect and the main branches more or less horizontal; the secondary branches, however, are pendulous and hang down to a depth of several feet. The junipers offer several glaucous varieties; chinensis, virginiana, and communis all having bluish-leaved forms. Though these represent the best of the glaucous leaved conifers they do not exhaust the list, but they are sufficient to show what a wide selection we have of this particular group of trees and shrubs.

Royal Gardens, Kew.

SHRUBS WITH ORNAMENTAL LEAVES.

It is surprising how rich and varied are the tones of colour which prevail among trees and shrubs, and although these are discernible to the questioning eye at every season of the year, they become in the autumn months conspicuous even to the most careless. Particularly is this the case with those whose leaves are deciduous, as in nearly every instance they change from the normal green of summer, so that in autumn they become robed with colours which are especially effective in the landscape, and, in some instances, the results are more refined than we produce with flowers.

Apart from their glowing autumn colours, there lie untold possibilities in the skilful grouping of the various ornamental-leaved shrubs; the diverse character of the leaves are rarely shown to the best advantage unless one type of foliage is brought in to contrast with another. To illustrate this,a large bed of shrubs having compound leaves like Rhus typhina, Rhus sinica, or Rhus glabra lacinata, is not easily excelled if we employ them one at a time, yet how speedily is the individual character of each destroyed by grouping them together, or in company with acacia, gleditschia, koelreuteria, sophora, and taxodium. All have compound leaves, each is beautiful in outline and delicate in colour, and when seen as specimens or in groups of a kind cannot fail to evoke admiration. When we employ them in mixed shrubberies we must necessarily group with them shrubs whose leaves have different characteristics, such, for example, as those having small entire leaves, like Berberis Knighti or B. Thunbergi.

The same treatment accorded to catalpas, cercis, or paulownias, renders them doubly effective, as it rarely expresses the highest form of planting to employ extreme types in juxtaposition. It is much better that the transition be a gradual one, through which every delicate curve of leafage, and branch, and symmetry of form may stand revealed, and that every group or individual may unfold to us its character, and, as it were, speak through these glowing colours in language all may understand.

This system of grouping might be extended indefinitely; much of its success depends upon the planter's acquaintance with the various trees and shrubs, both in relation to the form and colour of their leaves, and also to their ultimate development. Happily, there is a wealth of deciduous shrubs which can be employed in masses of a kind; these include Aronia floribunda and A. erythrocarpa, Euonymus alatus and E. atropurpurea, Colutea bullata—a dwarf form, with interesting crisped and curled compound leaves; Cornus florida rubra and C. macrophylla, Ononis rotundifolia, Rhamnus alpina, and Sambucus plumosa tenuifolia; then we have also deutzias, philadelphuses, and spiræas, etc., every one of which gains by grouping in their own kinds, and form a distinct contrast and change to the sparse planting so frequently seen. Two extremely beautiful shrubs with compound leaves are Cæsalpinia japonica and Xanthoceras sorbifolia; neither are too well known in gardens, although the latter has a growing reputation as a forcing shrub, for the pretty horse chestnut-like flowers are easily forwarded by gentle forcing in heat. Cæsalpinia has cream-coloured pea-like flowers, but the plant is not too hardy in some gardens, except the soil be well drained and the exposure a sunny one.

With plants which ultimately develop into trees there is less difficulty in supplying undergrowth or foreground subjects. Those with distinct leafage, like the tulip tree and maidenhair tree, should be accompanied by shrubs whose foliage is less interesting, so that the eye may naturally be led to seek out and dwell upon their merits. Trees whose foliage is conspicuous at all seasons, like Prunus Pissardi and spinosa purpurea, or Pyrus Malus Niedwetzkiana, stand out with striking effect upon elevated positions, or as background for every tone of green comes into relief against their strong and ruddy purples. One final word upon the grey tones, whose mission is always to prevent discord. Atriplex halimus belongs to this class, and though the grey is not of the best, it has at least the advantage of being cheap to plant. The sea buckthorn yields as good a grey as can be found among deciduous shrubs, yet the lithe wands of Tamarix gallica can scarcely be surpassed in effectiveness when planted in a great mass. There are grey tones among evergreens, which no hardy deciduous tree or shrub can rival: we have it in part among olearias and again in old-world favourites like rosemary, lavender, santolina, and rue; but the softest tones occur among conifers, as we have it in the filament-like growths of the grey forms of chamæcyparis, juniper, and again in the cedars: the young growths of Abies concolor exhibit this tone in a striking degree: Picea pungens argentea carries it on until the full cadence is expressed in those lustrous blue-grey tones, which characterise the foliage of Picea pungens glauca.

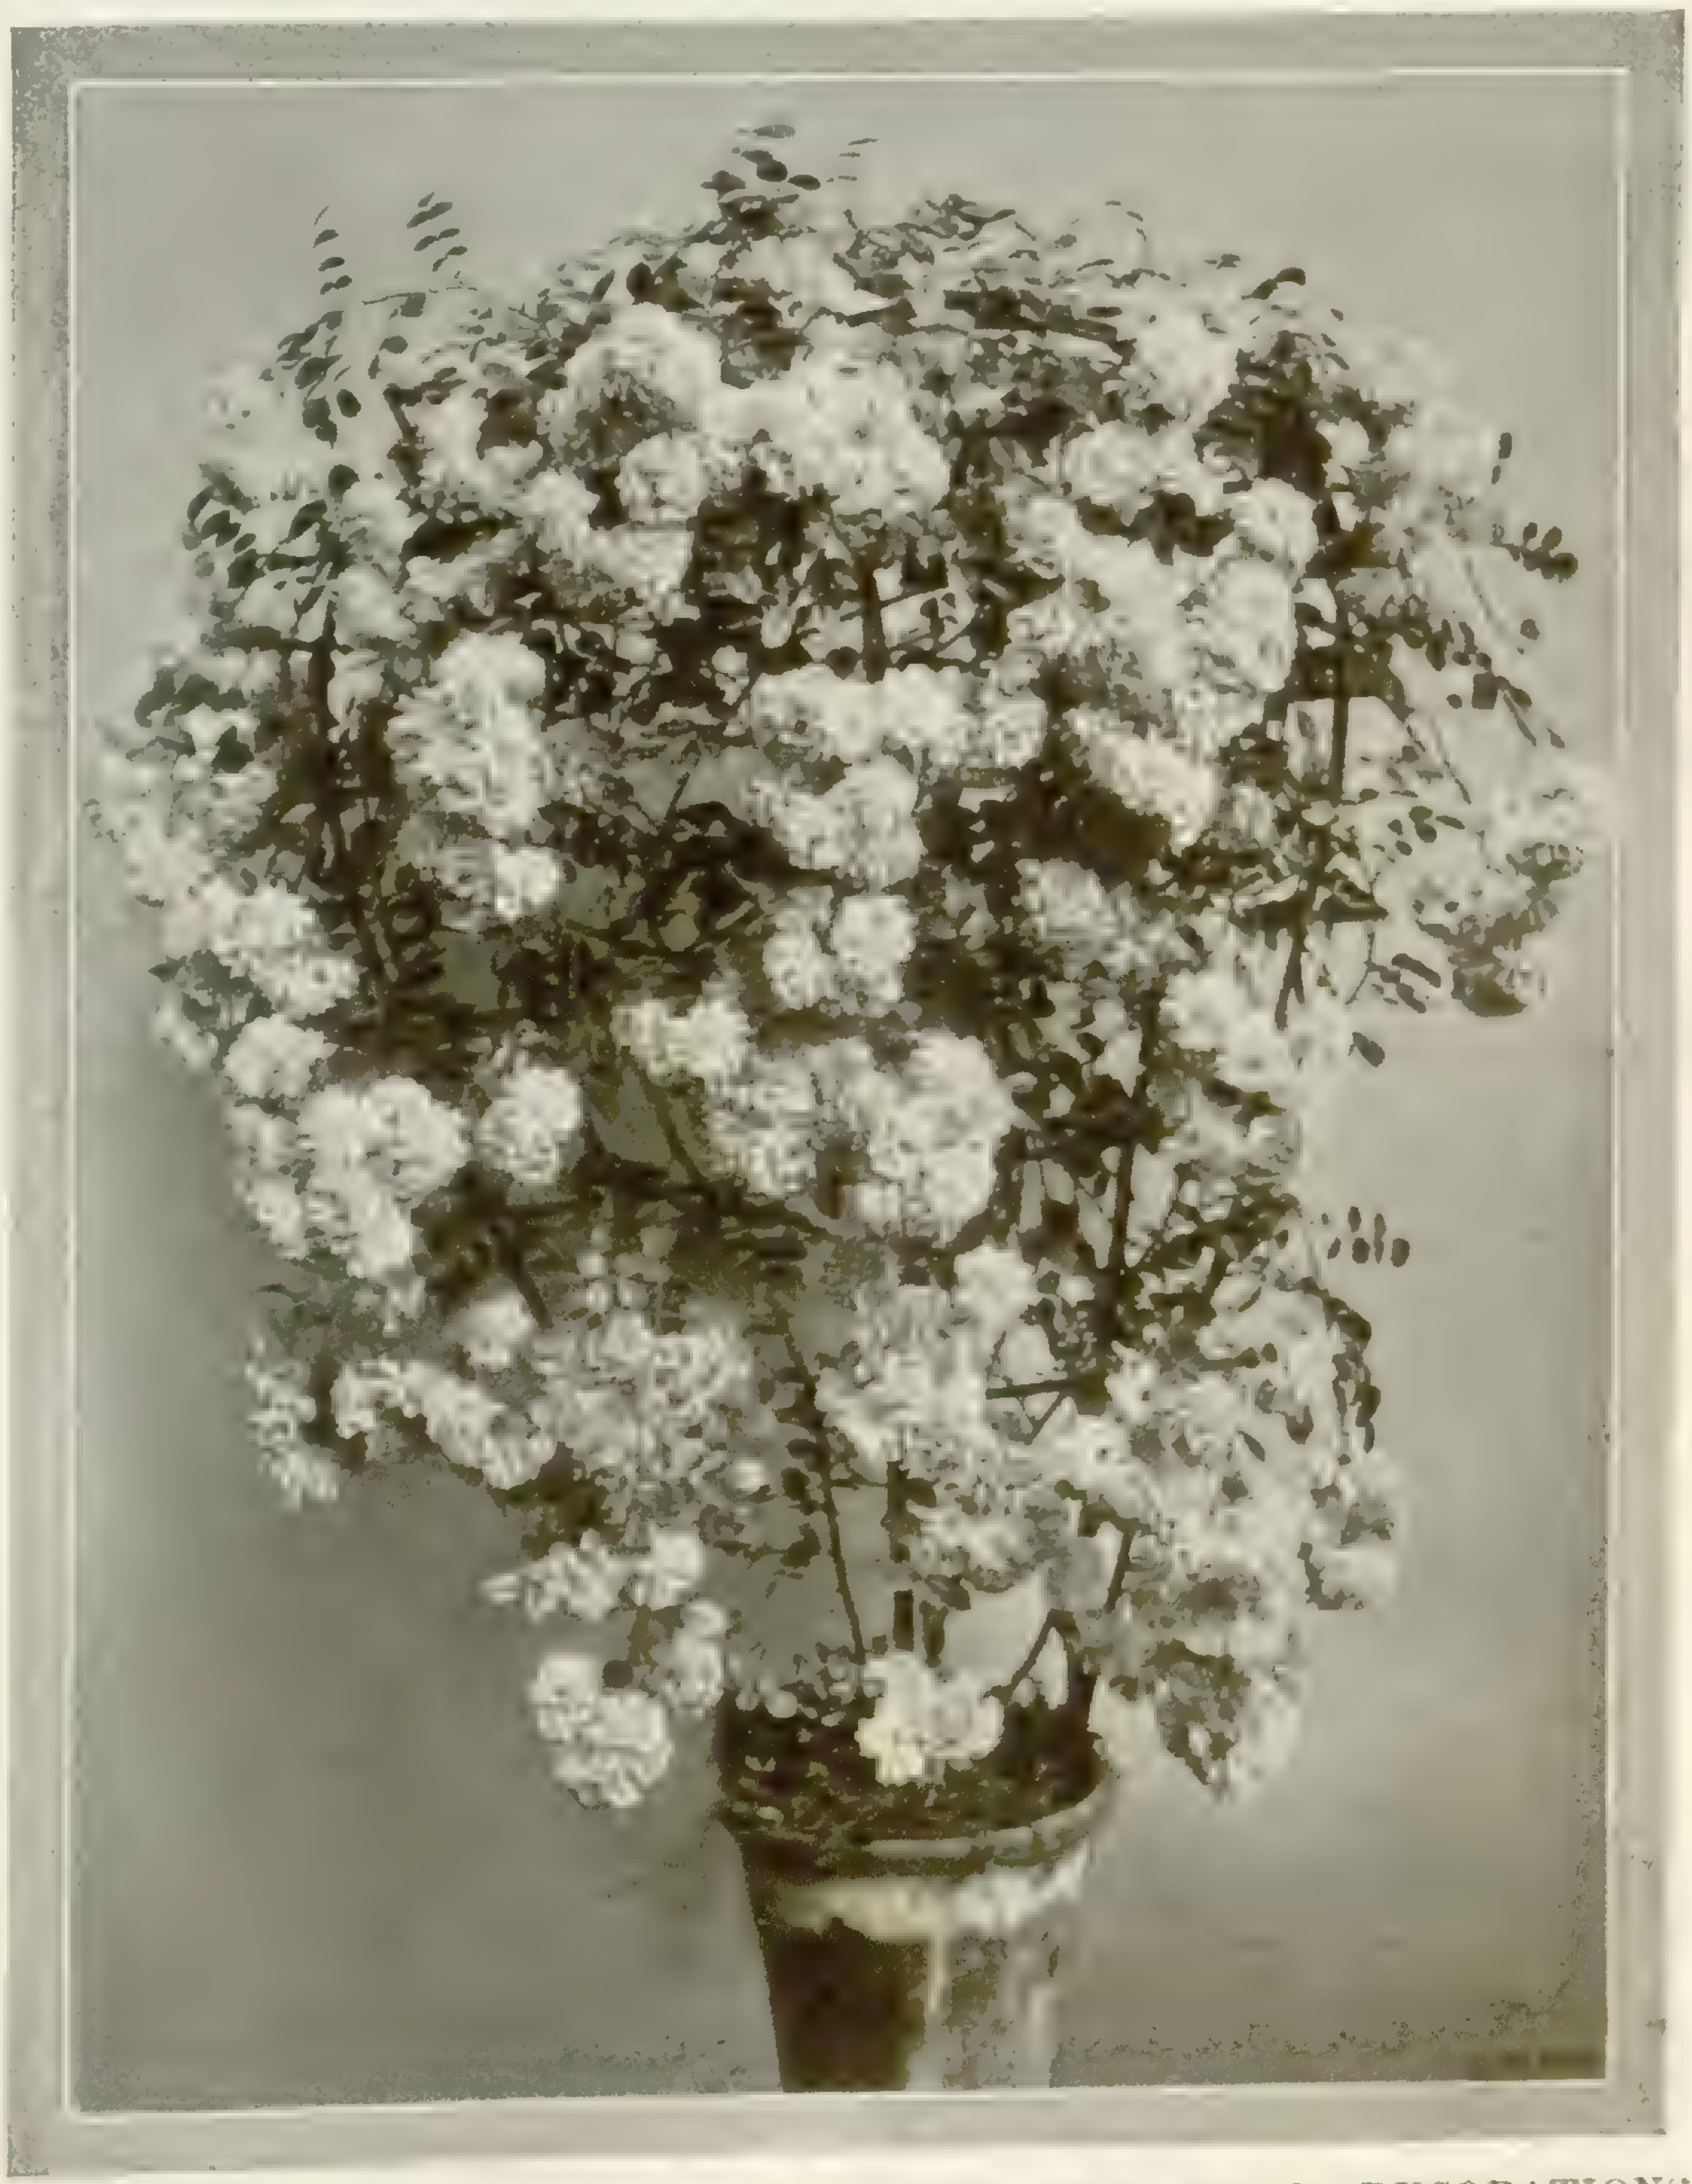
BULB CULTURE.—A practical treatise on the culture of hardy, hothouse and greenhouse bulbous and tuberous rooted plants is "BULBS AND THEIR CULTIVATION," by T. W. Sanders, price 2s. 6d. net, or by post 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

RAMBLING ROSES FOR DECORATIONS.

Within recent years we have on several occasions called attention to the usefulness of certain of the rambling roses for the embellishment of the conservatory and indoor decoration, and we have illustrated some of the varieties best suited to these purposes. Grown as pillars and standards on rather tall stems, they can be used to great advantage in the formation of groups in corridors, ball-rooms, and other spacious apartments, and they present a pleasing appearance when placed singly in suitable positions. In the conservatory, well-flowered examples, whether in pillar or standard form, can without difficulty be so associated with both tall and dwarf-flowering and foliage plants as to produce the most charming effects. The utility of pillars and standards, and also of formally trained cylindrical specimens, is now fully recognised by the leading floral decorators in London, and as a consequence their cultivation has assumed considerable proportions in some of the principal market growing establishments within a convenient distance of the Metropolitan markets.

There is yet another form in which rambling roses can be used with success in the embellishment of indoor apartments, and with the aid of the illustration of the finely flowered example given herewith there should be no difficulty in persuading our readers that it is well deserving of attention. In this form the plants are trained somewhat in the form of a shield, are flat or nearly so on either side, and so manipulated as to produce the flowers on one side. Trained in this manner the plants occupy very little space measured from back to front, and are consequently useful for placing in positions where the space would not be sufficient for pillars with somewhat spreading branches or standards with large round heads. These shield trained plants can be placed quite close to the wall, and are, therefore, most useful for narrow corridors either placed on the floor, or on pedestals, or brackets, as may be preferred. They are also admirably adapted for placing on the landings of the principal staircase; and it is not difficult to understand that placed on strong brackets round the walls of a ball-room finely flowered specimens would produce a distinct and beautiful effect.



RAMBLING ROSE LADY GAY, AS GROWN FOR WALL DECORATIONS.
Colour of flowers, rich rose pink.

The specimen we have the pleasure of illustrating is one of a large number grown by Messrs. H. Cannell and Sons, of the Swanley Nurseries, who, it will be remembered, included several splendidly flowered shield-trained examples in their fine group at the Temple Show in May last. The most suitable varieties for this method of training are those like Lady Gay and Dorothy Perkins which have a drooping habit and bear flowers of a colour that appears to advantage under the influence of artificial light.

G.

SIMPLE ROCK GARDENS.

There are many to whom the elaborate and imposing rock garden is a forbidden luxury, either because of its cost or on account of the position it has to occupy being such that one of any height would be unacceptable to its owner and his friends. There are many to whom the expense of a large rockery is an insuperable obstacle, and who must content themselves with one of less ambitious character.

[Photo: C. Godfrey Bennett.

ROCK GARDEN, COOMBE WOOD, CROYDON, THE RESIDENCE OF A. LLOYD, ESQ.

These need not, however, despair of the successful cultivation of the greater number of the best alpines, seeing that these can often be cultivated as successfully or even better on the low and cheaply built rockery than on the one which is of an effective character in itself, because lofty and imposing in its dimensions.

The two illustrations which accompany this show how much can be done at a moderate cost, and with what freedom many alpines will grow and bloom when only a little above the ordinary soil level. These two views, at Coombe Wood and Coombe House, Croydon, will do more than pages of print to illustrate the truth of my proposition, and give an admirable object-lesson to those who wish to construct such simple rockeries.

The two rockeries in the illustrations are examples of the best work of the kind, the paths winding in and out among the little mounds which form the basis rockery, and which have fittingly placed about them the blocks of stone which are of such benefit to the flowers, and which harmonise with their character.

In constructing rockeries of this class the mounds of soil which form the basis of the rock garden should be of good quality, loam, leaf-soil, sharp sand, and grit being freely used. The stones should be of one kind, and so arranged as to present a natural appearance, either of an outcrop of rock or giving the idea of a natural fall of stones from some higher ground. These stones ought to be well embedded in the soil, so that they will not be readily overthrown by the frost, and firm enough to stand under the feet of the worker among the flowers. In one or two places a little rockwork pool will often come in admirably; and where a streamlet, or even a trickle of water into the pool from a small rocky channel can be added, the effect will be all the more pleasing.

It is almost impossible to limit the selection of plants which can be happily accommodated on such a rockery. The margins may be fringed and the higher parts crowned by arabises, aubrietias, sedums, saxifrages, iberises, arenarias, cerastiums, and such free-growing subjects. A moist stone may be clad with Arenaria balearica, whose tiny white stars will spangle the carpet of green so beautifully, even in a shady spot. In the crevices, sempervivums, encrusted or silvery saxifrages, androsaces, and many other choice things will flourish, and a greater appearance of height may be given where desired by the introduction of a few of the dwarf conifers, rhododendrons, and other beautiful shrubs so plentiful nowadays.

The little rocky pool in full sun may be made delightful by its occupation by a water lily or two, while in another the fragrant flowers of Aponogeton distachyon will delight the passer-by. The rocky steps, should such be necessary, may have between the stones some of the dwarfer campanulas of the type of cæspitosa, garganica, or Portenschlagiana, while these and others will fill many a crevice between the stones which constitute the higher, as well as the lower parts of the rockery. Such a simple rockery will thus afford an endless source of pleasure, especially if its attractions are heightened by the inclusion of some good dwarf bulbs to add to the general air of brightness so easily secured.

S. Arnott.

NEW DECORATIVE CHRYSANTHEMUMS.

Decorative chrysanthemums are those not large enough to be classed as show varieties owing to their want of size, but which by their pleasing form and distinctness of colour are desirable. Such varieties, if not encouraged from a decorative point of view, would stand but a poor chance of remaining long in existence. The following are new, or nearly so, and deserve attention, even from those with but limited means.

Freda Bedford (Wells).—Bronzy-orange, with an apricot shading; most pleasing.

Foxhunter (Wells).—A late-flowering reflexed variety; scarlet-chestnut, with a golden reverse, and with stiff stems.

Mrs. Wakefield (Jones).—This belongs to the reflexed section, and produces as many as sixteen good blooms on a plant. Red or bright terra-cotta.

Moneymaker.—Although not strictly new this is a variety that should be better known by those who require pure white flowers in quantity; well-grown plants produce as many as twelve full-sized blooms of perfect form.

Clara Vernum.—Crimson-chestnut in colour; an excellent variety.

R. F. Felton.—Rich yellow, very striking in its appearance, as so well shown in the excellent illustration that was given in the Gardeners Magazine of the 21st inst.

Formality (Davis).—Classed as a large-flowered Japanese, but as I have seen blooms of it it reminded me of a small-flowered Madame Carnot, and just the variety for decoration: pure white.

True Gold (Davis).—Of the richest shade of yellow, quite a pleasing tint; the flowers are produced on stiff stems at the end of November and well into December, therefore the more valuable.

Miss Faith Moore (N. Molyneux).—Of dwarf growth, therefore valuable for grouping, and, being pure white, it is very desirable.

E. Molyneux.

Swanmore Park.

THREE GOOD GOOSEBERRIES

It is not necessary to grow many varieties of gooseberries, as there is not so much difference in the quality, season, and purpose for which they are adapted, as with most other fruits. Some recommend growing several of the old-fashioned small-fruiting varieties, like Red Champagne, Early Green Hairy, Ironmonger, and others—solely for dessert, but this is quite unnecessary, as there are larger varieties of almost, if not quite, as good flavour, and berries of larger size are much preferable for eating, while if the berries of the small varieties are thinned at all so as to get them as large as the variety permits, the thinnings are much too small to be really acceptable in the kitchen. I have grown a fair number of sorts, and have come to the conclusion that, taking all things into consideration, the three I am going to speak about—if the editor permits me—cannot well be improved upon.

Whitesmith.

The first is Whitesmith, a large green smooth variety of strong upright growth, an immense cropper, and one which, by reason of the early expanding of the leaves relatively to the blossom, does not suffer so much from frost as many do. It needs, and pays for, a liberal thinning, and as it is one of the first to attain a good size, it is very useful for the kitchen, while those left, if thinning has been done pretty rigorously, leaving the berries an inch apart or more, attain a large size, and if allowed to hang sufficiently long, instead of being gathered as soon as they are soft, are of surprising richness. They ripen very unevenly, so that one may keep picking from the same tree for at least a month if it is protected from the birds. Being of upright growth, it is one of the best for a wall, the strong young shoots lending themselves very easily to nailing in to replace old wood. I have a large tree on a wall which has been yielding heavy crops annually for twenty years or more. I also grow it in single cordon form, and find it well adapted for the purpose. It is called Whitesmith because when fully ripened it almost loses its greenness and becomes of a very pale colour.

Whinham's Industry.

Next I would mention Whinham's Industry, a gooseberry of comparatively recent introduction, which attained popularity very quickly as a market fruit by reason of its tremendous cropping qualities, and the quickness with which it grows into a good-sized tree. It is a large dark red, slightly hairy variety, and it has been condemned by some because of its thick skin, and though this may be an objection for preserving—though I have avoided using it for the purpose because I have heard it spoken of unfavourably in that connection—yet I have not noticed it of any disadvantage for cooking in a green state. When ripe, a thickness of skin is of no consequence as one does not eat the skin, and besides, when fully ripe, the skin of this variety becomes as thin as that of most others. It is a very strong upright grower, and the fruit, when properly thinned, becomes so large as to be classed among the Lancashire large-fruiting varieties. It is one of the earliest to come into use in a green state, and I have often begun using it from a wall the second week in May, and that in Essex. Three-year-old trees will grow to the top of a six-feet wall the second year after planting and I have trees on a wall which have not failed to produce a heavy crop for fifteen years. As a cordon, too, it is very successful. The flavour of the fruit when well thinned and thoroughly ripened I consider quite first class. It is not so handsome as some by reason of the somewhat mealy appearance of its skin, though this is really in the nature of bloom.

Red Warrington.

The third I shall mention is Red Warrington, which is of a quite different character to the two already mentioned, being of drooping growth, of medium size, and rather hairy. It is a late variety, lasting a long time in season, for though I began to use it in a ripe state the third week in July last summer, I did not finish picking it till the middle of September, these later pickings being from a north wall. On account of the drooping character of its growth it is not so good a variety as some for walls, though it is often grown on north walls for a late supply, and when planting bushes in the open they should be obtained with a good clear length of stem, so that the fruit may be well above the ground. It needs special pruning to counteract this drooping tendency, and this consists largely in leaving all strong, upright-growing shoots wherever possible, and pruning all others to a bud pointing upwards, while the bush should be kept well open because of the prickly nature of the wood. The fruit is of medium size in a green state, but when well thinned it swells up a good deal in ripening. When bright red there is a briskness in its flavour which is almost peculiar to this variety, but as the colour becomes deep crimson after hanging another week or so, it attains a richness and sweetness, combined with briskness, which renders it, in my opinion, second to none. I have always set apart this variety for preserving—as far as the household needs for this purpose extended—still adhering to the tradition that, for preserving, a hairy gooseberry is preferable, though whether there is anything in it or not I do not know. One does not want too sweet a fruit

[Photo: C. Godfrey Bennett.

ROCK GARDEN, COOMBE HOUSE, CROYDON, THE RESIDENCE OF F. C. LLOYD, ESQ.

for preserving, and the Red Warrington, if picked in the scarlet state, makes very fine ripe gooseberry jam, combining the briskness and richness of the fresh fruit. Dr. Hogg, in his "Fruit Manual," says it is a first-rate late variety, highly esteemed for preserving. It makes excellent gooseberry jelly, having, in addition to its excellent flavour, a clear bright crimson colour not unlike that of red currant jelly. This variety has a very thin skin when fully ripe, and I suppose it is on that account that the flies are sometimes troublesome. Its season may be prolonged two or three weeks by having trees in a shady position, or on a north wall.

The above varieties will keep up a succession of ripe fruit for at least two months, say, from early in July till the beginning of September—long enough perhaps for one kind of fruit—but if it is desired to prolong it a fortnight by beginning earlier, it can be done by planting Early Green Hairy or Golden Drop (syn. Early Sulphur), and if one of these is planted on a south or south-west wall—both varieties are upright growers—ripe gooseberries may be had in some seasons by the middle of June. Still, I have not included either of these among the "three good gooseberries," as I consider both of them inferior for general purposes to the three mentioned and mainly desirable because of their earliness, though it must be admitted that Early Green Hairy is of very fine flavour.

Alger Petts.

MANURING AND TRENCHING.

There has been much written about this important subject in connection with kitchen gardening that there appears to remain very little to add, but as this is the season when the garden offers the best facilities for these operations, the quarters being relieved of their summer crops and leaving them bare, it may be fitting to again remind cultivators of the need of them, where the best results are expected from the soil.

Every gardener of experience knows that upon working the land in this way hangs to a very great extent the key of success, so my remarks more especially apply to beginners who have not yet had the opportunity of testing its true value. To these I would recommend this work through the winter months for next year's crops, carrying it out to the full extent that the strength of the staff will permit without seriously affecting other current work that has to be seen to.

The usual method of procedure in trenching, and decidedly the most practical for general kitchen garden cropping, is to take out a trench from two to three feet wide and two spades deep, and wheel it to the opposite end of the site that is to be operated upon. If the soil is light or short of humus a layer of manure is placed at the bottom of the trench. The second trench measured exactly the same as the first one, and the top spit of soil is placed over the manure in the first one; upon this is placed another dressing of manure, and over that the bottom spit of soil is put, and left as rough as possible for the winter to act upon and sweeten and purify it before the spring arrives for sowing or planting. With the exception of soils that are of a light, hungry character, one good dressing of manure laid between the two spits of soil is sufficient for general cultivation, but this matter must be determined by the condition of the soil and the nature of crop that it is intended to plant.

Where fresh land is being broken up, and it is of a strong retentive clay, the earlier in the autumn or winter the work is done the better the results. Unless the expense of removing and replacing the subsoil (should it be sour), with good turf or other soil is allowed, I prefer to bring only a limited quantity to the top at one time, and so ameliorate it by degrees. Deeply-stirred, strong land, that is sweet and well-drained, is, as a rule, the most profitable and desirable for heavy cropping, being more holding, and plants invariably stand better on it through periods of drought. The chief drawback is the difficulty to planting, and obtaining proper seed beds during a wet spring, hence the reason for laying up this kind of land to exposure early.

In old kitchen gardens, where the soil has frequently been deeply dug and manured, and is not naturally charged with lime, a surface dressing after trenching will be found advantageous, but it is not advisable to allow it to come into direct contact with fresh manure that may be dug in at the time. Constant impoverishment of the land from close cropping, especially with the Brassica family, demands liberal treatment in digging and manuring. No hard and fast rule can be laid down for the management of the kitchen garden soil, as we have all to be controlled by circumstances. Too many gardeners suffer from insufficient labour to do the work in a thorough manner, but where it can be managed it is an excellent plan to divide the quarters into three sections, that is to say, arrange the cropping, so far as convenient, that a third of the garden is trenched each year, including the celery quarter, which is already well treated.

C. Flack.

Cholmondeley Castle Gardens.

WHAT CONSTITUTES AN AMATEUR?

I cannot agree with the remarks on p. 792, as to what constitutes an amateur. It is there stated that "all who take an interest in gardening and do not regularly sell the produce of their gardens are amateurs." While this definition may be literally correct, when we put it into practice we find obstacles. The R.H.S. recognises gardeners to lords, dukes, and squires as amateurs, and permits them at their shows to compete against what I venture to say is a true amateur, viz., a person who attends to a garden for the pure love of the occupation and not as a profession in the same way that a gardener obtains his living.

The main and right reason why amateurs should be correctly defined is that the amateur (as I describe him or her) should not be so severely handicapped in competition with gardeners owing to the knowledge and means at command of the leading cultivators in various phases at the present time, as for example, Mr. Beckett in vegetables, Mr. Goodacre in fruit, or Mr. Alexander in orchids. There is no more enthusiastic person in horticulture than the true amateur, but how can such a person compete on anything like equal terms with a professional gardener, who has considerable encouragement from his employer, who supplies the means—without limit in many instances—to procure all that is requisite to achieve an object.

In many societies there exists a rule that the professional grower shall not compete with his less favoured rival in many classes, but the amateur can compete in open classes. To give the amateur an opportunity to compete on an equality he is defined very often thus—"An amateur is a person who cultivates plants, etc., purely for love, and who does not regularly employ a gardener."

E. Molyneux.

[Mr. Molyneux is evidently under the same misapprehension as that which has given rise to so much discussion and difficulty with regard to the position of amateurs in competitions at horticultural exhibitions. In other words, he assumes that the produce exhibited by gardeners is their own, instead of it being, as is the case, the property of their employers. He is certainly mistaken in supposing the Royal Horticultural Society recognises gardeners to lords, dukes, and squires as amateurs. They do not do that, but they allow "lords, dukes, and squires" to exhibit the products of their gardens, and, as a matter of course, permit their gardeners, as their agents, to make all the arrangements necessary for submitting the products to the judges. The society does not differentiate at its exhibitions between amateurs who employ a score or more of gardeners and those who do the greater part, if not the whole, of the work themselves. Whether the society should do so or not is open to discussion, but the question in no way affects the status of the amateur. We are in full agreement with Mr. Molyneux as to the desirability of arrangements being made at flower shows by which amateurs who do all, or nearly all, the work of their gardens would not have to compete with those whose gardens are managed by a gardener with a staff of men under him. If those who are responsible for the management of horticultural exhibitions would recognise the fact that all owners of gardens who do not grow for profit are amateurs, and then divide them into two sections, those who regularly employ gardeners and those who do not, and arrange the classes accordingly, the second of the two classes would then have opportunities for competing on equal terms, and all cause for complaint removed.—Ed.]

Pentstemons raised from cuttings give more than double the flowers that seedlings produce, further, they come into bloom much earlier, and as they continue flowering right on till frost comes, it follows that they are invaluable for autumn displays. Rich light soil in cold frames is preferable to boxes for striking the cuttings.—Thomas Smith. Walmsgate Gardens.

Salvia azurea grandiflora.—In the early 'eighties this salvia was sent here from the United States under the name of Salvia Pitcheri, and as such it is still occasionally to be met with in gardens. It differs from most of the salvias in its manner of growth, the slender wand-like branches being clothed with narrow greyish green leaves, while the flowers, borne for a considerable distance along the shoots, are of a charming shade of blue. This salvia needs to be freely stopped during its early stages in order to lay the foundation of a bushy plant, and once this is done there will be no further trouble in this respect. The slender branches have an upward tendency, but at the same time are totally devoid of any stiffness or formality. Clean grown specimens are admirably adapted for associating with chrysanthemums, as they supply a totally distinct and much admired shade of colour. This species of sage and its scarlet relative Salvia splendens, are of great service in the greenhouse during the autumn months. The cultivation of Salvia azurea grandiflora is an easy matter, as the plants may be treated much as chrysanthemums, that is to say, left outside till they are nearly ready to flower; in fact given a fine autumn it is often very attractive out of doors. Salvia azurea grandiflora is a native of Texas.—W. T.

AN ANTIDOTE FOR WIREWORMS.

In many gardens the wireworms, or grubs of the Click Beetle, are so numerous that it is next to impossible to produce certain crops in a clean, presentable condition. Carrots seem to be their tit-bit, for if there is a wireworm in the garden it will find out the carrot quarter.

Some years ago I was very much troubled with this pest, and thought if I encouraged a rapid growth the bad effects of the wireworms would be overcome. Knowing that carrots require a liberal supply of sodium in the soil in which they are growing, I determined to see what results would be obtained from several light dressings of nitrates. The first application (1½oz. to the square yard of ground) was given when the crop was thinned, and similar dressings at intervals of about three weeks. In showery weather the rain carried the one dressing into the soil before the other was applied, and during a dry spell I had the ground watered. I did not expect these dressings of nitrate of soda to do more than foster rapid growth, but I was agreeably surprised when I came to use the roots to find them not only of unusual size, but entirely free from any trace of wireworms.

A few days ago I had occasion to visit a garden, and, after looking round, the gardener remarked that I must see his carrots before I went. He took me to the portion of the garden where they were growing, and dug up some of the finest examples of good cultivation I have ever seen. I complimented him on his success, and asked what means he had employed to secure such exceptional results. His reply was that he had never been able to grow carrots in his garden till this year, because wireworms always ruined his crop. This summer he had a quantity of nitrate of soda on hand, and, as an experiment, used it freely on his carrot bed. I asked if he could give me any reason why the nitrate had the effect of keeping the wireworms away from the crop, but this he could not do, only remarking that he supposed they did not like it.

Now, as two of us obtained similar results from the use of nitrate of soda on carrots, and on different kinds of soil (mine was sandy and his heavy), we have come to the conclusion that it is an antidote for wireworms, so far as carrot cultivation is concerned. Anyone interested in the production of fine, clean, large roots of this vegetable should give nitrate of soda a trial if he is in any way troubled with wireworms in his soil. Apart, however, from wireworms, it is evident that nitrate of soda is one of the chemical manures specially suited to the growth of carrots, and should be used for this purpose. It can be employed in quantities not exceeding 1½oz. to the square yard for a single dressing, or ½oz. to the gallon of water when it is desired to use it in solution.

PEDESTRIAN.

APPLE THE SANDRINGHAM.

This is a very fine culinary apple, and one that is now becoming better known and appreciated than was the case a few years ago. It is not exactly a new variety because it received a First-Class Certificate as far back as 1883, when it was exhibited before the Royal Horticultural Society by the late Mr. Charles Penny, then gardener to the Prince of Wales, now our King, at Sandringham. The variety had been recommended for a certificate at the Apple Congress, and the certificate was ratified by the Fruit Committee on November 13, 1883. In not a few of the gardens we have visited this season we have found Sandringham doing well, and have heard it spoken highly of as an apple of fine quality, a very free and regular bearer, and a good keeper. Its season is from January to March, and towards the end of its season it becomes a very passable dessert fruit. Firm and juicy, with solid greenish white flesh, and a pleasantly aromatic flavour, there is small wonder Sandringham is gaining in popularity. The fruits are roundly conical in shape and the smaller fruits are the most conical. The colour is dull yellow, flecked with crimson over the dull red-brown cheek. The tree is of good habit, upright, and excellent alike on the paradise stock for the garden, or the crab stock for the orchard. The Sandringham apple is also one of the most beautiful when in flower, as the blooms are of a lovely pink shade, and almost red on the outer side of the petals.

A FINE CULINARY APPLE, THE SANDRINGHAM.

WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

COOL HOUSE ORCHIDS. — The winter treatment of the cool house orchids differs very considerably now from that which was in general practice a few years ago. I think many failures to grow odontoglossums successfully might very easily be traced to the winter treatment, perhaps more than to any other cause, and there can be no question but that since more liberal treatment has been given the results have been better. It appears to me only reasonable to give plants the greater encouragement at the season of the year when they are at the height of their growth, and it is during the winter months that we find the bulk of the odontoglossums are in their most active state, and consequently in need of every encouragement that will conduce to their proper development. If a low temperature is given to any class of plants at the season of full growth, there is naturally a tendency to the production of stunted leaves, such as were generally to be found when the night temperature for odontoglossums was 45 degrees in winter. A temperature of about 55 deg. is desirable, and we have a night standard of from 53 to 55 deg. With such a temperature as this we are enabled to give the necessary encouragement when it appears to be the most necessary.

WARMTH AND AIR.—Where the plants are treated thus liberally there are always better opportunities for ventilation and the prevention of a stagnant atmosphere. The warmer conditions which have been put into practice during the winter months here now for several years has been to the advantage, not alone of the odontoglossums, but to practically the whole of the cool house section of orchids. The small-growing masdevallias especially rarely show any signs of damp spotting.

DAMPING.—Discretion should be used in damping, and the amount of damping down required must be governed by the prevailing outside conditions, remembering that the situation in which the plants have to be grown materially affects the hygrometric state of the air in the houses. It will generally be understood that where there is an obstruction to light there is less drying taking place. All these particulars must have careful consideration, but there is a rule that, I think, may generally be applied to damping the houses, i.e., it should be done sufficiently early in the day to permit the excess of moisture evaporating before the low evening temperature is reached. In excessively cold weather, and when a low temperature is unavoidable, it is well to reduce the atmospheric moisture in accordance with the fall of the temperature. Plants rarely take harm in low temperatures, providing that both the atmospheric moisture is reduced to its minimum and the plants are kept in a dry state at the roots until such conditions are again favourable.—H. J. CHAPMAN, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

ZONAL PELARGONIUMS. — Plants that were rooted in the summer and are now in three-inch pots may be put into their flowering pots. Always avoid overpotting, as pelargoniums bloom most satisfactorily if allowed to become somewhat root-bound and liberally fed with liquid manure. Good fibrous loam and dried manure, with a free admixture of wood ashes and silver sand, make the best compost. It is most essential that the soil should be rammed fairly firm in potting, or the growth will be sappy. Afford good drainage, and water with care during winter. Keep the plants near the glass in a light airy pit, with a rather dry atmosphere. To encourage a sturdy growth, the plants should be stopped occasionally, and all flower buds be pinched out.

SHOW, DECORATIVE, AND FANCY PELARGONIUMS require somewhat similar treatment. Due attention must be given to the training and tying of the growths of the earliest batches; later plants should be kept pinched, and a sharp look-out be kept for greenfly, and immediate measures taken to eradicate this pest. I find vaporising to be the best remedy.

HYACINTHS. — For the early supply of flowers the single varieties, as the buds show, should be transferred to the forcing house, according to the requirements of the season. Keep the plants near the light, and employ as little fire-heat as possible. A high temperature will cause weak growths and poor colour. Tulips will stand a higher temperature better than the hyacinth. In any case the temperature of the forcing house should not be allowed to exceed 65deg. A succession of narcissi and jonquils should be brought on at intervals.

CHINESE PRIMULAS. — The earliest batch will now require more room, as the flowers are showing colour, and although not so useful for cutting as many subjects which could be named, these are easily produced, have a charm distinctly their own, and are warmly appreciated in many of the humbler greenhouses one often visits. A light top-dressing should be given, as the foliage renders liquid feeding somewhat difficult. Should it be desired to postpone the flowering period, then the flower spikes should be removed. The old double white is still a favourite in many gardens, and all care should be taken that the best possible plants are produced, as these will come in flower at a season when they are justly appreciated.

EARLY ARUMS. — Arum lilies that were planted out in the open garden during summer, and lifted and potted in October are somewhat slow in throwing up blooms till after Christmas, if placed in a cool house. I find it a good plan to select a few of the best-furnished plants and stand them on a bed in the cucumber house, giving a temperature of about 60 deg. at night, and keeping the atmosphere tolerably moist, assisting them also with a little farmyard liquid. The result is dense plants, carrying several fine blooms by Christmas, which are then most acceptable.—T. B. FIELD, Ashwellthorpe Gardens.

THE FLOWER GARDEN.

PROTECTION. — No further time should be lost in affording protection to everything likely to benefit thereby. No hard and fast rule can be given, for what may pass through the winter unharmed in one position or district, might in another be quite killed. Bracken may be used, especially with semi-hardy climbing plants on walls, and this may be placed between and over growths, and loosely bound in or held in position by old netting, securing it so that strong winds or birds cannot dislodge it. The disadvantage of fixed protection is that beneficial light is shut out, and if an early spell of warm weather comes, buds are apt to start into growth in the dark, producing bleached and weakly shoots, which, when exposed, are very susceptible to any chill or slight frost. Tea and H.T. roses are safest with protection, especially if freshly planted, and this may be given in the way of a liberal dressing of half-rotten manure all over the bed, and thinly covered with soil for appearance sake, and to prevent birds scratching it out. Lobelia cardinalis is best lifted, boxed up, and wintered in a cold frame. Pampas grass, arundos, kniphofias, eremuri, gunneras, and others may be protected by placing leaves around them, and covering with soil or ashes, though in warm localities or sites it is unnecessary to protect these.

PRUNING.—Now that leaves are all off deciduous climbers, these may at once be attended to. It is not advisable to prune closely until the new year is well advanced, but loose hanging growths should be shortened back moderately close to where growth is secure; this applies to clematis, ampelopsis, jasminum, lonicera, roses, and several other vigorous or free-growing climbers; straggling or loose growths of ivy and other evergreen climbers should be treated in the same way.

VACANT FLOWER BEDS OR BORDERS should be dug and carefully levelled to give them a neat appearance during winter. Do not hesitate to remove some plants where these are overcrowded; this is often overlooked, or resolve not firmly made and carried out, so that overcrowding results and greater disappointment ultimately follows than if judicious thinning had been practised. If shrubs are removed as they begin to encroach upon each other, they can generally be used in some other parts of the grounds; failing this, it is better to sacrifice the surplus than spoil the whole lot. Growths of the golden elder may be shortened somewhat, but not cut quite back. The beauty of the golden privet is now more fully realised than when other colours predominate, and a liberal use of this for winter effect should always be made, but insure it being well protected from hares and rabbits, which are specially fond of it. Standard golden privet, grafted upon the common stock, must be examined, and any growth from stocks must be removed.

STORAGE. — Begonias may be stored in dry sand, leaf-soil, or moss, preferably in a temperature of about 45 deg. Gladioli, galtonias, etc., do well in a cooler temperature, if dry; cannas and dahlias may also be put in a cool dry place, where frost cannot penetrate. Liliums are best not dried off, but as soon as old stems have ripened the bulbs should be repotted or boxed up; if potted, insure ample clean drainage, and put the bulbs well down in the pots to allow for liberal top-dressing as growth proceeds. Where L. auratum has become well-established and grows satisfactorily, it is best not to remove the bulbs, but should growth show any signs of becoming enfeebled, they should be lifted and inspected to see whether anything is wrong with them; if no damage is apparent, they may be either replanted in the same position in fresh soil, or given a fresh position in a well-prepared site.—E. F. HAZELTON, Knowsley Gardens.

HARDY FRUITS.

ORCHARD TREES.—These should be examined annually, and the heads moderately pruned so that both air and light may reach the interior. Seldom have trees anywhere, if left entirely to themselves, produced for any length of time good crops of clean fruits profitable to the proprietor. Remove all cross and interlacing branches, and if the trees are in a bad condition do not be too severe at one year's pruning, but gradually thin out the wood until they have been brought into a reasonable shape and fruiting condition. After the pruning and thinning is finished, scrape the trunks and main branches, if overgrown with moss and lichen, with a piece of hoop-iron, and then give them a good washing with soap suds, and finally whitewash them, using lime and soot. A couple of sprayings with caustic alkali, according to directions given, will remove all kinds of moss, and most pests with which the trees are liable to be attacked. Top-dressing with fresh soil and manure, etc., first removing a portion of the top soil, will greatly assist the trees, and on light land good soakings of liquid manure from the farm-yard tank will prove highly beneficial.

YOUNG TREES, until they have attained a fair size, and the heads have been properly formed, ought to be pruned more or less annually. When shortening the leaders, always cut just above an eye pointing in the direction the next season's growth is required; side growths may be spurred back to within a couple of eyes of the main branches selected to form the future heads. Until the heads have been properly formed, and the branches are fairly strong, I usually shorten the leaders back to within fifteen inches of the older wood, more or less, according to the nature and strength of growth. All stakes and ties must be thoroughly examined yearly and made good. Do not overlook this important work, otherwise much harm may be done by wind.

FIGS.—These trees in the colder districts may require a little protection in severe weather. Bracken makes a capital protection. In some localities, the whole of the branches are removed from the walls and bundled up, and a covering of straw is tied over them. In this way they may be secured to the walls until the danger of frost is over.

STRAWBERRIES. — Remove weeds, and give a good mulching with well-decayed manure, packing this neatly around the plants. I am a great believer in mulching strawberry plants, more especially if the land is light, at this season. Short manure is best, and the beds may be littered down with a more strawy material in spring.

CUTTINGS of gooseberries, red currants, and black currants can be made in bad weather. These should be about 15 inches in length, all the lower eyes removed, and the wood of medium growth. Set them in trenches with the butt ends resting firmly on the bottom, and make the soil firm about them. Correctly name all the different varieties, and only grow those most suitable and profitable for the different purposes. — H. MARKHAM, Wrotham Park Gardens.

Character in Spring Beds.—An excellent plan to relieve the flatness so characteristic of spring bedding arrangements is to employ composite beds planted with evergreen and deciduous shrubs, which have been specially grown for this purpose, and are, therefore, best plunged in pots or boxes. The decorative effect of this system throughout winter is particularly good, as it goes a long way to relieve the nakedness of the beds; much more so where large areas are planted entirely with bulbs; then, when these and the other spring plants break into flower, it will often be seen that carefully-planted shrub beds exercise a healthy restraint, and in those spring gardens which otherwise would resemble so much high-coloured mosaic work, under this influence become increasingly interesting. Perhaps this is most evident when we employ shrubs distinct in form and of other colour values, such, for example, are the grey and blue-grey tones found in retinosporas, junipers, and cupressus; light and dark greens of various thuias; gold, as in euonymus, aucuba, and holly; then Cytisus praecox and the early double forms of peach and cherry among deciduous shrubs, and rhododendrons among evergreens, are all of great beauty, both by reason of their flowers and the character of their foliage.—THOMAS SMITH.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Royal Horticultural Society.

On November 24 there was a good display at the Royal Horticultural Hall, but there were several vacant spaces, and the attendance was not large. We very much regret the admission of other than horticultural exhibits, but on this occasion one part of the hall suggested a Christmas bazaar, or toy shop, and the goods displayed, excellent as they are in their way, were not in accordance with the traditions of the Tuesday meetings, and in keeping with the dignity of the society.

FLORAL COMMITTEE.

Messrs. W. Cutbush and Son, Highgate, were large exhibitors on this occasion, almost filling one whole table. One side was filled up with clean plants of such useful subjects as Daphne indica rubra, Aralia elegantissima, Dracæna Victoria, the graceful Phœnix Roebelini, Otaheite oranges, Dracæna Doucetti, etc., etc. On the other side of the table they had a very bright and beautiful exhibit of choice perpetual carnations, set up in vases of varying size. Of Enchantress, Victory, Winona, Robert Cray, White Perfection, Mrs. T. W. Lawson, Aristocrat, and Mikado there were fine sets of flowers, and there were, in addition, numerous seedlings. Primula obconica, and a selection of saxifragas and sedums were sent by Messrs. J. Peed and Son, West Norwood.

A beautiful lot of zonal pelargonium blooms, arranged in glass vases, in their usual imposing style, was set up by Messrs. H. Cannell and Sons, Swanley, a fine half-dozen out of about three dozen varieties were Naples, vivid scarlet; New York, brilliant orange-scarlet; London, rosy-red, with a purple tint; Paris, bright pink; Sydney, very deep rich pink; and Dublin, rosy-salmon—all these are fine new ones of this year. The Messrs. Cannell also set up an interesting exhibit of single, thread-petalled, pompon, and decorative chrysanthemums. The Misses Hopkins, Shepperton, contributed alpine plants. Messrs. H. B. May and Son, Edmonton, had a most interesting little exhibit of the exquisite filmy ferns, showing Trichomanes radicans, Todea superba, Hymenophyllum chiloensis, Asplenium heterocarpum, and other lovely things. This firm also exhibited a selection of frilled and tasselled hartstongues, Polypodium Schneideri, and other beautiful hardy polypodies, and a goodly set of autumn-flowering veronicas, both standards and little bushes.

A very bright bank of useful winter-flowering plants was well set up by Messrs. James Veitch and Sons, Chelsea. The begonias were the chief attraction, and Julius, Ritter, Mrs. J. Heal, John Heal, Winter Perfection, Winter Cheer, Agatha, Ensign, and Success were the varieties so well represented. Some hybrid greenhouse rhododendrons, and batches of Luculia gratissima, and the sweet-scented, woodruff-like Stevia serrata. Mr. L. R. Russell, Richmond, set up groups of bamboos, pernettyas, heaths, [illegible], berried aucubas, etc., on either side of the entrance door, just inside the hall. Messrs. Paul and Son, Cheshunt, showed good spikes of Souv. de Jean Crosy, R. Wallace, and Fra Johanna Wilshaw, [illegible] and well-grown plants of Begonia Gloire de Lorraine and its white form were staged by Mr. A. T. Paskett, gardener to J. Johnston, Esq., Burrs Wood, Groombridge, Kent. Messrs. Heath and Son, Cheltenham, showed their new carnation, Lady Audley Neild, and a buff-coloured variety named Golden Glory. Groups of fine white, red, and salmon-coloured cyclamens, Cheiranthus Kewense—the winter-flowering wallflower; Leonotus Leonurus, and carnations made up a fairly large exhibit from Messrs. Hugh Low and Co., Enfield.

Messrs. Bees, Lim., Wapping, Liverpool, arranged a bank of freely-flowered plants of the beautiful little Primula malacoides (A.M.); this was a charming and dainty exhibit of a delightful plant that is something like P. Forbesi in general appearance, and also suggestive of P. Veitchi. It is said to come from an elevation of 9,000ft. in China, and to be quite hardy in this country. Some well-grown and specially brilliant-coloured and large-flowered examples of Primula obconica were shown by Mr. J. Dickson, gardener to the Duchess of Bedford, Chenies, Rickmansworth, and these were greatly admired. Messrs. Barr and Sons, Covent Garden, submitted a small collection of nerines, notably N. flexuosa alba and N. Monselli, and there was also the yellow Freesia Chapmani. Mr. A. Young, Oxted, Surrey, showed a group of Begonia The Queen, a bright pink variety of the Gloire de Lorraine type.

A very fine display of beautiful chrysanthemums, was made by Mr. Norman Davis, Framfield, Sussex, opposite the entrance, and it was a well-arranged exhibit of excellent material. The feature of the group was the tall stands of flowers of one variety, notably of the lovely Edith Jameson, Mr. J. Hygate, True Gold, Miss Gertie Court, Polyphéme, Bessie Evans, Algernon Davis, Mrs. J. and C. Neil. Among single varieties, Pollux, Vesta, Perseus, Juno, Arcturus (crimson-scarlet), Canopus, and Pictor were conspicuously good. The whole exhibit was one of the finest Mr. Davis has set up. The flowers were of excellent quality, and well arranged over a pleasing groundwork of ferns, and in association with bamboos, palms, and crotons. Messrs. G. Williams and Sons, Canton, Cardiff, showed a number of striking single chrysanthemums, one named Caledonia, bright rose, with white ring round the eye, gaining an A.M., and attracting a great deal of attention by reason of its very large size and good form; the blooms were nearly six inches across. Mr. Williams also sent Helena Williams, the new yellow sport from Madame Oberthur.

A glorious exhibit of chrysanthemums was arranged by Mr. H. J. Jones, Ryecroft Nursery, Lewisham, across the end of the hall. Mr. Jones had a green background, and in front of this he set up in his usual bold style large vases, stands, and baskets of big blooms, and some of single and decorative varieties. The groundwork consisted of low bowls of flowers, large specimen blooms, and ferns and foliage plants. A few of the varieties that were especially attractive were Jean G. Day, Kitty Gulliver, Lord Brooke, Mrs. Wynne, J. L. Burgess, the beautiful Mrs. Wakefield, Mrs. R. Oberthur, White Barkley, True Gold, Yellow Brooke, F. S. Vallis, and Moneymaker. This was a big effort, and a fine decorative display, showing how well big blooms may be used in vases, etc.

Messrs. Thos. S. Ware, Lim., Feltham, contributed a selection of alpine plants of various kinds, and also a few useful evergreen shrubs. Messrs. W. Wells and Co., Merstham, filled the side of one table with chrysanthemums, his interesting display consisting largely of single and decorative varieties. There were, however, some good big flowers of Frank Payne, Mrs. J. C. Neal, Mary Inglis, Algernon Davis, Mrs. A. G. Price, Miss Muriel Smith, etc. We also noticed the large starry-white single Dorothy Fortescue in this stand, and also the new and beautiful single variety, named Merstham Jewel (A.M.).

ORCHID COMMITTEE.

Messrs. Sander and Co., St. Albans, set up a large variety of cypripediums of the insigne and Leeanum types, and these included C. Dreadnought (F.C.C.), a very large-flowered hybrid from C. [illegible] and C. insigne Harefield Hall, but the great attraction of the group was Vanda cærulea var. R. Chollet (F.C.C.), a wonderful and beautiful form, with a big spike of fifteen very large blooms of the brightest blue shade, probably the finest form of this species yet seen. From Messrs. Hugh Low and Co., Bush Hill Park, Enfield, came several flowering plants of the curious Cycnoches chlorochilon, Cypripedium Maudiæ, Cymbidium giganteum, C. Winnianum, Cycnoches maculatum, Dendrobium formosum giganteum, and the pretty Masdevallia tovarensis. Messrs. Heath and Son, Cheltenham, brought up a collection of cypripediums that included C. Spicerianum, C. Lathomianum giganteum, C. Leeanum magnificum, and C. insigne vars.

Some fine flowers of Dendrobium formosum giganteum, from plants grown for the last seven years, were sent by Mr. Mackellar, Royal Gardens, Windsor. Mr. J. Float, gardener to Mrs. Talbot Clifton, Lytham Hall, Lytham, sent a very big spike of Odontoglossum Halli, but the variety was a poor one. Mr. Maurice Mertens, Mont St. Amand, Ghent, showed a small group of very choice odontoglossums, notably a lovely O. Vuylstekiæ, a good O. Vuylstekei, O. Ardentissimum, and O. crispum seedling. Messrs. Armstrong and Brown, Tunbridge Wells, showed flower heads of Neobenthamia gracilis, Bulbophyllum Careyanum, Cattleya labiata Amesiana, and a strong plant, with long branching spike of Odontoglossum Groganæ (A.M.), the result of crossing O. Uro-Skinneri with O. Edwardi; it has crimson-purple flowers. Messrs. J. Veitch and Sons, Chelsea, submitted Cypripedium San-Actæus Etoniense (A.M.), derived from C. i. Harefield Hall, and C. Actæus Langleyense.

A group of beautiful orchids, sent by Messrs. Charlesworth and Co., Hayward's Heath, Sussex, that contained Odontoglossum Uro-Skinneri magnificum, O. ardentissimum, Cycnoches chlorochilon, Odontioda Bohnhofiæ, Lycaste Skinneri alba, the brilliant Lælio-cattleya Sunray, calanthes, Saccolabium giganteum with two fine racemes, and Cymbidium Mastersi. Mr. Alexander, orchid grower to Lieut.-Colonel Holford, Westonbirt, Gloucester, exhibited Cypripedium Arethusa (Sallieri x Milo), which gained an A.M.

A grand plant of the old Cœlogyne barbata, carrying nine large and beautiful spikes of white, brown-lipped flowers, was shown by Mr. E. Bristowe, gardener to Mrs. Temple, Leyswood, Groombridge; this was a splendid example of good culture (Cultural Commendation). Mr. J. Davis, gardener to J. Gurney Fowler, Esq., Glebelands, South Woodford, brought up a spike of the yellowish Cymbidium Maggie Fowler.

Messrs. Cypher and Sons, Cheltenham, were responsible for a small group of cypripediums, all well grown plants, and of C. Fairrieanum, C. insigne Sanderæ, C. Lathomianum, C. Alcibiades, etc.

FRUIT AND VEGETABLE COMMITTEE.

Some very fine apples were shown by Mr. F. G. Gerrish, gardener to J. G. Williams, Esq., Pendley Manor, Tring, Herts, and the collection included splendid examples of The Queen, Chas. Ross, Newton Wonder, Blenheim Pippin, Peasgood's Nonsuch, Mère de Ménage, Bramley's Seedling, Ribston Pippin, King of the Pippins, etc.; a fine exhibit. Mr. W. A. Cook, gardener to Sir Edmund Loder, Bart., Leonardslee, Horsham, showed about four dozen dishes of apples and pears, setting up fruits of Sturmer Pippin, Newton Wonder, Allington Pippin, Adam's Pearmain, Sandringham, Peasgood's Nonsuch, Catillac, Chas. Ross, Doyenne du Comice, Beurre Baltet Pere, Le Lectier, etc., in excellent style.

Messrs. G. Massey and Sons, Spalding, contributed a selection of potatoes, that included Northern Star, Duke of York, Ringleader, Dalmeny Red, and other good things, as well as a large and interesting collection of tubers from seedling plants. This exhibit was in two parts, and proved to be of great interest. A large exhibit of bottled fruits was set up by Miss C. E. Martin, Willowbrook, Auburn, New York.

CERTIFICATES AND AWARDS.

First Class Certificates.—To Vanda cærulea, var. J. Chollet, from Messrs. Sander and Sons, St. Albans; to Cypripedium Dreadnought, from Messrs. Sander and Sons, St. Albans; to Polystichum aculeata gracillimum Drueryi, from Mr. Charles T. Druery, Shaa Road, Acton.

Award of Merit.—Pear Dana's Honey, from Messrs. James Veitch and Sons, Chelsea; Chrysanthemum Merstham Jewel (single), from Messrs. W. Wells and Co., Merstham; Primula malacoides, from Messrs Bees, Lim., Wapping, Liverpool; single Chrysanthemum Caledonia, from Messrs. G. Williams and Sons, Canton, Cardiff; Cypripedium San-Actæus Etoniense, from Messrs. J. Veitch and Sons; Cypripedium Arethusa, from Mr. Alexander, orchid grower to Lieut.-Colonel Holford, Westonbirt, Gloucester; and Odontioda Groganæ, from Messrs. Armstrong and Brown, Tunbridge Wells.

MEDALS.

Silver-gilt Flora.—Mr. Norman Davis, Framfield, Sussex; Mr. H. J. Jones, Ryecroft Nursery, Lewisham.

Silver-gilt Knightian.—Mr. J. G. Williams, Tring.

Silver-gilt Banksian.—Messrs. W. Cutbush and Son, Highgate, N.; Messrs. H. B. May and Sons, Edmonton; Messrs. James Veitch and Sons, Chelsea.

Silver Flora.—Messrs. Sander and Sons, St. Albans; Messrs. Charlesworth and Co., Hayward's Heath.

Silver Banksian.—Messrs. Heath and Son, Cheltenham; Messrs. Hugh Low and Co., Enfield; Messrs. Cypher and Sons, Cheltenham; Mr. Dickson, gardener to the Duchess of Bedford, Chenies, Rickmansworth; Messrs. H. Cannell and Sons, Swanley; Mr. L. R. Russell, Richmond; Messrs. T. S. Ware, Lim., Feltham; Messrs. W. Wells and Co., Merstham; Mr. Cook, gardener to Sir Edmund Loder, Bart., Horsham; Messrs. G. Massey and Sons, Spalding.

Bronze Flora.—Mr. E. J. Johnstone, Groombridge; and Messrs. H. Low and Co., Enfield (cyclamens, etc.).

SCIENTIFIC COMMITTEE, November 14.

Present: Mr. E. A. Bowles, M.A., F.L.S., F.E.S. (in the chair); Messrs. J. Fraser, W. Cuthbertson, L. Crawshay, A. E. Rolfe, J. T. Bennett-Poë, W. Fawcett, W. C. Worsdell, G. S. Saunders, R. Curtis, and F. J. Chittenden (secretary).

GREASE BANDS.—Mr. W. Voss showed a grease band from a plum tree from a fruit garden at Enfield Highway. The grease band was about 6in. wide, and upon it were a few specimens of the female winter moth, C. brumata. The band had been on the tree a month, but not till now had any winter moths been caught. The insects were near the bottom of the band. Mr. Voss promised to send up a band from the same garden to each meeting.

FASCIATION IN MUSHROOM. — Mr. Worsdell showed a fasciated specimen of the common mushroom, Agaricus campestris. Fasciation is apparently very uncommon in fungi.

ABNORMALITY IN RUBUS. — Mr. J. Fraser showed a specimen of Rubus rhamnifolius, Weihe and Nees, with foliaceous sepals and adventitious roots at the base of the fruiting panicles, which are mostly flowerless. The internodes of the fruiting panicles (or what should have been such) are very little developed on the whole of last year's stems. Barren stems and leaves of this year are normal.

Numerous diseased plants were received and dealt with.

Cambridge Horticultural Society.

This admirably-managed society, which was founded eighty-four years ago, worthily maintained its traditions on the occasion of its autumn exhibition by holding one of the best shows of the season. The spacious Corn Exchange was, as usual, filled to overflowing, and chrysanthemums, fruit, vegetables, and miscellaneous subjects were not less remarkable for their high quality than for their numbers.

The most important of the classes for cut blooms of chrysanthemums was that for thirty-six Japanese, distinct, as the liberal prizes brought out a strong competition and blooms that evinced cultural skill of a high order. Mr. G. Barker, gardener to Miss Gibson, Saffron Walden, occupied the premier position with a remarkably fine collection, in which Mrs. Knox, Mrs. W. Wells, Lady Henderson, Madame G. Rivol, Duchess of Sutherland, Magnificent, an effective crimson variety, when, as in this case, fully developed, and Lady Talbot, were conspicuous. Mr. J. Vert, gardener to Lord Howard de Walden, Audley End, Saffron Walden, followed closely for second place with an excellent stand, the examples of F. S. Vallis and Algernon Davis standing out prominently. Mr. J. Heath, who was third, also had finely-developed blooms. In the competition for the prizes for twenty-four Japanese, distinct, Mr. R. Smith, gardener to E. B. Foster, Esq., Tumpington, secured premier honours with a grand lot of blooms, and in the class for twelve Japanese Mr. W. Hall, gardener to J. J. Briscoe, Esq., Bourn Hall, Cambridge, was first, and Mr. R. Smith second, both staging well. Mr. W. Hall was also first for six Japanese, closely followed by Mr. T. W. Birkinshaw.

Incurved varieties were admirably shown, and the finely-formed and highly-finished blooms formed a very pleasing contrast to the loosely arranged, and brilliantly-coloured Japanese. Both for twenty-four and twelve blooms Mr. J. H. Walker, Stirtloe House Gardens, Buckden, obtained premier honours, and his blooms reminded one of the splendid examples that were seen at exhibitions twenty years or so ago. In the larger of the two collections, we noticed especially good examples of W. Pascoe, Duchess of Fife, Major Bonaffon, Louisa Giles, and Mrs. Wynn, a white variety with medium-sized blooms of superb form. Mr. T. Todd, gardener to W. A. Briscoe, Esq., Longstow Hall, Cambridge, also exhibited incurved remarkably well.

The contributions to the classes for chrysanthemums exhibited in vases formed, as usual, a large and attractive feature. For six vases of Japanese, three blooms in each, Mr. G. Barker was first with finely-developed examples of well-known varieties, and Mr. J. Heath was a good second. Not less satisfactory were the vases of incurved, and it is of interest to mention that, while the varieties belonging to the section are not usually regarded as of much value for decorative purposes, they received on this occasion a full share of attention, and were much admired by the general body of visitors. Mr. G. Barker, Mr. J. H. Walker, and Mr. T. Todd were the prizetakers in the order of their names. Especially attractive were the vases of flowers grown without disbudding, and of the six or more competitors Mr. A. Lelliott, Colebrook, Fulbourne, was first with fresh, finely-coloured flowers. Mr. J. H. Walker showed well for second place. Single varieties in three vases were splendidly shown, and the vases staged by W. Dobbs, Esq., Middleton Cottage, Newnham, Cambridge, are deserving of the warmest praise. Mr. J. H. Walker also showed well in the class. Pompons were also well shown in vases.

Groups arranged for effect were of a high degree of excellence, and at the head of the several competitors was Mr. J. Wright, gardener to A. Matthew, Esq., the hon. secretary of the society, Cambridge, whose group was remarkable for the high quality of the blooms and the taste evinced in the arrangement. Mr. F. J. Cook, gardener to the Hon. Mrs. Thornton, and Mr. Hutchinson, who were second and third, also had meritorious arrangements. The finest of the specimen plants came from Mr. G. Willers, who was first in five classes, Mr. Hutchinson and Mr. J. Wright being second and third. For collections of salvias, Mr. J. Wright obtained premier honours, and Messrs. Allen and Son were second. Mr. J. Wright was awarded a special certificate for a group of finely-flowered examples of Begonia Gloire de Lorraine.

Fruit was splendidly shown, and the several hundred dishes of apples produced a bright effect. Mr. J. H. Ridgwell, Histon, Cambridge, was especially strong in the apple classes, as proved by the fact that he was first for twelve and for six varieties, and in several of the minor classes. Each of the two collections comprised an equal number of dessert and cooking varieties, and of special merit were the dishes of Peasgood's Nonsuch, Golden Noble, Charles Ross, King of Tompkins County, American Mother, Cox's Orange Pippin. In the smaller class Mère de Ménage, Lord Derby, Golden Noble, Cox's Orange Pippin, and King of the Pippins were seen at their best. Mr. Todd, Mr. T. W. Birkinshaw, gardener to Sir C. E. Hamilton, Hatley Park, Mr. A. Lelliott, Mr. J. Vert, Mr. S. French, and Mr. J. Hall also exhibited with much success in the classes for apples. Mr. T. Todd obtained premier honours for six dishes of pears with finely-finished examples of well-known varieties. W. Dobbs, Esq., was first for three dishes with fruit of much merit, and in the class for two dishes Mr. W. P. Hollis obtained premier honours. Mr. T. Todd had the best dish of Pitmaston Duchess. Mr. T. W. Birkinshaw the best dish of Doyenne du Comice, and Messrs. Jones and Son were first in the class for any other dessert variety. Mr. J. Kirkpatrick, gardener to P. L. Hudson, Esq., Pampisford, Cambridge, first for a dish of Catillac, and for a dish of Uvedale's St. Germain. The most successful of the exhibitors in the grape classes were Mr. T. W. Birkinshaw, Mr. Kirkpatrick, Mr. J. Vert, Mr. J. Heath, and Mr. R. Smith. Gros Colmar was especially well coloured, and highly finished.

Vegetables constituted a feature of much interest, and in the class for a collection of ten kinds, Mr. A. Pepper, gardener to A. Hurrell, Esq., Harston, was first with splendidly-grown specimens. Mr. F. J. Cook and Mr. Kirkland, gardener to A. H. Paget, Esq., Brandon, were second and third. Mr. J. H. Ridgwell and Mr. Kirkland were first and second in the class for potatoes with well-finished tubers.

Stratford.

The annual show of the Forest Gate and Stratford Chrysanthemum Society was held at the Town Hall, Stratford, and was a phenomenal success, both as regards the number of visitors and the quality of the exhibits. This society, although covering one of the poorest districts in suburban London, bids fair before long to become one of the most popular within the Metropolitan area.

The principal attraction was the Marlborough Challenge Cup for a group, and for which there were eight entries. The winner was Mr. W. J. Rowell, of Gordon Road, Wanstead, whose group contained fine blooms of Valerie Greenham, Henry Perkins, Reginald Vallis, Walter Jinks, Bessie Godfrey, and F. S. Vallis; Mr. W. J. Smith was second, and Mr. C. Ennis third, and Mr. W. J. Stride fourth.

The classed for cut blooms were well filled, the principal class being for eighteen Japanese on a board, where Mr. W. J. Smith was closely followed by Mr. W. J. Stride. For twelve Japanese, on a board, Mr. W. J. Rowell was first, Mr. F. Clements second, and Mr. A. Willett third. For six Japanese, on a board, Mr. A. Willett, Mr. W. J. Stride, and Mr. W. Rowell won in the order of mention. For twelve, incurved, Mr. W. J. Stride, Mr. A. Willett, and Mr. J. Tyler were the winners. For six vases of Japanese blooms, Mr. J. D. Smith, Mr. W. J. Smith, and Mr. F. Clements scored. For three vases of Japanese blooms, Mr. A. Willett, Mr. J. A. Ward, and Mr. F. Clements won as placed.

The decorative classes showed excellent judgment and skill on the part of the exhibitors, the principal item being a table decoration, 6ft. by 3ft. The winning table by Miss Port was, perhaps, a trifle heavy, but nevertheless, a beautiful effort. The classes for singles also produced some very fine blooms, and the popularity of these useful specimens was amply proven; the winners in these classes were Mr. C. J. Froud and Mr. J. D. Smith.

Edinburgh,

NOVEMBER 19, 20, and 21.

The annual show was held, as usual, in the Waverley Market, and was quite the best display yet produced by this society, although many remarkable shows have been held by it. Perhaps some slightly better blooms have been seen in the Japanese section, but, taking the show as a whole, never has there been a finer display.

In the open classes over one thousand blooms were shown, then there were the various amateur classes, in which there were numerous entries, all arranged in vases. This is one of the few societies that have wholly dispensed with the show boards. In the purely decorative section there was a most remarkable display, not only in point of numbers, but in the quality of the exhibits, and never have single-flowered varieties been shown so finely as they were on this occasion. Dinner table decorations, too, were numerous and good, and miscellaneous plants were a distinct feature. Add to this a very fine array of vegetables, nurserymen's exhibits, and the charm of listening to the full band of the Grenadier Guards, and it can easily be imagined what an interesting exhibition is provided for the many thousands of visitors that annually flock to this show.

Cut blooms formed the chief item in the schedule, and no fewer than twelve vase classes were provided for Japanese blooms, with cash prizes of the value of £120, in addition to valuable cups. The leading class was for fifteen varieties, three blooms of each, in separate vases. The City of Edinburgh Cup and £20 in cash was the premier prize. £15 for the second, and £10 for the third. Six competed, making a good display. At this show the prizes were awarded in the three leading classes by points, which are published on cards with each exhibit as an educational lesson. Where the entries are numerous the labour devolving on the judges by this method is enormous. Mr. E. Molyneux, on this occasion, adjudicated single-handed. To show the merits of the blooms we publish the list of points obtained by each variety in the winning stands. The maximum number of points allowed for each bloom being twelve. As on several previous occasions the winner was Mr. T. Lunt, gardener to Captain Stirling, Keir, Dunblane, with an even set of fresh, richly-coloured specimens of R. Vallis, 11; Bessie Godfrey, 11; F. S. Vallis, 11; Melchet Beauty, 11; Victoria and Albert, 10; Edith Jameson, 10; Mrs. F. W. Vallis, 9; Marquis V. Venosta, 9; Mrs. C. Penford, 9; J. H. Silsbury, 9; Lady Conyers, 9; Mrs. G. Mileham, 8; O. H. Broomhead, 7; Mrs. A. G. Pirie, 7; Miss R. Stoop, 6; total, 137 points. Mr. D. Nicoll, gardener to J. F. Bell, Esq., Rossie, Forgandenny, was second with 123 points, his best blooms being Mrs. C. Penford, Mrs. F. W. Vallis, Splendour, F. S. Vallis, and J. H. Silsbury. Mr. F. J. Moir, gardener to J. D. Fletcher, Esq., Rosehaugh, Ross-shire, was third, with 118½ points, in which Elsie Fulton and Florence Penford were conspicuous. Mr. G. Stewart, gardener to Sir James Sivewright, Bart., Tulliallan Castle, Kincardine-on-Forth, fourth, with 112 points.

For eight varieties, three of each, for which the Scottish Cup and £10 was the leading prize, nine entered, the premier award going to Mr. A. Hutton, gardener to C. G. Keith, Esq., Usan House, Montrose, for a remarkable exhibit of high-class blooms of Lady Talbot, 12; F. S. Vallis, 11½; Reginald Vallis, 11; Mrs. G. Mileham, 11; Victoria and Albert, 10; President Viger, 10; Mrs. A. T. Miller, 9½; and J. H. Silsbury, 9½; total, 84½. Mr. R. Addison, gardener to Sir W. Dalrymple, Bart., North Berwick, was second, with 82½ points; Mr. J. Tinnie, gardener to A. R. Brown, Esq., Summerhill, Brandon, third.

Class three was confined to gardeners and amateurs, and was for six varieties, three of each, and £5 was the leading prize. Eleven competed. Mr. A. Morton, gardener to Countess Seafield, Cullen House, was first with exceedingly fine blooms of Victoria and Albert, Lady Talbot, J. H. Silsbury, Reginald Vallis, and Algernon Davis. Mr. Stewart, Dunkeld, second; Mr. D. Mackay, gardener to C. Dickson, Esq., Viewbank, Lasswade, third. For twelve, distinct, Japanese varieties, in four vases, there were seven entrants, Mr. Morton leading with medium-sized blooms of good quality; Mr. Hutton second, with Mr. Lunt occupying third place. In the class for six blooms of any one variety seven entered, and Mr. Hutton led with F. S. Vallis in fine order, followed by Mr. Moir with Florence Penford.

Single-flowered varieties were some of the best exhibits ever seen. For six varieties, arranged in 8in. vases, Mr. A. E. Todd, Stoneybank, Musselburgh, was distinctly a winner with as many as five dozen high-class blooms deftly arranged in each vase. The varieties were Edith, White and Bronze Pagram, Mary Richardson, Crown Jewel, and Kitty Bourne; Mr. W. G. Pirie, Dalhousie Castle, second; and Mr. W. P. Bell, Bothwell Castle, third. Mr. Todd also won for three varieties. For three vases of decorative varieties, arranged with any foliage, as many as thirteen competed. Mr. W. Galloway, gardener to Earl Wemyss, Gosford House, was distinctly first with La Triomphante, and its gold and yellow sports effectively arranged with golden privet, vine leaves, and green box. Mr. A. Hogg, Luffness, second. Nine competed in the class for one vase of large blooms, arranged for effect, with any foliage, and Mr. G. Scott, gardener to A. Sinclair Henderson, Esq., was awarded premier place for blooms of F. S. Vallis and J. H. Silsbury, arranged with vine shoots and dead leaves of Cycas revoluta; Mr. D. Kidd, Carberry Towers, second, with thirty blooms of J. H. Silsbury, arranged with Prunus Pissardi, which, in our opinion, should have been placed first. Very fine was the class for six varieties, three single and three double, as grown for market. Six entered, and here again Mr. Todd was invincible with Romance, Moneymaker, Market Red, E. Pagram, Kitty Bourne, and White Pagram; Mr. J. Bruce, Davidson's Mains, second; and Messrs. Craig and Son, Davidson's Mains, third.

The association's silver medal was awarded to Japanese Helena Williams, a pale yellow sport of charming appearance from Madame Oberthur, as the best new variety not in commerce. It was staged by Messrs. G. Williams and Sons, Manor House Nurseries, Cardiff. The bronze medal for the second went to Messrs. Wells and Co., Merstham, Surrey, for R. F. Felton, a rich yellow decorative variety. The premier bloom in the show was Lady Talbot, shown by Mr. Hutton, in the Scottish Cup class.

FLORAL DESIGNS.

For one bride and two bridesmaids' bouquets Miss Todd, Stoney Bank, Musselburgh, was first with some of the finest bouquets we have seen, especially the two made with Madame A. Chatenay roses and lily of the valley; Mr. A. Campbell, gardener to Colonel R. E. Aitken, Lansdowne Park, Helensburgh, second. No fewer than thirteen entered for a bouquet of chrysanthemums, and Mr. A. M. Crabbe, 22, Hope Terrace, Edinburgh, secured the premier award with an effective combination of Source d'Or and its yellow sport. Miss Todd, with Enchantress, secured the first prize for a bouquet of carnations from seven other competitors, as also did she for one bouquet of any other flowers with orchids, in which Vanda cærulea figured prominently.

For a basket of chrysanthemums eight competed, and Mr. Beats, gardener to L. Boase, Esq., Binrock, Dundee, won with a pretty combination of yellow and bronze. Miss Todd won for a basket of any other flowers with orchids delightfully arranged. Messrs. Laird and Sinclair had the best floral wreath, while Miss Todd had the premier award for a floral design with a cross elegantly draped with choice orchids. No fewer than twenty-five entered in the class for three sprays of chrysanthemums, and Mr. J. McHardy, gardener to J. S. Dixon, Esq., Fairleigh, Bothwell, was first with an exhibit that left little to be desired.

Dinner tables, 10ft. by 5ft., decorated with chrysanthemums and any foliage, made a brave show, as many as eleven taking part. Mr. W. P. Bell, gardener to the Earl of Home, Bothwell Castle, was easily first with a yellow single-flowered variety, relieved with the reddish-salmon of Mary Richardson, and suitable greenery. Unfortunately, all employed rustic stands, thus making a sameness in the whole of the exhibits.

PLANTS.

Plants were finer than usual. For six specimens £6 was offered as the premier award. Mr. F. Pulman, gardener to D. R. F. Hine, Esq., Hollywood, Colinton, was first with freely flowered examples of Souvenir de Petite Ami, Swanley Giant, and Nellie Pockett. For four Japanese, distinct, Mr. Pulman was again successful. Mr. W. Michie, gardener to Lady Steel, Boroughfield, Colinton Road, won for two specimens with Mary Anderson and Rosinante, 4ft. in diameter, and smothered with flowers.

For six Japanese, in 7in. pots, Mr. Pulman won with plants carrying, on an average, a dozen good blooms each. £6 is offered for a group of chrysanthemums and foliage plants, arranged for effect, in a space of 15ft. by 10ft., yet the results were distinctly poor, not one single exhibit could be considered good.

FRUITS AND VEGETABLES.

Ten guineas were offered for twenty-four dishes of fruit, in not less than twelve distinct kinds, on a table space of 10ft. by 5ft., decorated with plants or cut flowers. Two entered, Mr. Barnes, gardener to the Duke of Westminster, Eaton Hall, Chester, being easily first with good grapes, apples, and pears, and a decoration of orchids, chrysanthemums, etc. Mr. D. Kidd, second. For eight dishes, Mr. Galloway was first with good grapes, pears, and apples. Mr. H. E. Hughes, gardener to Sir Duncan E. Hay, Kingsmeadows, Peebles, was first for four bunches of grapes, distinct, with Mrs. Pearson, Muscat of Alexandria, Melton Constable, and Alicante; Mr. Barnes second. Mr. Lunt won for two bunches of black and white grapes with Muscat of Alexandria, very fine, and Gros Guillaume. Mr. Pirie had the best Muscats. Apples and pears were fairly good and numerous.

Vegetables were a strong feature. For a collection of twelve distinct kinds six entered for the first prize of six guineas. Mr. J. Gibson, gardener to the Duke of Portland, Welbeck Abbey, Worksop, was first, with one of his fine efforts.

NON-COMPETITIVE.

Non-competitive exhibits were numerous and interesting. Gold medals were awarded to Messrs. Moore and Co., Rawdon, Leeds, for orchids; to Messrs. W. Wells and Co., Merstham, Surrey, for chrysanthemums in variety; Messrs. W. Cutbush and Son, Highgate, N., for carnations; and Messrs. Brown and Co., Queen's Ferry Street, Edinburgh, for floral designs.

Silver-gilt medals were awarded to Messrs. Laxton and Sons, Bedford, for apples. The Agent-General for British Columbia for apples. To Messrs. G. Williams and Sons, Cardiff, a silver medal was awarded for chrysanthemums, in which the new single-flowered variety, Caledonia, figured prominently.

Bolton.

The twenty-second exhibition was held in the Albert Hall on November 20 and 21, and proved highly successful.

In the circular group class there was an excellent competition, Mr. W. Burgess, gardener to John Harwood, Esq., securing the silver cup presented by the president, Alderman J. P. Haslam, and the premier prize, with a charming combination. The groundwork was composed of ferns, crotons, caladiums, oncidiums, and bertolonias, and the pyramid in the centre was surmounted by a well-grown palm, but this lacked brightness at the base; Mr. H. Shone, gardener to J. W. Makant, Esq., was an excellent second, but would have done better with a somewhat larger palm for the centre. For a semi-circular group of naturally-grown chrysanthemums, Mr. Burgess was again to the fore, but a little more colour in his display would have proved an acquisition; Mr. H. Wainwright, gardener to Charles Taylor, Esq., had also an effective display. First prize for a group of large-flowering chrysanthemums arranged in a half-circle, with foliage plants, went to Mr. W. Drinkwater, gardener to H. T. Parke, Esq.

The best table of orchids, 6ft. by 4ft., came from Mr. W. Holmes, gardener to J. McCartney, Esq., who had odontoglossums, vandas, oncidiums, cattleyas, cypripediums, etc.; Herbert Arthur, Esq., was second with an excellent selection.

For twenty-four cut blooms, twelve incurved and twelve Japanese, dissimilar, Mr. G. W. Drake, Cardiff, led; and Mr. A. Chandler, gardener to A. James, Esq., Rugby, was a good second. For thirty-six Japanese, not less than twenty-four varieties, Mr. A. Chandler held the coveted position with a strong lot, including F. S. Vallis (immense), Pres. Viger, Duchess of Sutherland, Reginald Vallis, Algernon Davis, Splendour, etc.; Mr. J. Jones, gardener to Sir E. Evans, second; and Mr. W. Iggulden, Frome, third. For six vases of singles, undisbudded, Mr. James Lee, gardener to George Rhodes, Esq., led with bright examples, and for the six vases of decorative varieties Mr. J. P. Holt, gardener to Sir John Mark, was to the fore.

For two bunches of black grapes Mr. R. Jones, gardener to James Amplett, Esq., won with large bunches, and for two bunches of white grapes the same exhibitor was to the fore with Muscat of Alexandria. For three dishes of dessert apples, Mr. L. Bailey, gardener to Lady Hindlip, won with good fruits of Lord Hindlip, Cox's Orange, and Blenheim Orange Pippins. For three dishes of culinary apples Mr. R. Jones led with Peasgood's Nonsuch, Warner's King, etc.

For the collection of vegetables, eight varieties, Mr. C. Weaver won with a strong set, onions and carrots being excellent.

For the classes confined to a radius of twelve miles Mr. J. Wainwright won the gold medal and first prize for twelve incurved and twelve Japanese blooms, and he also led for six vases of large-flowering chrysanthemums and one vase of incurved; Messrs. H. Shone, J. Parkinson, and C. Weaver were first prizemen. Mr. H. Wainwright, gardener to Mrs. C. Taylor, had the leading grapes, and Mr. W. Echersley the best two plants of Japanese chrysanthemums.

Newcastle.

The fourth annual exhibition was held in the Town Hall, Newcastle, on November 18 and 19, and some remarkably fine exhibits were displayed, and the competition was keen in all classes.

In the open class for twelve vases of blooms, not less than twelve varieties, for which a challenge cup and money prizes were offered, Mr. W. Rome, gardener to James Knott, Esq., Close House, Wylam, was first with well-finished blooms of J. H. Silsbury, Mrs. A. T. Miller, Reg. Vallis, Algernon Davis, Mrs. G. Mileham, T. Miller, Mrs. W. Knox, and Bessie Godfrey; Mr. Musk, gardener to Captain Laycock, Weston, Notts, second with General Hutton and the Vallis section in very fine form; Mr. A. W. Appleton, gardener to C. Lacy Thompson, Esq., Farlam Hall, Brampton, third. For six vases of Japanese blooms, Mr. Appleton was first with R. Vallis, F. S. Vallis, Mdme. P. Radaelli, Mrs. W. Knox, Mrs. Mileham, and Mrs. A. T. Miller; Mr. G. W. Musk second, and Mr. J. Kerr, gardener to J. B. Simpson, Esq., Bradley Hall, Wylam, third. For four vases of Japanese, Mr. Musk was first, and Mr. Appleton second. In the class for three white Japanese, Mr. Appleton was first with Mrs. A. T. Miller; Mr. Rome second. For Japanese blooms Mr. Musk led with F. S. Vallis. For twelve incurved chrysanthemums Mr. J. Elliot, jun., Jesmond Dene, was first; Mr. A. Woods, gardener to S. D. Shaftoe, Esq., Beamish Park, second.

In the section confined to growers in Northumberland and Durham, Mr. Rome was an easy first in the class for four varieties, Japanese, three blooms, and won the cup with J. H. Silsbury, Mrs. A. T. Miller, Algernon Davis, and F. S. Vallis; Mr. Kerr second, and Mr. F. Eldon, gardener to H. F. Balman, Esq., third. In the class for four vases, not less than four varieties, Mr. J. Hale, gardener to Mr. Hunter, Wickham Grange, was first; Mr. W. Atkin, gardener to Rev. W. D. Heclas, second.

For a group of chrysanthemums and other flowering and foliage plants, arranged for effect, Mr. T. Bell, gardener to A. E. Bambridge, Esq., led with a finely-arranged group, in which the background of chrysanthemums was in striking contrast to the orchids, foliage and flowering plants in the foreground; Mr. G. Davidson, gardener to J. P. Lindsay, Esq., Gosforth, second; Messrs. Carnegie and Co., Newcastle, third. Five very fine groups were shown in this competition.

The vegetable classes were, as usual, well filled, the pitmen showing their fine examples of good cultivation in all the classes.

The specimen plants of chrysanthemums were marvellous examples of good culture, and in all classes the competition was very keen indeed. The table decoration class brought out five competitors, and here Mr. Lovatt, gardener to E. B. Collingwood, Esq., was first; and Mr. J. Kerr second. The cut flower and bouquet classes were also well represented, and in the fruit classes for two bunches of black grapes, Mr. Musk scored. For two bunches of white grapes Mr. Bell was first; for two dishes pears Mr. Musk led; for two dishes of apples Mr. Musk was again first, and Mr. C. English, Sherfield, Botley, Hunts, second.

Among the numerous trade exhibits, Mr. W. Lawrinson, of Yarm and Newcastle, had a fine display of ornamental trees in tubs. Finely-flowered heaths, chrysanthemums, Primula obconica (a remarkable strain), and winter-flowering begonias, the whole being filled in with winter-flowering carnations, and a small group of orchids. Messrs. Clibrans, Manchester, had a large group of chrysanthemums in varied forms, and their large-flowered strain of winter-flowering begonias. Mr. W. R. Armstrong, florist, Newcastle, had a fine exhibit of retarded lily of the valley, etc., intermixed with Cypripedium insigne. The Tyneside Seed Stores, Newcastle, showed retarded lily of the valley, and a collection of bulbs and vegetable roots. Mr. W. E. Welsh, Sunderland, had a fine display of cyclamens in variety. Messrs. Finneys, Newcastle, showed a collection of well-grown vegetables and apples in variety. Messrs. Hugh Low and Co., Enfield, had a most interesting group of well-grown winter-flowering cypripediums and other orchids in variety.

Beckenham Horticultural Society.

On Friday week, with Mr. H. W. Tyler, F.R.G.S., in the chair, Mr. E. Lovitt, of Croydon, lectured on "Flowers of the Snow Mountains," illustrated with lantern slides. There was a capital attendance, and the lecture proved exceedingly interesting and instructive, as all the mountain scenes put on the screen were from the lecturer's own photographs, and a great part of the pictures of plants represented those of Mr. Lovitt's own collecting, but growing in his own garden at Croydon. It was pointed out that the rock garden should be in a fully exposed position, but it was desirable to have differing aspects to suit various plants, and also that dead leaves should not be allowed to accumulate and decay about the plants, as valuable ones may be lost thereby. Hearty thanks were accorded both lecturer and chairman. The society's Certificate of Merit was awarded Mr. A. Henderson, Eccleshill, Hayes Lane, Bromley; and to Mr. Langford, Cedar Lawn, Beckenham, for exhibits of large anemone and single-flowered chrysanthemums.

Bradford.

One of the prettiest of chrysanthemum shows in the northern counties was the one held recently at Bradford, in the St. George's Hall. A fine effect is produced by arranging groups below the stage, plants and bouquets behind them, and the specimen flowering plants, tier above tier, upon the orchestra seats, right up to the organ. Room is left for the band, but there is no room or opportunity for anyone to reach these elevated plants, either to find their names or those of their owners. Cut flowers were very fine, and some of the best blooms seen were to be found here. The show was not a large one, but it was a most excellent one.

In the chief open class, for two dozen Japanese blooms, Mr. Thomas Stevenson, gardener to E. Mocatta, Esq., Woburn Place, Addleston, led with magnificent flowers of F. S. Vallis (2), Mrs. F. W. Vallis, Lady Talbot (2), Miss M. Hankey, Edith Smith, Mrs. S. Fox, Leigh Park Wonder (2), Duchess of Sutherland, O. H. Broomhead, Mrs. J. C. Neill, Reginald Vallis, Madame G. Rivol, Maud Jefferies (2), Splendour, Miss M. Hankey (2), Valerie Greenham, Mrs. A. T. Bott, Edith Jameson, and J. H. Silsbury. All these were remarkably fine blooms, clean, and of great substance and size. Second prize fell to Mr. W. Chandler, gardener to A. James, Esq., Coton House, Rugby, who also showed splendidly, and had F. S. Vallis, Algernon Davis, and Lady Talbot in fine condition. Mr. Chandler led for twelve Japanese, distinct, and here he had F. S. Vallis, Mary Mason, Duchess of Sutherland, Valerie Greenham, Mrs. F. W. Vallis, Ethel Fitzroy, Mrs. N. Davis, Mdlle. A. Bertrand, Bessie Godfrey, Marquise Venosta, Pres. Viger, and Algernon Davis; Mr. Stevenson must have been a very close second, and Mr. W. Iggulden came third.

There was a splendid array of incurved blooms, probably the best in the county. For twenty-four, in not fewer than eighteen varieties, Mr. G. W. Drake, Cathay's Terrace, Cardiff, was first, and he had big firm flowers of May Phillips (2), Montbrun (2), Mrs. G. Denyer (2), Pantia Ralli, C. H. Curtis, G. F. Evans (2), Mrs. Judson, Ialene (2), Lady Isabel (2), W. Biddle, Duchess of Fife, Madame Vrembly, Boccace, O. J. Muelenare, Doris Rayner (2), Embleme Poitevine, and Nellie Threlfall; Mr. E. Ellis, River View, Heswall, Cheshire, second; and Mr. Chandler third. The best twelve incurved blooms, distinct, also came from Mr. G. W. Drake, who had similar varieties to those staged in his twenty-four stand; Mr. Chandler was second, and Mr. Ellis third.

The class for twelve bunches of singles, brought out a grand display, and here Mr. J. Thornton, Lumb Hall Nurseries, Drighlington, led with Stella, Queen Alexandra, Miss Bird, Mrs. W. Jordan, Annie Holden, Richard Borton, Edith Pagram, etc.; Mr. T. Stevenson, second; and Mr. L. Shearman, Undercliffe Cemetery, Bradford, third. For eighteen Japanese, in six varieties, in vases, Mr. Stevenson led with Maud Jefferies, F. S. Vallis, Madame G. Rivol, J. H. Silsbury, Lady Talbot, and Reginald Vallis; Mr. Chandler, second; and Mr. W. Iggulden, Lock's Hill Nurseries, Frome, third.

Mr. Stevenson led for six vases of carnations; Mr. J. Brooke, Market Hall, Bradford, scored for a bride's bouquet, for a hand bouquet, and for a carnation bouquet; Mr. M. Brooke, North Parade, Bradford, was also successful in the floral design classes, and Mr. E. Midgley, gardener to R. J. Foster, Esq., Harrowins, Queensbury, was also successful. Mr. T. Dawson, 68, Leeds Road, Otley, scored for a table decoration of chrysanthemums, using Source d'Or. The best exhibit of cut flowers and flowering and foliage plants, arranged on a space of 16ft. by 4ft., came from Mr. M. Brooke, whose floral designs were novel and pleasing; Mr. J. Brooke second.

In the fruit classes Mr. F. Howland, gardener to T. Aston, Esq., Micklefield House, Rawdon, and Mr. H. Foster, gardener to W. Ferrand, Esq., J.P., St. Ives, Bingley, were the most successful competitors.

In the local class for eighteen Japanese, in not less than twelve varieties, the silver cup presented with the first prize by the Lord Mayor was won by Mr. J. Thornton, Lumb Hall Nurseries, Darlington, with a very even set, in which Mrs. F. W. Vallis, Lady Talbot, and Mary Inglis were the best flowers. Mr. Foster; Mr. P. Gudgeon, gardener to J. Whittingham, Esq., J.P., Fern Bank, Heaton; Mr. A. Brown, gardener to C. Beverley, Esq., J.P., West Royd, Farsley; Mr. Attenborough, gardener to J. A. Godwin, Esq., J.P., Clock House, Manningham; Mr. R. Eichel, Eldwick, Bingley; and Mr. A. Robinson, gardener to C. B. Shaw, Esq., J.P., The Grange, Shipley, were the leading prizewinners in other local classes.

There were several non-competitive exhibits. Messrs. Conway and Sons, Bull Green, Halifax, contributed a display of carnations, lily of the valley, begonias, and heaths. Messrs. E. J. Batchelor and Sons, Harrogate, contributed a fine lot of the new nephrolepises, notably N. todeaoides, N. Whitmani, and N. elegantissima; Messrs. Dicksons, Chester, showed a very pretty table of capital apples and numerous tall vases of the best winter-flowering carnations rising above the fruits. Mr. F. C. Edwards, Leeds, contributed a good bank of winter-flowering carnation blooms, chrysanthemums, and ferns. Messrs. Moore, Lim., put up a fine bank of orchids, and in their display we noticed excellent odontoglossums, the quaint Cynoches peruviana, oncidiums, Cypripedium insigne Sanderæ, hybrid cypripediums, and lælio-cattleyas in variety. The Agent-General of British Columbia set up a very attractive exhibit of packed apples. Messrs. Clibrans, Lim., Altrincham, had a pretty exhibit of chrysanthemums, that included a charming lot of single varieties, such as Mr. W. Jordan, Mrs. N. F. Barnes, Earl of Durham, Miss M. Bird, Mrs. F. J. Kitson, Metta, J. Stevenson, Mr. H. G. Little, and Mrs. W. L. Hepton.

Winchester, NOVEMBER 17 and 18.

The twenty-sixth annual autumn show was held in the Guildhall, and well sustained the reputation of the society. Cut blooms were numerous and good. It is not too much to say that the incurved were some of the finest seen this season. Nowhere can such handsome chrysanthemum plants be seen as here in the classes set apart for what are termed for conservatory decoration. In the ladies' department, too, there was a bright display of decorated subjects. Fruit and vegetables were plentiful and good, especially the apples, which were highly coloured. The management was of the best under the careful guidance of Mr. Chaloner Shenton, hon. secretary.

For the prizes for the best collection of chrysanthemums, arranged in a space of 8ft. by 7ft., two competed, and Mr. Henderson, gardener to the Earl of Northbrook, Stratton Park, Winchester, was easily first with plants carrying good blooms, but rather too tall for the purpose. Mr. W. Pearce, gardener to Herbert Johnson, Esq., Northgate House, Winchester, second. In the class for nine plants, distinct, each plant to carry not less than five blooms, four entered, the best coming from Mr. G. Cousins, gardener to J. A. Fort, Esq., 69, Kingsgate Street, Winchester; they were dwarf, well furnished with high-class blooms, and amply clothed with foliage. Such varieties as J. H. Silsbury, F. S. Vallis, and Mrs. Judson were conspicuous. Mr. G. Adams, gardener to Colonel F. A. Dickens, Edge Hall, Winchester, was a close second. For nine white or yellow varieties Mr. C. White, gardener to C. Mitchell, Esq., was first with exceedingly fine examples of F. S. Vallis, C. H. Curtis, and Nellie Pockett; Mr. G. Cousins second, who had F. S. Vallis remarkably fine.

Mr. F Stone, gardener to the Rev. A. G. Baker, Sunnyside, Compton Road, Winchester, was first for six plants carrying not less than eight blooms, with a really good set; Mr. F. Smith, gardener to the Rev. Canon Valpy, Winchester, second.

Groups of miscellaneous plants, arranged for effect, were numerous. Four competed in the class, and the best arrangement was that from Mr. J. Hughes, gardener to A. P. Ralli, Esq., Twyford Lodge, Winchester. The flowering plants were mainly orchids, such as Oncidium varicosum Rogersi and cattleyas, and with these were interspersed palms, crotons, etc. Mr. E. Long, gardener to F. C. Birch, Esq., Christchurch Road, Winchester, a close second, wanting a little more finish in detail. Table plants, primulas, and begonias were well shown.

In the class for thirty-six blooms of Japanese, in not less than twenty-four varieties, there were five competitors. Mr. G. H. Hunt, gardener to P. Ralli, Esq., Ashtead Park, Epsom, was distinctly first with large, even, highly-coloured examples of F. S. Vallis, Miss M. Hankey, Lady Talbot, Algernon Davis, Mrs. H. Barnes, Rose Pockett, Mrs. F. W. Vallis, John Peed, Marquis of Northampton, Magnificent, Charles Jones, Bessie Godfrey, Madame P. Radaelli, Edith Smith, Duchess of Sutherland, Thomas Stevenson, and Marquis V. Venosta. Mr. C. E. Garrett, gardener to Lord Ashburton, The Grange, Alresford, was second with rather irregular blooms; Mr. B. Hollis, gardener to Major Chichester, Embley Park, Romsey, third. Mr. C. Moore, gardener to A. Pearson, Esq., Frensham Place, Ascot, had the best exhibit of twenty-four Japanese; Mr. A. J. Marsh, gardener to M. Hodgson, Esq., Morton House, Kingsworthy, Winchester, second, with an even and attractive exhibit. Seven competed in the class for twelve distinct, and Mr. D. Edwards, gardener to W. Garton, Esq., Lansbury Court, Southampton, was the premier prizetaker; Mr. A. Mackey, gardener to R. G. Schwerdt, Esq., Old Alresford House, second.

For six varieties, three blooms of each, arranged in vases, Mr. C. Moore was first with fine blooms of F. S. Vallis, Bessie Godfrey, Madame G. Rivol, and John Peed, and other well-known varieties; Mr. B. Hollis second with a good set. Mr. G. Adams staged Edith Smith in the class for five blooms, any white-flowered variety; Mr. B. Hollis second with Ben Wells.

Incurved were very fine. For thirty-six, in not less than twenty-four varieties, or more than two blooms of any one variety, Mr. G. Hunt obtained premier honours with large, even, beautifully finished examples of May Phillips, Duchess of Fife, Mrs. B. Hankey, Mrs. R. C. Kingston, Mdlle. Lucie Faure, Godfrey's Reliance, Triomphe de Montbrun, Clara Wells, Embleme Poitevine, Doris Rayner, Calypso, Madame Vrembley, C. H. Curtis, Mrs. Judson, Godfrey's Eclipse, W. Matthews, Frank Hammond, Lady Isabel, and Amber Beauty; Mr. J. Hughes second with good blooms, a trifle smaller, but neatly finished. Mr. Marsh secured the leading place for eighteen, in not less than twelve varieties, with a fine exhibit of popular varieties; Mr. W. Gill, St. Mark's, Southsea, second.

Single-flowered varieties were numerous and good. For six bunches, in vases, distinct, Mr. G. Ellwood, gardener to W. H. Myers, Esq., Swanmore Park, Bishop's Waltham, was distinctly ahead for the premier position with a set of bright varieties; Mr. W. Neville, gardener to F. W. Flight, Esq., Cornstiles, Twyford, Winchester, second. Decorative varieties in vases are always a strong feature here, the entries are numerous and the exhibits good. For six distinct Mr. E. Long was first with bunches of typical varieties.

Fruit was an interesting display, especially the apples, which were richly coloured. Mr. W. West, gardener to Mrs. Knox, Holt Hatch, Alton, had the best dessert varieties. Mr. Hall, gardener to Lord Swaythling, South Stoneham House, Southampton, the best kitchen sorts. The latter won for white grapes, and Mr. Hollis for black, with desirable exhibits.

Vegetables were of high excellence, Mr. G. Ellwood winning for the two collections of six varieties with high-class produce.

Not for competition displays added to the attractiveness of the show. Mr. Ellwood had an effective group of apples, in piles, richly coloured, with which were associated twigs of coloured trees and shrubs, flowers, etc. Messrs. E. Hillier and Son, Winchester, had apples, pears, and flowering plants—an effective exhibit, across one end of the hall. Mr. C. Fay, Totton, Southampton, had a really fine exhibit of carnations; and Mr. Ladhams, Shirley, hardy flowers.

Huddersfield.

The seventeenth annual exhibition of the Huddersfield Society was held in the Town Hall. In 1907 there were no open classes, as the result of an objection on the part of subscribers to prizes being taken out of the town, but this year the committee returned to previous methods, and provided open classes, as last season's results were by no means good. The recent show was a fine one, and the attendance was good. The Deputy Mayor, Alderman Balmforth, opened the show, and he was supported by the Mayor and Mayoress, and other influential local friends of the society.

In the open class for two dozen Japanese blooms Mr. Chandler, gardener to A. James, Esq., Coton House, Rugby, secured the chief award, and was followed by Mr. F. W. Jameson, Aston Hall, North Ferriby, and Sir Edward Evans, Spital Old Hall, Bramborough. Mr. Jameson was first for two dozen incurved, followed in order by Mr. G. Bardon, Oxton, Birkenhead, and Mr. Chandler.

There were three group classes, and in the one for chrysanthemums only the prizetakers were Mr. T. H. Ramsden, Oakwell, Golcar; and Mr. J. Cook, Oaklands, Birkby. For a large group of miscellaneous plants, arranged on a space of 65 square feet, Mr. H. Broadbent, Edgerton Grove; Mr. T. H. Ramsden, and Mr. J. Lumb, Rose Hill, Birkby, secured the awards as placed. In the smaller group class Mr. Ramsden, Mr. Lumb, and Mr. J. S. Sharp, Valley Nurseries, Almondbury, gained the prizes. Mr. F. Eastwood, Buckden Mount, Edgerton, scored for three specimen plants, large flowering, and also led for three specimens of single varieties. Messrs. Lumb and Eastwood were very successful in other plant classes.

In the district class for eighteen Japanese blooms, Mr. T. J. Hirst, Meltham Hall, and Mr. J. E. Shaw, Brooklands, Stainland, were placed equal first. Mr. Hirst led for eighteen incurved, and was followed by Mr. G. H. Fleming, Greetland. Mr. Hirst had the best dozen Japanese blooms, and Mr. F. Eastwood the best dozen incurved, in vases. Mr. Hirst scored both for six Japanese and for six Japanese, and Mr. Eastwood led for pompones.

Cardiff Chrysanthemum Show.

The twenty-second annual show took place at the Park Hall. The weather was glorious, and the show was well supported by a large number of enthusiasts. The entries were, owing to the unfavourable season, a little below the average, but the exhibitors were well worthy of the praise bestowed upon them by the judges, who considered the blooms were of a high standard, and would compare favourably with those at other leading shows.

In the open class for eight vases of specimen blooms, Japanese, distinct, three blooms of one variety, Mr. G. Drake secured first honours with good blooms of J. H. Silsbury, Bessie Godfrey, A. T. Miller, Mrs. Barkley, Reg. Vallis, Mdme. G. Rivol, F. S. Vallis, and Mdme. P. Radaelli; Mr. H. R. Farmer, gardener to the Marquis of Bute, second with fine flowers of Miss M. Hankey, Ben Wells, President Viger, J. H. Silsbury, W. A. Ethrington, F. S. Vallis, Mdme. G. Rivol, Bessie Godfrey, and Mdme. P. Radaelli; Mr. Joy, Cwrtyalla, Cardiff, third. For twelve Japanese, Mr. Farmer led, and Mr. Joy was second. For twenty-four blooms, incurved not less than twelve varieties, Mr. G. Drake led, and Mr. Farmer was second. Both exhibitors showing grand blooms of Mrs. G. Wynn, Lady Isabel, Godfrey's Eclipse, G. F. Evans, W. Pascal, Ialene, Mrs. F. Judson, Bernard Hankey, Emblem Poitevine, Doris Raynor, Mrs. G. Denyers, Pantia Ralli, and C. Curtis.

In the amateurs' division, Mr. A. F. Hill was first, and Mr. H. Edwards second for twenty-four Japanese. For twelve Japanese, Mr. A. F. Hill and Mr. F. Primavessé secured the awards. For twelve blooms of Japanese, not less than four varieties, Mr. F. E. Atkins and Mr. H. A. Allen were the most successful. In the class for six white Japanese, Mr. G. Drake, Mr. W. J. Coles, and Mr. H. A. Joy secured the awards.

Chief prize in the open group class for single and large-flowering chrysanthemums was won by Mr. G. Williams, Manor House, Cardiff (gardener, Mr. J. Howe), and the National Chrysanthemum Society's Certificate of Merit was awarded to Mr. Williams for chrysanthemum H. Williams, a beautiful yellow Japanese variety.

Gold medals were awarded to Mr. J. Basham, Bassaleg, for a grand collection of fruit; Mr. William Treseder for floral displays; Messrs. Cypher and Sons, and J. J. Neale, Esq., for orchids; and to Messrs. Clibrans for winter-flowering begonias and single chrysanthemums. Silver medals went to Messrs. Young and Co., Cheltenham; Mr. Hodge, Albany Road, Cardiff; and Messrs. P. Thomas and Co., Albany Road, Cardiff, to the former for winter-flowering carnations, and the latter two for floral displays.

Reading Gardeners' Association.

A highly successful meeting of this flourishing society was held on Monday, November 16, in the Abbey Hall. The President (Mr. Alderman Parfitt, J.P.), presiding over a large audience, which included the Vice-President (Mr. L. G. Sutton), Mr. T. Tunbridge (chairman), Mr. G. Hinton (vice-chairman), etc.

After the usual business of the meeting had been disposed of, the President called on the lecturer for the evening, Mr. F. Phillips, representative from the Redhill and Reigate Association, to introduce his subject, "Plants for Exhibition."

By his robust, and at the same time, lucid style, Mr. Phillips at once won the attention of his audience, and the many amusing anecdotes which he introduced to emphasise his remarks frequently provoked hearty laughter. In a brief notice such as this, it is, of course, impossible to deal with such a subject as that so ably handled by the lecturer.

After a few remarks on what he considered the best form of houses in which to bring forward plants for exhibition, Mr. Phillips proceeded to advise those among his hearers who thought of propagating dracænas and crotons, to start immediately; delays are dangerous, he remarked. Then with regard to soil he urged the necessity of thoroughly mixing the different ingredients, introducing to illustrate the necessity of this an amusing story as to what might be expected were the cook to fail in the proper admixture of a pudding. The dangers of over-watering, improper ventilation, overcrowding, insect pests, and many other matters were dealt with in a manner which proved Mr. Phillips to be a thorough master of his subject.

The lecturer then named some of his particular favourites among dracænas, crotons, palms, lilies, aralias, as among the subjects he largely relied on as a successful exhibitor, expressing, too, his admiration for Begonia Gloire de Lorraine. He also mentioned that for the floral embellishment of his exhibits he largely used seedling begonias, gloxinias, schizanthuses, francoas, as well as gloxinias from roots, and, of course, orchids.

In conclusion, the lecturer admonished his audience to break away from formality and endeavour to be original in grouping. On resuming his seat, Mr. Phillips was loudly applauded. In the discussion which followed many questions were put to Mr. Phillips, and readily replied to by him. Among others taking part in the debate were Messrs. Neve, Judd, Exler, Durward, Foster, Alexander, Goodger, Turnham, Carter, etc. On the proposal of the Vice-President, seconded by Mr. Tunbridge, a hearty vote of thanks to the lecturer was carried with acclamation, and Mr. Phillips suitably responded.

Mr. Wilson staged a most excellent collection of fruit (not for a certificate), for which he was accorded a hearty vote of thanks. Mr. F. Townsend, gardener to the vice-president (Mr. L. G. Sutton), exhibited a beautiful group of Primula obconica set with Cyperus alternifolius, for which he was awarded a certificate.

Two new members were elected, and a vote of thanks to the president concluded the meeting.

Royal Horticultural Society of Aberdeen.

The annual general meeting of this society was held in the Music Hall Buildings, Aberdeen, on Saturday evening. There was a good attendance, and the chair was occupied by Bailie Milne, vice-chairman of the society. The annual report by the directors was submitted, which showed that, from a horticultural point of view, the show held in August last was an exceedingly good one, the exhibits being above the ordinary both in number and quality; but the financial result was not satisfactory owing to the breakdown in the weather on the last day of the show. The income for the year amounted to £416 13s. 8d., and the expenditure to £477 2s. 11d., showing a deficit for the season of £60 9s. 3d., the balance at the credit of the society to be carried forward to next year being £31 16s. 1d. Attention was also called to the fact that the membership was decreasing, and members were earnestly urged to do all they could to remedy this defect.

The Chairman moved the adoption of the report. Mr. Alexander Marr, Aberdeen, seconded, and the motion was agreed to. Mr. Robson, of Messrs. William Smith and Son, Aberdeen, and Mr. John Leith emphasised the remarks in the report with reference to the desirability of increasing the membership.

On the motion of the Chairman, Lord Provost Alexander Wilson was unanimously elected as honorary president. Mr. Burnett, of Powis, was re-elected chairman, Mr. Robson stating that he thought they could have no one better qualified to fill the post. All the vice-presidents were re-elected, with the name of Sir Alexander Lyon, who was president during his Provostship, included in the list of honorary vice-presidents. Directors were appointed as follows: Messrs. James McDonald, W. A. Dustan, William Anderson, J. M. Simpson, Alexander Marr, Alex. Burns, jun., Alexander Mortimer, A. M. Cocker, R. Harvey, A. Douglas, John Leith, A. Giles, W. Adam, William Walker, James Duncan, William Pirie, and John Taylor. Mr. William Reid and Mr. William Wyllie were re-elected auditors, and Mr. J. B. Rennett, Aberdeen, reappointed secretary and treasurer.

Aylesbury.

This Mid. Bucks society held its thirtieth show on November 19, and this was a floricultural and horticultural success, being much more numerously attended than the shows held for some seasons past. The Town Hall was utilised for plants and blooms, the adjoining Meat Market accommodating the extensive vegetable competition and fruit.

The exhibition, though held somewhat late, was up to a full average standard of excellence. In the competition Mr. Brandon, gardener to Mrs. Gurney, led for nine and one Japanese, six and one large-flowering, and three pompons, specimens; Mr. W. Tipler, gardener to Colonel D. Lee, Hartwell Park, securing the premier award for a mixed group; and Mr. Hygate, gardener to J. C. E. Bridge, Esq., led for a 56ft. arrangement.

Cut blooms were mostly in vases, in triplets, the premier ten, from Mr. Tipler, being generally fresh, well-developed trios of Duchess of Sutherland, F. S. Vallis, Madame R. Oberthur, Valerie Greenham, The Lyon, Algernon Davis, Leigh Park Wonder, M. Montigny, Mrs. F. W. Vallis, and Annie Hamilton. The class for eight vases proved a good one, Mr. Partridge securing the chief award with a noble set, comprising triplets of Mrs. W. Knox, Mrs. B. Hankey, Miss E. Fulton, Madame Ferlat, H. Ellis, Louise Giles, Madame M. de Mons, and Mildred Lynne. For six incurved, one variety, the awards went to Countess of Warwick, first; Triomphe de Montbrie, second; and C. H. Curtis, third; and in the corresponding class for Japanese F. S. Vallis was placed first, and Madame R. Oberthur second.

The display of fruit was good; pears were not numerous, but the best varieties of apples were well represented, some Cox's Orange Pippin being very fine. In this section Alicante grapes, from Mr. Tipler, secured the premier award, he also staging a fine collection of apples, including varieties Dumelow's Seedling, Tom Putt, Gloria Mundi, Mère de Ménage, Blenheim Pippin (a fine sample), Lane's Prince Albert, Adam's Pearmain, Cox's Orange, King and Ribston Pippins, Lord Burghley, and Barnack Beauty.

The vegetables (very largely allotment produce) made up a fine show, the carrots (intermediate and horn) being splendid for colour and shape, and every garden variety was represented in bulk, there being fully 100 dishes of potatoes of twelve tubers each in the competition, one cottager, Mr. Joseph Deering, winning a silver teapot for a collection of twelve dishes. Other classes were for eight, six, and four varieties. The potatoes were very bright and shapely, the following varieties being repeated again and again, viz., Up-to-Date, Purple Perfection, Windsor Castle, The Nobleman, Russet Queen, Great Central, Dunbar, Mr. Bresee, Red Dalmeny, King Edward VII., Charles Fidler, Sharpe's Empress, Satisfaction, Reading Russet, Reading Giant, Sir J. Llewelyn, Bright Eyes, and The Dean.

Non-competitive exhibits included a 60ft. group of plants from Mr. H. Warren, gardener to Miss Rothschild, Aston Clinton, in which the cream and pink Lorraine begonias figured largely.

South Shields.

This well-known society in the North of England scored another success at its annual exhibition held in the fine Assembly Hall, being packed with most meritorious productions. The Japanese blooms were good and very fresh, while the incurved were splendid examples and well finished, showing a great improvement in this section. The specimen plants exhibited in the basement of the hall were enormous, some of the Japanese and singles measuring quite 6ft. across. For many years this exhibition has been noted for the display of bridal and other bouquets, epergnes in variety, and table decorations, but this year it surpassed itself.

The president, Mr. James Readhead, Westoe Hall, gives very great financial and other support to the society, and it is gratifying to note his success in the plant classes, and also in the cut blooms. Mr. J. E. Stout exhibited some very fine specimen plants of single varieties, the best that have been shown here. The certificates of the National Chrysanthemum Society were awarded in the plant classes, one to Mr. Readhead for Japanese, and one to Mr. Stout for singles.

In the principal class for thirty-six Japanese, eighteen varieties, for which the President's Silver Cup and valuable money prizes were offered, the first prize was won by Mr. Albert Chandler, gardener to Arthur James, Esq., Coton House, Rugby, with a splendid exhibit of well-developed fresh blooms of the leading varieties. The F. S. Vallis in this stand was selected as the premier bloom. Mr. Chas. Jennings, gardener to F. W. Jameson, Esq., North Ferriby, second; Mr. H. Smith, gardener to R. D. Marshall, Esq., Keswick, third; and Mr. G. E. Thomas, gardener to the Marquis of Ripon, Studley Royal, fourth. For eighteen Japanese, Mr. H. Smith was first; Mr. T. Reay, gardener to James Readhead, Esq., second. In the class for twelve Japanese, Mr. Chandler, Mr. Smith, and Mr. Fixter were successful, in this order.

For twenty-four incurved, duplicates allowed, Mr. John Readhead gives a silver cup, valued five guineas, in addition to money prizes, and Mr. C. Jennings was first with a fine lot, followed closely by Mr. Chandler, Mr. G. E. Thomas, and Mr. Fixter. The same exhibitors were successful in the class for twelve blooms, and in the same order. Mr. T. Reay, gardener to the President; Mr. Baser, gardener to Alex. Purvis, Esq.; Mr. J. Cooper, Mr. Stout, and Mr. J. T. Smith were the principal exhibitors in the plant classes.

Mr. James Summers, Sunderland, as usual carried off the principal prizes in the bouquet section, securing Mr. Graham's five-guinea cup and £3 in cash for a bridal bouquet; he was also first for a hand bouquet, first for a table laid out with fruit and flowers, and first for an epergne as a centre-piece for a table. The flowers used were of the choicest description, orchids playing a prominent part. Mr. George Hillier, Darlington; Mr. George Knight, Middlesbrough; Miss Dora Summers, Sunderland; and Mr. G. Webster, Sunderland, were also very successful in securing prizes in this section, all showing well.

Mr. William B. Readhead offers a seven-guinea cup for a miscellaneous group of chrysanthemum and other plants, and the class brought out three exhibits, the first prize being won by Mr. Hetherington, gardener to C. T. Rendall, Esq., North Shields, who had an excellent front arrangement, but a weak background; Mr. Thos. Bell, Jesmond, was second, with Mr. George Knight third.

Mr. Alex. Purvis makes an excellent chairman of committee of this well-managed society, and his son, Mr. Allen Purvis, is a worthy successor to the late Mr. Bernard Cowan as hon. secretary. Mr. J. Athey is the staging superintendent, and much credit is due to him and others for the tasteful arrangement of the show.

Norwich, NOVEMBER 19 and 20.

The Norfolk and Norwich Horticultural Society is especially favoured in many respects. It has a remarkably strong committee, an exceedingly able and courteous hon. secretary in Mr. W. Smith, and it includes among its members some of the most successful cultivators of chrysanthemums, fruits, and vegetables in the United Kingdom. This year, so far as the autumn show was concerned, it was not particularly favoured by the weather, and in consequence of the high temperature that was experienced during the greater part of October, and the damp, foggy weather by which it was followed, much difficulty was found in keeping the blooms in first-class condition. As the result, some of the leading growers in the county were not able to take part in the competition in the chrysanthemum classes, and the display was not quite so large as usual. Notwithstanding this fact, there was a big display, and an abundance of superbly developed blooms. Of orchids and miscellaneous plants the numbers were larger than usual, and fruits and vegetables were staged in enormous quantities, and in a condition that did credit to the large body of exhibitors.

CUT BLOOMS.

The premier class in the section devoted to blooms of chrysanthemums was that for forty-eight Japanese, and in this the principal award was made in favour of Mr. C. Nicholls, gardener to T. A. Rising, Esq., Manor House, Ormesby, who had fine examples of Mrs. A. T. Miller, F. S. Vallis, Madame G. Rivol, Madame P. Radaelli, Florence Penford, Duchess of Sutherland, and Mrs. W. Weeks. There was a spirited competition in the class for thirty-six Japanese, and Mr. Goude, gardener to E. Reeve, Esq., The Grange, Old Catton, Norwich, occupied the post of honour with large, fresh, and brightly coloured blooms of Princesse Alice de Monaco, Mrs. C. F. Boosey, Madame P. Radaelli, J. H. Silsbury, Mrs. W. Knox, and other varieties that stand high in the estimation of cultivators. Mr. E. Leech, gardener to W. H. Palmer, Esq., Ormesby, was a capital second with an excellent stand of blooms, and Mr. J. Wynn, gardener to H. Ingleby, Esq., Sedgeford Hall, Lynn, was third, with good blooms. Not less satisfactory was the competition in the class for twenty-four Japanese, and the premier award was taken by Mr. W. L. Brooke, of Attleburgh, who may well be described as one of the most successful amateur cultivators of chrysanthemums at the present time. Every bloom was of the largest size, and finely finished. Mr. A. Gibson, gardener to Sir E. Mann, Thelveton Hall, was a capital second. Mr. H. Rogers, gardener to Lord Rendlesham, Rendlesham Hall, had the best twelve blooms, and Mr. R. Cooper, gardener to the Rev. R. F. Taylor, Hedenham Rectory, was a good second. Mr. W. Laws, gardener to E. G. White, Esq., Eaton House, Norwich, was first for six Japanese, and his stand was remarkable for the magnificent bloom of Florence Molyneux that it contained. It is now some years since we have seen so finely developed a bloom. Mr. A. Gibson and Mr. G. Tweley, gardener to A. Reece, Esq., Riverside, Thorpe, were first and second for six blooms of any one white Japanese variety, with Madame Carnot, so closely matched that there was hardly half a point between them. Mr. Rogers and Mr. C. Nicholls were first and second respectively for six blooms of any variety other than white, and both staged F. S. Vallis at its best. In the amateurs' division Mr. Brooke was first for twelve Japanese, with magnificent blooms, and Mr. Prentice was first for six with fine examples. The blooms of incurved were not equal to the high average that has so long obtained at Norwich, but this was due to the unfavourable climatic conditions that had obtained in the district of which the city is the centre. Mr. J. Wynn obtained premier honours in the class for twenty-four varieties with a good stand in which several seedlings possessing much merit were represented. Mr. Cooper was first for six incurved, and Mr. W. Turner was a capital second. For six blooms of any one incurved variety Mr. E. Leach and Mr. R. Cooper were first and second with C. H. Curtis in capital order.

The contributions to the vase classes and to those for pompons, pompon anemones, and decorative varieties formed a very pleasing feature, and brought into strong relief the value of these classes for giving variety to an exhibition. Very attractive was the class for twelve vases of naturally-grown flowers, i.e., without disbudding, and in this Mr. W. Turner, gardener to Dr. Andrews, Great Yarmouth, was at the head of the numerous competitors with an effective collection. Mr. P. Wright, gardener to W. J. Birkbeck, Esq., Stratton Strawless Hall, Norwich, was an uncomfortably close second. Single chrysanthemums were finely shown in vases by Mr. Evans, gardener to Mrs. Mills, Brook House, Norwich, Mr. F. Matthews, Aylsham, Mr. Turner, Mr. Breese, gardener to F. Matthews, Esq., Wroxham. Very beautiful were the collections of anemone pompons from Mr. W. Turner and Mr. C. J. Harrison, who were first and second in the class, and other exhibitors. Pompons were also plentiful and of a high order of merit, and in the class for twelve bunches Mr. A. Woodham, gardener to Sir H. Cozens-Hardy, Letheringsett Hall, Norwich, and Mr. W. Turner, were first and second respectively. Mr. R. Woodhouse staged a fine collection for third place.

The premier bloom in the classes for Japanese varieties was a grand example of F. S. Vallis, and the premier incurved was an unnamed seedling in Mr. Wynn's first prize twenty-four.

PLANTS.

Groups were, as usual, of a high degree of excellence, and arranged down the centre of the hall, produced a fine effect. Mr. Palmer was first with admirably-grown plants, bearing superbly-developed blooms, but the white sticks used in supporting them were a little too much in evidence. Mr. C. Burtenshaw, gardener to H. Skelton, Esq., St. Helen's House, Norwich, was a close second, and Mr. Rush Thorpe was third with a good arrangement. Naturally grown plants were well shown in sixes and threes, the specimens being large and finely-flowered. Mr. W. Laws' collection of six specimens must be mentioned for their splendid development. Begonias of the Gloire de Lorraine type were staged in large numbers, and in capital order, and produced a rich display of colour. The prize-takers for six were Mr. H. Goude, Mr. R. Woodhouse, and Mr. W. Palmer.

Orchids were more largely shown than in any previous year, and the numerous collections constituted an attractive feature. Prominent among the winning exhibitors were Mr. W. Mason, gardener to H. Rider Haggard, Esq., Ditchingham House; Mr. Cheetleburgh, gardener to Colonel Rous, Worstead House, Norwich; Mr. A. V. Coombs, each of whom obtained several prizes, and staged specimens of much merit. Primulas, zonal pelargoniums, and cyclamen were all well represented, but space will not permit of their being referred to in detail.

FRUIT AND VEGETABLES.

There was an immense display of fruit and vegetables, and the vast Blackfriars Hall was not sufficient to accommodate the whole of the products. The class for a collection of fruit, arranged with suitable plants, was an attractive one, and here Mr. W. Allan, gardener to the Hon. Colonel Harbord, Gunton Park, Norwich, was first with fruit remarkable for its high quality and tasteful arrangement. There was a keen competition in most of the classes for grapes, but the quality in the classes for white varieties was rather below the average. Mr. A. V. Coombs scored with Alicante, staging finely-finished clusters, and Mr. Goude was a good second; the exhibitor last-named staged excellent Gros Colmar. Mr. Allan was first for three varieties of grapes, with Alicante, Gros Colmar, and Gros Maroc.

Apples were exceptionally good, both in size and finish. In competition for the prizes for nine dishes of dessert, Mr. F. Hanson, gardener to Sir F. Crossley, Bart., Somerleyton Hall, was at the head of the several exhibitors with fine examples of Charles Ross, King of the Pippins, Cox's Orange Pippin, and other good varieties; Mr. Allan second. Mr. H. Woollerton, gardener to Sir F. D. Chute, Multon Rectory, was a splendid first for six dishes of dessert apples, and Mr. W. Cheetleburgh exhibited well for second place. Mr. Youngman was successful in taking premier position for one dish of dessert apples with some of the finest fruit of Ribston Pippin yet placed upon the exhibition stage. Mr. W. Mason second, with Blenheim Pippin as near perfection as we can hope to see it. Mr. G. D. Davison, gardener to Major Petre, Westwick Hall, Norwich, was at the head of the numerous competitors in the class for nine dishes of kitchen apples, with magnificent examples of the several varieties represented, and in the class for six varieties Mr. T. Jones, Honing Hall, was first. Mr. Hanson was successful in obtaining premier honours for six dishes of pears with good fruit of Charles Ernest, Glou Morceau, Beurre Diel, Doyenne du Comice, and Marie Benoist. Mr. G. D. Davison was a close second with Marie Louise as his best dish. Mr. H. Goude and Mr. F. Matthews were first and second for three dishes of dessert pears. Mr. Rogers had a fine dish of Doyenne du Comice in the class for that variety. There were about fifty classes for vegetables, and as they were all well filled, in some the entries being a score or more, they formed an important part of this great gathering. Both in the collections and single dishes the quality was very high, and in the numerous potato classes the tubers were especially noteworthy for their fine finish.

Miscellaneous contributions included a large display of chrysanthemums from Messrs. Hobbies, Ltd., and collection of fruits, flowers, etc., from Messrs. Daniels Brothers, and splendidly-flowered specimens of winter-flowering begonias of the John Heal type, those of Ideala being especially noteworthy from Mr. A. V. Coombs.

East Anglian Horticultural Club.

Plenty of splendid exhibits and a large gathering of members to see them was the case at the November meeting of this club, which was held at the Royal Hotel, Norwich. It is surprising what good feeling and comradeship these clubs seem to encourage. A hand-shake here and there, and a talk over how this or that is doing seems to stimulate one. This club is, perhaps, more favoured than some, as so many members are able to get together. At this meeting alterations to rules and schedules were handed in for consideration. A paper on "Onion Culture" was read by Mr. F. Carrington, who has proved by his wins at local shows to be one of the best amateur "onionists" in the district. His remarks were attentively followed by the meeting, and gave rise to a remarkably good discussion. Mr. W. Shoesmith, gardener to F. W. Harmer, Esq., Cringleford, won outright the Girling Silver Challenge Cup. Mr. H. Goude, gardener to E. Reeve, Esq., The Grange, Catton, brought up some of his superb Begonia Gloire de Lorraine plants, which won for him a special prize, given by Mr. J. F. Betts. Mr. F. Williams, gardener to Louis Tillett, Esq., M.P., Catton, set up a grand display of vegetables in competition for Messrs. Daniels Bros., Lim., special prizes, and received the premier award. Messrs. Hobbies, Lim., Dereham, gave prizes for naturally-grown chrysanthemums, which brought out a keen contest, and the monthly classes of flowers, fruits, and vegetables were all sources of keen fights.

Banbury.

The twenty-third exhibition was held in the Town Hall, Banbury, when there was an excellent display. Entries were much as last year, for while cut blooms were not so numerous, other classes were better, notably fruit and vegetables. Banbury Town Hall, though a modern structure, is not large enough to display the products to advantage, and the fruit classes are disposed in an adjoining Council room, and the vegetables in the basement.

Chrysanthemum plants are not encouraged, but the cut-flower section contains liberal prizes, and there was a very keen contest in the "vase" class for not less than eight varieties, three blooms of each, the premier award going to Mr. J. M. Bush, gardener to F. J. Myers, Esq., Charlton Lodge, who had grand blooms, and thus secured the Town Challenge Cup and £3 cash prize; Mr. S. Brown, gardener to W. C. Cartwright, Esq., Aynho Park, was second; Mr. G. F. Hallett, gardener to Lady Hasketh, Eastor Newton Park, third. For eighteen Japanese, Mr. Bush was again to the front with sturdy blooms; Mr. G. H. Bonner, gardener to Z. Merten, Esq., Watlington Park, second; Mr. Hallett third; while for a dozen blooms the premier award went to Mr. F. Tapper, gardener to Sir S. Scott, M.P., Westbury Park, for a well-balanced set; Mr. A. Sadler, gardener to Rev. R. W. Bradford, Broughton Rectory, second; Mr. Hallett third. Six Japanese blooms made a good class, the awards being in favour of Messrs. Sadler, Bonner, and A. Busby, gardener to Colonel Murray, Deddington. In the next class for six white blooms, some noble flowers were staged by Messrs. Bush, Hallett, and Bonner, the half-dozen, not white, being best shown by Messers. Tapper, Sadler, and Bush, an extra prize going to Mr. Bonner.

Incurved blooms were none too numerous, the best dozens being staged by Messrs. Brown, Bush, and D. F. Power, gardener to Lord North, Wroxton Abbey; while for six Messrs. Sadler, W. J. Florey (schoolmaster, Chipping Warden), and Hallett, divided the honours. Single flowers, in bunches, set up in vases, were attractive, as staged by Mr. E. Cox, gardener to the Lady Kingsley, Fawdry Court.

The tables of decorative plants were rich in highly-coloured orchids, the challenge cup going to Mr. Hallett, who beat Mr. Bush, who has held the cup for two seasons. Winter-flowering begonias were attractive, as set up by Messrs. Bonner and Power; cyclamens from Messrs. Bonner and Sadler; and zonal pelargoniums, of which there was a charming display, secured positions for Messrs. Sadler and Power.

Trade exhibits of cut blooms and floral devices were numerous. The fruit was at once a large and attractive feature, the colouring being excellent, the tables of dessert fruits being beautifully arranged, Mr. F. G. Bull, Weston Flavell, securing the £10 cup, with Mr. Bush coming a close second. The prizes for vegetables were largely in the hands of Mr. A. V. Cross, who scored premiers for a collection—carrots, parsnips, beet, onions, and coloured kidney potatoes; and Mr. W. Dale, who led in the classes for three dishes of potatoes and a dish of white rounds.

Woolton.

This was an admirable show, although hardly so extensive as its predecessors. Trained plants were good, as also were the single cut chrysanthemums. Staging here is more for general effect than for the convenience of the judges, but it merits the approval of the visitors.

For twenty-four blooms, Japanese, not less than eighteen varieties, Mr. G. Eaton, gardener to W. Tod, Esq., secured the silver challenge vase with a good stand that included the premier bloom, Mrs. Chas. Penford; other prize winners in this class were Mr. J. Stoney, gardener to Lieut.-Colonel J. B. Gaskell, and Mr. J. Clarke, gardener to T. Clarke, Esq. For eighteen varieties, distinct, Mr. G. Haigh, gardener to Sir W. H. Tate, Bart., won with a creditable stand, and Mr. T. Keightley, gardener to P.W. Barr, Esq., had the best twelve blooms. For eighteen incurved, distinct, Mr. J. Stoney was the winner, and for twelve Mr. H. Howard, gardener to A. S. Mather, Esq., led, while for the best bloom Mr. J. Clarke scored with Buttercup.

The best collection of cut flowers arranged for effect came from Mr. J. Stoney. For nine vases of single varieties, distinct, nine blooms in each lot, Mr. H. Howard held the coveted position with a grand set of large, fresh, and well-coloured blooms; other prizemen were Messrs. G. Eaton, T. Keightley, and G. Haigh; the exhibits in this class were generally admitted to be the finest yet seen. For three vases Mr. W Wilson, gardener to W. Cunningham, Esq., led.

The three prizes for bouquets went to the Highfield Gardens, and for sprays, to Childwall Nursery and Highfield Gardens.

The section for chrysanthemums in pots fully sustained its high standard, Mr. W. Wilson upholding his high position by winning for three large-flowered, one incurved, one reflexed, and one pompone specimen, the whole giving evidence of high cultural skill and good training. Mr. T. Hitchman, gardener to A. Earle, Esq., won with a beautiful single variety, and Mr. T. Keightley for a fine anemone variety. In other plant classes Mr. T. Hitchman won for cyclamens, and for two Begonia Gloire de Lorraine, Mr. H. Howard for Roman hyacinths, Mr. J. McColl, gardener to J. W. Hughes, Esq., for a fern with a large Goniophlebium subauriculatum; Mr. G. Eaton for any other foliage plant, with a well-coloured croton; Mr. J. Stoney, for a cypripedium; and Mr. G. Haigh, for any other flowering plant, with Eucharis amazonica.

For two bunches of white grapes and two bunches of black grapes, Mr. A. A. Evans, gardener to Colonel R. Ireland-Blackburne, won with good bunches of Alicante and Muscat of Alexandria; Mr. Evans also had the best three dishes of dessert apples, three dishes of culinary varieties, and one dish of stewing pears, showing well in each class. Mr. G. Hammond scored for one dish of dessert and one dish of culinary apples; Mr. J. McColl for three dishes of dessert pears; and Mr. J. Rothwell for the single dish.

For vegetables the winners in the several sections for collections were Mr. T. Keightley (gardeners), Mr. J. Glover (farmers), and Mr. J. Worth (cottagers).

Bristol, NOVEMBER 18 and 19.

The Drill Hall was again devoted to the annual show, and although the display was a great success the entries were slightly fewer than in some former years. Orchids are here a distinct feature, creating much interest in the neighbourhood.

For a group of chrysanthemums, interspersed with foliage plants, there were but two exhibitors, the first prize arrangement coming from Mr. W. H. Bannister, gardener to Mrs. St. Vincent Ames, Bristol. Stove and greenhouse plants, with ferns, are here a strong feature. Mr. J. Binfield, gardener to John Baker, Esq., was the most successful, showing really fine examples of cultural skill. For a group of orchids arranged on a table space of 6ft. by 4ft., with ferns and foliage plants, Mr. W. Gostling, gardener to A. G. Groves, Esq., Bristol, was first with an exhibit of much interest; Mr. Cary Batten second. For three specimens Mr. J. F. Arntis, gardener to Sir Howell Davis, M.P., was first, with Cypripedium Harrisianum and Cattleya labiata. For two specimens Mr. Gostling was again first with Cypripedium insigne and C. punctatum violacea. In another class for two, distinct, Mr. Gostling again won with Odontoglossum Grande and Cypripedium insigne. Mr. Curtis, with Cypripedium Spicerianum, carrying twenty-one flowers, won premier place for a specimen.

In competition for the prizes for thirty-six Japanese Mr. Iggulden, Frome, had the best of four entries with medium-sized and deeply-coloured examples; Mr. T. Coote, gardener to D. E. Taylor, Esq., Bristol, second. For twelve distinct Japanese Mr. F. W. Lockwood was first with a well-arranged stand. For six Japanese, any variety, in two vases, Mr. Iggulden was first with Madame P. Radaelli in the pink of condition; Mr. Lockwood second. For any white variety Mr. Iggulden had the best six blooms with Katie Palgrave; Mr. Woodward second with Elsie Fulton. The best yellow variety was F. S. Vallis, staged by Mr. Iggulden. For six vases, distinct, three blooms in each, Mr. Iggulden added one more success with desirable specimens, F. S. Vallis, Madame G. Rivol, and J. H. Silsbury as the best; Mr. G. Sutton, gardener to W. A. Todd, Esq., second.

Incurved varieties were not numerous. For twelve, distinct, Mr. W. Strugnell, gardener to W. J. Long, Esq., Rood Ashton, was first with medium-sized, neatly-finished specimens of popular varieties; Mr. A. Saunders second. Single-flowered varieties are numerous here. For six varieties, five sprays in each vase, eight competed. Mr. G. Sutton was the winner with bright examples of popular varieties; Mr. F. J. Little, gardener to Lord

Offices: 148 and 149, Aldersgate Street, London.

Justice Farwell, second. Violets are here a strong feature. For six bunches, in not less than three varieties, Mr. Lambourne was first with a pleasing selection of good blooms.

Fruit and vegetables were good, and trade exhibits were interesting, and a gold medal was awarded to Mr. J. Cypher for orchids, in which the following were conspicuous. Cypripedium insigne Sanderæ, C. i. Harefield Hall, C. Colbiana, C. Ernesti, C. Madame Jules Hye, C. Fairrieanum, and a nice collection of cattleya hybrids; and to Messrs. Sutton and Sons, who had a fine exhibit of vegetables in which tomatoes were conspicuous. Messrs. Felton and Son, London, had a pleasing exhibit of floral arrangements of various kinds.

Pangbourne Gardeners' Association.

This society commenced a new session recently, when Mr. E. Trollope, The Gardens, Coombe Park, Whitchurch, Oxon, read a very practical paper on "Spring Bedding." A good discussion followed, in the course of which many interesting points were brought out. The meeting terminated with a hearty vote of thanks to Mr. Trollope for his paper.

On the evening of November 4, Mr. F. J. Bright, The Gardens, Whiteknights Park, Reading, read a paper on "Fuchsias," which was listened to with much interest by the members present. The paper was principally devoted to the growing of specimen plants, as practised so successfully at Whiteknights by Mr. F. Bright, sen., for many years. The discussion which took place after the reading of the paper proved very instructive. A vote of thanks to Mr. Bright brought a very pleasant evening to a close.

Rare Alpine and Rock Plants, especially those liable to die through excessive damp in winter, ought now to be propagated, early in the autumn small pots with several cuttings dibbed in round the sides, and stood in a close frame, will soon root, after which admit air, and grow them hardy. Surplus plants, after replenishing losses, can always be used for beautifying odd corners, and are also useful to exchange with friends.—Thomas Smith.

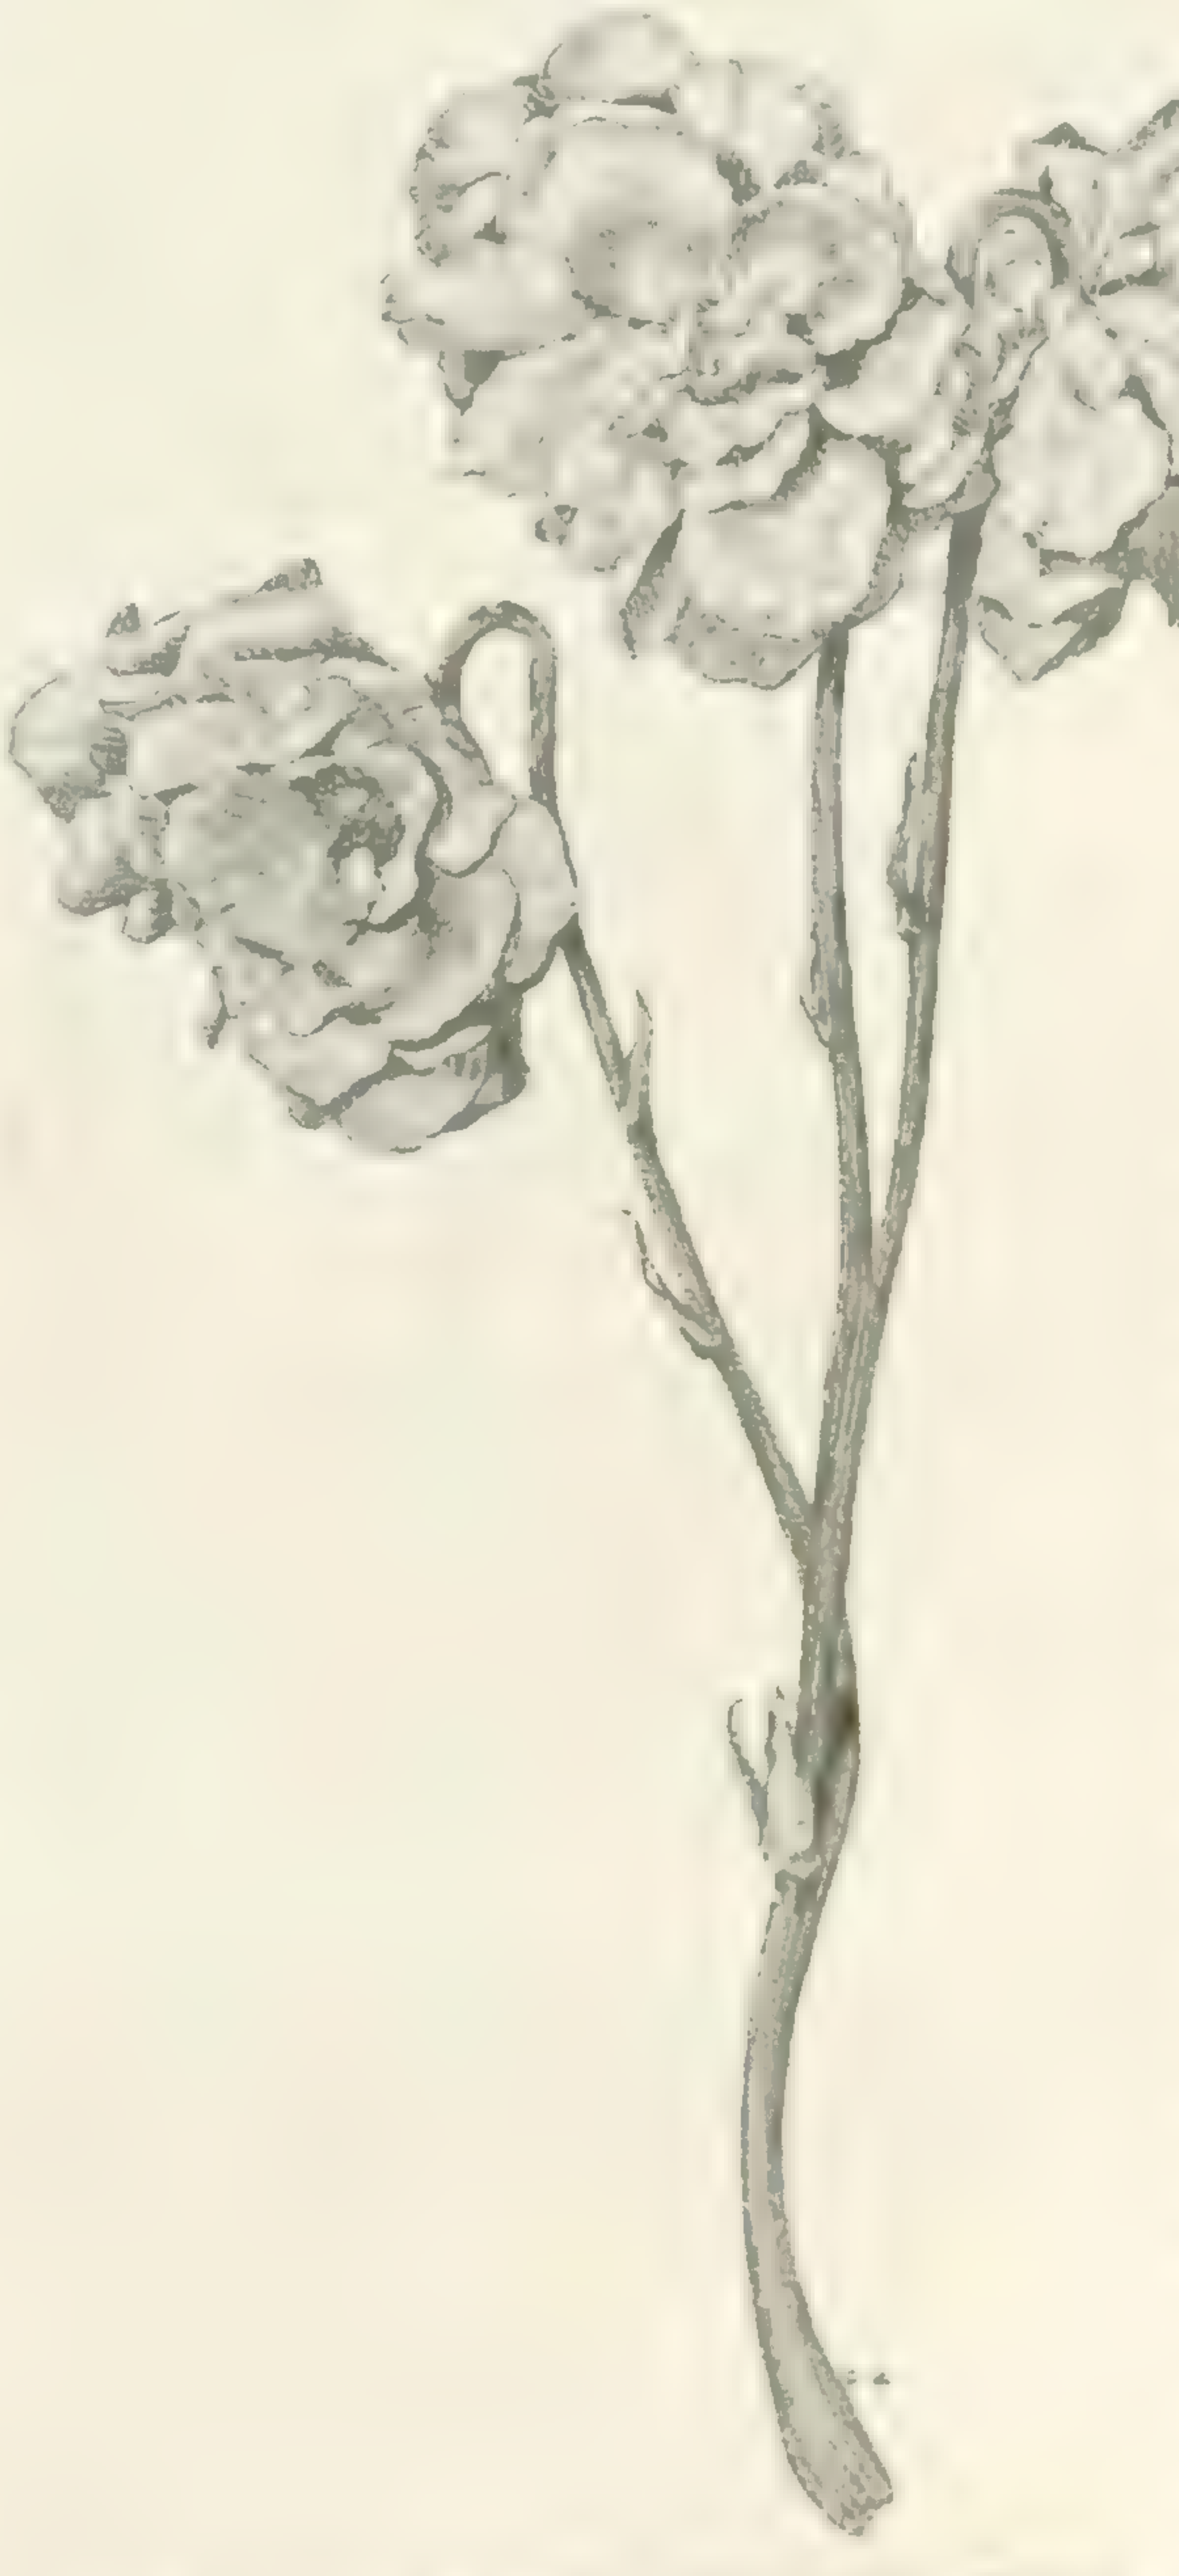
ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

BRANCHED VIOLET STEM.—S. W. H., Cardiff: The flower stem sent is not really a branched one, but is a fasciated one. It is an example of how three violets may become joined together from the base upwards for about half their length. In their earliest development the three buds were so close together that their stems became conjoined, although the flower heads remain free, and thus they grew up and produced the curious inflorescence depicted. Some kinds of flowers and plants seem more addicted to fasciation than others, for instance, every year we have specimens of fasciated asparagus stems and Lilium auratum spikes sent us.



A FASCIATED DOUBLE VIOLET STEM, WITH THREE BLOOMS.

DISEASED CHRYSANTHEMUMS. — J. R., Portmadoc: We have already received similar specimens from other sources, and the matter is being carefully investigated. There are evidences of a mite, similar to the mite that causes begonia rust, but there are also evidences of fungus attack. The mite infestation seems to have been fairly common this season, especially on outdoor-grown chrysanthemums. Spraying with tobacco liquor, to which soft soap has been added, is a good remedy, as also is dusting with tobacco powder.

DATE FOR INSERTING CHRYSANTHEMUMS.—G. H., Taunton: The best time at which to take cuttings of large-flowered chrysanthemums is from November onward, as soon as there are cuttings to take. Some few growers advocate late cuttings and propagate after Christmas, while others, again, believe that success can only be obtained when the cuttings are inserted in November. Locality and methods of culture have a considerable bearing upon the subject. Your letter is an interesting one, and we therefore publish it, and ask for any comments upon it that our numerous chrysanthemum-growing friends may care to make: I have been growing chrysanthemums for the production of big blooms for some years past, with fairly good results. But there is one important point of cultivation that I am not at all clear about, i.e., the best time to insert the cuttings. From my own observation I have not found that it makes much difference in the size of the blooms whether the cuttings are inserted in November, December, or January. I have been under the impression that the earlier the cuttings are inserted the better chance the plants have of building up a good constitution, and of becoming thoroughly matured (other details being satisfactory), than by later propagation. On the other hand, I believe there are growers who believe in late insertion, as the plants get away more quickly. Again, others appear to take them at any time during the months mentioned. Mr. Molyneux, in his book, says that plants are liable to show buds prematurely by early insertion, but I have not found it so. I might mention that I believe in cool treatment; I propagate in a frame out of doors, sheltered, and safe from frost, and the plants are grown as hardily as possible. Two points I notice about my plants are, that I can seldom retain the foliage down to the pots throughout the season, and that my plants are usually much more dwarf than those of my neighbours. But I scarcely think this can be attributed to the propagation, although it might be. Last year I commenced about December 10, but I find that some varieties do not vary much in size from the blooms produced in other seasons by being inserted the middle of November. I am well aware that cuttings are not always procurable just when required. Again, varieties differ in the time of flowering if grown naturally. Amongst the varieties I grow are F. S. Vallis, Mrs. F. W. Vallis, Mrs. W. Knox, Mrs. A. T. Miller, Mrs. J. Dunn, Mrs. J. E. Dunne, Duchess of Sutherland, H. Perkins, Madame P. Radaelli, General Hutton, Algernon Davis, Ben Wells, Marquis V. Venosta, Miss O. Miller, and most of these I have had fairly good. Others that I hope to grow are Reginald Vallis, J. H. Silsbury, Mrs. G. Mileham, Mrs. Coster, and Lady Talbot.

OLDEST SWEET PEA ILLUSTRATION. —W. S. S., Harrogate: So far as we are aware the oldest illustration of a sweet pea is Caspar Commelins' drawing in the "Horti Medici Amstelodamensis," of 1697-1701, second volume. Mr. S. B. Dicks, who is an authority on the history of the popular annual, regards this as the oldest illustration, and a reproduction of the drawing appeared in connection with some notes of his in the "Sweet Pea Annual" for [illegible].

VARIETIES OF RHUBARB.— N. A., Southend: Good varieties of rhubarb are Hobday's Giant, Daw's Matchless, Hawke's Champagne, and the old, finely flavoured, and free-growing Victoria.

WASTE PETROL FOR THE GARDEN.— We shall be glad of any information our readers are able to give us concerning the point raised by a correspondent who writes, from Dorset: "Will you kindly say whether petrol that has been taken from a gas-making machine as unfit for the purpose, can be utilised in the garden in any way. I thought it might be of service in soil that is badly infested with grubs, etc., as ours is. If so, please state the best way to apply it, and how long the plot should be left vacant between the application and seed-sowing or planting."

AMALGAMATION OF DAHLIA SOCIETIES.—E. G. C., Esher: The proposal that the London Dahlia Union shall amalgamate with the older National Dahlia Society has been under discussion by the committees of these bodies for some time, and we believe the first step was taken by the younger, and, we believe, more enthusiastic body. At the time of writing nothing has been definitely decided, but it is most probable that ere this reply appears in print, a decision will have been arrived at

WINTERING THUNIAS.—H. E. J., Warwick: As the leaves have faded and fallen the plants should be placed on a shelf in an intermediate house, where they will be fully exposed to light for the winter. Do not give water until there are signs of new growth at the base next spring.

NAMES OF FRUITS.

F. F., Leyton.—1, Newton Wonder; 2, Gascoigne's Scarlet.

B. E. J., Coventry.—1, Blenheim Pippin; 2, Fearn's Pippin; 3, not recognised.

R. D. N., Suffolk.—1, Alfriston; 2, Rymer; 3, Cox's Orange Pippin; 4, Beurre Diel.

C. R. T., Staines.—1, probably Reinette du Canada; 2, Hollandbury; 3, Lane's Prince Albert.

N. C. A., Keighley.—1, Minchull Crab; 2, Waltham Abbey Seedling; 3, Mère de Ménage; 4, not recognised; 5, Court Pendu Plat.

P. A., Rayleigh.—1, Sandringham; 2, King of the Pippins; 3, Gloria Mundi; 4, Dumelow's Seedling; 5, Braddick's Nonpariel; 6, Vicar of Winkfield.

On Dec. 12 will be published
THE GRAND
CHRISTMAS NUMBER
OF
Amateur Gardening
FOR TOWN AND COUNTRY

THE CONTENTS INCLUDE INTERESTING ARTICLES ON:—

WEATHER FLOWERS.—The effect of sunshine and rain on flowers. (Illustrated.)
A MOTHER OF MILLIONS.—Aphis or green fly.
THE WEATHER PLANT.—Abrus precatorius nobilis.
DO PLANTS FEEL?—A proof of sensory power. (Illustrated.)
ANCIENT SUNDIALS.—The precursors of clocks.
THE GLASTONBURY THORN.—Illustrated.
INTERESTING FUNGI.—Mushrooms and toadstools. (Illustrated.)
CHRISTMAS DECORATIONS for the Home.
A GARDEN OF MEMORIES.
IN A SHADY BOWER.—A pretty feature in gardens.
ENGLAND'S GARDEN.—Spring-time in Dorset.
IN TIME OF CHERRIES.—Popularity of blossom and fruit.
QUAINT FLOWER NAMES.
NOVEL PLANT CULTURE.—Gardening without soil. (Illustrated.)
SEEDS THAT FLY.—Their quaint methods of flight. (Illustrated.)
BREAKFAST PLANTS.—Tea—Coffee—Cocoa.
ECCENTRIC VEGETATION.—Leaf, fruit, flower oddities. (Illustrated.)

A CHARMING SUPPLEMENT OF FINE ART PHOTOGRAPHS OF LOVELY FLOWERS & GARDENS;
AND A
DOUBLE-PAGE COLOUR PRINT,
"IN AN OLD TIME GARDEN."
(A reproduction of the Water-colour Drawing by Mr. PETER LESLIE.)

FORTHCOMING ENGAGEMENTS.

WEDNESDAY, December 2.—National Chrysanthemum Society, Winter Exhibition at Crystal Palace; two days.

Royal Society of Arts Meeting, 8 p.m.

TUESDAY, December 8.—Royal Horticultural Society, Meeting of Floral, Fruit, and Orchid Committees, noon; General Meeting and Lecture, 3 p.m.; Scientific Committee, 4 p.m.

WEDNESDAY, December 9.—Perpetual-flowering Carnation Society, Exhibition at the Royal Horticultural Hall.

Royal Society of Arts Meeting, 8 p.m.

CATALOGUES RECEIVED.

R. WALLACE AND CO., KILNFIELD GARDENS, COLCHESTER.—A catalogue of hardy plants and bulbs, but one that deals at considerable length with the beautiful lily family.

H. LANE AND SON, GREAT BERKHAMSTED, HERTS.—A useful catalogue of roses and fruit trees, and one in which the roses are grouped in classes and also given in alphabetical order. Also a comprehensive list of hardy trees and shrubs.

CHAS. TURNER, SLOUGH.—This firm's rose catalogue gives the varieties in alphabetical order, the class, habit of growth, etc., being given in parallel columns.

THOMAS RIVERS AND SON, SAWBRIDGEWORTH, HERTS.—An eminently useful catalogue of the best fruit trees, roses, and shrubs, and one in which peaches, pears, and plums receive special attention.

H. CANNELL AND SONS, SWANLEY, KENT.—This firm's autumn catalogue deals chiefly with fruit trees of all kinds, but also contains descriptive lists of roses, florists' flowers, hardy plants, etc.

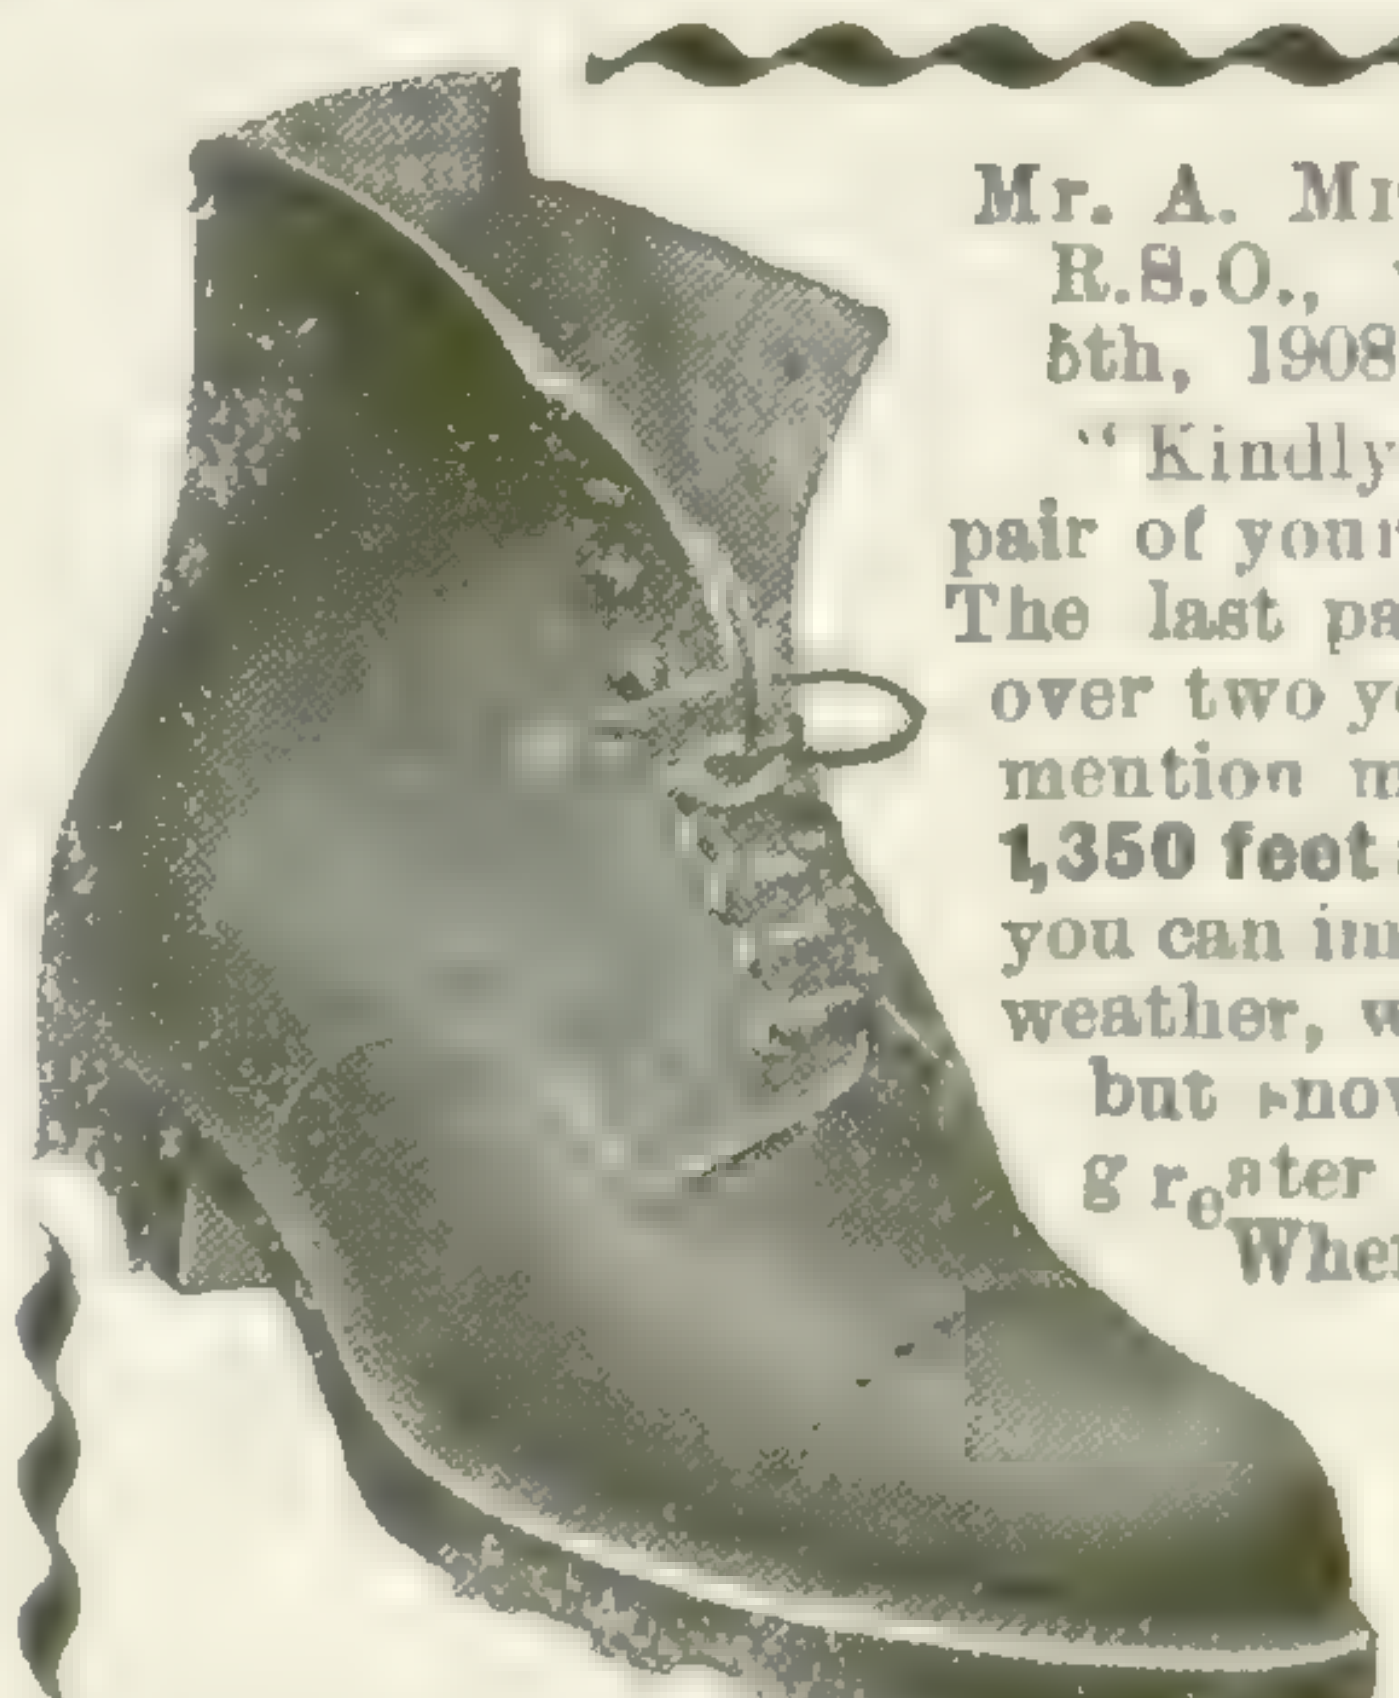
MIDDLETON, MANCHESTER.



Mr. A. MITCHELL, Corrour R.S.O., writes us Mar. 5th, 1908:—

"Kindly send on another pair of your splendid Boots. The last pair has worn me over two years and when I mention my house stands **1,350 feet above Sea level,** you can imagine the awful weather, we have nothing but snow and slush the greater part of the year. When I state I never had a wet foot it speaks well for your Boots. Enclosed P.O. 16/-.

For full advertisement see page iii.

TO-DAY! AND FOR YEARS AND YEARS PAST the XL ALL Specialities are and have been the best on the market. Where is the Gardener who does not pin his faith to one or the other of these celebrated Insecticides or Fertilisers? XL ALL FERTILISER has pleased all who have used it this season. The Sales of XL ALL FUMIGATOR prove that it is more popular than ever. XL ALL LIQUID NICOTINE INSECTICIDE is always spoken of by gardeners and growers as the most deadly to Mealy Bug, Thrip, etc. XL ALL WINTER WASH for dormant Trees acts like magic, clearing the Trees and Bushes of all Insects' Eggs, Moss, and Fungoid Growths. XL ALL LAWN SAND, a weed eradicator and fertiliser for weedy and poor lawns. XL ALL WEED KILLER used once a year "No weeds can live." Please ask your Nurseryman, Seedsman, or Florist for a copy of my small pink list, giving particulars of these and many other XL ALL Preparations, which can be obtained from the Horticultural Trade throughout the World. G. H. RICHARDS, Manufacturer and Patentee, 234, Borough High Street, London, S.E.

Situations Wanted.

GARDENER (Head Working, of four or five).—Mr. SMITH, Colston Bassett Gardens, Notts, can with confidence recommend his FOREMAN (H. ASBURY) as a steady, reliable man; well up in all branches; life experience; age 30; married when suited. Address as above.

GARDENER (Head Working, or good Single-handed, with help); good practical experience in all branches; interested in bees; good references; age 37, married, two children. Abstainer. ELLIS, Beenham Grange, Reading.

GARDENER (Head Working), married, age 41; abstainer; over 25 years' experience; 15 years as Head in good gardens. Disengaged when suited. CHEAL, Rose Cottage, Cliffe, Lewes.

GARDENER (Head Working), where more are kept; 25 years' practical experience all branches, Inside and Out, early and late Forcing, Vines, Cucumbers, Melons, Stove, and Greenhouse Plants, Herbaceous Borders; thoroughly reliable; highly recommended; married, without encumbrance. WOODHOUSE, Eastwood Road, Bramley, Surrey.

GARDENER (Head Working), age 47; good practical experience in all branches, Inside and Out; many years as Head; can have good references. H. TURNER, Fineshade, Stamford.

GARDENER (Head).—Advertiser offers his services as above; seventeen years' experience in first-class establishments; excellent references for the cultivation of flowers, fruits, and vegetables, early and late forcing, house and table decorations, and all the general requirements of a gentleman's garden; age 31 years. H. MOCKETT, Porter's Park, Shenley, nr. Barnet.

GARDENER (Head Working, where two or more are kept); 16 years' good practical experience in all branches; thorough knowledge of grapes, melons, cucumbers, stove and greenhouse plants, flower and kitchen garden; age 30; married when suited; good ref.; 2½ years in last place. B. BROOKS, Minerva Cottage, Elm Grove, Worthing.

GARDENER (Head), where two or more are kept; thorough knowledge of gardening generally, both Inside and Out; life experience; good references; abstainer; age 31, married, no family. L. A. KETTEL, 33, Adelaide Road, Chislehurst, Kent.

GARDENER (Head Working or good Single-handed) wants SITUATION; all-round experience, understands Pigs, Poultry, and Cows; married, two children; good characters. Apply, ETHERINGTON, Gardener's Cottage, Aboregrove, Chertsey.

MURRAY ROBERTSON, Esq., The Hall, Wedmore, Somerset, recommends his HEAD WORKING GARDENER; experienced in all branches; age 32, married, no family; excellent references; abstainer. Apply JAMES HOLT, Grant Road, Wedmore, Weston-super-Mare.

GARDENER (good Single-handed or with help); 15 years' experience Inside and Out; good references; married, age 31; three years present place. SCRIVENS, Ferney, Malvern Wells.

GARDENER (Single-handed or with help); age 29; life experience in all branches; married, no family, abstainer; good references. BAKER, 40, Manor Place, Staines, Middlesex.

FOREMAN (Outside), age 25.—Mr. THOMPSON, Knighton Frith Gardens, highly recommends F. GIBSON as above; 10 years' practical experience. F. GIBSON, The Gardens, Knighton Frith, Leicester.

FOREMAN (Working).—H. G. APTED recommends C. BOXALL as above; 19 years' experience in Grapes, Cucumbers, Tomatoes, etc.; 6½ years present situation; age 36, married. BOXALL, 4, Oxford Terrace, Broadwater, Worthing.

GARDENER (Second, where three or four are kept); Inside and Outside; life experience; 6½ years' character from last place; single; age 32. G. EUSTON, Shrubbs Hill, Sunningdale, Ascot, Berks.

GARDENER (Second or Single-handed); Vines, Melons, Flowers; married, one child; 7 years' experience; good references; age 24. A. BEACHER, Albert Road, Rustington, near Worthing, Sussex.

YOUNG MAN requires SITUATION as Second Gardener in a small place, or Leading Hand in kitchen garden and pleasure ground; age 27; well recommended. C. CRADDUCK, Brandfold Gardens, Goudhurst, Kent.

GARDENER (Under), age 19, seeks SITUATION; five years' experience Inside and Out; three years' good character. A. WORSFOLD, Benenden, Cranbrook, Kent.

GARDENER (Under) seeks SITUATION in Kitchen Garden or Pleasure Grounds; well used to Scythe, Horse Machine; good references; bothy preferred; age 28. W. FULLER, Caxton, Cambs.

GARDENER (Under), Second of two or three; 26, single; good references; disengaged; recommended by Lady F. Blunt. H. JENNINGS, Watson Road, Westcott, Dorking.

£5 BONUS.—To Head Gardeners.—SITUATION wanted as UNDER GARDENER, in or near London; aged 24; no experience; bonus given; good reference; disengaged Jan. 31. J. D., 14, Park Hall Place, East Finchley, London.

ROSE GROWER on Gentleman's Estate or Nursery; life experience in Roses and Sweet Peas; good bookkeeper and French correspondent. ERNEST PRINCE, care of George Prince, The Oxford Roses, Longworth, Berks.

STOKER or HANDY MAN, willing to be generally useful; 10 years' good character one situation; age 34; married. Apply STOKER, 45, Fifth Avenue, Bush Hill Park, N.

FLORIST.—Young Lady seeks SITUATION as IMPROVER; highest reference; age 17. J. McGLASHAN, Widmore Court, Bromley, Kent.

YOUNG MAN, Single, or Second Gardener in Kitchen Garden; 4½ years present situation, 7 years previous; aged 25. R. SMITH, Lower Winchendon, Aylesbury, Bucks.

YOUNG MAN seeks SITUATION in small Nursery (Inside), in or near London; willing to accept low wages. CHAS. COLES, 199, Camberwell New Road, London, S.E.

YOUTH requires SITUATION as IMPROVER; quick at Potting, Watering, and Tying, etc.; two and a-half years' reference; age 18. F. BAKER, Lodge, Twyford Abbey, Willesden.

Situations Vacant.

CAN Employer recommend GARDENER, for small country place, who really takes an interest in his work. Cow and fowls kept; single; to live in. Or Married Couple (no children), as Gardener and Cook-General. State wages to M., c/o Morffew, 19, Edgware Road, London.

NOTES OF THE WEEK.

The Past Chrysanthemum Season.

The season of chrysanthemums that has just passed has been a period of quiet demonstrations rather than of sensational surprises, and there has been but little of the enthusiasm that was associated with the competitive gatherings that were held from fifteen to twenty-five years ago. The experiences of societies have during the past season been somewhat variable, as for several years past. Some have suffered from the apathy of the residents in the districts over which their operations extend, while others have received ample support, and been placed in a position to bring the year's work to a close with a satisfactory balance in hand. On the whole, however, the season has been so far successful as to justify a feeling of satisfaction on the part of those specially interested in the cult of the chrysanthemum, and to show that the flower is still held in high estimation by the great flower-loving community. Financially the exhibitions that were the least successful have for the most part been those wanting in the diversity of attractions so essential to the success of horticultural exhibitions that appeal to the general public. One of the lessons that has been taught by the exhibitions held during the past season, as indeed by those held in recent years, is the importance of autumn shows being at once varied, interesting, and attractive. Or to state the case in another way, we have had brought into prominence the fact that a display of chrysanthemums is no longer sufficient to attract the public in sufficient numbers to ensure satisfactory financial results. Visitors now require something more than chrysanthemums to sustain their interest, and they look for other flowers belonging to the season, and also for fruits and vegetables, in which increased interest is now being taken. It has also been made abundantly evident that the single varieties are steadily increasing in popularity, and that when staged in a tasteful manner they invariably command much attention. In mentioning this we would suggest to societies who have as yet given but little encouragement to these elegant and attractive forms, the desirability of their increasing the number of classes for them; and we would strongly urge upon all concerned the importance of their being staged in such manner as will display their distinctive charms to the best advantage. They certainly ought not to be staged on the orthodox boards, as when crowded together on these the visitor cannot obtain otherwise than an imperfect idea of their beauty or of the way in which they can be the most successfully utilised in decorations. The pompons and the anemone pompons also deserve more liberal encouragement than is usually given them, and the prizes offered for these, and for the singles, should more closely approximate in value those given for Japanese blooms than has hitherto been thought necessary. It should be remembered that however attractive in form and colour the Japanese varieties may be, and their attractions are great, visitors tire of the sameness which obtains when they unduly predominate. But when the several sections are adequately represented, the interest of visitors is sustained throughout and they leave the exhibition fully satisfied with what they have seen. Not unnaturally chrysanthemum enthusiasts will regret that their favourite flower is no longer able of itself to attract the public in such large numbers as was the case some years ago; but it must not be forgotten there are other flowers of much value for beautifying the conservatory and the home during the autumn and winter months, and that the cultivators of fruits and vegetables should be encouraged to present the products of their skill to public notice. What appears to us necessary to maintain the interest in the shows held during the chrysanthemum season, is to make them where practicable sufficiently comprehensive to include all the leading classes of fruits, flowers, and vegetables that are then available and suitable for exhibition. Such gatherings are not only more attractive to the general public, but they interest a much larger number of those engaged in the practical work of the garden, and thus have a more potent influence upon the advancement of gardening. Thus far we have referred to societies in general terms; but we would express the pleasure we had in recording the superiority of the November exhibition of the National Chrysanthemum Society as compared with some of its more immediate predecessors. We have derived much gratification from this because the position of the society has for some time past been, and indeed is, such as to occasion considerable anxiety to those who are interested in its welfare. We would fain hope that it might be restored to the strength and vitality it possessed when it occupied a commanding position amongst the organisations specially associated with the chrysanthemum. We are not sanguine as to the realisation of our hopes, as we fear but little can be done in bringing about a material improvement in the affairs of the society without a thorough reorganisation of the executive. The reorganisation should, indeed, be such as would ensure the inclusion in the governing body of a larger number of those who possess sufficient breadth of view to appreciate the needs and the responsibilities of a society that claims to be national.

MR. JAMES O'BRIEN,
Secretary of R.H.S. Orchid Committee.

Mr. James O'Brien, V.M.H., whose portrait we have the pleasure of giving in this issue, has long been known as one of the leading horticulturists in the

United Kingdom. He has an unusually wide knowledge of plants, especially of exotics, and it is safe to say that no one knows orchids so well as he does, whether species, varieties, or hybrids. Mr. O'Brien has been hon. secretary of the Royal Horticultural Society's Orchid Committee ever since that body was instituted. It is probable that Mr. O'Brien has been called upon to give special evidence in connection with horticultural practice and usages, in law cases, more often than any other authority, while as a valuer of, and agent for the sale and purchase of orchids he is much in request. Mr. O'Brien has a very intimate knowledge of that class of plants known collectively as Cape bulbs, and he has done not a little to improve several kinds. He now lives at Harrow-on-the-Hill, but he has in no sense retired from participation in horticultural activities, and though it is many years ago since he was manager at the then famous Pine Apple Nurseries of Messrs. E. G. Henderson and Co., he is as stalwart and active as of yore. He is a staunch supporter of the Gardeners' Royal Benevolent Institution, and he has held the Victoria Medal of Honour in Horticulture ever since that honour was founded.

The New Seedling Polystichum.—When Mr. C. T. Druery placed the new seedling Polystichum angulare pulcherrimum gracillimum Drueryi before the R.H.S. Scientific Committee he stated it was a "seedling" from the variety of P. angulare (or aculeatum?) called pulcherrimum (which was originally found growing wild), named gracillimum. The parent plant had remained sterile for a very long period, but at last two sporangia had been found upon it (without an indusium). The spores from these had been sown, and about 75 per cent. of the resulting plants had come precisely like the parent, and the remainder consisted of about 5 per cent. reversions to the normal type of the species, and 20 per cent. rather varying forms somewhat similar to the plant shown, where the frond was cut up into a number of narrow divisions, and was of an exceedingly graceful form. The variation had shown itself only after some time, the younger leaves being of the normal form.

Scottish State Forest.—According to the report of H.M.'s Commissioners of Woods and Forests for 1907-8, during the past year the purchase was completed of the Inverliever Estate, containing about 12,530 acres lying at an elevation between about 120 and 1,400 feet above sea level on the north-west side of Loch Awe, in the county of Argyll. The land is occupied as sheep farms except about 290 acres, which is under timber. The purchase has been made for the purpose of carrying out a scheme of afforestation in Scotland on scientific and economic lines. The estate has been carefully selected with a view to its suitability for this purpose, and it is proposed gradually to plant it at the rate of 150 acres per annum. Arrangements are being made for a commencement of the work this year. A residential forester has been appointed, who will act under the general supervision of the Commissioners.

Mr. Arthur E. Thatcher, who has acted as foreman in the shrub and hardy plant department at Aldenham House, Elstree, has obtained an appointment in the Arnold Arboretum, Boston, U.S.A. Mr. Thatcher's knowledge of trees, shrubs, and hardy plants generally is very wide, and the further knowledge he is likely to gain should fit him for an important post later on. Previous to his sailing for America Mr. Thatcher was the recipient of many valuable presents, including a handsome one from the Hon. Vicary Gibbs, the Hon. Edith Gibbs, one from the employees at Aldenham House, and from the St. Dunstan's Lodge of Oddfellows, of which he was a very active member. To these presents were added the good wishes of all who have known him at Aldenham for the past twenty-four years.

York Florists' Chrysanthemum Show for 1909.—The committee of the Ancient Society of York Florists, at the meeting held on Tuesday evening last, arranged that the next show be held on November 17, 18, and 19, 1909.

National Rose Society.—The annual meeting of this society will be held at the Westminster Palace Hotel on Thursday next, at 3.30, when, we have reason to believe, the committee will be able to present a highly satisfactory report to the members. The Rev. F. Page-Roberts is nominated for election as president, in succession to Mr. E. B. Lindsell, who retires in accordance with the rules, after two years' service. Owing to the great increase in the work of management consequent on the enormous growth of the society, it is proposed to have financial, publication, and exhibition sub-committees in addition to the General Purposes Committee, and sundry alterations are proposed to admit of this being done. The annual dinner, at which the Rev. F. Page-Roberts will preside, will be held shortly after the close of the annual meeting at the same hotel. Sir Daniel Morris, Sir G. Watt, and Mr. H. J. Veitch will be the guests of the society.

Fruit Conference at Wye.—On the 27th ult. a conference of fruit growers was held at the South-Eastern Agricultural College, Wye. At the morning meeting Mr. E. S. Salmon gave an address on "Spraying and Spraying Machines," and specially referred to the recent discovery in this country of the existence of the American gooseberry mildew. A demonstration of various types of spraying machines was afterwards given in the grounds. At the luncheon Mr. G. L. Courthope, M.P., spoke on the subject of legislation and agriculture and horticulture, and strongly advised united action on the part of those interested, so as to compel Governments to pay attention to their demands. In the afternoon Mr. S. Pickering gave an address on some recent trials of insecticides, showing that the use of petrol was effective in destroying woolly aphis, and also that hot water had been used with good effect. This was followed by an address on fruit growing, etc., in British Columbia, by Mr. Scott, who explained how the Government there safeguarded the interests of the fruit growers and circulated information for their benefit. The colony had no codlin-moth, but its gooseberry culture had been ruined by mildew. He also gave a practical illustration of the methods adopted in grading and packing fruit for the markets.

Economic Mycology.—The Report on Economic Mycology, by Mr. Ernest Salmon, F.L.S., for the year ending July last, contains much to interest cultivators generally, for the diseases that have obtained prominence during the past few years are dealt with at some length, and several diseases that are quite new are described, and suggestions made for their prevention and cure. In the introduction Mr. Salmon mentions several diseases that have been sent to the mycological department of which he is the chief, at Wye College, refers to diseases that are being investigated by himself, and then proceeds to criticise the Board of Agriculture, more particularly with regard to the American gooseberry mildew and the black scab of potatoes, both of which are spreading so rapidly in the United Kingdom as to justify considerable anxiety on the part of cultivators. The volume contains special articles on the American gooseberry mildew, with a special map on the present distribution of the disease in England; the "warty disease," or "black scab," of potatoes, the "apple scab," the "leaf spot" disease of the apple, a "leaf spot" disease of the chrysanthemum, and the "rhizoctonia" disease of seakale, all of which are especially deserving of the attention of cultivators. The report is published by Messrs. Headley Brothers, Ashford and London, and the price is 2s. 6d.

The Gardens Around Bristol are numerous, interesting, and variedly beautiful, and our readers will remember we have published illustrated accounts of one group of these western gardens. We now propose to publish, on Dec. 12 and 19, descriptions of such well-known establishments as Tyntesfield, The Holmes, Clifton Zoological Gardens, Henbury Hill, Henbury Hill House, and Blaise Castle. Numerous illustrations representing beautiful scenes and distinctive features will accompany the text.

Diseases of the Potato formed the subject of an instructive lecture given by Professor M. C. Potter, of the Armstrong College, at a meeting of the Newcastle Farmers' Club. In the course of his lecture Professor Potter said the potato was particularly susceptible to disease, and the resultant loss was very great. Great Britain's yield was estimated at 3,203,000 tons, the value of which would be £13,653,000, representing a net profit to the growers of £8,007,000. But it was computed that the value of the crop was reduced by disease to the extent of at least one-third, and added to that there was the indirect loss caused through the heaviest croppers—the Up-to-Date class—not being so largely grown as they might be because of their liability to disease. There were diseases of the leaf, the stem, and the tuber. After describing the forms of these, he went on to speak of the means of checking them. It was a common practice to leave any hard potatoes on the soil, and any found in the pit were left exposed to the air. This was one of the most prolific means of spreading disease. A practice also to be condemned was that of throwing potatoes on the manure heap. Careful examination should be made of seed potatoes, as there was much danger of the spread of disease by the spores which remained adherent to the tubers, especially to the eyes. When possible, these spores must be killed by a germicide, such as formalin or Bordeaux mixture, before planting.

British Gardeners' Association.—On Thursday, the 10th inst., a public meeting of gardeners will be held at Collier's Restaurant, Commercial Street, Newport, Mon., when an address upon the B.G.A. will be given by Mr. J. Weathers, secretary. Mr. W. W. Pettigrew, superintendent of the Cardiff public parks, will occupy the chair, and the meeting will commence at 7 p.m. At the last meeting of the Executive Council the new members elected brought the total up to 1,365. A resolution was passed unanimously declaring that the association was not a trade union within the meaning of the term, and had no connection with any trade union organisation in the kingdom.

PRIMULA SIEBOLDI.

Although fairly familiar plants in the cool greenhouse and in extensive use as decorative plants in pots, there is a still greater use for the Japanese Primula Sieboldi in the hardy flower garden, and peculiarly favourable sites are often waiting for such a type of plant. The cool and shady border so frequently given to a fern collection, and which must be well tilled or even ferns would not thrive there, offers ideal conditions for Japanese P. Sieboldi, and if such a site is not available, the soil shaded by cerasus or kindred deep-rooting trees may serve.

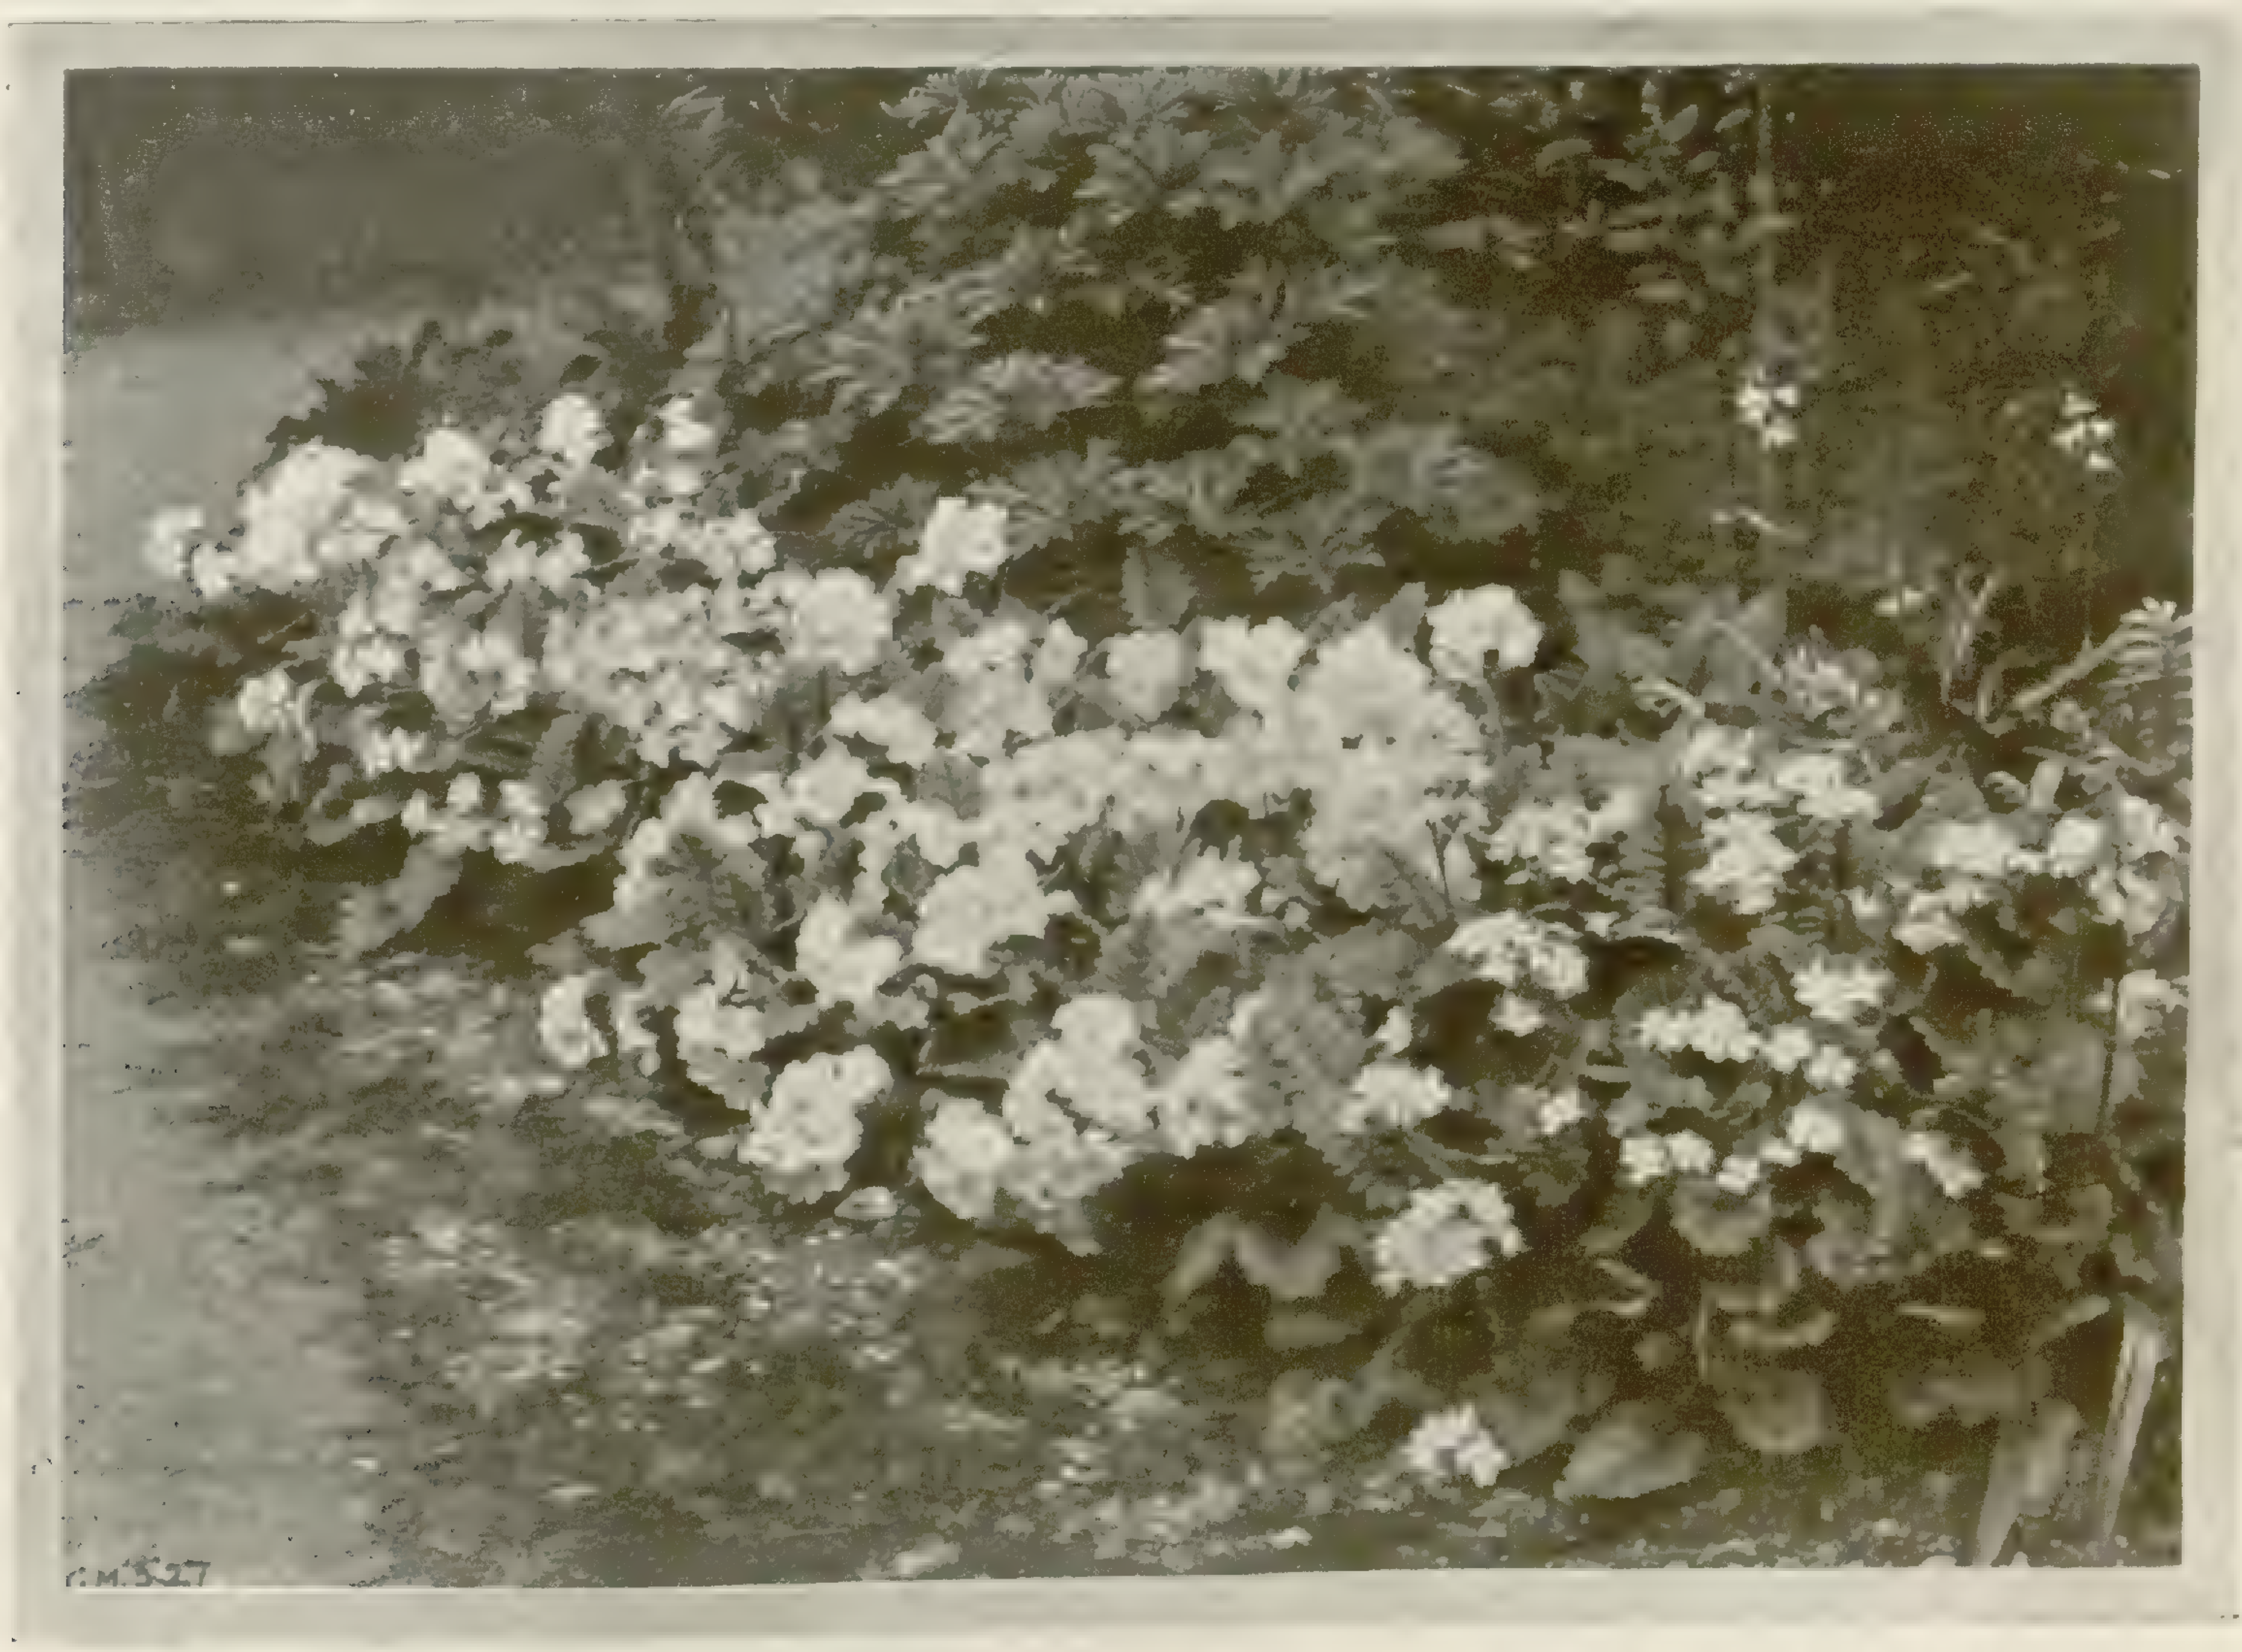
These primroses are less vigorous than P. japonica, and generally they enjoy a lighter soil, preferably well charged with grit and leaf soil, and the site must be tolerably free from slugs. This past winter has put their hardiness severely to the test, and whilst many plants of acknowledged hardiness have suffered, these primroses, being absolutely deciduous have survived, and are now in full display and likely to remain so for a long time. Nothing but a tangle of roots survives the winter, but there is abundant potentiality in this, and a fine leafy cluster a foot through, overtopped by a series of flower trusses of fine proportions, is remarkable when hardier things, such as tulips, show traces of recent wintry weather, and are spoilt for a season.

These primroses associate remarkably well with garden forms of British ferns, if both types of plants are given ample room to develop, and the root conditions of the one are helpful to the other.

There are forty or fifty named varieties in cultivation, and I believe they are mostly distinct, but their nomenclature is so hopelessly mixed that it is doubtful if it is of service—a similar condition prevailing among pæonies, irises, and other Japanese races of garden plants. Suffice it to say there is every tint from white through pink to rose and purple represented, some flowers are smooth-edged, others elegantly fringed, some are self-coloured, others distinctly "eyed" with white, and they are aggregated into umbels that equal the best of the Chinese primroses of the greenhouse in many respects.

I have met with thriving colonies in various parts of Britain, in Scotland, and in Cornwall, but rarely have I seen the plants grouped or disposed in the best possible way. The sight of a colony peeping through several inches of snow recently, and flowering none the worse a week later, is sufficient to satisfy anyone as to hardiness, but one needs to see them grouped in cool shrubbery recesses, in the cooler elevations of the rock garden, and in association, but not direct contact, with water, to realise the important part they can play in furnishing sites generally difficult to plant with satisfactory subjects. What Primula japonica can do for the woodland and wild garden, where water is abundant, Primula Sieboldi can do for the garden proper, and in a similar planting scheme.

G. B. Mallett.



A SUCCESSFUL EXAMPLE OF USING PRIMULA SIEBOLDI IN AN ENFIELD GARDEN.

Fallen Leaves should be collected as soon as possible, especially on grass that is at all weak or thin, or they will further weaken and damage it. If all leaves collected are not required for use, the best, such as beech, oak, and Spanish chestnut, should be retained for that purpose, and others either burned, carted away to some hole or refuse heap, or raked inside the rather close shrubberies, where wind cannot again blow them out. Leaves blown about after they have once fallen give an untidy, uncared for appearance. Sycamore, ash, horse chestnut, and leaves of similar texture are the least desirable for garden purposes.—E. F. Hazelton.

KEEPING QUALITY OF FRUIT

There is a general complaint among those I have met recently of the unsatisfactory way in which apples and pears are keeping this season. It is some years since I have found the fruits so quickly ripen after gathering. It would be interesting to know if other readers are having the same experience, and whether it is due to the weather during the past season, and also if it is only in certain localities this premature ripening and rapid decay have taken place.

I am inclined to think in our case it is due to a second growth of the fruits; second growth of trees or fruits, as a rule, is of little value, as such growth seldom matures. In this locality we suffered very much from drought during the summer, and, unfortunately, our supply of water at the time was deficient; this drought stopped the growth of the fruits, and when the welcome rains came in quantity it caused a second growth, in fact it was surprising how the apples and pears increased in size after the rains, so much so that the size was astonishing when we gathered them.

Very curious is the way in which decay shows itself. Two-thirds of the apples which are taken out of the fruit-room show decay first round the eye of the fruits, and unfortunately Cox's Orange Pippin is one of the most affected in this way. Even with this defect we have some fine large well-coloured fruits of this choice apple, and in quantity this variety has been very good. Generally speaking the colour has not been so good, and while I am digressing somewhat in touching on colour, I may say that whatever reason may be assigned for the intense colouring which apples and pears assume in some soils, moisture undoubtedly plays an important part in producing it.

One apple which has decayed rapidly this season is Norfolk Beauty. I was under the impression, and I think I have also seen it in print, that this was a variety which would keep into the New Year; three weeks after gathering our fruits of this variety were useless; fortunately the quantity we had was small. Warner's King has kept badly, and Blenheim Pippin must also be included amongst the unsatisfactory keepers this season.

Doyenne du Comice, Emile d'Heyst, and Marie Louise pears have kept no better than an August variety, while Charles Ernest in the middle of November is finished, for if not eaten they would have become useless. T. H. Slade.

Poltimore Gardens, Exeter.

Seeds of Sweet Peas are being eagerly inquired for, and as the stock of the best varieties is limited no time should be lost in placing orders. It is always annoying to receive varieties substituted for those ordered, but the good things among sweet peas invariably go to the earliest applicants. —Thomas Smith, Walmsgate Gardens.

CHRYSANTHEMUM ARCTURUS

A crimson-scarlet single variety, exhibited by Mr. Norman Davis, Framfield, Sussex.

NOTES ON SOME NEW ROSES
No. I.

Not for many years has the rose season promised so well as that of 1908, nevertheless, so far as is relative to the exhibition period, the fulfilment fell considerably below all expectation. All seemed at one time to be going well; a mild winter, a genial spring, not even a cold snap, the usual snap, at the end of May; everything looked most promising. It was perceived in early pruning time that the wood of 1906 and earlier, especially on old unpruned plants, such as the ramblers, and the strong-growing hybrid teas, Caroline Testout, Florence Pemberton, and Bessie Brown —which are generally found to give finer flowers from plants left almost unpruned—was severely crippled. But what of that when the young root shoots of 1907 were sound? And then with respect to the maidens. They broke well, very well, and developed into strong plants; they grew and grew, and carried plenty of foliage, but without correspondence in size and substance of flowers. At first one was led to imagine that the cause lay at the door of the cultivator; an overdose of manure or something, but when other growers were seen to be experiencing the same difficulty, one felt that it was due to climatic influences.

Rose growers congratulated themselves in June that there was comparatively no aphis, no mildew, some perhaps not realising that that which held these enemies of the rose in check held in check the flowers also. Aphides and mildew flourish in a humid atmosphere; so does the rose. These parasites dislike a harsh, dry air; so does the rose. Although there were slight frosts in June, it was, in the opinion of the writer, not so much the frost but the prevalence of a bright, but harsh atmosphere, plenty of sunshine, and plenty of north-easterly wind that did the mischief; roughness in outline, lack of substance, and shortness of petal were all due to climatic influence.

But if the early season was disappointing we were fully rewarded by the glorious blooms that appeared towards the end of July and beginning of August. And see the roses we have had at the end of September and right through October, and even well into November. Gustave Grunerwald, Rosette de la Legion d'Honneur, and Trier were in good condition, and one has hopes that, as last year, vases of Frau Karl Druschki will adorn the altar on Christmas Day.

And, turning our attention to roses of recent introduction, is one correct in affirming that never before have there been so many new roses distributed as in the year 1908? When one attempts to enumerate them, one is absolutely bewildered with the number. Take up the trade catalogues of British growers and note the glowing description of most of these many novelties; all have their good points, freedom of growth, and blooming qualities are their principle characteristics. But is there not a tendency to bring out novelties that, however excellent they may be for forcing purposes, are lacking in form and substance? A distinction, clear and decisive, should be drawn between roses whose beauty lies in the individual flower, a specimen rose, and those that are primarily useful for giving a blaze of colour on the beds regardless of form. Each has its proper place in the rose family, but a thin-petalled, undersized rose, unless it is a variety that gives masses of flowers, cannot be regarded as good for specimen blooms.

Let raisers ever bear in mind the definition of a good rose as laid down by the National Rose Society: "The highest type of bloom is one which has form, size, brightness, substance, and good foliage." It is evident this does not fit roses of a decorative character, and yet there have been several roses sent out in recent years as so-called exhibition roses which are lacking in form, size, and substance. Indeed, the majority of the new roses of 1908, especially the Continental varieties, come under this category.

Joseph H. Pemberton.

Havering-atte-Bower.

Epimediums are generally regarded from the standpoint of utility as if leaves were the only production of these inestimable hardy plants, but the flowers are as quaint and beautiful as those of any exotic orchid. Try them in spring in light glasses for the table, and to many their exquisite beauty will come as a revelation, and be much appreciated by those who like a change of flowers.—Thomas Smith, Walmsgate Gardens.

DEEP VINE BORDERS.

From experience, and a close observance of the results obtained by others, I am forced to the conclusion that many vine borders are too deeply made to give the best results. Vines that do not make vigorous growth, especially when young, but produce small, puny leaves, display a wrongdoing somewhere, because it is not natural for vines of the Muscat of Alexandria type, or a Black Hamburgh, for example, to do other than romp away under ordinarily agreeable circumstances. A close inspection too often reveals the cause of trouble to lie in the composition of the rooting medium, which should be rectified with as little delay as possible.

The loss of sunheat to the roots in early spring, consequent on the border being either too deep or too low, is a cause of shanking in many instances, and in others is the reason why weakly growth is the rule. A border, whether inside the vinery or outside, should be raised well above the level of the surrounding ground to admit of easy drainage, and of the roots obtaining the benefit of solar heat. A depth of two feet of soil is ample for any vine border.

A good time to set about reorganising any defective border is the autumn, while the vines are still clothed with foliage, as they then quickly get over the inevitable check that lifting gives, no matter how carefully the work is performed.

Years ago it was considered to be the correct thing to form an outside as well as an inside border, so that the roots could ramble away at will. Experience has taught that much greater success is obtained from vines where the roots are entirely confined to an inside border, where they are thoroughly under control, and receive whatever stimulative food is given them. The roots, too, is an inside border are maintained at a more regular degree of warmth, and are not subject to fluctuations, as in the case of an outside border, especially where the border is not limited by a retaining wall. Under the latter conditions the roots ramble away for a surprising distance, and instead of being numerous, and composed of fibre, they are too often fibreless. This is not what is needed to give the best results; we want the greatest number of feeding fibres, not a limited number of those that are fibreless.

Mr. Shingler, of Melton Constable, has all his vine borders inside, and restricted, so that he has them well under control.

When making a new border, or renovating an old one, it is better to make it piecemeal, adding a couple of feet each year until the whole space is occupied. When a border is made up its whole width at first the fibrous matter contained in the turf used decays before the vines have had the opportunity of receiving any benefit from its use, whereas by adding to its width annually each part of it is utilised properly by the roots for the benefit of the vines. For the first year's growth a width of three feet will be ample. It is a good plan to concrete the bottom of the border where there is any risk of the roots penetrating into the subsoil below, as the concrete effectually prevents deep rooting. The concrete should be so arranged that it has a natural fall towards a drain, to carry off surplus water, and thus ensure against stagnation of the roots.

The depth of the border should be so arranged that one foot of rubble or stones can be employed on the top of the concrete base, with two feet depth of soil, and if one foot of the latter is above the surface of the surrounding level so much the better, if the natural soil be of a heavy description, for this is always much colder during the winter and spring than where the soil is inclined to be of a sandy nature.

When making a new border care should be taken to preserve the drainage intact, as fine soil washed down quickly blocks the water passage.

PLANTING.

Although much useful advice has been given to planters from time to time in the Gardeners' Magazine and other journals, there is still a large amount of really bad work done in various parts of the country in connection with this branch of gardening and forestry. During the past summer several examples came under my notice of plants being killed by an application of strong farmyard manure to their roots, instead of covering the roots with soil, and using the manure as a mulch. By adopting the latter method the strong caustic, acid, or alkaline properties of the manure would have become neutralised, or weakened, before reaching the roots. Several instances of planting too deeply have also come under my notice. In some cases the stems of trees have been buried eighteen inches. The trees, of course, were dead. Another frequent malpractice I have met with is that of making the holes for the roots of the plants too small, and crowding the roots into them. With the knowledge that these evil methods are still in practice I should like to point out to those readers who intend undertaking work of this kind a better method, and a sure road to success.

Soil.

The first thing in connection with planting is to make the soil fit, by seeing that it contains an ample supply of the necessary constituents of plant food, and is also in a condition to yield them freely. By this it will be understood provision should be made for the escape of water from the rather heavy formations to prevent acidity, to foster oxidation, and to encourage a sweetness in the mass. There are few soils sufficiently rich in phosphates as to be able to support a healthy, vigorous growth in trees for any length of time, so that when preparations are being made for planting the opportunity to add a liberal quantity of finely ground bones, or other fairly readily soluble phosphatic manure, should not be lost. Many soils are rich in either potash or lime, or both, and it will be all the better for the well-being of the trees or shrubs if any constituent that is lacking be made good before the planting.

When a fruit tree is removed, and another is to be planted in its place, a different kind should be selected. Otherwise it will be advisable to remove a portion of the soil, and make good with fresh fibrous loam to which has been added the ingredients mentioned. Phosphates should be mixed with the soil, and potash salts and lime applied to the surface. When the planting operation is completed 4oz. of lime and 1½oz. of sulphate of potash to the square yard is an ample dressing. The soil should not be cultivated to a greater depth than 2ft. In fact, 18in., in most cases, will be preferable, as all the most valuable roots should be retained as near the surface as possible. In cultivating it the present surface soil should always be retained on the top.

Planting.

If the trees or shrubs require support a stake should be driven into the centre of the sites when they have been prepared. Broken or mutilated roots should be cut with a sharp knife from the underside of the root upwards. The roots should now be dipped in water, then evenly spread out in this position at a depth of from 2½ft. to 3ft. below the surface, and the more finely reduced soil worked in amongst them. The soil should be made fairly firm as the work proceeds, and the stems made fast to the stakes. For standard trees three ties are necessary to prevent the stems rubbing the stakes. If lime and potash are to be used they should then be applied to the surface, and a mulch of farmyard manure applied. Although it is not a general practice to stake small shrubs, yet I have sometimes found it advisable. Especially is this desirable when the position is exposed, or wind-swept; and a certain amount of protection, in some instances, almost imperative till the plants get a hold of the soil.

In preparing sites for trees and shrubs on land which has not been tilled for a considerable period, the sod should be put from nine to twelve inches below the surface. In this position it serves the purpose of manure, and does not draw the roots too far down. Whenever the plants are fit for moving in autumn it is undoubtedly the best time to plant, but they can be planted from the fall of the leaf to the bursting of the bud. When light sandy soils have to be dealt with every effort should be made to have them planted as early in autumn as possible.

In brief, the soil should be well prepared, and not worked too deeply, the most healthy and best-rooted plants should be selected, and their roots moistened before they are planted; no manure should come in immediate contact with the roots, nor should the stems of either trees or shrubs be buried, if healthy plants and vigorous growth is to follow planting.

Pedestrian.

PRIMULA MALACOIDES.
Flowers soft rosy-lilac. A.M., R.H.S., November 24. Messrs. Bees, Lim., Liverpool.

Hedges of Roses.—Sweet Briar was the typical rose of bygone days wherewith to form a hedge. The fragrance emitted from the leaves is its greatest merit, and we are still old-fashioned enough to enjoy this. At the same time, hedges of Penzance Briars, Conrad F. Meyer, Blanc Double de Coubert, or Cramoisie Superieure are not uncommon, and these are beautiful and welcome additions to any garden, requiring only the minimum of labour and material to retain them in vigour from year to year.—Thomas Smith, Walmsgate Gardens.

Broad Beans.—To obtain a few dishes of broad beans early in the season, make a sowing at once, choosing a south border for the crop. Sow the seeds in the usual way, in drills about two feet apart, and when they have germinated, keep a sharp look out for slugs, which do much damage where no check is imposed upon them. If a sowing is made in a couple of boxes at the same time, and placed in an unheated frame, nice plants will be obtained for planting outside in February. They will certainly give an early supply long in advance of those which are sown entirely outside. The best variety for sowing at this period is Improved Windsor.—T. W. Birkinshaw.

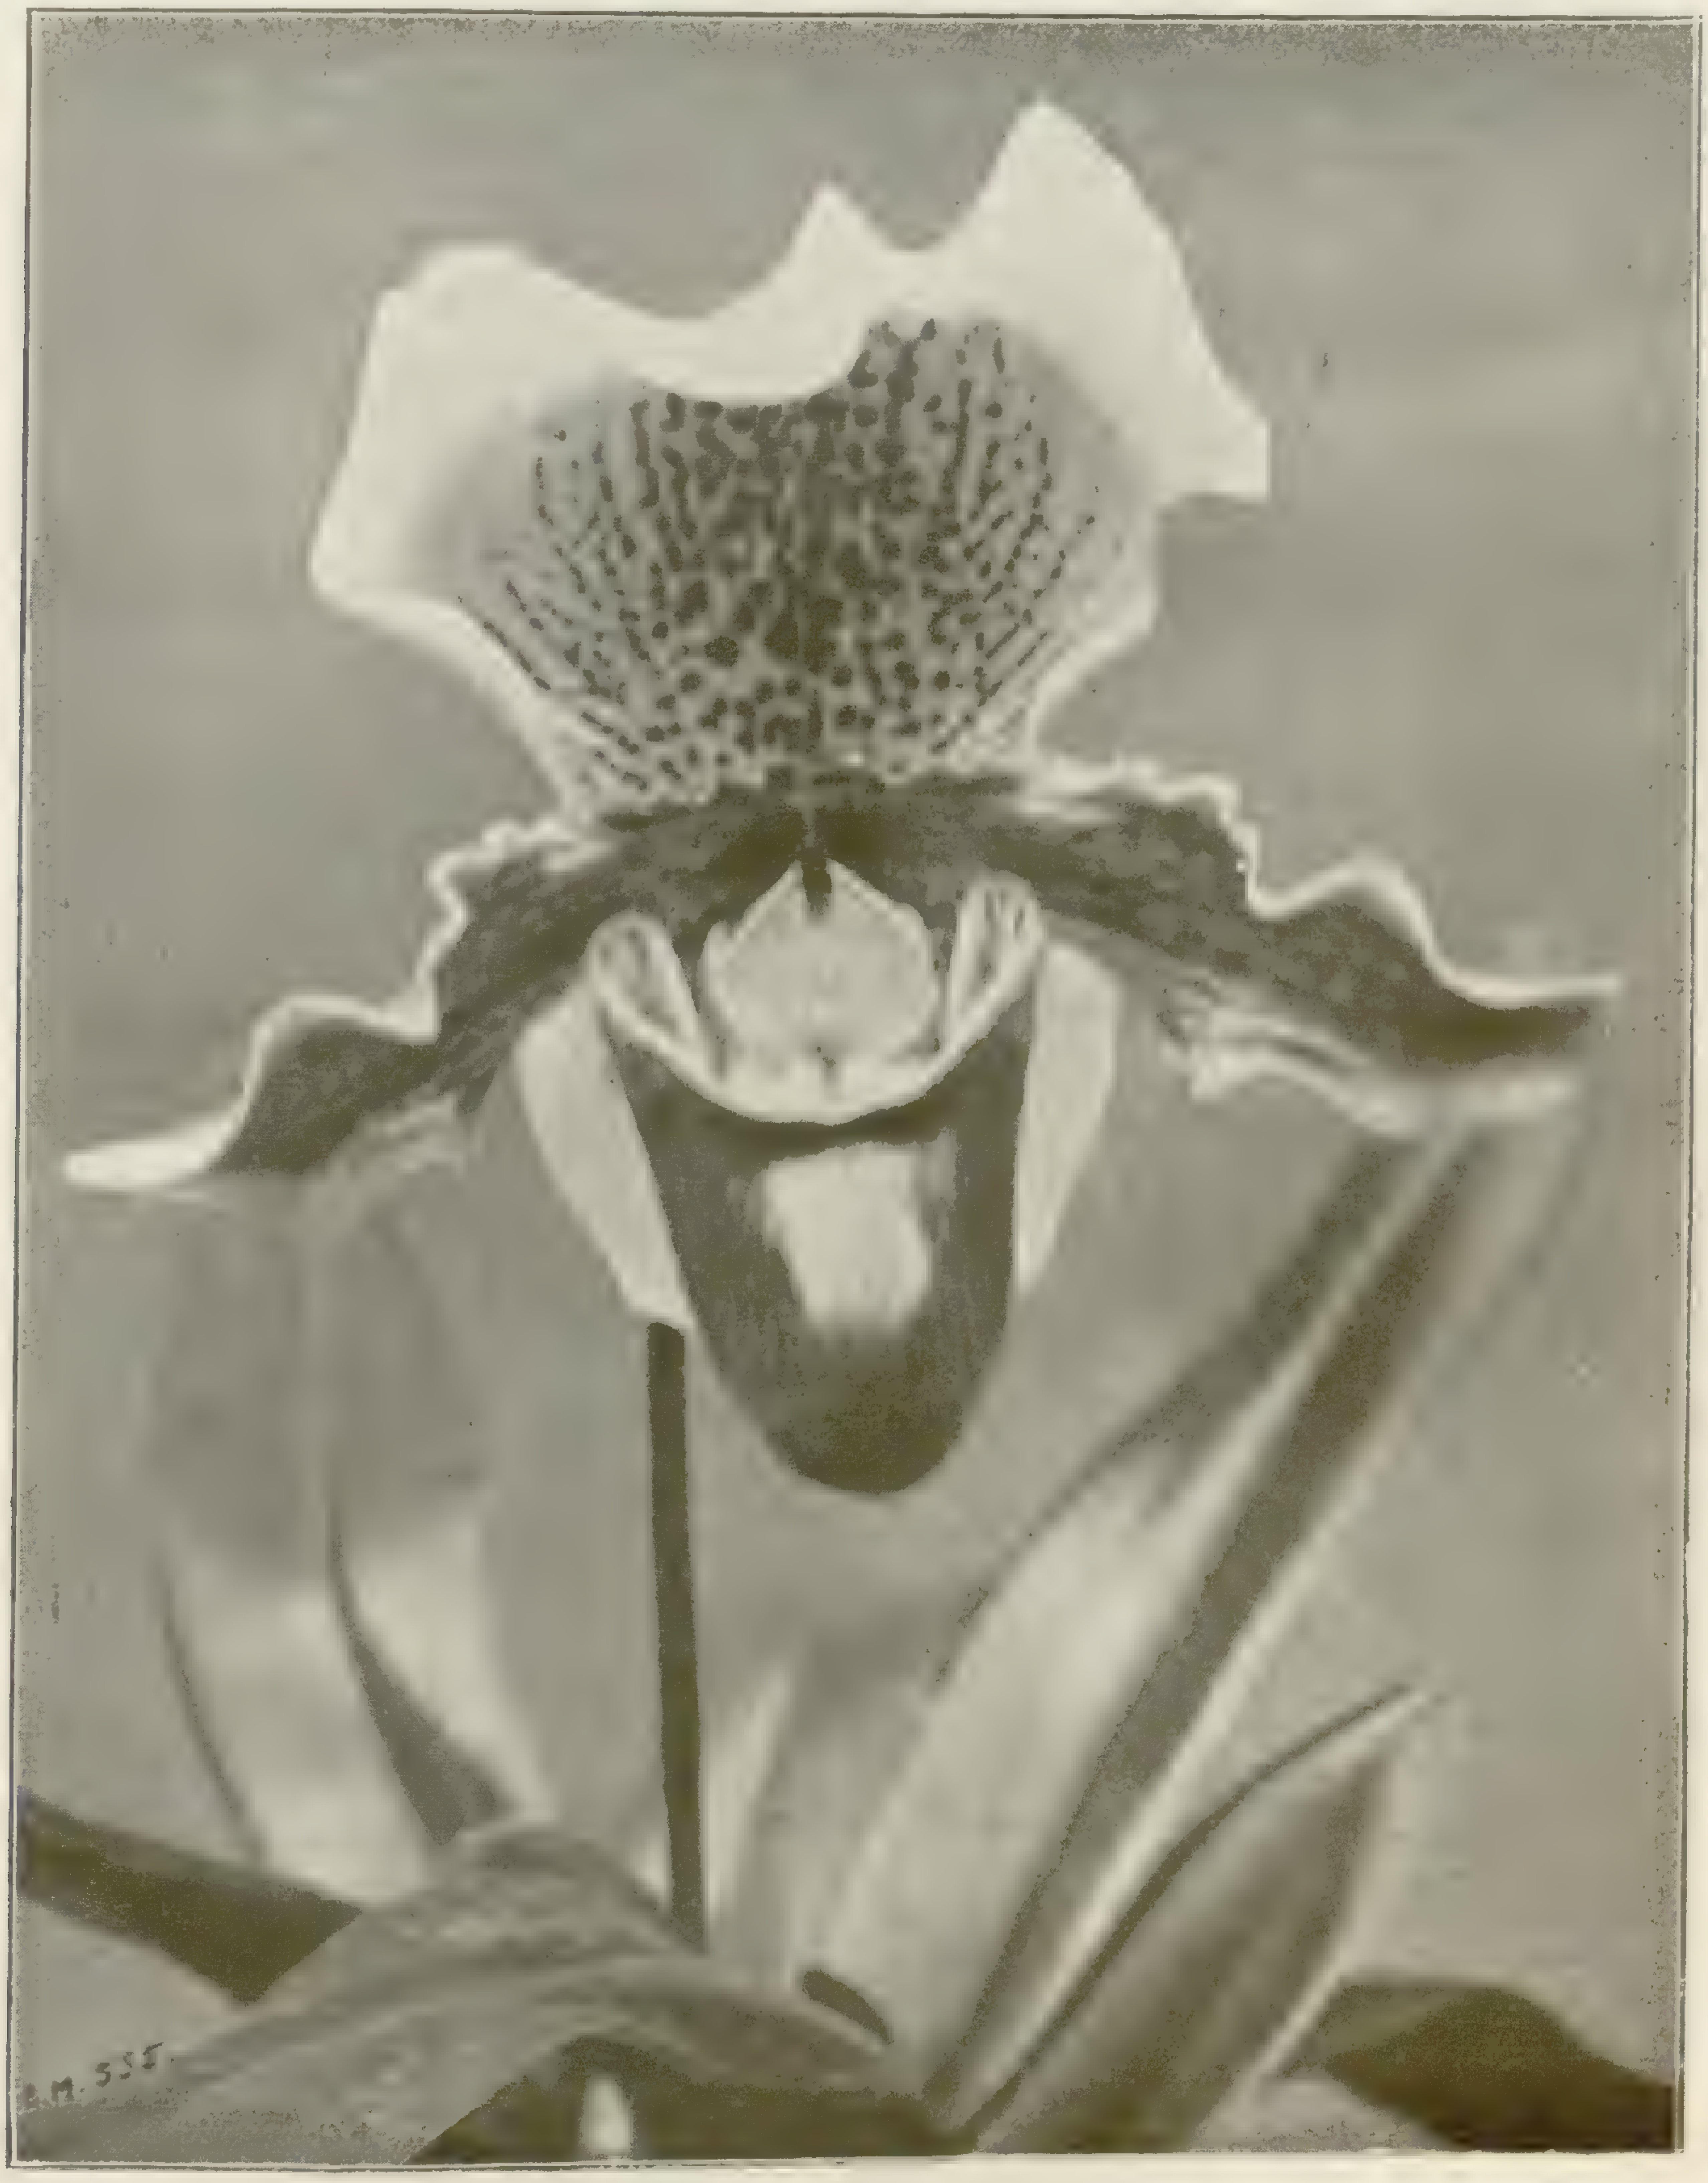
FRENCH GARDENING.

The much-advertised intensive system of vegetable culture, as practised by the French market gardeners, seems as though it will eventually have a far-reaching effect upon our English market growers.

There is nothing new in the system, for the Parisians have practised it for many years, and it has been referred to in past years by our own horticultural Press. Whether the main ideas were thought to be unsuitable for English soils and English climate I cannot say, but the fact remains that through the efforts of one or two pioneers, and the alluring description attending these efforts from the daily Press, the question of "intensive culture" on the approved French lines has become a very live one. In various places, as widely apart as Essex, Berkshire, Evesham, etc., small holdings have been opened up and started upon these methods.

The profits accruing to these ventures is said to be large, but before some of the golden accounts are taken and digested one would like to see a properly balanced statement, showing to the full the working expenses, including the wages bill and the many other incidental expenses, and then contrasting the outgoing expenses with the income derived from the sales of produce. I know full well that the French growers have made a good thing out of market gardening in the past. It has provided a good living for them, but it has also provided them with plenty of hard work, early and late. It is usual with them for both the proprietor and his wife to work, and to work hard, and in addition to this you have the fact that they are able to get labour cheaper than it would be possible for English growers to do, although with some of our own folks the rate of wages is none too high, when one considers the cost of rent and living in the vicinity of our large towns. The whole system of the French market growers was created probably by the sheer force of circumstances—by the necessity of growing vegetables upon small areas to meet the demands of a large population—hence the French gardener, with his one or two acres of land, was compelled to so utilise his space, that four crops grew where there was but one in the old way. To accomplish this the grower was compelled to resort to cloches, frames, and stable manure, and with the inherent industry and carefulness which is part and parcel of the Frenchman's character, the system has grown to great dimensions.

That there is a large opening for English growers in supplying early vegetables for the big markets no one can deny, and the pioneers will undoubtedly reap a very good harvest as a result of their foresight. But let not the beginner think that the method is all a "bed of roses"; on the contrary, one will find that as time goes on,



CYPRIPEDIUM DREADNOUGHT.

Colour, white, greenish yellow, and brown. F.C.C., R.H.S., November 24. Messrs. Sander and Sons, St. Albans.

and competition becomes keen, the present good prices will collapse, and the grower will have to be content with a much smaller margin of profit. Again, too, the price of manure will be forced above its present level, and the grower will find it very necessary that the long hours of the French growers must be his also. The cost of making an effective start may well cause many to hesitate ere they embark upon this sphere of garden work. The cost of cloches and frames necessary for starting on two acres of land was recently given by a primer on the subject as £140, but there are so many other incidental expenses that one might well suppose that this amount would be brought up to £200 without in any way acting recklessly in the matter of expenditure. Against this statement one can place the cost of thoroughly equipping a garden near Paris a few years back, which was about the same as the English garden in area. The cost of creating this garden, including the supply of water, pumps, hose, etc. (a very necessary item), implements, horse and market cart, storage sheds, etc., and the complement of lights, frames, and cloches, was given at £1,100! a very different figure indeed. As for the working expenses, it was found that they reached the sum of £550 per annum, clearly showing the need for good crops and good market prices for the grower to show really good profits from his two acres.

The great amount of labour needed for the culture, packing, and marketing of crops on the French system ought to give a fillip to the labour market, though one will readily perceive that the cost of the labour, together with the supply of water, manure, repairs, etc., must certainly represent a fairly heavy outlay even if one works on strictly economical lines.

Another point of extreme importance is the land itself. The questions as to the nature of the soil, its position, and the distance from market are of vital importance to the grower. A wet, heavy soil, or land that is not sheltered from cold winds, is of little value for early crops, in comparison to a naturally warm soil that occupies a sheltered position. Therefore the choice of land must be a first consideration.

The question of the provision of lights, frames, and bell glasses, or "cloches," will prove a subject for contract, and one will be able to secure quotations at lowest terms from firms interesting themselves in these specialities. One thing we may expect to see in the near future is a very keen competition for the supply of these articles, which will undoubtedly bring prices lower than they are at present. One may also expect that the principal seedsmen will give especial prominence to varieties of vegetables and salading suited for the purpose, and, naturally, improvements would follow which will supersede existing varieties.

The main crops grown under the French system are lettuces (cos and cabbage), cauliflowers, carrots, cucumbers, radishes, melons, turnips, and celery. Other crops which are utilised to keep the ground in constant use are kidney beans, tomatoes, endive, mustard and cress, asparagus, strawberries, mint, etc.

The question of manure must be settled by a contract. Either arrange with someone to "deliver in" given quantities at as low a rate as possible, or else, and the cheaper way, fetch it with one's own conveyance from large stables.

T. S. Hayward.

HARDY FLOWERS are always popular, as they make the garden bright and attractive, and require but little attention. All the information required for their successful culture is given in Easily Grown Hardy Perennials, by G. H. Vos. Price 5s. net, by post in box, 5s. 6d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

NEW PLANTS, ETC.

VANDA CÆRULEA R. CHOLLET.

This is a superbly beautiful variety of the old V. Cærulea, and one in which fine form and size are accompanied by the most brilliant blue colouring, the lip and principal veins being of a deeper shade of violet blue than the rest of the flower. The varietal name is given in compliment to Mons. Chollet, Messrs. Sander and Sons' grower at Bruges. F.C.C., R.H.S., November 24. Messrs. Sander and Sons, St. Albans.

CYPRIPEDIUM DREADNOUGHT.

A particularly striking hybrid derived from C. Troilus and C. insigne Harefield Hall. It is of unusual size. The immense dorsal sepal has a width of over three inches, is pure white on the upper half, and soft greenish yellow over the basal half, and light purple spottings running up into the white area. The wavy petals are yellowish, spotted with brown towards their base, and tinted with purple towards the apex. The lip is brown and the staminode yellow. It is a noble cypripedium. F.C.C., R.H.S., November 24. Messrs. Sander and Sons, St. Albans.

CYPRIPEDIUM SAN-ACTÆUS ETONIENSE.

A very attractive new cypripedium, produced by crossing C. actæus Langleyense with C. insigne Harefield Hall. The big dorsal sepal is pure white with a bright greenish yellow base, and with soft rosy purple spots running from base almost to apex. The petals are greenish yellow shaded with brown, and the shapely lip is yellow with a brown shade on the front. A.M., R.H.S., November 24. Messrs. Jas. Veitch and Sons, Chelsea.

ODONTOGLOSSUM GROGANIÆ.

This is a strong-growing hybrid from O. Edwardi and O. Uro-Skinneri. The specimen shown carried a very long branching spike, and the ruddy purple flowers, together with the style of the inflorescence, showed most markedly the influence of O. Edwardi. This was incorrectly ascribed to Messrs. Armstrong and Brown in our issue of November 28. A.M., R.H.S., November 24. Mr. J. H. Grogan, Slaney Park, Baltinglass, Co. Wicklow.

CYPRIPEDIUM ARETHUSA.

Another useful addition, and one that was raised by crossing C. Milo with C. Sallieri aureum. The finely formed flower has a white dorsal sepal save for its green-yellow base, and on this colouring the bright purple spots stand out conspicuously. The other parts of the flower are a pleasing shade of greenish yellow. A.M., R.H.S., November 24. Mr. H. Alexander, orchid grower to Lieut.-Colonel Holford, Westonbirt, Gloucester.

POLYSTICHUM ACULEATUM GRACILLIMUM DRUERYI.

An extremely beautiful and graceful variety, wherein the pinnæ have become attenuated and extended, some of them being two inches long. It is one of the most beautiful of hardy ferns, and marks distinct progress in connection with P. aculeatum. The plant was raised from spores obtained from P. a. pulcherrimum, by Mr. Green, of Acton, which is of interest because the pulcherrimum form has hitherto been regarded as sterile. F.C.C., R.H.S., November 24. Mr. C. T. Druery, Shaa Road, Acton.

PRIMULA MALACOIDES.

This is a charming and elegant species, very like P. Forbesi in general appearance, but with slightly larger flowers, stronger growth, and distinct leafage. One great difference is that, whereas P. Forbesi cannot be described as truly hardy, save in very sheltered places, P. malacoides is quite hardy. As a pot plant, P. malacoides promises to be a great success, and there is no doubt it will be in great demand for conservatory and table decoration in the course of two or three years. The flowers are rose-pink with a yellow eye, and freely borne on verticillate spikes. This newcomer hails from Yunnan, and was found at an elevation of 9,000ft. A.M., R.H.S., November 24. Messrs. Bees, Lim., Wapping, Liverpool.

CHRYSANTHEMUMS.

Merstham Jewel.—This very fine new single variety, with large bronzy-red flowers, has already been described in these columns. A.M., R.H.S., November 24. Messrs. W. Wells and Co., Merstham.

Caledonia.—An unusually large single variety, measuring well over six inches across. It is of good form, is rosy-pink in colour, and has a white ring round the disc. A.M., R.H.S., November 24. Messrs. G. Williams and Sons, Manor House Nursery, Cardiff.

Frank Payne.—We are now able to figure the beautiful blush Japanese variety that was described on p. 890. It gained a F.C.C., N.C.S., on November 16. Messrs. W. Wells and Co.

Arcturus.—This is a charming new single variety with bright crimson scarlet flowers, that are paler in colour near the disc. It is a flower of considerable beauty of form and colour, and it carries well. It was shown well by Mr. Norman Davis at the recent R.H.S. meeting, but was not placed before the Floral Committee.

PEAR DANA'S HOVEY.

A useful mid-winter pear, somewhat small, of good flavour. It has a russet skin. Dana's Hovey is by no means new, as it was raised in 1854 by Mr. Francis Dana, of Roxbury, Massachusetts, U.S.A. Mr. C. M. Hovey, whose name the pear keeps in memory, was a Boston nurseryman. A.M., R.H.S., November 24. Messrs. Jas. Veitch and Sons, Chelsea.

WHITE ROSES.

Surely the rose-growing friends of the writer of the article on "White Roses," that appeared in the issue of November 21 have overlooked that splendid white hybrid tea rose, Lady Quartus Ewart. In my opinion this is a variety far in advance of Madame (not Monsieur) Joseph Combet, and is undoubtedly the best white hybrid tea in commerce. For bedding and garden purposes generally it would be difficult to find a more satisfactory rose. It blooms very freely throughout the rose season, and as I write (November 21) my plants have large trusses of buds, which, with one or two more mild days, such as we are now experiencing, will yet give me a decent bloom or two.

Now Madame Joseph Combet is neither such a good white (creamy-white being its correct description) as the variety I am describing, and has the drawback of being quite late in opening its first flowers, it being about the most backward of all the H.T.'s in this respect; neither can the individual blooms compare in beauty of shape with those of Lady Quartus Ewart, being, I think, too full and without the depth of petal that the latter variety possesses. True, the blooms of Lady Q. Ewart are not very large, but they open well, and with the pointed centre and reflexed petals make an altogether charming and elegant flower, which sometimes is quite good enough for the exhibition box.

The variety is of vigorous growth, and its unusually deep green, glossy foliage forms a splendid contrast to the pure white flowers, which are borne in such profusion and over such a long period. As a white rose for garden effect, or for cutting for house decoration, Lady Quartus Ewart may be safely recommended, and for these purposes it will, in the opinion of many, be at least equal to that other splendid white rose, Frau Karl Druschki.

Edward A. Jefferies.

Cirencester.

MOTTOES FOR GARDEN USE.

A garden of mottoes is one that charms by its novelty and the poetic spirit that it breathes, but its success must be mainly due, of course, to the flowers and foliage therein cultivated and the excellence of the landscape effect produced; no pretty fancies, whether of brick, wood, wire, or word can atone for ill-kept, poorly-filled, or inartistic pleasure-grounds. It is certainly not desirable that mottoes should become very general in gardens, yet the judicious employment of a few add interest to various nooks, and the one garden of mottoes that I have seen had been carried out with such skill that the feature was absolutely unobtrusive.

The sun-dial, that usual preacher of a moral, had this couplet cut in its stone plinth:

> "Time is flying, time is fleet:
> Use it well, it proveth sweet."

while around the clock ran the counsel:

> "Be true as me, and you need fear no ill."

The rose garden, just beyond, was entered at various points by seven paths, each spanned by a quaintly carved oak arch of elaborate design, upon the summit of which, too high for the most rampant climber to cover, a motto was to be read against the sky, the letters being cut out clearly. These seven mottoes were the following:

> "Flores curat Deus—God cares for the flowers."
> "Aspera me juvant—Sharp prickles help me."
> "Firmum in vitâ nihil—Nothing in life is permanent."
> "Opes solis et umbræ—By the power of the sun and shadow."
> "Post nubila sol—After clouds, sunshine."
> "Sapienter uti bonis—Wisely to enjoy blessings."
> "Soli Deo honor et gloria—Honour and glory to God alone."

In the herbaceous border some mottoes appeared for those who liked to search for them, but the passer-by could ignore them, so unobtrusively were they written on the tops of the shield-shaped zinc labels that bore the Latin names of the plants. Against a group of purple honesty might be read:

> "My money maketh no miser, and 'tis for all,"

the helianthuses boasted proudly:

> "Solen ferre possum," or "I can endure the sun,"

the day lily suggested:

> "'Tis better to be brief than tedious,"

while a bush of Scotch roses offered the true reflection:

> "Roses have thorns and silver fountains mud."

The secret of the success of this garden was that the mottoes had all to be looked for; inscriptions in gay colours or bold lettering were nowhere visible, the mysterious having, indeed, been studied to such a degree that it required patience, or foreknowledge, to read in the iron scrolls of the gates:

> "Enter welcomed, and unwelcome will be your departure."

All along the painted iron scrollwork of the verandah sage statements had been rendered almost imperishable. The elegant pillar supports of the wire netting at the ends of the tennis lawn had these suggestions upon them:

> "Play that is fair deserves honour."
> "Recreation speeds labour."

and

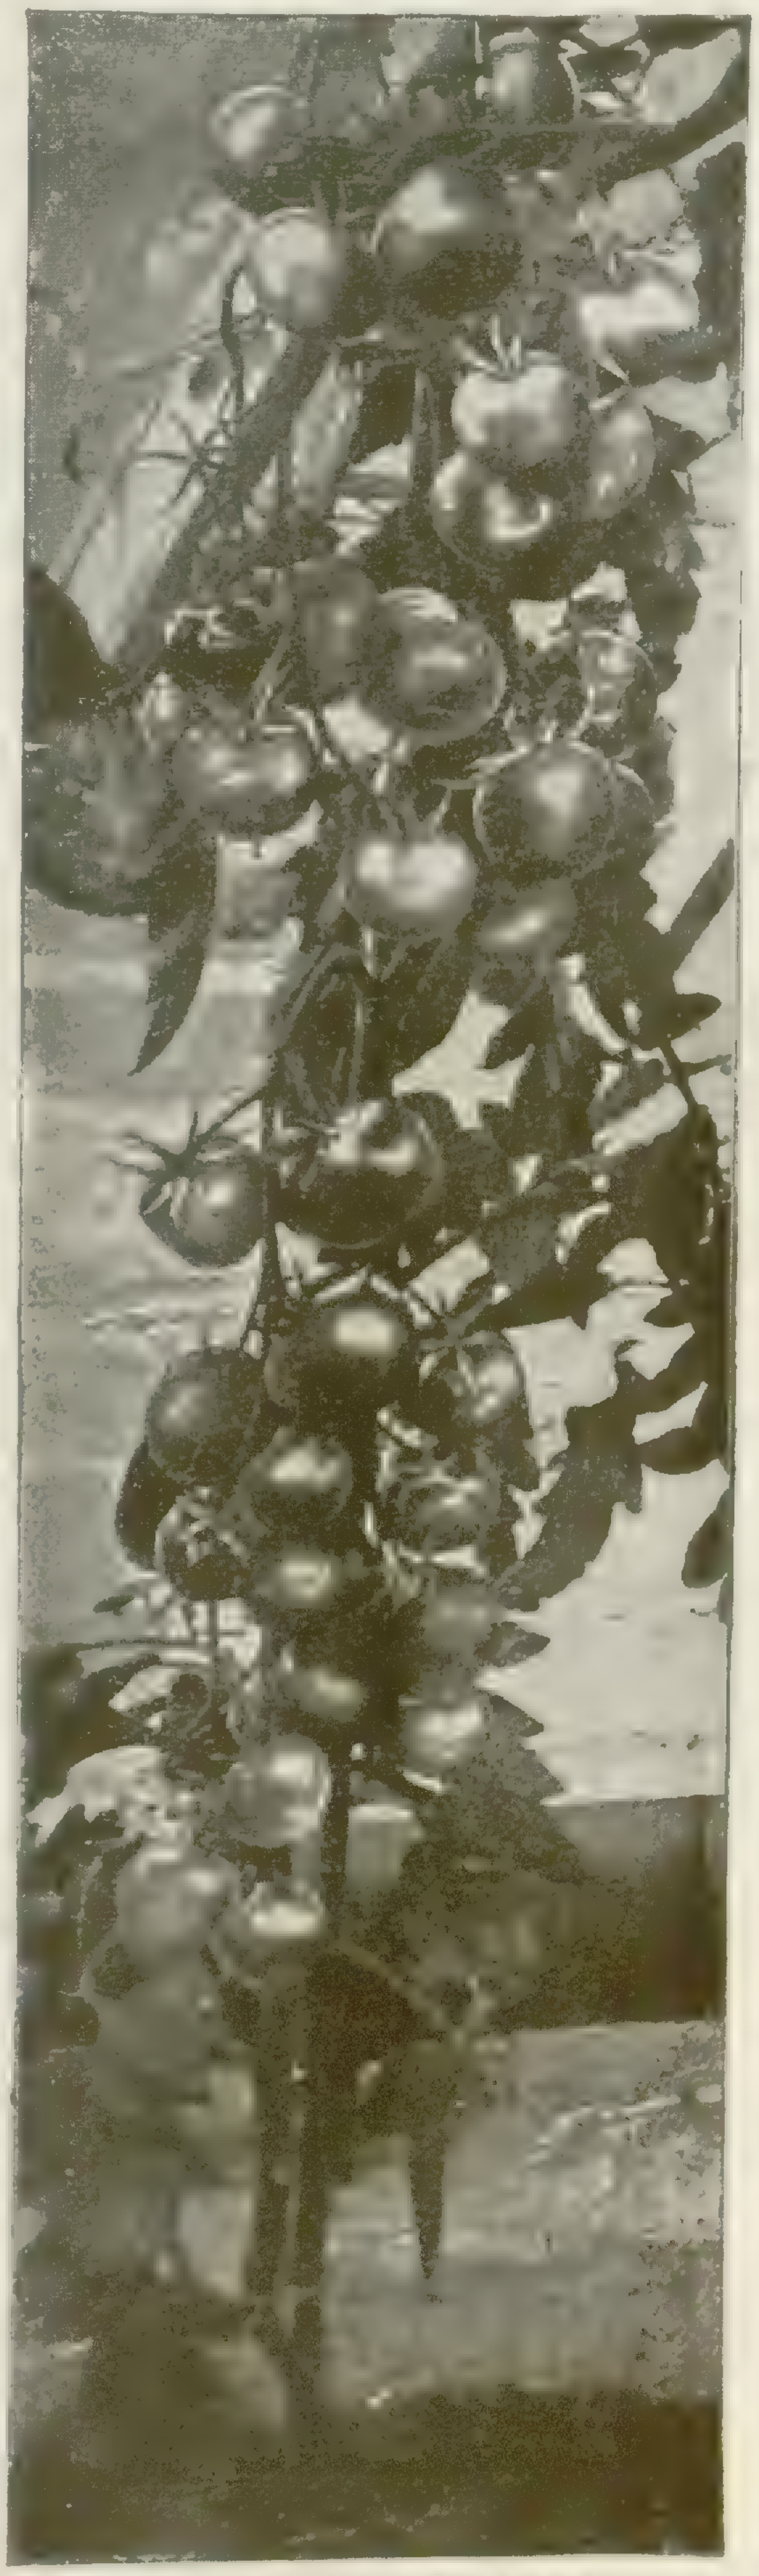
> "Smile at defeat and win to-morrow."

The summerhouses, three in number, were carved round inside, just where walls were joined to the roof, all with mottoes inviting to peace, rest, and confidences. The pergola, with a pillar for every day of the month, told of hope, contentment, and the merits of mere beauty, and the handrail of a bridge across a stream was cut deeply with the words:

> "Ut amnis vita labitur"—"Life glides away like a river."

A grotto in the ground of a Scottish mansion, perched high among rocks and surrounded by firs, bears above its entrance this statement:

> "Here may the student dream, or lover whisper, or hermit pray; but let no man pass by without gratitude to the man who set up this roof, aye, and yet deeper thankfulness to the God who made the canopy of sky."



TOMATO MONEYMAKER.

Friendship gardens need not be composed of plants given by friends, it is sufficient for sentiment if some existing flower is chosen as a representative by each "lover," and has his selected motto fastened upon it, or written on a heart-shaped label affixed to a slender green stake that is thrust into the earth near.

Exceedingly quaint have been mottoes or inscriptions used in gardens of ancient days; for example, the gateway warning:

> "Thistles and bad men avaunt,"

the invitation:

> "Come, but be brief as the flowers of summer";

or the proud boast:

> "All that grows here grows rarely."

Most stern of all, perhaps, was the statement, to be read as a threat to the bad, or an encouragement to the virtuous:

> "I cultivate no weed."

There certainly seems no reason why fair thoughts should not be written up here and there in our gardens, to lift the mind to heights of philosophy, suggest solace for sorrows, teach hopefulness, and preach the dignity of toil; all that is necessary is that the feature should not be over-accentuated and the aid of true art enlisted in this service.

M. H.

TOMATO MONEYMAKER.

A new tomato, if it is to attain a marked degree of popularity in these days, must possess exceptional merit in certain directions. Easily crossed, and easily raised, and so quickly raised, it is small wonder that almost every grower of tomatoes has produced a new variety. But, sooner or later, usually sooner, the said variety finds its level, because the tomato has long passed outside fanciful considerations, and questions of habit, fruitfulness, quality, size, shape, and constitution, are those alone that receive consideration, and according as a tomato has all these qualities in greater or less degree, so is the measure of its popularity.

Moneymaker is a variety we have met with on many occasions during the year, and it is without doubt a splendid cropper, of fine flavour, good size, and pleasing shape and colour. It is especially thin-skinned, and contains few seeds. We have seen trusses carrying as many as sixteen and eighteen good fruits, and, as the illustration shows, it fruits right from the base upwards. It is also of distinctly good habit, and will thus especially appeal to the private grower who has but limited space at command, for he will find a few plants of this prolific variety, introduced by Messrs. Dickson and Robinson, of Manchester, sufficient to meet the needs of a modest establishment, while the large growers will find the variety acts well up to that commercial standard suggested by its title of Moneymaker.

Dwarf Antirrhinums.—On paying a visit to the gardens of Barnwood House, near Gloucester, at the end of July, I had the pleasure of seeing one of the finest displays of dwarf antirrhinums that have yet come under my notice. The border, which is on one side of a broad, straight walk, is about eighty yards long by six feet wide, and contained over 7,000 plants. The dwarfs occupied four feet of the border, behind these were a row of the taller varieties, mixed colours; and behind these, a back row, a fine pure white, known as Sutton's White Queen, was growing. Mr. Walker, the able gardener, sows the seed the first week in February, and grows on the seedlings as hardily as possible. The practice at Barnwood House is to buy a collection of distinct colours, and then to mix the whole of the colours for forming the beds of mixtures.—John Aplin, Hasfield Court Gardens, Gloucester.

WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

GENERAL REMARKS.—Attention will be devoted to the winter-flowering cypripediums during the next few weeks. It is remarkable the hold this most useful class of orchids has acquired, not only on orchid specialists, but on amateur and professional gardeners throughout the country. I have been rather agreeably surprised, when visiting some of the local chrysanthemum shows during the past few weeks, to find so many, as well as so varied, an assortment of cypripediums included among the groups of flowering and foliage plants arranged for effect. It certainly appeared that the merits of this useful class of plants were at last being realised. It is many years ago since I first began to advocate the merits of these plants in this column of the Gardeners' Magazine, and I still hold the opinion then expressed, i.e., that these orchids are plants for everybody, and I do not consider any better illustration of this fact may be found than the extensive manner in which the cypripediums are shown at the fortnightly meetings in London and Manchester; and in the latter case it may also be claimed that cypripediums may be successfully cultivated under conditions of the atmosphere in which nearly all other plants fail. These facts cannot be overlooked, and should be brought more fully before others interested in gardening who have to battle against unkind conditions at this season of the year with such disheartening results. Many of the most beautiful of the winter-flowering hybrids and species of cypripedium are now procurable for a modest outlay, and they are deserving of every attention. It is scarcely desirable to give a selection, because tastes differ, and it is far more desirable to grow those that are appreciated than a general collection.

CALANTHES.—The summer and autumn have been particularly favourable to deciduous calanthes in this district, and there are no orchids more graceful in effect, or useful for decorative purposes than a general collection of the robust growing forms. I hope that within a few years hybridists will increase the number of varieties by the introduction of the fine colouring of the more delicate kinds into the robust forms. I have been rather struck by the remarkable difference found in the colour and substance of the flowers on plants that have become properly ripened, and those that are more or less sappy and are still carrying their leaves, when the flowers have commenced to expand. There can be no doubt but that it is desirable to procure thoroughly matured pseudo-bulbs. As the calanthes pass out of flower or have had their flowers removed they should at once be placed under resting conditions, and water be entirely withheld. If space is no object they may be permitted to remain in their pots during the dormant season, but they should be placed in a position where they may have the full benefit of all available light. Where accommodation is limited the plants may be turned out of their pots as soon as matured, have the roots trimmed to about an inch from the base of the pseudo-bulb, and placed in boxes on a layer of dry sphagnum moss and silver sand.—H. J. Chapman, Oakwood Gardens.

STOVE PLANTS.

BOUVARDIAS.—As soon as the earliest batch of these useful subjects has finished flowering the stems may be shortened back and the plants removed to a moist atmosphere, with a temperature of about 60 to 65 degrees. This treatment will encourage new growths, which will develop new flower buds for the early part of the new year. Alternate waterings of some approved chemical fertiliser should be applied as soon as the plants are growing freely.

DIPLADENIAS.—Although these succeed best throughout their flowering season when kept somewhat drier than most stove plants, it is, however, advisable not to allow them to suffer during the winter months from excessive dryness. They ought to be examined most carefully once or twice each week, and water applied immediately the wood shows signs of shrivelling. Young plants raised from cuttings during the summer and autumn may be kept steadily growing throughout the winter months, and shifted into larger pots, according to their requirements. I have noticed that dipladenias, when used as climbers for draping the roof of the stove, succeed best when kept in large pots or tubs, in which case their roots are restricted, and they flower the more profusely than when planted out in borders. The beautiful colour of their blooms is seen to the best advantage when the flowers hang loosely from the roof.

PLUMBAGO ROSEA.—This is most acceptable as a winter-flowering subject, and it is at this season one of the most attractive occupants of our stoves. When used as cut flowers they cannot fail to command appreciation for either house or table decoration, and when used for this purpose it gives a charming effect associated with lily of the valley or Roman hyacinths. I find the plants succeed best and produce the longest flowering season when subjected to the ordinary stove temperature, and, during the flowering period, given a little air on all favourable occasions.

CLEANING THE HOUSES.—This work must be taken in hand as time permits; it must also be done thoroughly, so as to eradicate mealy bug and other troublesome insect pests. If this operation is carried out thoroughly much time will be saved in the spring. Soluble paraffin, soap, and hot water are the most effective materials for this purpose. Should the stove require painting inside this work should be put in hand at once after cleaning down.—John Donoghue, Bardon Hill Gardens.

FRUITS UNDER GLASS.

TOMATOES.—These are now colouring up well, and a little artificial manure may be given about once a week. If the shoots are stopped at the required height the fruits swell quicker. Admit a little air at all times; damping down should be done carefully; maintain a night temperature of 60 degrees, with a rise of 5 degrees by day. Fumigate the house slightly once a week. As soon as the tops that were put in the other week have made roots put them near the glass on a shelf, and remove the flowers as they appear for a few weeks.

STRAWBERRIES.—In the pit or house made ready for these, plunge the pots in the leaves, providing they are not too hot; a bottom heat thermometer is the safest thing to use, and should not register more than from 45 to 50 degrees. If the top soil is disturbed when examining the drainage top-dress them afterwards. Select the plants that have plumped up their crown best, and those full of roots. A shelf may be placed in the early vinery that is started, and filled with strawberries, but as these are being forced early a few will be blind, and a few extra should be put in. Syringe when weather permits, and if red-spider is prevalent dip the plants in some insecticide.

EARLY FIG HOUSE.—The figs should be pruned, cleaned, and ready for starting by the end of the month. Wash the trees with a soft brush and a safe insecticide where there is white scale. Do not tie in the wood too thickly, but encourage young wood from the base of the tree to cover up the old wood. If the roots are restricted, which should be the case, and the trees are healthy, and generally carry good crops, the border should be liberally top-dressed. Remove the old surface soil, and renew with some good rich loam, charcoal, and bones. The house may be closed at once, but no fire heat should be applied for a month; syringe according to the weather.

BANANAS.—A few of the strongest will still continue to throw up fruit, but difficulty will occur in getting the bunch to run clear out from the stem. It is better to sacrifice a plant or two rather than to ruin the lot by using a very high temperature. Keep them steadily growing, if possible, and as the young roots appear on the top of the tub cover them up with a suitable compost. Syringing should not be done overhead; keep the house well damped down when much fire heat has to be used; 65 to 70 degrees at night will be sufficient heat.

ORCHARD HOUSE TREES. — These should be well covered or plunged in ashes to keep the frost from the pots. Peaches and nectarines may be placed in the house and syringed once or twice a day, according to the weather. The house should be well aired every day to assist the flowers to open strongly. If not too tall they should be stood on the top of the border, on a slate, as they are best in this position until they have set; they can be plunged afterwards.—A. B. Wadds, Paddockhurst Gardens.

THE KITCHEN GARDEN.

EARLY CARROTS.—Preparations should now be made for providing a hotbed, which should be made up of fresh leaves and long litter that have been thoroughly mixed. After the material has settled down, cover it with good soil to a depth of nine inches, making it nice and firm. Then sow the seeds broadcast, and cover with about a quarter of an inch of fine soil, and water them in. Admit a little air to the frame, so that excessive heat or moisture may escape. Choose a small-rooting variety, and make successional sowings according to the demand. Young carrots are always appreciated when they can be had.

SPRING CABBAGE.—These have come on rapidly of late, and they will be greatly benefited by having a little soil drawn up to the stems; this will afford them protection during hard frost, and also help to keep them in an upward position during strong gales. Select a dry day for the work if possible, as the soil will then be easily worked.

LETTUCE AND ENDIVE that are growing in frames should be attended to frequently, and have all decayed leaves removed and the soil stirred occasionally. Give abundance of air when the weather is fine by removing the lights altogether.

DIGGING.—As the ground is cleared of crops, such as celery, cauliflowers, etc., have it dug or trenched in readiness for the next crop. It is most important to have all vacant ground dug up, and especially strong clayey soils, to give the frost an opportunity of pulverising it. Plenty of wood ashes should be applied to such soils, and also leaf-mould.

LEEKS.—The latest batch should now have their final earthing up, and these will be most useful during the spring months, when other vegetables are comparatively scarce.

SALADS.—These are always in daily demand, and the lettuce and endive should be kept well blanched, in order that it may be nice and crisp. Mustard and cress seed should be sown in boxes weekly, and be placed in heat.

GENERAL WORK.—Now is a good time to attend to making new drains in the kitchen garden, or repairing any that are defective, so that the disturbed soil may settle down again before the spring. A depth of not less than three feet should be allowed for new drains, as generally deep cultivation is most necessary for nearly all kitchen garden crops. Strong clayey soils are always the more fertile when well drained; they are also drier and much warmer.

JERUSALEM ARTICHOKES should now have all the stems cut down, and the ground be cleaned from weeds. Dig up a quantity of tubers to have supplies in readiness should severe weather set in.

POTATOES that are in clamps should be examined occasionally, and at these examinations all diseased tubers be removed.—T. W. Birkinshaw, Hatley Park Gardens, Sandy, Beds.

A GRAND CARNATION SHOW,
under the auspices of
THE PERPETUAL FLOWERING CARNATION SOCIETY,
will be held in
THE ROYAL HORTICULTURAL HALL,
Vincent Square, Westminster,
On WEDNESDAY, Dec. 9th.
Admission: One p.m to Five p.m., ONE SHILLING.
Hon. Sec., HAYWARD MATHIAS.
Lucerne, Stubbington, Fareham, Hants.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Royal Horticultural Society.

The exhibition of Colonial fruits, fresh, dried, and bottled, held by the Royal Horticultural Society from November 26 to November 30, was a magnificent one, the big hall being well filled with splendid produce that gave evidence of high culture, skilful packing, and fine grading.

It would serve no useful purpose were we to detail all the various exhibits on this occasion, therefore we shall deal more particularly with the countries or colonies represented rather than with individual exhibitors.

Nova Scotia was well represented, and several large tables were filled with excellent produce. Bottled fruits, very bright, and some magnificent examples of Blenheim Pippin apples, from Mr. Dalmain, of Wolfville, were notably good, and the bottled gooseberries were notably fine. From Tupperville, Middleton, Upper Dyke, Kentville, Cambridge, Berwick, Port Williams, Bridgetown, Lakeville, and Kingston, there came excellent fruits, and among these, the boxes from the Berwick district were specially attractive. The leading varieties from Nova Scotia were Baldwin, King of Tomkins County, Cox's Orange Pippin, Golden Russet, Fallawater, Mann, Northern Spy, Ribston Pippin, Blenheim Pippin, the heavily bloomed and deep red Mackintosh Red.

Exhibits from the province of Ontario filled three big tables, and not only were apples, pears, and grapes, but also vegetables in great variety and of considerable size and fair quality. These latter were interesting as indicating the soil and climate of the province, but their value as exports would probably be very small. The Department of Agriculture sent black and red grapes, but the varieties were not labelled. The apples were of fair quality, and there were good dishes of Keiffer, Duchesse, Louis Bonne of Jersey, Howell, Beurre Bosc, Beurre d'Anjou, Le Conte, Josephine de Malines, Sheldon, and Beurre Clairgeau pears. The vegetables submitted included short, thick heads of celery, big and rather coarse intermediate carrots, very coarse large-eyed potatoes, such as Crown Jewel, Ontario Beauty, and Gem of Aroostock, but Rural New Yorker, Beauty of Hebron, and American Wonder were of better character; big white cattle carrots, parsnips, good onions, immense marrows, pumpkins, and squashes, maize cobs, huge bringals (egg plants), and large Snowball cauliflowers and Drumhead cabbages. In a big glass case there were excellent samples of preserved fruits, and, curiously enough, of tinned beet and beans. The apples were very clean and bright, but not so fine, as a whole, as those from other sources, and the leading varieties were Spy, Grime's Golden, King of Tomkins County, Gano, Canada Rex, Blue Pearmain, Scarlet Pippin, Fameuse, Baldwin, and Ben Davis; but pears, such as Duchesse, Kieffer, Beurre Clairgeau, Winter Nelis, Beurre Anjou, and Beurre Bosc, were of good quality and well packed.

The British Columbian display that filled the end of the hall was the finest of the whole set, and there is no manner of doubt that this province can produce grand apples, grade them well, pack them splendidly, and place them on our markets in fine style. From the Kasto district some superb specimens of Baldwin, Wealthy (perfect), King of Tomkins County, Spitzanberg, Famuese, Ribston Pippin (large and bright), and Blenheim Pippin were sent in the usual boxes. The Hyslop crab apple, so fine for jelly making, was well shown by several exhibitors, and Emperor Alexander, Cox's Orange Pippin, and Blue Pearmain figured largely from various parts of the province. For colour, Spitzenberg shone out among all other apples. Flemish Beauty pears were finely shown. Splendid Northern Spy, Golden Russet, Ribston Pippin, Newtown Pippin, and Nonsuch apples came from the Salmon Arm, and Summerland districts, and Kamloops districts; and Blue Pearmain from the latter district was unusually fine in size and colour.

The Botanical Department of Trinidad made up an interesting exhibit of grape fruit, shaddocks, papaws, citrons, various kinds of bananas, and many varieties of oranges and lemons. The botanical section of the Imperial Department of Agriculture for the West Indies displayed a large and interesting collection of tropical fruits from Dominica, Leeward Islands, etc. Oranges in variety were a great feature, but the giant shaddocks, huge things about 14 inches through, were the great popular attraction. Cocoanuts, limes, bananas, lime juice, and various preserves completed the display.

The Government of New South Wales had a very attractive and neatly arranged exhibit of dried and candied fruits and nuts, the citron and lemon peel, currants, raisins, sultanas, apricots, and prunes attracting a very large share of attention. Miss Martin, Willowbrook, Auburn, New York, showed fruits preserved in brandy. Mr. Banks, Park Street, W.; Mrs. Plowman, Chapter Street, Westminster; the Horticultural College, Swanley; Messrs. Austin and Co., Kingston, all showed preserved fruits, jams, etc. New Zealand's contribution consisted largely of bottled fruits, tinned fruits, and honey; and Messrs. Clark Bros., Whangarei, and Messrs. Kirkpatrick and Co., of Nelson, were the leading exhibitors.

Messrs. B. Shearn and Son, Tottenham Court Road, famous for "Fruit Lunches," had a very interesting display of nuts that included walnuts, chestnuts, filberts, almonds, sepucaia nuts, peccans, pistachios, Brazils, hazels, shelled walnuts, pine kernels, cocoanuts, and cocoanut flour, pea nuts, etc., etc. Dominican limes were submitted by the Dominican Agency, 49, Lime Street, as well as lime and grape fruit marmalades The Army and Navy Auxiliary Co-operative Supply, Lim., Francis Street, Westminster, showed Claret and yellow bananas, big grape fruits, various Canadian apples, preserved fruits, etc.

Mesers. R. Jackson and Co., of 72, Piccadilly, displayed a large collection of food products from Cape Colony, Cape gooseberry jam figuring largely, together with green fig preserve, grape jam, and tinned grapes, apples, peaches, etc. The Messrs. Westmacott and Co., Leadenhall Street, submitted samples of Cape wines, liqueurs, etc. Lady Algernon Lennox, Broughton Castle, Banbury, showed fruit grown and bottled by the cottagers and allotment-holders in the Banbury district; the samples were very clear, and the stoppers of the bottles were metal protected.

The West Indian Produce Association, Lim., Fenchurch Street, had a varied assortment of Colonial produce, submitting Jamaican and Trinidad cigars, West Indian liqueurs, maple sugar, guava jelly, limes, oranges, grape fruits, preserves, sauces, sugar, tea, and nuts of various kinds. Messrs. Fowler, Lee, and Co., Queen's Road, Reading, showed fruit-bottling outfits, and preserved fruits in glass-stoppered bottles. Mr. W. Poupart, Twickenham, set up a selection of bottled fruits, the plums being notably fine and bright.

There was a fairly keen competition for the prizes offered for home-grown and bottled fruits and vegetables, and in these the leading awards fell to Lady Algernon Gordon-Lennox; Mr. W. Poupart, Miss C. Jones, Mrs. V. Banks, Mrs. W. H. Plowman, Mrs. E. Beckett, and Miss M. G. Thompson.

MEDALS.

Gold.—The Province of British Columbia for apples; Nova Scotia Government for collection of fruit; the Government of Ontario for collection of fruit, etc.

Silver-Gilt Hogg.—To Mr. F. A. Parker, Berwick, N.S., for apples.

Silver-Gilt Knightian.—Kamloops District, British Columbia, for apples; Kaslo District Horticultural Association, British Columbia, for apples; Mr. Thomas G. Earl, Lytton, British Columbia, for apples; Mr. W. H. Woodworth, Berwick, N.S., for apples; Mr. H. A. Blanchard, Upper Dyke, Nova Scotia, for apples; the Botanic Section, Imp. Dept. of Agriculture, Dominica, for collection of fruit; the Hon. H. A. A. Nicholls, C.M.G., St. Aroment, Dominica, for limes and lime products.

Silver-Gilt Banksian.—To the West Indian Produce Association, for collection of fruits, etc.

Silver Hogg. — To Mr. J. H. Cox, Cambridge, Nova Scotia, for apples.

Silver Knightian. — Summerland District, British Columbia, for apples; to Mrs. J. A. Smith, Spences Bridge, British Columbia, for apples; to Mr. H. Delmain, Wolfville, Nova Scotia, for apples; to Mr. E. E. Archibald, Wolfville, Nova Scotia, for apples; to Mr. R J. Messenger, Tupperville, Nova Scotia, for apples; to Mr. J. A. Kinsman, Lakeville, Nova Scotia, for apples; to Mr. F. H. Johnson, Bridgetown, Nova Scotia, for apples; to the Hon. J. Cox Fillan, Wall House, Dominica, for limes, etc.; to Mr. A. R. C. Lockhart, Castle Comfort, Dominica, for limes, etc.; to the Jamaica Agency, Holborn, for oranges and grape fruits; to Messrs. B. Shearn and Son, Tottenham Court Road, for nuts; West Indian Produce Association, Lim., 4, Fenchurch Buildings, E.C.; Norbrook Preserving Company, Jamaica; Messrs. R. Jackson and Co., 172, Piccadilly, W.

Silver Banksian.—Salmon Arm Farmers' Exchange, British Columbia, for apples; to Mr. A. L. Moore, Berwick, N.S., for apples; to Mr. E. T. Neilly, Middleton, Nova Scotia, for apples; to Mr. F. Foster, Kingston, Nova Scotia, for apples; to Agricultural School, Dominica, for oranges, etc.; to Elders and Fyffes, Jamaica, for oranges; to the New Zealand Government, for apples, preserved by cold storage; S. Kirkpatrick and Co., Nelson, N.Z., for Colonial Fruits made into jam, jelly, syrup, etc.; the Dominica Agency, 49, Lime Street, E.C.; Government of New South Wales; Mr. W. J. Ansell, I.S.O., Cyprus.

Bronze Banksian. — Victoria District, British Columbia, for apples; Salt Spring Island, British Columbia, for apples; Mr. James Johnstone, Nelson, British Columbia, for apples; Mr. James Gartrell, Summerland, British Columbia, for apples; Chilliwack District, British Columbia, for apples; Berwick Fruit Company, Berwick, N.S., for apples; Mrs. Wm. Sangster, Falmouth, Nova Scotia, for apples; Mr. Ralph Eaton, Kentville, Nova Scotia, for apples; Messrs. Clarke Bros, W. Langarei, N.Z.; the Hokianger Co-operative Preserving Company, Rawerne, N.Z.; the New Zealand Government (for honey); the Monserrat Preserving Company.

SCIENTIFIC COMMITTEE.

NOVEMBER 24.

Present: Mr. E. A. Bowles, M.A., F.L.S. (in the chair); Messrs. A. Worsley, G. S. Saunders, W. C. Worsdell, J. T. Bennett-Poe, G. Gordon, W. Hales, J. Fraser, W. Cuthbertson, W. Fawcett, C. T. Druery, and F. J. Chittenden (secretary).

GREASE BANDS.—Mr. Voss showed another grease band taken from the same tree as that shown a fortnight ago, which had been placed upon the tree in succession to that. A considerable number of female winter moths had been captured near the base of the band, and a larger number of males. All, with one exception, belonged to Cheimatobia brumata, the exception being a male Hibernia aurantiaria.

WEEVILS IN SEEDS.—Mr. Saunders reported that the seeds of Abrus pescatorius which Mr. Bowles had shown at the last meeting were attacked by a species of Bruchus allied to, though not identical with, B. pisi. The weevils were nearly as large as the seeds in which they occurred.

SILVER-LEAF IN PLUMS.—Mr. Worsley called attention to a portion of the trunk of a plum tree which had been attacked by "silver-leaf" disease caused by the fungus Stereum purpureum. The discoloration of the wood appeared to start from the graft. Mr. Worsley also showed a seedling form of Chrysanthemum indicum and Jatropha podagraria attacked by Botrytis cinerea.

MARKS UPON APPLE.—Mr. G. S. Saunders showed a drawing of an apple which had a curious looking brown mark stretching up one side of it about three-sixteenths of an inch in breadth. It was thought that this had probably been caused by the destruction of the epidermis as by a scratch at an early stage of the development of the fruit.

STAPELIA GRANDIFLORA.—Mr. Bennett-Poë showed a flower of this species measuring about 11in. in diameter.

ABERRATIONS IN LONICERA PERICLYMENUM.—Mr. J. Fraser contributed flowers of the common honeysuckle with the petals green. It was remarked that this condition in honeysuckle is very frequently associated with the presence of aphis upon the plant, especially near the inflorescence. Mr. Fraser also showed a specimen of the common honeysuckle with leaves shaped somewhat like those of the oak—this form he had found most frequently in plants growing in a shady wood. In Lonicera japonica the aberration is very common.

HOLLY RETAINING BERRIES.—Mr. Chittenden submitted a branch of a holly from Wisley which was still carrying the berries produced in 1907. Adjacent trees had been stripped by the birds, but this and two other trees in the garden had retained their berries until now. During the past few days some had fallen, but otherwise the tree was as thickly berried as during the autumn of 1907.

National Chrysanthemum Society.

The annual dinner of this society was held in the Throne Room at the Holborn Restaurant, on Thursday, November 26, under the chairmanship of Sir Albert Kaye Rollit, LL.D., D.C.L., the president of the society. The President was supported by C. E. Shea, Esq. (past president), who took the chair until the arrival of the president. Over one hundred members and visitors sat down to the excellent dinner provided; among those present we noticed Messrs. C. Harman Payne, J. H. Witty, Thos. Bevan, R. F. Felton, D. Ingamells, J. Harrison Dick, E. F. Hawes, W. Howe, G. Schnieder, G. Prickett, and many others well known in the chrysanthemum world.

The first toast, as is the usual custom, was that of "The King, the Queen, and other members of the Royal Family," which was proposed by the Chairman, and loyally responded to by those present. "The Donors of Special Prizes" was proposed by Mr. J. McKerchar, who pointed out to the company that it had previously been stated that it was "more blessed to give than to receive," and with a view of testing this proverb at the present day, he suggested that more special prizes should be given to the N.C.S. for the coming shows. Mr. C. E. Shea, in reply, stated that it always gave him great pleasure to do what he could for the National Chrysanthemum Society. He was very glad indeed that the society was in possession of such excellent officers, and also to see the wise policy that prevails, which, in his opinion, was an augury for the future success of the society.

The toast of the evening was next proposed by Sir Albert Rollit, namely, "The National Chrysanthemum Society." He stated, on rising, that he had received a telegram from the Mayor of Windsor who expressed his great regret at inability to attend the dinner, but hoped to have the pleasure of attending on some future occasion. The society, stated the Chairman, was formed to venerate a splendid flower, one that was in full beauty during the dull, cold days of autumn, and that was not only honoured in this country, but was also the national flower of our great ally, Japan. It formed the Japanese badge of chivalry, the greatest honour that could be bestowed in that country. He referred in warm tones to the splendid services rendered to the society by Mr. Shea and its present officers, and made an appeal to the ladies to assist in increasing the membership, as he desired floriculture for the mass and not only for the class. This toast was responded to by Mr. T. Bevan, who stated that he would support the idea of holding shows at the Crystal Palace as long as possible.

"The Exhibitors and Affiliated Societies" was proposed by Mr. E. F. Hawes in a few well chosen remarks, in which he alluded to the excellent support received at both the shows already held, and to the large number of new varieties staged before the Floral Committee. Mr. W. Wells, in responding, hoped that those who had been unsuccessful during the past would continue trying until they were able to become prize-winners. Several other toasts followed.

The presentation of the challenge trophy, Holmes' Memorial Cups, etc., took place during the evening. The decorations were excellently done by Messrs. R. F. Felton and Sons, to whom the thanks of the society was given, as well as to Mr. Richard A. Witty for the general arrangements connected with the dinner.

"The Chairman," proposed by Mr. J. T. Simpson, and rendered with musical honours, received a very hearty reception, and after a brief reply, the gathering was brought to a close.

WINTER SHOW.

The last chrysanthemum show of the season was held on December 2 and 3 at the Crystal Palace, Sydenham, and there was a very pretty exhibition arranged towards the clock end of the great building. Competition was fairly good, and there were numerous excellent non-competitive displays that did much to enhance the general effect.

GROUPS AND PLANTS.

First prize for a group of flowering, berried, and foliage plants was won by Mr. W. Howe, gardener to Lady Tate, Park Hill, Streatham, with a bright group of begonias, liliums, poinsettias, spiræas, cypripediums, and Callicarpa purpurea; Mr. J. Hedges, Kirkdale Nursery, Sydenham, came second.

Mr. W. Howe was also first for a large group, and here he had a bright lot of poinsettias, chrysanthemums in mounds, chiefly singles, cypripediums, cyclamens, and a good assortment of palms, ferns, etc.; Mr. Stevens, Laurie Park, Sydenham, second, with a rather formal display of chrysanthemums and arums.

Mr. W. Newton scored for six plants of Begonia Gloire de Lorraine, with good examples; Mr. Harrison second, and Mr. W. Whitehead, Sydenham Hill, third.

CUT BLOOMS.

Premier award for nine vases of Japanese blooms, three blooms in a vase, not fewer than six varieties, was won by Mr. G. Hunt, gardener to Pantia Ralli, Esq., Ashstead Park, Leatherhead, with good examples of J. Peed, Madame Oberthur, Mrs. A. G. Pirie, Algernon Davis, Mrs. C. Neill, T. Stevenson, and Madame R. Cadbury; Mr. H. C. Horton, gardener to T. P. Boyd, Esq., North Firth, Tonbridge, second.

Mr. G. Hunt scored for eighteen Japanese blooms in not fewer than twelve varieties, with medium sized, bright flowers of T. Stevenson, Algernon Davis, R. C. Pulling, J. Peed, Mrs. Neill, Madame R. Cadbury, etc.; Mr. H. Humphrey, gardener to Lord Ludlow, Langport, Northampton, second; and Mr. W. Mease, gardener to A. Tate, Esq., Downside, Leatherhead, third; six entries. Mr. Hunt led for twelve blooms, and he had J. Peed and Mrs. Neill very fine; Mr. Mease came second, and his best blooms were of Madame P. Radaelli, Mrs. Neill, Mrs. A. G. Pirie, F. S. Vallis, and Bessie Godfrey; Mr. J. Preece, gardener to Miss Willmott, V.M.H., Warley Place, Brentwood, third.

Mr. Hunt was again first in the class for a dozen incurved, leading with good flowers of W. Wainright, Mdlle. L. Faure, G. W. Matthews, Ialene, Marjory Shields, and Egyptian; Mr. J. Preece came second with well-finished flowers of moderate size; Mr. W. Mease third; four entries.

Mr. Newton, gardener to Mrs. Nathan, Little Heath Wood, Potters Bar, led for six vases of three blooms each, and showed Madame P. Radaelli and Algernon Davis well; Mr. M. Raymont, gardener to W. Beech, Esq., North Ockenden, Romford, second. Mr. W. Walters, Alexandra Road, Burton-on-Trent, scored for a dozen Japanese blooms in six varieties, with a very moderate set; Mr. G. Prudden Clarke, Hitchin, and Mr. T. W. Stevens, gardener to W. H. Stone, Esq., Donnington, Laurie Park, Sydenham, were second and third; five entries.

The class for a table of twelve vases of single varieties was a good one, and here there were four competitors. The chief award fell to Mr. G. Hurst for a beautiful set of Annie Farrant, Doreen, G. Rose, Edgar Forbes, Princess, Gerbera, Edith Pagram, Lady Windsor, G. W. Forbes, Cannell's White, Golden Star, and Mrs. Wm. Jordan; Mr. W. Newton second with a good, clean set; and Mr. F. Brazier, Caterham, third.

Mr. C. B. Gabriel, Eardale, Woking, led for six bunches of spidery chrysanthemums with Sam Casswell, Mrs. Filkins, Mrs. Carter, Cannell's Favourite, White Jitsujetsui; one exhibitor was disqualified. Mr. J. A. Humphries, gardener to J. L. Burgess, Esq., Maisey Hampton, Fairford, scored for six bunches of pompones, with Snowdrop and Primrose League; Mr. C. B. Gabriel second.

Mr. W. Rigby, gardener to Rev. A. Cooper Marsden, 60, Wickham Road, Beckenham, led in the amateur class for six Japanese, from six competitors. Mr. G. Prudden Clarke won the first prize for six vases of Japanese blooms, and Mr. Moorman, Hampton Court Palace, was second; but neither showed well.

FLORAL DECORATIONS.

There were nine competitors in the class for a table decoration of chrysanthemums, and here Mr. T. W. Stevens won first prize with a pretty and light arrangement of Mrs. Filkins, and a yellow and a red single variety, with asparagus plumes; Mrs. A. Robinson, Park Hill, Carshalton, was second with bronze flowers and croton leaves; Mr. A. W. Trossell, gardener to H. Attenborough, Esq., The Avenue, Beckenham, third, with bold yellow and orange flowers.

Miss C. B. Cole, Feltham, scored for a big vase of spidery and single varieties, with a beautiful arrangement; Mr. H. W. Hedges, Kirkdale Nursery, Sydenham, second; and Mr. R. B. Leech, gardener to C. J. Ean, Esq., Wood Hall, Dulwich, third, with a vase of large flowers, yellow and white varieties; seven entries. Miss C. B. Cole was also to the front for a vase of pompones, with a very pretty vase of Antonius, Snowdrop, Primrose League, and small Cullingfordi; Mr. J. W. Harrison, Sydenham, second; and Mr. W. Webb, gardener to J. Chapman, Esq., Melrose, Sydenham, third; four entries.

There were five entries in the basket class, and here Miss C. B. Cole again led, this time with a beautiful design in yellow and bronze flowers; Miss E. H. Ekins, Rushden, St. Albans, second; and Mr. F. Brazier, Caterham Valley, third.

NON-COMPETITIVE.

Mr. P. Ladds, Swanley Junction, put up a large circular group of chrysanthemums, pleasingly associated with ferns, palms, spiræas, ficuses, etc. It was a bold and bright exhibit, well put up. In addition, Mr. Ladds showed a table of cut blooms of late and useful market varieties, putting these up in goodly bunches. Messrs. J. Peed and Son, West Norwood, submitted a table of alpines. Messrs. W. Wells and Co., Merstham, were represented by a large table of cut flowers of late decorative varieties, and a feature of the display was the central group of the big white single named Dorothy Fortescue, surrounded by the new Merstham Jewel, with a bunch of Chrysanthemum indieum to show the type from whence our modern varieties have come.

Mr. Norman Davis, Framfield, Sussex, put up a very charming exhibit of single chrysanthemums, that showed in a striking manner the great variety of form and colour the late section possesses, and the great usefulness of such varieties. The blooms were arranged in tall stands, in baskets, and in vases of various sizes, all set over a groundwork of maidenhair fern; Perseus, Aurore Boreale, Juno, Pegasus, Arcturus, and Pollux were conspicuously good varieties. Messrs. H. Cannell and Sons, Swanley, contributed a collection of single, thread-petalled, and decorative chrysanthemums, and among these the big white semi-double Cannell's White was specially attractive. With these was shown a very bright collection of grandly grown zonal pelargoniums, the blooms of lovely colour, and fine size and substance.

Mr. H. J. Jones, Ryecroft Nursery, Lewisham, had one of the best December displays he has ever put up. It was a big effort, and consisted of large, bold stands of Mrs. Wakefield, True Gold, Mrs. J. Wynn, Snowdrift, Mdme. Oberthur, Lord Brooke, J. G. Day, Kitty Gulliver, Princess Victoria, Yellow Victoria, and Helena Williams, all fine late varieties, as well as Keston Gem, a new single. Palms, ferns, and crotons made a suitable groundwork and finish to the group.

From the Nova Scotia Government came a couple of large tables of bright, well-grown apples representing a large number of well-known varieties, such as Ribston Pippin, Cox's Orange Pippin, Blenheim Pippin, Wellington, Lane's Prince Albert, etc. The fruit exhibit put up by the British Columbian Government was a very attractive one, the apples being of wonderful colour and size, and particularly free from blemish.

New chrysanthemums gaining awards were Kathleen Pestifield (Pestifield), crimson, decorative anemone (F.C.C.); Perseus (Davis), yellow single (commendation); and Aurore Boreale (Davis), large orange and crimson single (F.C.C.).

MEDALS.

Gold.—Mr. Norman Davis, Framfield, Sussex; Mr. H. J. Jones, Ryecroft Nursery, Lewisham; Mr. P. Ladds, Swanley Junction.

Large Silver.—British Columbian Government; Messrs. H. Cannell and Sons, Swanley; Messrs. W. Wells and Co., Merstham.

Silver.—Mr. Riley, Herne Hill; Nova Scotian Government.

Bronze.—Mr. T. Williams, Ealing.

Aberdeen Chrysanthemum Show.

NOVEMBER 27 and 28.

The annual show under the auspices of this society was held in the Music Hall Buildings, Aberdeen, on the above dates. For twelve years now this society has held an exhibition of flowers, fruits, and vegetables, which has most deservedly held a high place among such displays in Aberdeen. The entries this year, though somewhat fewer than last year, numbered nearly 500. These came from all the counties in the North-east of Scotland, and even from as far south as Dumfries—from the Moray Firth to the Solway Firth. One pleasing feature in this year's exhibition was the greater attention given to naturally-grown chrysanthemums, where disbudding had not been allowed, and to the decorative smaller varieties. Experts tell us that the day of the big bloom is closing, but there was no sign of this prophecy being borne out for yet awhile. The quality of the exhibits was of a very high standard, and from the spectacular point of view, most attractive. Mr. M. H. Sinclair, the courteous secretary, was, as of yore, at his post, and, thanks to the practical and technical knowledge he brings to bear upon his duties, these were carried out without a hitch.

POT PLANTS.

Though the summer was, on the whole, good, the fogs and the rains during November considerably retarded the development of the blossoms; but, nevertheless, the show in this section was a very good one. The chief laurels here were carried off by Mr. John Tough, Great Western Road, Aberdeen, for four distinct chrysanthemums, three blooms to a plant. Mr. Tough's entry was a very meritorious one, and reflected great credit upon him. Mr. Alexander Duncan, gardener to Mr. Adam Maitland, Rubislaw Den House, Aberdeen, was one of the chief winners in this section, the chief characteristics of his entries being the size and freshness of the blooms. Mr. Duncan carried off no fewer than five first prizes here. Among other leading prize-winners were: Mr. Robert Begg, Garthdee House, Aberdeen; Mr. George Robertson, Langley House; Mr. A. Murray, Ashley House; Mr. John Petrie, Crathes Castle; Mr. C. McLennan, Viewfield House; Mr. Andrew Reid, Durris House; and Mr. P. Youngson, Aberdeen. Palms, ferns, and begonias were fairly well represented.

CUT FLOWERS.

This section was undoubtedly the feature of the show, the blossoms being large in size, of fine symmetry, and beautiful in colour. it was in this section where the chief honours of the show were to be won. For twelve vases Japanese chrysanthemums, in twelve varieties, three blooms of each variety, all named, chrysanthemum foliage only to be used, Mr. A. Morton, gardener to the Dowager-Countess of Seafield, Cullen House, had a splendid win, and worthily gained for himself the blue ribbon of the society. Mr. Morton's claims to the honour were unmistakable, there being no fewer than twenty points separating him from the second prize-winner. The entry was one of rare beauty, and a tribute to the skill and taste of the grower. It consisted of the following varieties: Ethel Fitzroy, Madame P. Radaelli, J. H. Silsbury, Mrs. Knox, Algernon Davies, Mrs. J. Mileham, Victoria and Albert, Madame J. Rivol, Reg. Vallis, F. S. Vallis, Lady Talbot, and Madame Cadbury. For the second place, Mr. W. Paterson, gardener to Captain H. F. Lumsden, of Balmedie, had a very good entry. There were a large number of classes in the cut flower section, the leading winners, apart from Mr. Morton and Mr. Paterson, including Mr. Oliphant, The Links, Montrose, who had a very fine entry for twelve best Japanese chrysanthemums, at least nine varieties. In this entry was found the best bloom in the show, a truly magnificent specimen of F. S. Vallis. Winners of premier places included Mr. John Tough, Aberdeen; Mr. George Jamieson, Loughborough; J. Jenkins, jun., Woodside; Mr. John Petrie, Crathes Castle; R. Begg, Garthdee House; Mr. William Milne, Corsindae House; Mr. Alexander Douglas, Kepplestone House; Mr. Andrew Reid, Durris House; Mr. James Joss, Montrose; Mr. James Strachan, Botanic Gardens, Aberdeen; and Mr. R. A. Grigor, Dalswinton, Dumfries.

In the section devoted to florists and nurserymen there was not much worthy of mention, the display this year being much under what has been usually seen at this show. What there were of baskets, bouquets, sprays, and such like were good; but, as already stated, the numbers were small. Mr. Strachan, of the Botanic Gardens, Aberdeen, was first for a basket, his entry being a very meritorious one. Mr. James Joss, Aberdeen, was first for bouquets, while Mr. John Petrie, Crathes Castle, won for lady's spray and buttonholes. Mr. R. A. Grigor, Dalswinton, Dumfries, had a most commendable entry for best decorative display of cut flowers on a centre table space, ten feet by five feet, floral design (bouquets, etc.), excluded, but foliage plants may be used in the arrangement, chrysanthemums to be the main feature. Mr. Grigor was awarded for his exhibit the silver cup presented by Mr. A. Kynoch, vice-chairman of the society.

FRUIT.

The display in this section was an exceedingly fine one, and reflected the greatest credit on all concerned. Apples, especially, made a splendid show. Mr. R. Singer, Forres, had some exceedingly fine apples forward; his collection of kitchen apples, four varieties, comprising Peasgood's Nonsuch, Bramley's Seedling, Alfriston, and Lane's Prince Albert, was deservedly admired. Pears were not a numerically strong section, and the best were shown by Mr. George Jamieson, Loughborough. Praise in this section must also be accorded Mr. A. McLeod, Cluny Castle, for his fine entry of grapes, and also to Mr. Andrew Reid, Durris House, for a similarly fine exhibit. Praise must also be accorded Mr. A. Paterson, Inverness; and Mr. C. Cumming, Pitgaveny House; for in their respective entries one could easily see those gardeners gave of their best.

VEGETABLES.

The show of vegetables was an education in itself; Mr. Edward Joss, Sunnyside House, Montrose (best collection, six varieties); Mr. W. Lawson, Oakbank School; J. and D. McKenzie, Lower Bucksburn; Mr. W. Milne, Corsindae House; Mr. W. Scorgie, Springhill; Mr. Andrew Reid, Durris House; Mr. George Jamieson, Loughborough; Mr. James Ferguson, Linton, Cluny; and Mr. W. Webster, Laithers House, Turriff, all carried off premier honours. Leeks, potatoes, and onions constituted the feature of this section; Messrs. William Smith and Son, seedsmen, Aberdeen, had on exhibition a new potato, "The Devanha Seedling," which in the autumn was awarded a certificate of merit by the Royal Horticultural Society. It is a round, white variety, fine and uniform in size and symmetry, and has very shallow eyes—properties that go far to enhance its value as an exhibition potato.

AMATEURS' DISPLAYS.

In the amateurs' displays of pot plants and cut flowers, there was some remarkably fine work shown. Mr. James Jenkins, jun., Woodside, Aberdeen, made a most commendable show, taking many first prizes. Mr. John Tough, Aberdeen, had also a good record, the other premier honoursmen including: Mr. John L. Milne, Mr. P. Youngson, Aberdeen; Mr. J. D. Smith, Aberdeen; Mr. James Jenkins, sen., Woodside; Mr. A. Cumming, Cairnfield Place, Aberdeen; Mr. John Thomson, Aberdeen; and Mr. J. C. Brown, Aberdeen.

MISCELLANEOUS.

Although not so numerous as we have seen them at this show, the entries for exhibition only were very good. Messrs. Ben Reid and Co., Pinewood Nurseries, Aberdeen, had a most interesting and seasonable exhibit.

The British-Columbian Government had forward a very fine collection of fruit, with the view of showing the resources of that country as one of the best centres for the cultivation of fruit in the world. Messrs. T. Rivers and Sons, Sawbridgeworth, Herts, had a magnificent collection of apples which, from their very fine quality, attracted considerable attention. Medals were awarded to these firms by the society.

Bristol Gardeners' Association.

"Some Principal Subjects of the Hardy Fruit Garden" was the topic at the usual fortnightly meeting held on Thursday, November 26, at St. John's Parish Rooms, when Dr. Shaw presided over a good attendance. The lecturer was Mr. Farmer, gardener to the Marquis of Bute, Cardiff Castle, and he gave a description of the various uses and qualities of apples, pears, plums, and cherries. He pointed out that by a careful selection of varieties the former may be had in season from July till the following July for both culinary and dessert purposes. Mr. Farmer also enumerated the respective merits of pears, plums, and cherries, and gave some useful hints as to soil, stocks, planting, and pruning. Planting operations may be carried out, the lecturer said, in October and November as the best time, but it could be done successfully so late as March. The roots ought not to be packed in anyhow, but carefully spread out in well prepared holes. To illustrate the value of pruning when planted, Mr. Farmer said he planted

280 trees last March, and pruned them the same day. All the trees so treated started away well, and made good growth; but eighteen trees left unpruned made very stunted growth. Dr. Shaw opened the discussion, and was followed by Messrs. Brook, Binfield, Lee, Holt, Curtis, Young, Garnish, Clark, Scott, Woodward, House, Attwell, and Shaddick. Mr. Farmer answered all inquiries in a satisfactory manner, and well earned the vote of thanks at the close. For two bunches of violets first prize was awarded to E. Watts, Esq. (gardener, H. Woodward).

Cardiff Gardeners' Association.

The fortnightly meeting of the above society was held at St. John's Schools on November 24, Mr. H. R. Farmer presiding over a large gathering of the members. A lecture on "Vegetables for Exhibition" was given by Mr. R. Milner, head gardener at Margam Abbey. In his opening remarks the lecturer alluded to the great strides which had been made in the cultivation of vegetables during the last decade, and which he attributed to the excellent work done by horticultural societies in general. With regard to the preparation of soils during autumn and spring, he said that deep culture was one of the secrets of producing good vegetables. Selecting and cleansing and staging for exhibition were explained, and particularly the packing for distant shows. Mr. Milner considered that more uniformity was required in judging, and that medium sized vegetables of good quality should be given the preference rather than those which are too coarse for the table.

The lecturer was heartily applauded at the close of his paper. Mr. F. G. Treseder, F.R.H.S., opened the debate. He first thanked Mr. Milner for coming forward and giving such practical and valuable information. He felt sure that all present would go away thoroughly pleased with the sound advice of one of the most able growers and adjudicators of vegetables. Many questions were asked, which added much enthusiasm to the meeting. A hearty vote of thanks was proposed by Mr. M. Toy, which was seconded by Mr. C. Cosson, and carried amidst acclamation. Mr. Milner very pleasantly acknowledged the vote, thanking everyone for their kind appreciation.

"Hobbies" Exhibition.—During the past week Messrs. Hobbies, Lim., held, in the Memorial Hall, Farringdon Street, London, an exhibition of examples of fretwork, wood-carving, repoussé work, modelling in plasticine, etc. There were also demonstrations of various arts and crafts, and of daylight and gaslight photography.

ROSE CULTURE IN SMOKY DISTRICTS.

The other evening a very interesting meeting was held at the Institute, Saltaire, under the presidency of Mr. F. Jowell, when Mr. Arthur H. Rigg, chairman of the Saltaire Rose Society, gave an address on the cultivation of roses in a smoky district.

In his opening remarks Mr. Rigg pointed out that rose culture in a district which was only four miles from the centre of one of the largest manufacturing towns in Yorkshire was necessarily attended with difficulties. The soot and sulphur from a forest of chimneys to a great extent checked the growth of the trees, but this did not deter him from growing thousands of beautiful blooms every year. In the North of England they could not expect to succeed like their friends in the south, who were free from the adverse conditions that obtain in manufacturing districts; their roses would grow both better and stronger, besides being in bloom much earlier. They could also grow more delicate varieties. He wished to offer a few simple hints to the amateur who had a small garden, and who would like to grow a few roses, or who had tried to grow them, and failed to get a result that would encourage him to go further into the delightful culture of the queen of flowers. The love and culture of the rose was like a microbe—when once it got hold it stuck. Certainly it had been so in his own case. He started with a Marechal Niel in a small conservatory nearly twenty years ago; he had been planting a few trees every year since, until he had now over 2,000 trees, and was still planting more.

Rose Growing as a Hobby.

The culture of the rose gave one infinite pleasure, besides diverting the mind from business cares and worries. It was a charming and elevating hobby for ladies as well as gentlemen. When they had grown these emblems of purity imagine the pleasure derived from sending some to a sick friend, or a few to the hospital or sick poor. Referring to the success of the Saltaire Rose Society, Mr. Rigg said the members took roses to the meetings, where they were criticised as to their merits or otherwise, and thus they learnt from each other the best methods to treat each variety. They also visited each other's gardens, and for their mutual benefit discussed such problems as mildew, blight, etc. By means of a charity floral fete the Saltaire Rose Society had raised over £100 each year in order to send poor children to the country or seaside, so that growing roses and other flowers did some good in the world, in addition to the pleasure derived from their cultivation. He remembered three of them going home together from one of the society meetings at the beginning of July—about a fortnight before one of their shows. It was a most delightful evening; everything so peaceful that they could hear nothing but the noise of the trains as they steamed up the valley. One of the trio suggested to his companions that they should call and see his roses. It being then half-past ten, they made some slight protest against the proposal, but eventually they did call. The lady of the house said she thought it was rather late, and too dark to see roses, but their friend soon had a large lantern ready, and into the garden they went. The effect of the light from the lantern on the roses he should not soon forget; it was charming, and he advised his hearers to try it themselves. On the night he was referring to they were not satisfied with inspecting one garden; leaving there they went to the other friend's garden, and finally to his own. He should not like to say what time they finished, but he might inform them that the sun was shining brilliantly, and the birds singing, and that one of the party did not go to bed at all, but started working among his roses! It was one of the most delightful nights he had ever spent, and he might say that they had since made it an annual event.

The Best Site for Roses.

Whatever size the garden was it was important to select the best site for roses. As far as possible roses should be kept away from trees and strong-growing shrubs, as they would not grow under them, but must be in the open, where they could enjoy sunlight, and have a free circulation of air about them. If there were room roses should have a bed to themselves, as the other trees and shrubs took out of the ground the nourishment which the roses ought to have. The rose tree was a gross feeder, and liked plenty of attention. In his opinion that was the chief reason why the amateur with a small garden did not succeed in growing them successfully. Roses liked plenty of manure, and a little variety of it; farmyard manure was the best, as it was mixed already. Most amateurs did not give their roses enough manure. He had seen numbers of trees which had been planted without the beds being properly prepared; some people appeared to think that all that was necessary was to make a hole in the ground and put the tree in. But no rose tree would grow under these conditions. Another very important point was pruning, and in this connection the members of the audience were warned against employing men who had not been trained for the work to look after their gardens. There were many so-called jobbing gardeners who had spent the biggest part of their lives in the mill or workshop, and who had taken up gardening as a sort of last resource. If the grower did not himself understand the rose tree he should get someone who did, and thus avoid failures.

Size of Bloom.

The rose grower should not confine his attention to the production of the largest blooms possible, and it was suggested that they should not, in pruning, cut all the shoots back to two or three eyes unless they were going to try to beat their neighbours at the forthcoming show, but grow some of them in a semi-wild state. He trained many of his roses up stakes placed in different parts of the garden, in order to take the stiffness away from the beds. The garden should be made as artistic as possible both in form and colour. Colour is a thing which is seldom studied, and more attention should be given to it. A blue put near a yellow, or a purple next to an orange, would always look well. Hundreds of gardeners, both amateur and professional, planted their bedding-out and herbaceous plants without giving a thought as to either harmony or contrasts of colour. As rosarians they were short of a blue rose to make them complete from a colour point of view, although they could get some beautiful combinations with dark reds, yellows, pinks, and whites. When they wanted to introduce blue they could not do better than plant delphiniums, although there were, of course, various other flowers of the same order which would serve the purpose more or less effectively. For border purposes lobelias were most valuable in any garden.

Roses Suitable for a Smoky District.

Mr. Rigg's experience was that the following varieties of roses did very well in the Shipley district: Madame Abel Chatenay, Madame Ravary, Alister Stella Gray, The Garland, Jersey Beauty, Lady Gay, Blush Rambler, Hiawatha, Conrad F. Meyer, William Allen Richardson, Gustav Regis, and Liberty. Near manufacturing towns standards and half-standards did not grow so well as dwarfs; they could not stand the heavy rains and hard winters which are experienced in the North. Some of the stronger sorts would grow if well looked after, and the heads where they had been grafted, protected with straw or bracken. He believed that all rose trees gradually failed every year after the second year of planting. He obtained the best roses from the newest trees, and he thought the best plan was to plant a few fresh trees every year. Many of the new roses would not do well in the neighbourhood of large towns, and it was only by experience or taking advice that they could hope to make a selection which would give the best results according to the locality where the trees were to be planted. In the Shipley district it was a waste of time and money to plant such roses as Bessie Brown, Earl of Dufferin, Alice Graham, Mildred Grant, Duchess of Portland, and Kaiserin Augusta Victoria. It was impossible to tell what a rose was like if they only had one plant of a variety, because they might have a tree that was diseased and would not grow: it was, therefore, advisable to buy three or more of one kind, and plant them close together. Amateurs were advised to start with the following varieties: Caroline Testout, Frau Karl Druschki, Captain Hayward, Mrs. John Laing, Hugh Dickson, Mrs. R. G. Sharman Crawford, Ulrich Brunner, Victor Hugo, Dean Hole, Florence Pemberton, Joseph Hill, Killarney, Lady Ashtown, La France, Madame Abel Chatenay, Madame Ravary, Mrs. W. J. Grant, or Belle Siebrecht, Viscountess Folkestone, Madame Jules Graveraux, Mrs. Myles Kennedy, Clio, Duke of Wellington, Duke of Edinburgh, Jeannie Dickson, Margaret Dickson, Tom Wood, Countess of Derby, Pharisaer, Richmond, Mrs. Theo. Roosevelt, Prince de Bulgarie, La Tosca, and Earl of Warwick.

When to Plant Roses.

The best time to order roses was October, then they would probably be to hand in November, before the bad weather set in. By ordering in good time the grower should obtain the best and strongest plants, as the nurseryman generally supplied his orders in rotation. If any shoots or roots were broken when the plants were unpacked, these should be cut off; the plants must then be put into a trench, and at once covered with soil, water being also thrown over them. Unless the roots were kept covered they would become dry and would suffer in consequence. If the ground were frozen when the plants were received from the nurseryman they should not be unpacked, but put into a cellar or outbuilding until the thaw set in. Should the plants have become dry in the meantime it would refresh them if, before planting, they were covered with soil for two or three days. The beds having been prepared, a hole should be made about 14in. square, and after 3in. of fine soil had been placed over the roots, it was advisable to tread this firmly round the plant. The same rule applied to planting climbing roses, but in this case the hole should be a little deeper, because the roots were larger, and wanted more room to grow in. The soil in which rose trees thrived best was a rich loam that felt greasy when pressed between the hands. Where this was not to be had, and the soil was very light, a little clay should be added, in addition to cow manure. If the ground was heavy clay, leaf mould and sand, with a little burnt earth or road scrapings, and horse straw manure should be mixed with it. All beds should be well drained, as the roots must not stand in water. This was very important. The site selected for a rose bed should be sheltered from high winds, not too near or under other trees, but open to the south, south-east, or south-west. If the beds were made 3ft. to 4ft. wide the gardener could get to the plants without standing on the soil. The soil should be dug 24in. deep and plenty of manure should be mixed with it; if possible, it was also advisable to place some sods upside down, at a depth of about 16in. or 18in. This should be done two or three weeks before planting, so as to allow the soil to settle. Planting could be done any time between November and the end of March. The union of the stock should go two inches below the surface of the soil, and care should be taken to spread out the roots, and not to have them crossing each other, or be all on one side of the plant. The manure should not be put on to the bare roots, and it should not be too new, but partly decayed. A handful of bone-meal thrown over the roots would do good. The care and time spent in planting each tree would be amply repaid later on. With regard to pruning it was necessary that each tree should be studied, and the knife used accordingly. One tree might be left only four inches high, another nine inches, and in other cases eighteen inches, and so on. In the North of England pruning should be done in the last week in March or the first week in April. It was always advisable to cut away all dead, weak, and unripe wood, leaving only the strong and well-matured shoots.

A hearty vote of thanks was accorded Mr. Rigg at the close of his address.

OBITUARY.

MR. C. GREENWOOD.

It is with regret we learn of the death of Mr. C. Greenwood, on November 20. Mr. Greenwood was on the staff of "The Gardener," and was well known among sweet pea enthusiasts, as he had been a member of the Executive Committee of the National Sweet Pea Society from the foundation of this body.

Chrysanthemum Baronne de Vinols.—This charming and effective little decorative Japanese chrysanthemum, known in this country as Caprice du Printemps, and largely used at all the French shows for an edging, has given rise to quite a family of sports. We recently saw in Paris a group containing them all (except the yellow one recently obtained in England). They were Miss Kathleen Thompson, M. Le Docteur Georges Barré, Madame André Boeuf, Madame Emiliennè, Surprise, M. Charles Boeuf, Madame Courbron, Ami José Barre, and Madame George Barré. With the exception of Surprise and Ami José Barré, which are white, the others are either rosy-amaranth or golden-chestnut of varying shades, but none, in our opinion, are equal to the original.—C. H. P.

On Dec. 12 will be published
THE GRAND
CHRISTMAS NUMBER
OF
Amateur Gardening
FOR TOWN AND COUNTRY

THE CONTENTS INCLUDE INTERESTING ARTICLES ON:—

WEATHER FLOWERS.—The effect of sunshine and rain on flowers. (Illustrated.)
A MOTHER OF MILLIONS.—Aphis or green fly.
THE WEATHER PLANT.—Abrus precatorius nobilis.
DO PLANTS FEEL.—A proof of sensory power. (Illustrated.)
ANCIENT SUNDIALS.—The precursors of clocks.
THE GLASTONBURY THORN.—Illustrated.
INTERESTING FUNGI.—Mushrooms and toadstools. (Illustrated.)
CHRISTMAS DECORATIONS for the Home.
A GARDEN OF MEMORIES.
IN A SHADY BOWER.—A pretty feature in gardens.
ENGLAND'S GARDEN.—Spring-time in Dorset.
IN TIME OF CHERRIES.—Popularity of blossom and fruit.
QUAINT FLOWER NAMES.
NOVEL PLANT CULTURE.—Gardening without soil. (Illustrated.)
SEEDS THAT FLY.—Their quaint methods of flight. (Illustrated.)
BREAKFAST PLANTS.—Tea—Coffee—Cocoa.
ECCENTRIC VEGETATION.—Leaf, fruit, flower oddities. (Illustrated.)

A CHARMING SUPPLEMENT OF FINE ART PHOTOGRAPHS OF LOVELY FLOWERS & GARDENS;
AND A
DOUBLE-PAGE COLOUR PRINT,
"IN AN OLD TIME GARDEN."

OFFICES: 148 and 149, ALDERSGATE STREET, London, E.C.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

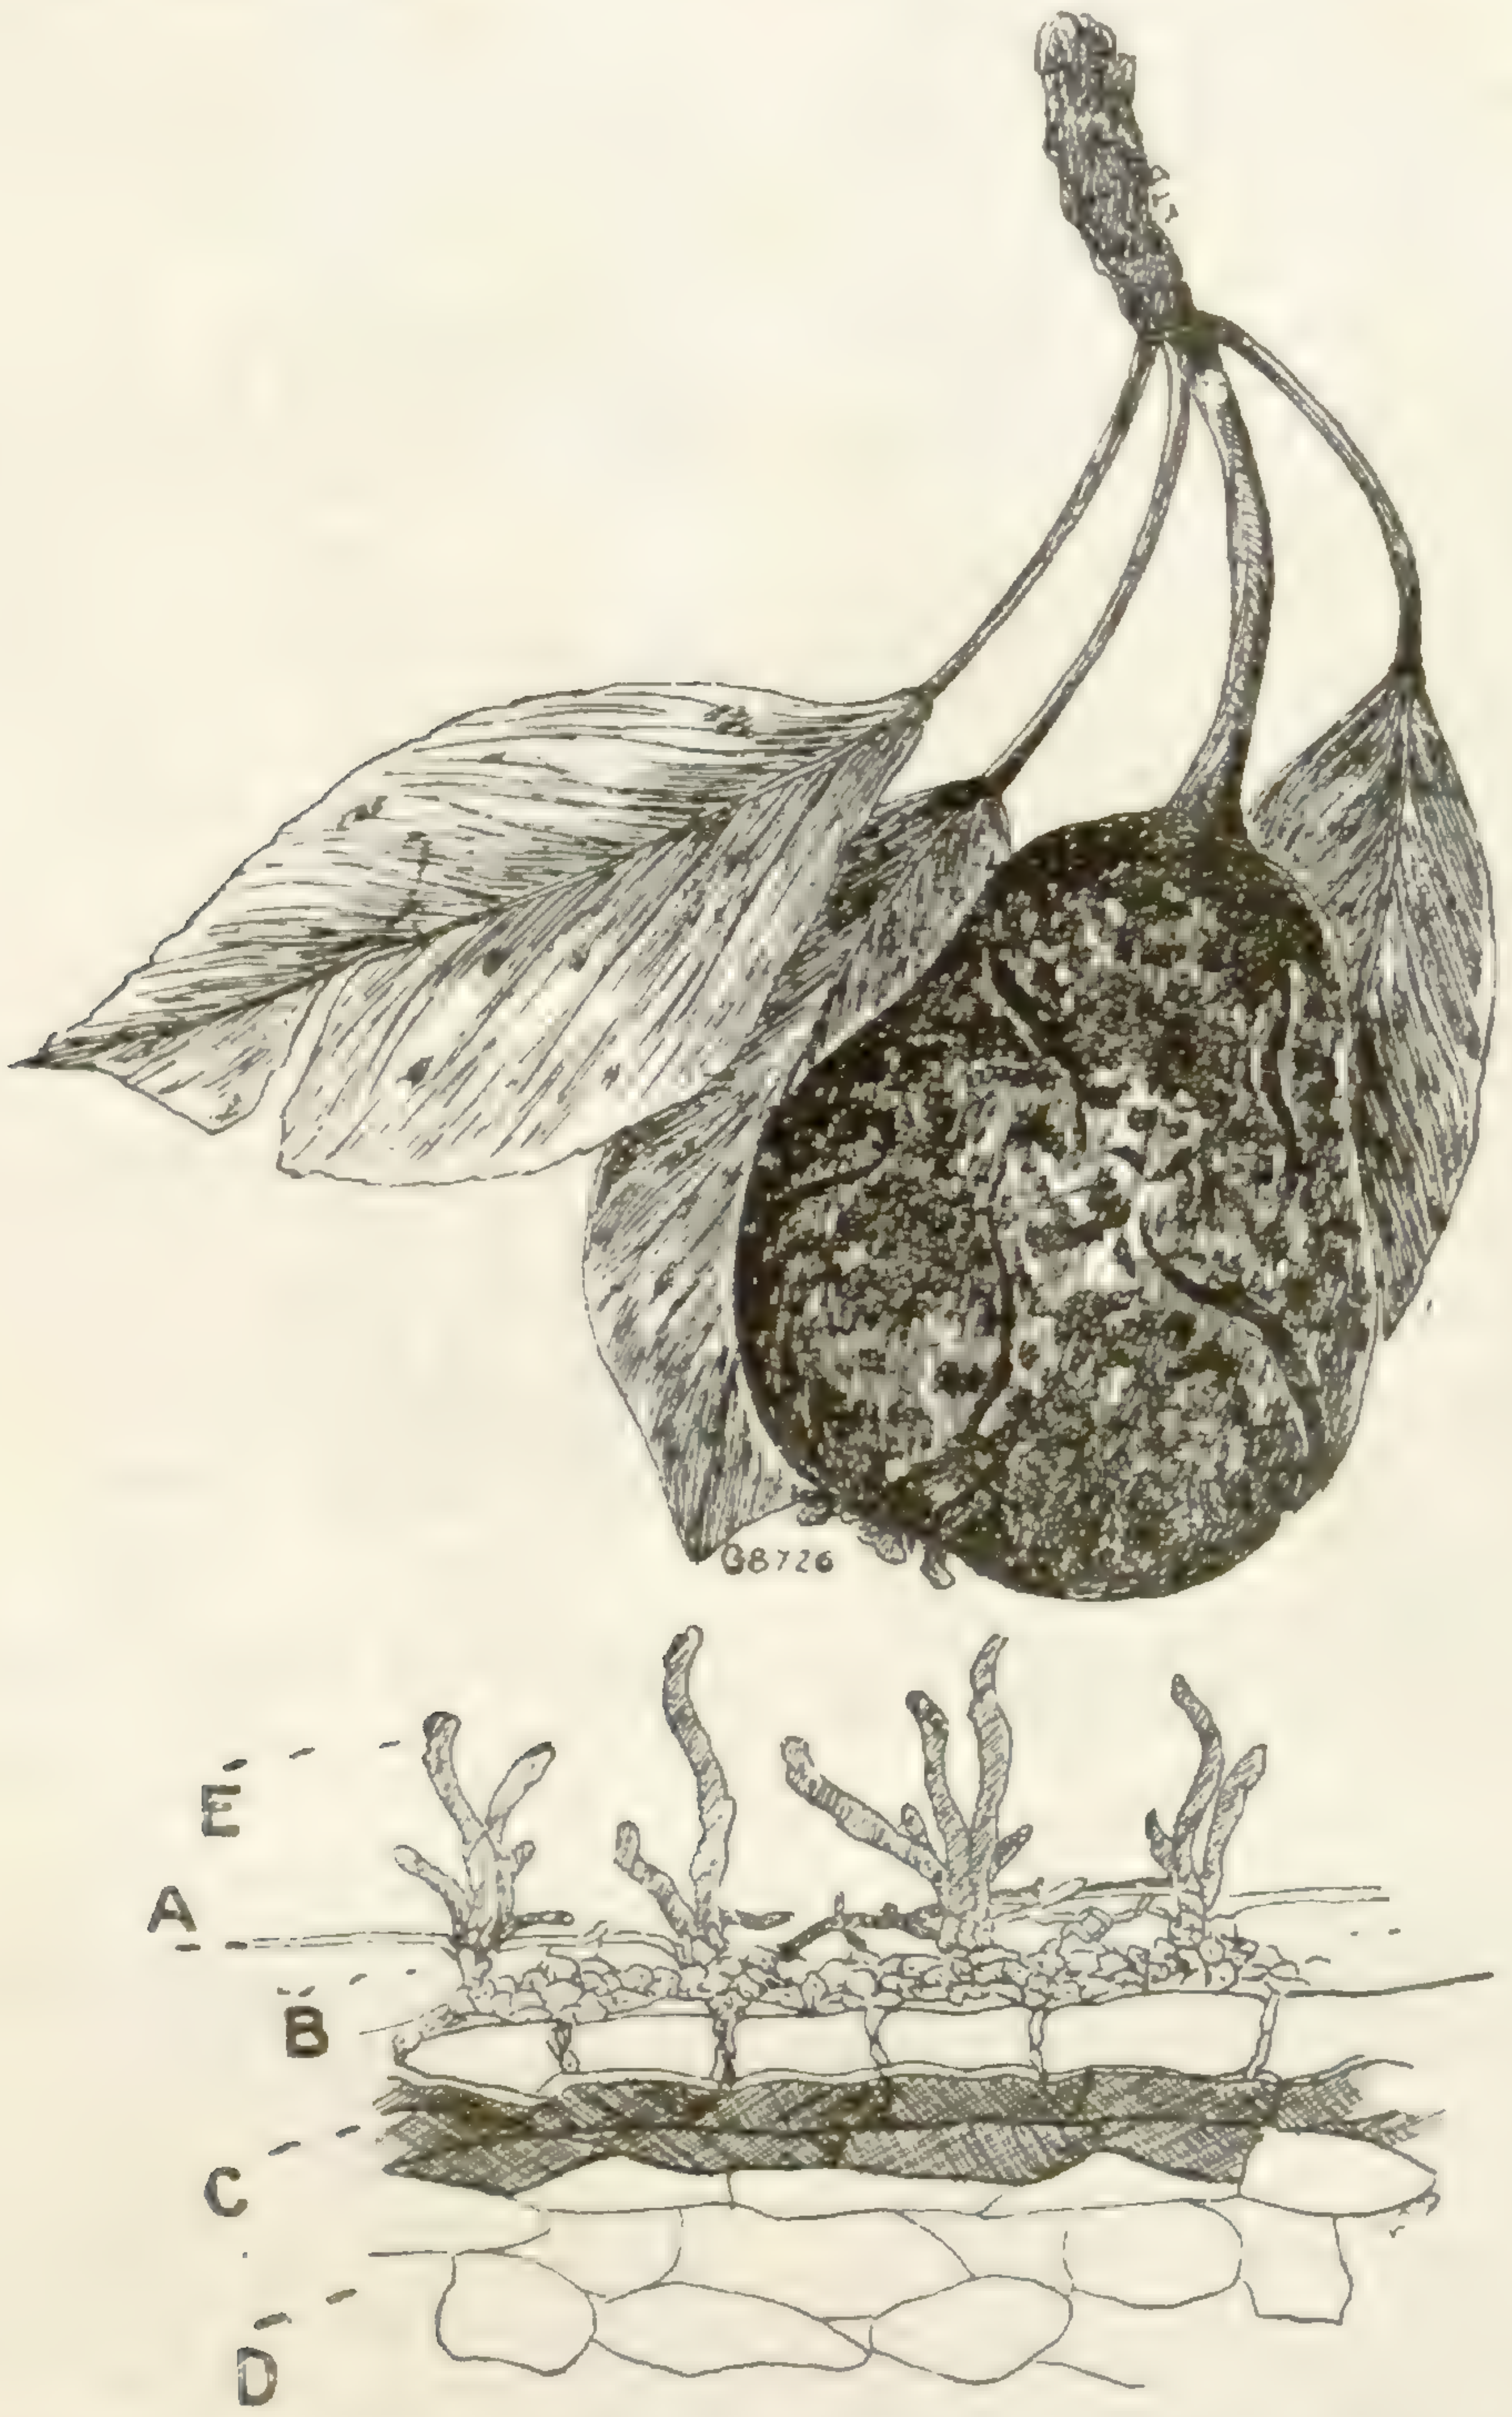
FRENCH HORTICULTURAL PAPER.—P. S., Norwood: An excellent gardening paper is "La Jardin," published at Rue de Grenelle, Paris. A good Belgian paper, in the French language, is "La Tribune Horticole," published at 43, Rue Vonck, Brussels. The address you desire is Old Market Place, Grimsby. In the matter of illustrations your best plan will be to apply to the leading photographers, or get a camera and take the views yourself. Your best method of procedure, in regard to your last question, is to advertise in these pages early in the New Year, stating experience and requirements.

MUSHROOMS. — E. R., Worcester: The mushrooms sent show a slight malformation. It would appear as though the general body of the mushroom had developed much faster than the reproductive parts or gills and almost overgrown them. At various points near the margin the gills have become free. It is extremely difficult, indeed, almost impossible, to account for these malformations, and a quick-growing, soft-tissued plant like the mushroom is specially susceptible to influence by changes of temperature, obstruction, etc. We do not think these mushrooms would prove different to the others when cooked, but as they spoil the genuine sample, it may be desirable to cut out the portion of the bed where they appear.

APPLES KEEPING BADLY.—E. R., Worcester: On almost every side one hears complaints respecting the manner in which apples are keeping this season. The weather has, we believe, had the most to do with the rapid ripening and decay of apples and pears. We had a beautiful autumn, following on a period of dry weather that was itself succeeded by abundance of rain. The rain, coupled with mild bright days, caused an increased flow of sap, a flow of unusual strength for so late a date; this caused fruits to swell up wonderfully, but the new soft tissue thus produced was not firm enough to keep well into or through the winter. The little spots are most likely but indications of a fungus that quite naturally puts in an appearance when vegetable matter begins to decay.

FUNGUS GROWTH ON SMALL BRANCH.—R. H. W., Holmwood: The specimen was rather badly damaged during transit, but we feel quite certain it represented the Stereum Wood-rot (Stereum hirsutum), a fungus that is very destructive to both live and dead wood. This fungus is most common on dead wood, but it was proved, many years ago, that all too frequently it attacks live wood, entering by means of wounds made in the tree, and developing its mycelium to the destruction of the branch, and probably of the entire tree. So freely does the mycelium develop that once the fungus has obtained a real hold, it is practically impossible to save the host plant. The only remedy is to cut back from the infected portion until sound, clean wood is found, and then, making a clean cut, wash the wound with paraffin, and afterwards paint it over with tar. The mycelium is perennial, hence if ever so small a piece remains in the tree it will develop, and presently produce the mushroom-like processes that represent its fruiting stage. As this fungus is almost certain to appear on dead wood, the latter should be cleared away. Further, wounds on trees, whether accidental or intentional, should be tarred over, and in the case of accidental wounds the damaged portion should be cut back to clean, sound wood before being dressed. "A Text Book of Plant Diseases," by Mr. G. Massee (Duckworth and Co.); and "Fungoid Pests of Cultivated Plants," by Dr. M. C. Cooke (Royal Horticultural Society), are both useful works. The last-mentioned has numerous illustrations in colours, while the former contains small engravings.

CRACKED AND SHRIVELLED PEARS.—H. W. G., Thorp Asch: The specimen fruits sent give ample evidence of a very bad attack of Pear Scab (Fusicladium pirinum), a disease that does an enormous amount of damage in some parts of the country, and, unfortunately, appears to be spreading. The accompanying illustration serves to show the working of the fungus, though the fruit displayed does not show such deep cracks as in the case of the specimens sent. If the fungus is to be eradicated one must be prepared to take a great deal of trouble, and unless this trouble is taken the trees had better be cut down at once and burned, so that others may not become infected. It is quite certain that unless strong measures are taken the fruit crops produced will be useless, and therefore the trees will be uselessly occupying valuable space. Fallen leaves should be removed and burned. We strongly believe in winter spraying with the caustic soda and potash wash, not because it will itself arrest the fungus, but because it will effectually cleanse the tree and thus enable the grower to detect diseased branches; these latter should be cut out and burned. During the winter, after pruning, and while the trees are quite dormant, they should be dressed with an iron-sulphate solution, made by pouring one pint of sulphuric acid on to 25lb. of iron sulphate, in a wooden vessel, and then, by degrees, adding 50 gallons of water; these proportions must be maintained whatever the quantities used. Stems and branches must be thoroughly wetted with this solution, but the application must be made before the buds commence to swell. The next proceeding is to watch the swelling flower buds, and just as these begin to open spray the trees with a dilute form of Bordeaux mixture; give another spraying directly the petals have fallen, and yet another when the fruits are about the size of small marbles.



PEAR SCAB—INFECTED FRUIT AND SECTION THROUGH SCAB SPOT.

A, Cuticle; B, Epidermis; C, Corky area formed by cells below diseased area; D, Pulp cells; E, Erect threads of fungus.

RENOVATING OLD ORCHARD.—A., Yorks: It appears to us that you are retaining a great deal too much new growth, and pruning this back too severely. If we judge aright, your method will only increase the evil of crowded branches, because hard pruning in such case will induce a quantity of growths to start, whereas you need comparatively few growths for the purpose of providing thinly-disposed branches. In the case of the big plums and damsons some amount of thinning may be practised, but any attempt to lop the trees for the purpose of reducing their height and inducing new branches to form lower down, will almost certainly be followed by gumming and canker. Your letter raises matters of the greatest importance to yourself, and we could not properly advise you unless we saw the orchard and the condition of the trees. As this is practically impossible, we suggest that you communicate with the County Council authorities, and ask them to send a horticultural instructor to advise you on the spot. It not seldom happens that the authorities are glad of such an opportunity as your orchard appears to afford, of holding a public demonstration to which fruit growers in the district would be invited.

NAMES OF PLANTS.

F. E. G., Aylesbury.—1, Osmanthus illicifolius; 2, Pyrus Aria.

S. G., Rochdale.—1, Odontoglossum crispum, a good form; 2, Saintpaulia ionantha; 3, Linum trigynum.

B. P., Carlisle. — 1, Euonymus radicans variegata; 2, Adiantum cuneatum grandiceps; 3, Luculia gratissima.

G. C. F., Richmond.—1, Pteris tremula; 2, Nothochlæna sinuata; 3, Selaginella apoda; 4, Adiantum Mariesi; 5, Gymnogramma Mathewsi; 6, Woodwardia radicans.

TRADE NOTE.

A new company has been formed under the name of Max, Limited, to take over the sale of the hose couplings, water distributors, etc., the inventions of Mr. W. Claude Johnson. Mr. Louis Burn has been appointed managing director, and in consequence is discontinuing his business as consulting engineer. The offices and works of the company are at Westcombe Hill, S.E.

FORTHCOMING ENGAGEMENTS.

TUESDAY, December 8.—Royal Horticultural Society, Meeting of Floral, Fruit, and Orchid Committees, noon; General Meeting and Lecture, 3 p.m.; Scientific Committee, 4 p.m.

WEDNESDAY, December 9.—Perpetual-flowering Carnation Society, Exhibition at the Royal Horticultural Hall.

Royal Society of Arts Meeting, 8 p.m.

Books as Christmas Presents.—In the Christmas Catalogue issued by Messrs. W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London, will be found a wide choice of suitable books for presentation to friends whose interests lie in the garden and greenhouse, or among poultry, live stock, or other rural pursuits. A full description of the contents of each book is given in the catalogue, a copy of which will be sent by post to any reader on application.

CATALOGUES RECEIVED.

HENRY DREW, LONGWORTH, FARINGDON, BERKS.—A catalogue of roses, with the best of the newer varieties set out in large type.

DICKSONS, CHESTER.—A particularly useful and interesting catalogue of forest and ornamental trees, covert plants, and climbers.

JAS. COCKER AND SONS, ABERDEEN.—A substantial catalogue of Scottish-grown roses, herbaceous plants, fruit, and forest trees, etc.

WM. WISEMAN, FORRES, SCOTLAND.—A closely printed list of roses, forest trees, and hardy plants.

DOBIE AND MASON, OAK STREET, MANCHESTER.—A catalogue of bulbs and horticultural sundries.

JOHN JEFFERIES AND SON, CIRENCESTER.—This illustrated catalogue contains good lists of roses, fruits, carnations, and trees and shrubs.

JAS. MASON, CRAWSHAY ROAD, BRIXTON.—A concise list of bulbs and seeds.

P. BERNAIX AND SON, VILLEURBANNE, NEAR LYONS.—This is an extensive list of roses, well arranged, illustrated, and in English.

A. BERNAIX, VILLEURBANNE, NEAR LYONS.—A very full catalogue of roses, with illustrations.

THIS IS GOOD ADVICE.

V1 FLUID

THE WINTER SPRAY FLUID.

V1 FLUID CLEARS THE TREES OF MOSSES, FUNGI, AND LICHENS.

Easy to Mix. Easy to Apply. A Powerful Cleanser & Invigorator.

Hampton Loade, Nr. Bridgnorth. Sept. 1st, 1908.

Dear Sirs,—I may say your V1 Fluid has exceeded my expectations, foliage very dense and apples a lot larger, in fact I have some trees which only bore small ones but this season good bold fruit, which speaks for itself; trees very healthy. I may say I left some unsprayed, and it does not need pointing out which they are.

Yours faithfully, GEOFFREY BOOTH.

1 Gallon of this Fluid makes 100 Gallons of Spray Mixture.

For full advertisement see page iii.

TO-DAY! AND FOR YEARS AND YEARS PAST the XL ALL Specialities are and have been the best on the market. Where is the Gardener who does not pin his faith to one or the other of these celebrated Insecticides or Fertilisers? XL ALL FERTILISER has pleased all who have used it this season. The Sales of XL ALL FUMIGATOR prove that it is more popular than ever. XL ALL LIQUID NICOTINE INSECTICIDE is always spoken of by gardeners and growers as the most deadly to Mealy Bug, Thrip, etc. XL ALL WINTER WASH for dormant Trees acts like magic, clearing the Trees and Bushes of all Insects' Eggs, Moss, and Fungoid Growths. XL ALL LAWN SAND, a weed eradicator and fertiliser for weedy and poor lawns. XL ALL WEED KILLER used once a year "No weeds can live." Please ask your Nurseryman, Seedsman, or Florist for a copy of my small pink list, giving particulars of these and many other XL ALL Preparations, which can be obtained from the Horticultural Trade throughout the World. G. H. RICHARDS, Manufacturer and Patentee, 234, Borough High Street, London, S.E.

Situations Wanted.

GARDENER.—A. STARMER, The Grange, Walton-on-Thames, would be glad to get engaged as HEAD; acting now as Foreman; age 34; could enter on duties at once; character vouched for by present employer; past references available.

GARDENER (Head Working). — Major WITHINGTON can highly recommend his GARDENER, who has been with him five years, to a lady or gentleman requiring a thorough practical man; 23 years' experience in all branches; age 37, married. EDWIN LEE, Thelveton Grange, Scole, Norfolk.

GARDENER (Head Working, of four or five). —Mr. SMITH, Colston Bassett Gardens, Notts, can with confidence recommend his FOREMAN (H. ASBURY) as a steady, reliable man; well up in all branches; life experience; age 30; married when suited. Address as above.

GARDENER (Head Working, or good Single-handed, with help); good practical experience in all branches; interested in bees; good references; age 37, married, two children. Abstainer. ELLIS, Beenham Grange, Reading.

GARDENER (Head Working), married, age 41; abstainer; over 25 years' experience; 15 years as Head in good gardens. Disengaged when suited. CHEAL, Rose Cottage, Cliffe, Lewes.

GARDENER (Head Working), where more are kept; 25 years' practical experience all branches, Inside and Out, early and late Forcing, Vines, Cucumbers, Melons, Stove, and Greenhouse Plants, Herbaceous Borders; thoroughly reliable; highly recommended; married, without encumbrance. WOODHOUSE, Eastwood Road, Bramley, Surrey.

GARDENER (Head Working), age 47; good practical experience in all branches, Inside and Out; many years as Head; can have good references. H. TURNER, Fineshade, Stamford.

GARDENER (Head Working, where two or more are kept); 16 years' good practical experience in all branches; thorough knowledge of grapes, melons, cucumbers, stove and greenhouse plants, flower and kitchen garden; age 30; married when suited; good ref.; 2½ years in last place. B. BROOKS, Minerva Cottage, Elm Grove, Worthing.

GARDENER (Head), where two or more are kept; thorough knowledge of gardening generally, both Inside and Out; life experience; good references; abstainer; age 31, married, no family. L. A. KETTEL, 33, Adelaide Road, Chislehurst, Kent.

GARDENER (Single-handed or with help); age 29; life experience in all branches; married, no family, abstainer; good references. BAKER, 40, Manor Place, Staines, Middlesex.

GARDENER (Single-handed or with help); 12 years' experience; Inside and Out; good character; age 28; married, two children. H. ALLISTON, 27, Keemor Street, Woolwich.

GARDENER (Single-handed); age 30; life experience in all branches; married, no family; good references; 4 years in present situation. J. McDOUGALL, Grange Cottage, Shorncliffe Road, Folkestone.

GOOD GARDENER, or Single-handed or Second; life experience; good references; age 38; married. T. B. HOWE, Whiteball Cottage, near Wellington, Somerset.

FOREMAN (Working) in Market Nursery.—H. G. APTED recommends C. BOXALL as above; 19 years' experience in Grapes, Cucumbers, Tomatoes, etc.; 6½ years present situation; age 36, married. BOXALL, 4, Oxford Terrace, Broadwater, Worthing.

MR. HEATH highly recommends his late Inside FOREMAN; experienced in Fruits and Plants, House Decorations, Forcing, etc. Apply P. ANDREWS, 103, Old Road, Holcomb, Ramsbottom. Lancs.

GARDENER (Inside and Out); experienced; steady; industrious; good references from present employer; leaving for no fault. RICHARDSON, 65, Maynard Road, Walthamstow, N.E.

GARDENER (Second, where three or four are kept); Inside and Outside; life experience; 6½ years' character from last place; single; age 32. G. EUSTON, Shrubbs Hill, Sunningdale, Ascot, Berks.

GARDENER (Second or Single-handed); Vines, Melons, Flowers; married, one child; 7 years' experience; good references; age 24. A. BEACHER, Albert Road, Rustington, near Worthing, Sussex.

YOUNG MAN requires SITUATION as Second Gardener in a small place, or Leading Hand in kitchen garden and pleasure ground; age 27; well recommended. C. CRADDUCK, Brandfold Gardens, Goudhurst, Kent.

GARDENER (Under), age 19, seeks SITUATION; five years' experience Inside and Out; three years' good character. A. WORSFOLD, Benenden, Cranbrook, Kent.

GARDENER (Under) seeks SITUATION in Kitchen Garden or Pleasure Grounds; well used to Scythe, Horse Machine; good references; bothy preferred; age 28. W. FULLER, Caxton, Cambs.

GARDENER (Under), Second of two or three; 26, single; good references; disengaged; recommended by Lady F. Blunt. H. JENNINGS, Watson Road, Westcott, Dorking.

TO HEAD GARDENERS.—£5 Bonus.—SITUATION wanted as UNDER GARDENER; good reference; no experience; bonus given; disengaged Jan. 31. J. D., 14, Park Hall Place, Finchley, N.

FLORIST.—Young Lady seeks SITUATION as IMPROVER; highest reference; age 17. J. McGLASHAN, Widmore Court, Bromley, Kent.

LADY desires RE-ENGAGEMENT as MANAGERESS; West End experience; Bouquets and Designs a speciality; highest references. FLORIST, 16, Gladys Road, West Hampstead.

ROCK and WATER GARDEN EXPERT, Designer of Japanese Gardens, offers services for such work; 18 years' experience. Address, MIMOSA, 99, St. Thomas' Road, Finsbury Park, N.

YOUNG MAN, Single, or Second Gardener in Kitchen Garden; 4½ years present situation, 7 years previous; aged 25. R. SMITH, Lower Winchendon, Aylesbury, Bucks.

YOUNG MAN seeks SITUATION in small Nursery (Inside), in or near London; willing to accept low wages. CHAS. COLES, 199, Camberwell New Road, London, S.E.

Useful Books for

CHRISTMAS PRESENTS.

Published at "AMATEUR GARDENING" Office, 148 and 149, Aldersgate Street, London, E.C.

"Clear and concise—may be heartily commended."—THE SCOTSMAN.

. . THE . . FLOWER GARDEN.

By T. W. SANDERS, F.L.S.
Bound in cloth, bevelled edges, 480 pages.

7/6 net;

By post, packed in box, 8/-.

SIXTY-FOUR PLATES of Beautiful Garden Scenes, Plants and Flowers, and FORTY EXPLANATORY DIAGRAMS.

A comprehensive Work on the Formation, Planting, and Management of the Flower Garden, and the Cultivation of Flowers, Plants, etc., adapted for Outdoor Culture.

THE FLOWER GARDEN

"Of great assistance to those who have greenhouses or intend to build one."—THE FIELD.

THE AMATEUR'S . . . GREENHOUSE.

By T. W. SANDERS, F.L.S.
Bound in cloth, 416 pages.
154 illustrations.

5/- net;

By post, packed in box, 5/6.

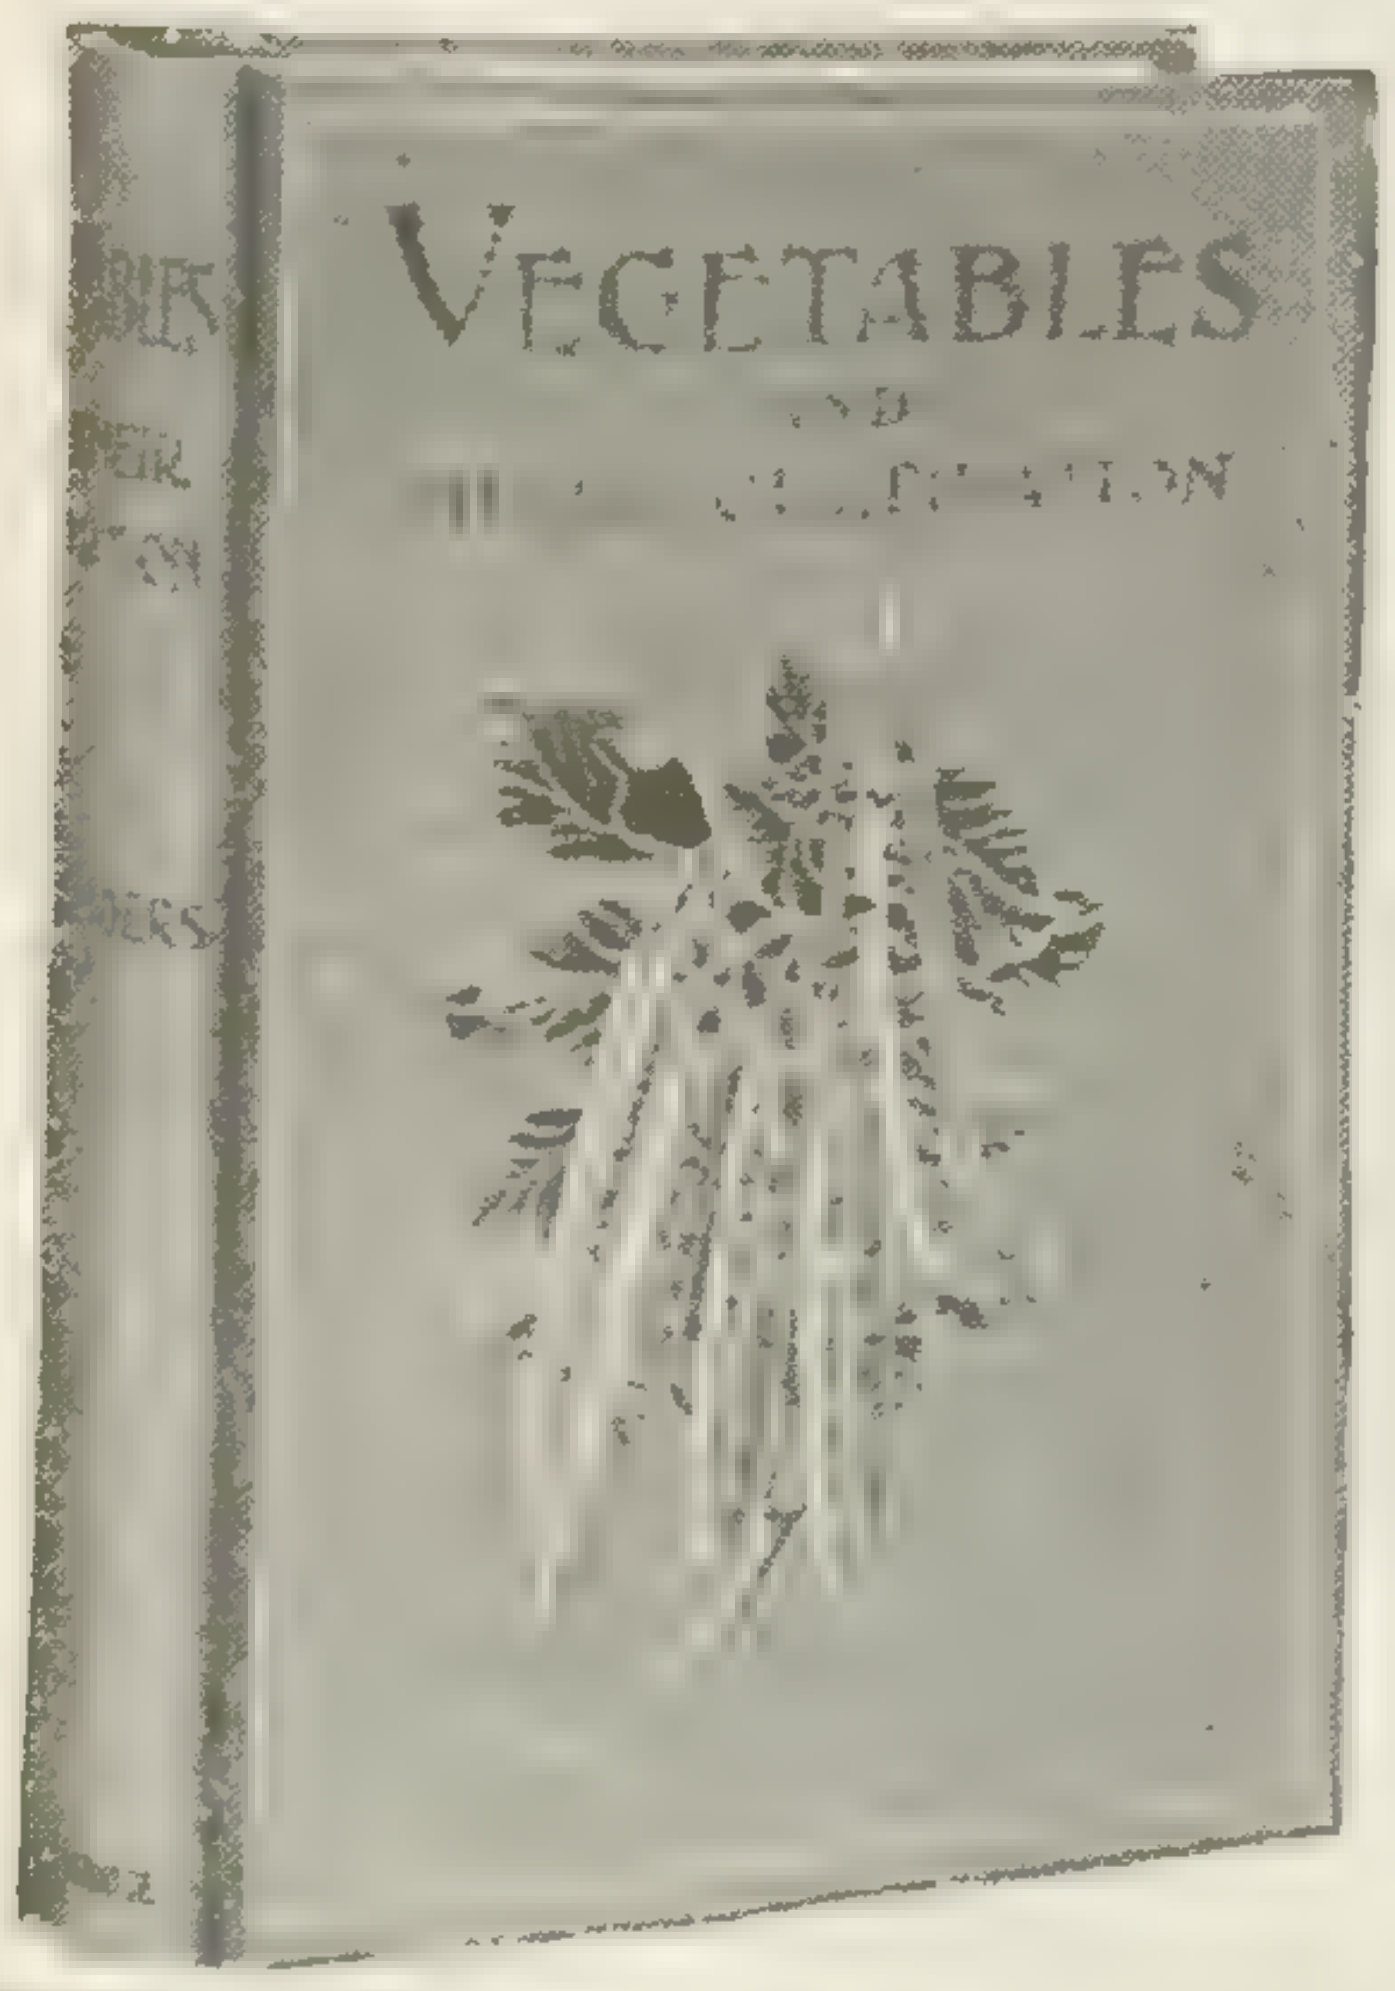
SIXTEEN PHOTO PLATES, TWO COLOURED PLATES, and COLOURED FRONTISPIECE.

A Complete Guide to the Construction, Heating and Management of the Greenhouse, and the Cultivation of Greenhouse Plants.

AMATEUR'S GREENHOUSE

"A most excellent five-shillingsworth."—THE LADIES' FIELD.

VEGETABLES and their CULTIVATION.



By T. W. SANDERS, F.L.S.
Bound in cloth, 464 pages,
140 illustrations.

5/- net;

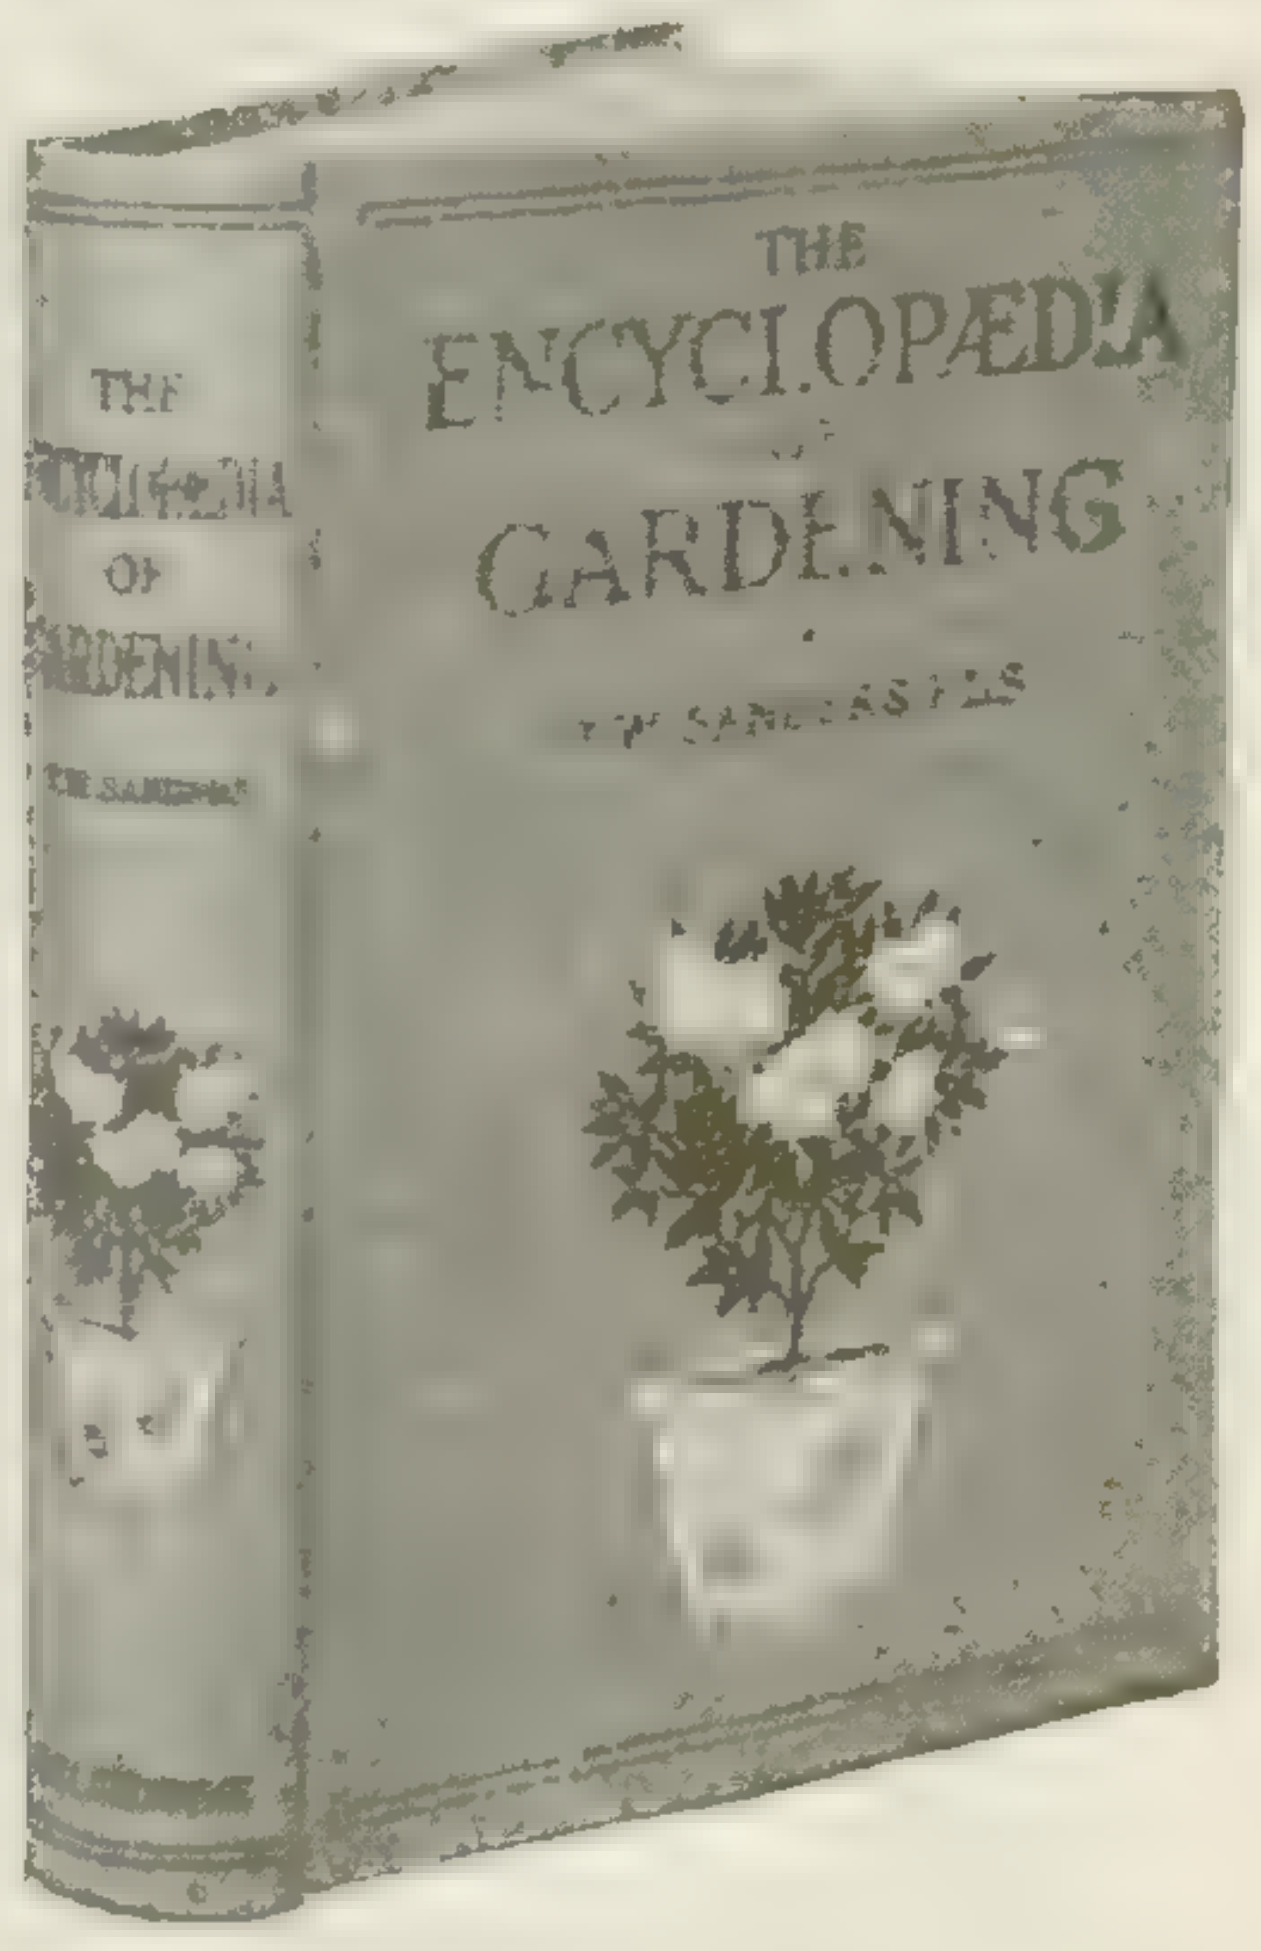
By post, packed in box, 5/6.

EIGHT PHOTO PLATES and FIVE COLOURED PLATES.

An up-to-date Practical Guide to the Formation and Management of the Kitchen Garden: Soils, Manures, and Culture of Vegetables for Home Use.

New Edition —REVISED—ENLARGED—IMPROVED.— Just Published.

ENCYCLOPÆDIA OF GARDENING.



By T. W. SANDERS, F.L.S.
Bound in cloth, 482 pages,

3/6 net;

By post, packed in box, 3/10.

A complete Dictionary, giving at a glance the Cultivation and Description of every Flower, Fruit, Vegetable, Plant, Tree, or Shrub: Popular and Technical Names, Time of Planting, Colour of Flowers; Name of every Species, Suitable Soil, &c., &c.

THIRTEENTH EDITION.

"Of great value, apart from its artistic charms, for the minute particulars of culture."—YORKSHIRE POST.

EASILY GROWN HARDY PERENNIALS

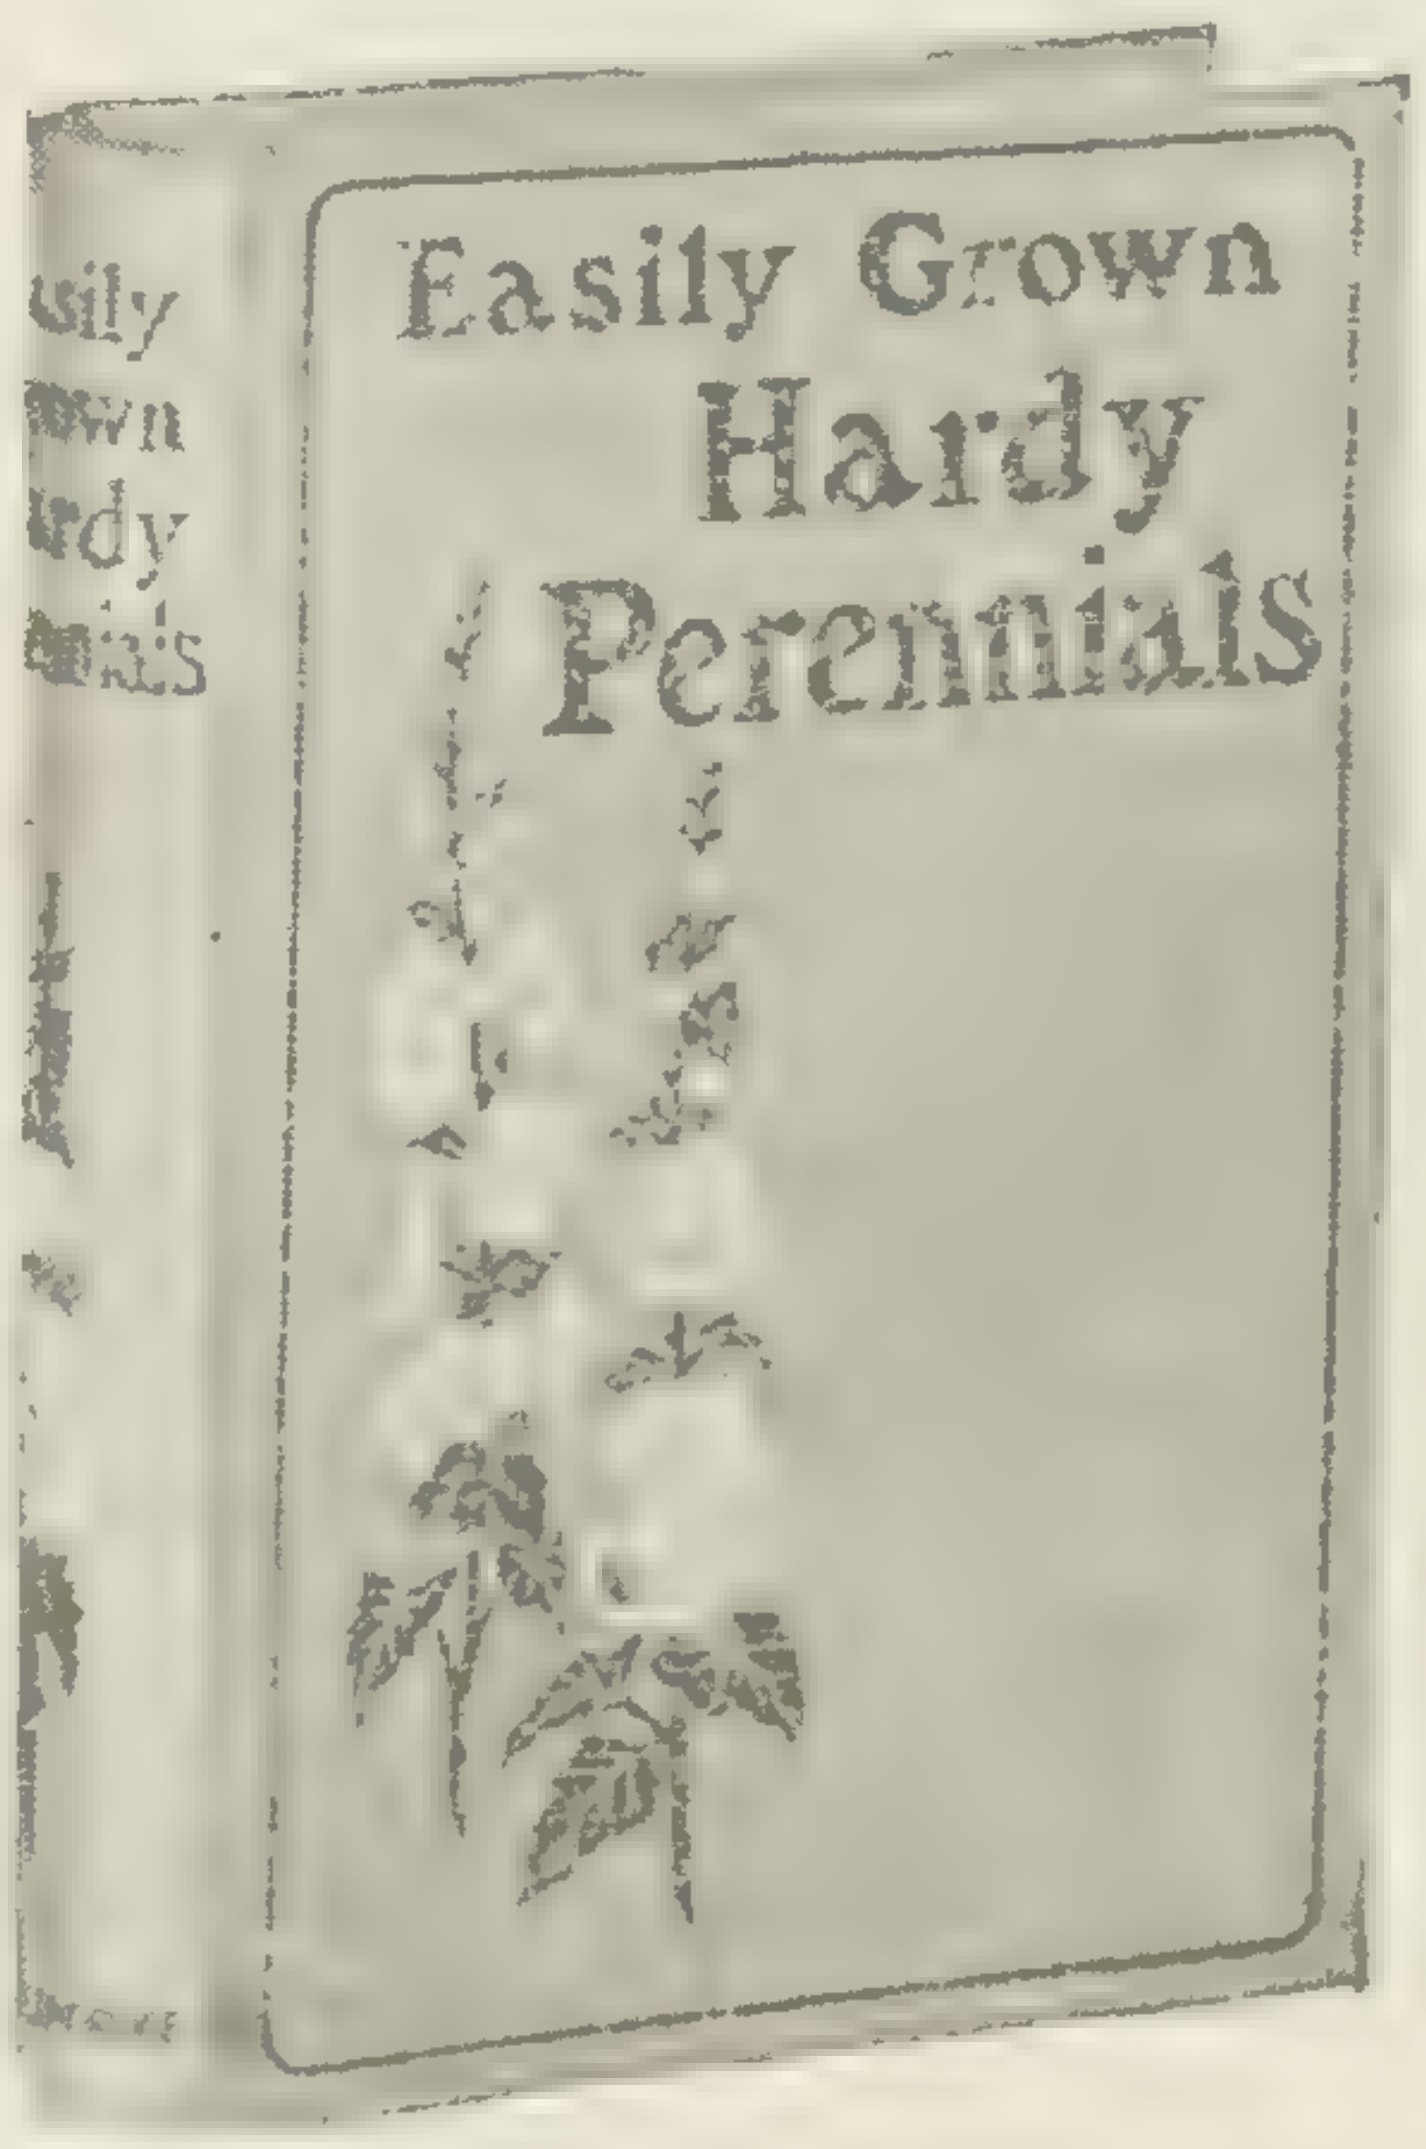
By GEORGE H. VOS, B.A.
Bound in cloth, 476 pages.

5/- net;

By post, packed in box, 5/6.

Illustrated by 255 REPRODUCTIONS OF PHOTOGRAPHS FROM NATURE.

A Guide to the Culture of Hardy Flowers, including Bulbs and Tubers, Habits and Uses, English Names, &c.



"Far and away the best of its kind as a guide in the delightful art of rose culture."—DUNDEE ADVERTISER.

ROSES and their CULTIVATION.

By T. W. SANDERS, F.L.S.
Bound in cloth, 180 pages,
50 illustrations.

2/6 net;

By post, packed in box, 2/10.

SIXTEEN PHOTO PLATES and COLOURED FRONTISPIECE.

A Practical Guide as to Growing Roses Outdoors and Under Glass; When to Plant; How to Prune, Bud, and Graft: Full list of 1,500 Cultivated Roses with description.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Exotics.

The wonderful development of facilities for plant collection and transport which has taken place practically within the last half-century, has had for its results the introduction into Great Britain of an enormous number of species of exotic plants—that is, plants which do not occur naturally in these islands. These exotics consist of several classes, hardy, half-hardy, and tender, but it must not be assumed that the first two classes necessarily originate in cold and cool regions. So far, at any rate, as these are concerned, the plants may be natives of the torrid zone, and owe their resistance or partial resistance to cold to the simple reason that their native habitats are at such an elevation on tropical mountain ranges that their environment is as cool or as cold as in temperate or subarctic regions. The tender class of plants are, however, naturally inhabitants of warm regions alone since they could not exist elsewhere. In addition, too, to the factor of elevation, many hardy and half-hardy exotics are natives of warm and cold countries outside Great Britain, and owe their greater or less resistance to frost to the natural climatal conditions prevailing therein. In addition to temperature, the prevalence of drought or humidity also plays a material part in determining the distribution of plants, as does also the character of the seasons. Thus, while in this country the periods of rest and of active growth are mainly determined by temperature, in some countries long spells of absolute drought preclude the possibility of growth during their continuance, and the plants native to such regions adapt themselves accordingly, sleeping when the temperature is highest, and waking up when it falls and the rainy season sets in. It is thus seen that the term "exotic" is really no guide to the cultivator, and that for successful cultivation it is essential to know much more about the environmental conditions than is always at our command. A vast number of exotic plants take quite kindly to our climatal conditions in the open, these possibly not varying appreciably from those obtaining in their native haunts; others, equally immune from frost, are apt to perish from the very lack of those frosty conditions which mean a winter protection of snow, for which is too often substituted here an alternation of frost and thaw, of freezing and thawing, which saps their vitality and eventually kills them. This particularly applies to many alpine plants, and the remedy, as we may see at Kew, is simply placing a pane of glass over the susceptible plants as a substitute for the normal protection of the snow, and a shield from superabundant wet. One great need of many exotics is abundant sunshine, and as most of our garden bulbs are of exotic origin from lands lit by baking sunshine, the need for the fullest possible exposure is seen at once in order to enable the new bulb to mature and ripen properly. As regards hardy or half-hardy introductions from tropical countries, many have been lost by warm treatment, given on the assumption that plants from such and such a country must need it, ignoring the possible fact that there they grow high up on the mountain sides, many thousands of feet above the hot plains at the sea level, and are thus exposed to the same conditions as on the European Alps near the snow line. It has happened repeatedly that plants apparently killed by wrong treatment due to such ignorance have revived and flourished when accidentally thrown out into the open, and thus given a chance of resuscitation by restoration to their natural coolness. Many plants from regions of alternate hot, droughty and rainy periods, perish when impelled to continued growth by constant watering, they absolutely need a dry season, and the rest it involves, and thus, though tended with the utmost care, die from mistaken kindness bred of ignorance of their real needs. The earth's surface is so diversified, its soils are of such varied character, and the local climatal conditions differ so greatly, that plants evolved under such complex conditions are diverse in an equal degree, and the most successful cultivator is consequently he who best grasps their individual requirements and conforms to them accordingly.

MR. GEORGE W. COOK.
Hon. Treasurer of the National Rose Society.

Mr. George W. Cook, whose portrait we have much satisfaction in giving in this issue, has, during the past twenty years or so, occupied a prominent position among amateur rosarians, and his successes have been all the more remarkable from the fact that for a considerable part of the time he has grown his roses well within a radius of eight miles from Charing Cross. During the eleven or twelve years that Mr. Cook resided at Torrington Park, North Finchley, he was so successful in the production of exhibition roses that he might well have been regarded as a splendid example of what might be accomplished under conditions not specially favourable to rose growing, by well directed effort, perseverance, patience, and close attention to details. Of late years Mr. Cook has resided some distance farther from London, and his roses, favoured by a greater abundance of light and a purer atmosphere, have attained to a much higher state of development, and proved to demonstration that twenty years of rose growing has in no way abated his enthusiasm and love for his favourite flower. How many prizes for roses Mr. Cook has won we are not able to say, but we know that they may be reckoned by the hundred, and that by far the larger proportion of the awards have been firsts. Mr. Cook has not only given unremitting attention to his roses, and won a large number of prizes at the National and other exhibitions, but he has taken a share, and a substantial one, in the management of the National Rose Society. Long a member of the General Committee, Mr. Cook has for several years been one of the auditors, and has in consequence an intimate acquaintance with the society's finances. Owing to this fact, and the high estimation in which he is held by his colleagues, the members of the General Committee at once turned to Mr. Cook when the treasurership became vacant through the resignation of Mr. Herbert Molyneux. The committee unanimously invited him to allow his name to be placed on the house list of officers and members of committee, and after some pressure assent to this being done was obtained. That Mr. Cook should have hesitated is not surprising, for the growth of the society has enormously increased the duties of the treasurer, and as so well known to his many friends, he occupies a high position in the legal profession. Mr. Cook, we would add, shows his interest in gardening in other directions, as evidenced by the fact that he has for several years past been chairman of the committee of the National Amateur Gardeners' Association.

Prize Roses in the Bagatelle Gardens.—We have already acquainted our readers with the interesting trials of new roses held this season in the Bagatelle Gardens Paris, where varieties have been grown and judged from time to time. We have already stated that Rhea Reid, shown by the E. G. Hill Company, of Richmond, U.S.A., gained the grand gold medal offered by the City of Paris for the best rose; this is a tea rose, and a seedling from American Beauty. We now add that the premier prize, offered by the Minister of Agriculture, was won by Messrs. A. Dickson and Sons, Newtownards, with Dorothy Page Roberts. The premier prize offered by the National Horticultural Society of France, was won by Messrs. Soupert and Notting, with Madame Segond Weber, a tea-scented rose obtained by crossing Antoine Rivoire with Souvenir de Victor Hugo. A second prize medal, offered by the Rose Section of the National Horticultural Society of France, was won by Messrs. William Paul and Son, Waltham Cross, with Mrs. Dudley Cross, a variety somewhat like Marie Van Houtte. Another second prize, given by the French Rose Society, fell to M. Peter Lambert, Treves, for Frau Oberhofgærtner Singer, a H.T. derived from Jules Margottin crossed with Madame Eugenie Boullet.

Flowering Trees and Shrubs.—Mr. George Gordon, V.M.H., will give a lecture on "Flowering Trees and Shrubs" before the Royal Botanic Society on Thursday, December 17, at 4 p.m. The lecture. to be delivered in the club room at the society's gardens, Regent's Park, will be freely illustrated by lantern views.

Foreign Fruits shared to the full in the decline in the imports that was so marked in November. In no corresponding month of the past twenty years have the decreases been so general as in the month that is just passed. Indeed, the only fruits that were imported in increased quantities were lemons and pears. The imports of apples aggregated 616,210 cwt., of the value of £364,716, or a decrease in quantity of 174,687 cwt., and in value of £104,678. In November, 1907, the imports of apricots and peaches were 635 cwt., of the value of £1,368, but this year they were nil. Of bananas the imports were 414,432 bunches, of the value of £121,965, or a decrease in number of 81,831 bunches, and in value of £18,951. Grapes show a decrease of 128,299 cwt., of the value of £107,110, the total imports having been 93,188 cwt., of the value of £97,674. Pears, as already intimated, were imported in increased quantities, the total being 48,393 cwt., of the value of £40,927, as compared with 31,805 cwt., of the value of £28,756, in the corresponding month of last year. Unenumerated fruits dropped from 12,152 cwt., of the value of £18,408, in November, 1907, to 9,973 cwt., of the value of £15,666, last month. The total value of the fruit imports in November was £9,389,069, or a decrease of £360,138.

A Floral Christmas Number.—Truly there is no dearth of interest for lovers of things floral this season, and we can heartily welcome the Christmas Number of our popular contemporary, "Amateur Gardening," issued this week. Herein we find beautiful pictures of home, garden, and sylvan scenes in abundance. And not only are we provided with a wealth of charming pictures in this issue, but also find much food for thought and reflection in its literary contents. Many of the mysteries of Nature in the vegetable kingdom are unfolded in an interesting way, and a vast amount of readable information is imparted in the numerous essays. A double-page coloured plate is a beautifully executed picture of a maiden in an old-time garden, and adds materially to the attractiveness of the number. The price is sixpence, the cost inadequately representing the value of the issue.

Weather in November.—The past month was remarkable for its equable temperature and a large amount of sunshine, and may be regarded as one of the most pleasant Novembers within recent years. The mean maximum temperature was 53 degrees, or 3.4 degrees above the average, and the mean minima 42.2 degrees, or 3.8 degrees above the average. The highest temperature recorded in London was 59 degrees, and the lowest 30 degrees. The sunshine registered in London during the month was 46.2 hours, or 19 hours above the average.

Seakale Disease.—Mr. E. S. Salmon, F.L.S., states, in his report on economic mycology, that in the autumn of 1906 serious damage to various kitchen garden crops was noticed in the vegetable department of Wye College. This damage proved to be due to the attacks of the fungus, Rhizoctonia violacea, a root or stem parasite, capable of attacking a wide range of plants. The disease had not previously been noticed in the gardens, but on lifting the crops it was found that the fungus had attacked carrots and parsnips, had done considerable damage to salsify, and had so seriously injured the seakale as to render the crowns required for the next year's forcing useless to the extent of about one-half the crop. The fungus is seen as a felted mass of violet spawn or mycelium, adhering closely to the surface of the root, and forming purplish patches. Scattered about over the spawn are usually to be found numerous small violet bodies. These are called sclerotia, and are composed throughout of densely interwoven hyphæ, which pass into the tissue of the host plant. Decay of the tissues ultimately sets in over the affected areas, and in severe cases of attack a large area, if not the whole, rots away. So severe were the effects of the disease on the seakale that Mr. Salmon decided to try various remedial measures during the season of 1907. The seakale bed was divided into eleven parts, two being control plots, and solutions of copper sulphate, iron sulphate, mercuric chloride, phenol (carbolic acid), and formalin, in two strengths, and petroleum, and sulphur and quicklime applied in a dried state. The disease was prevalent in the control plots, and also in those that were treated, with the exception of the one treated with carbolic acid. The plot measured nineteen by nine feet, and was treated with forty gallons of solution, which consisted of equal parts of carbolic acid and water. The crop on this plot is described as having been "heavier and better in every way than on the other plots," and the roots quite free from disease.

Nitrogen-fixing Bacteria. In a lecture entitled "Plants and their Allies," delivered on Thursday last before the Royal Botanic Society, by Professor Bottomley, of King's College, the lecturer referred at length to the bacteria on the roots of leguminosæ, and also told how the alder and some other plants, few in number, had somewhat similar nodules, but of different form, on their roots. He claimed that certain crops had been improved by the inoculation of the soil with nitrogen-fixing bacteria, but urged that it was yet too early to advocate soil inoculation as a commercial advantage, and asked for the help of gardeners and farmers, who could experiment in a manner that would yield some definite results, and help to decide for or against the use of bacteria solutions on commercial lines.

Vegetable Imports in November last show a material falling off, as compared with the corresponding month of last year. The imports of onions aggregated 620,202 bushels, of the value of £101,731, and these figures are of interest as showing that while there was a decrease in quantity of 148,711 bushels, there was an increase in value of £18,173. Potato imports dropped from 1,422,471 cwt., of the value of £262,516, in November, 1907, to 127,086 cwt., of the value of £18,702, last month, or a decrease in quantity of 1,295,385 cwt., and in value of £243,814. Germany only sent 989 cwt., against 279,457 cwt.; France, 113,532 cwt., against 295,621 cwt.; and other countries, 12,366 cwt., against 847,387 cwt. in the corresponding month of last year. In the imports of tomatoes there was an increase in quantity of 7,670 cwt., and in value of £4,337, the total having been 74,292 cwt., of the value of £58,646. The aggregate value of unenumerated vegetables was £19,559, or an increase of £811

Peloria in Cattleya labiata.—In Mr. Gurney Wilson's collection at Hayward's Heath there recently flowered a very perfect specimen of a peloric Cattleya labiata in which the perianth was perfectly regular, as is not unusual, and in addition there were three properly developed stamens adnate to the column. Mr. Wilson also has a dimerous specimen of Cypripedium insigne, which is not only a very perfect specimen of this rather common aberration, but is interesting on account of the fact that this is the second successive year in which the aberration has occurred in the plant.

Bipalium Kewense at Wisley.—This curious worm-eating worm has been found at Wisley, and a specimen was exhibited by Mr. Chittenden at the recent meeting of the R.H.S. Scientific Committee, obtained from the propagating pits at Wisley. The worms are of a dark greyish colour, and measure up to about 15in. in length. They are found living among the crocks at the bottom of the pots. They feed voraciously upon earthworms, and are, no doubt, capable, by reason of their shape and size, of pursuing them into their burrows. The animal, first noticed at Kew, is said to occur in hothouses throughout the world.

TAKING CHRYSANTHEMUM CUTTINGS.

No sooner are the exhibitions over than operations for the next season commence. In fact, one successful cultivator of specimen plants—and they are becoming rare—inserts cuttings before the shows take place, because he sells his plants at the shows each year to save the trouble of taking them home again. He thus secures an early start for this particular method of culture. It is wise, too, to propagate early where the plants need to make extra quick growth, as is the case where each plant carries as many as from fifty to one hundred specimen blooms. Chrysanthemum cultivators of experience know that growth is best when not hurried by artificial warmth. The chrysanthemum is a hardy subject, and this should be remembered.

Occasionally we heard of some remarkable achievements in the production of fine blooms upon plants struck from cuttings in April. I need hardly say there is an exception to every rule, but, speaking broadly, early propagation has its advantages, especially in the fact that it allows the plants a long season of steady uninterrupted growth, thus laying the foundation for sturdy development of root, leaf, and stem.

A change of cuttings cannot be other than an advantage in the same way that it is in potatoes and cereals. Experience has taught present-day cultivators that cuttings exchanged between the southern counties (like Hampshire) and Scotland produce the best results, and this method is largely being acted upon.

Even for the sake of convenience in the utilisation of space early propagation is an advantage, as the retention of old stools in large pots for an extra six weeks means some inconvenience, and very often, too, if the precaution is not taken of thinning the weakly growths where they are numerous, many cuttings are spoiled by overcrowding. Experience has taught that vigorous cuttings most readily grow into robust plants. A good foundation must be secured, and thus early propagation with good, stiff, sturdy cuttings is an advantage that cannot be overrated.

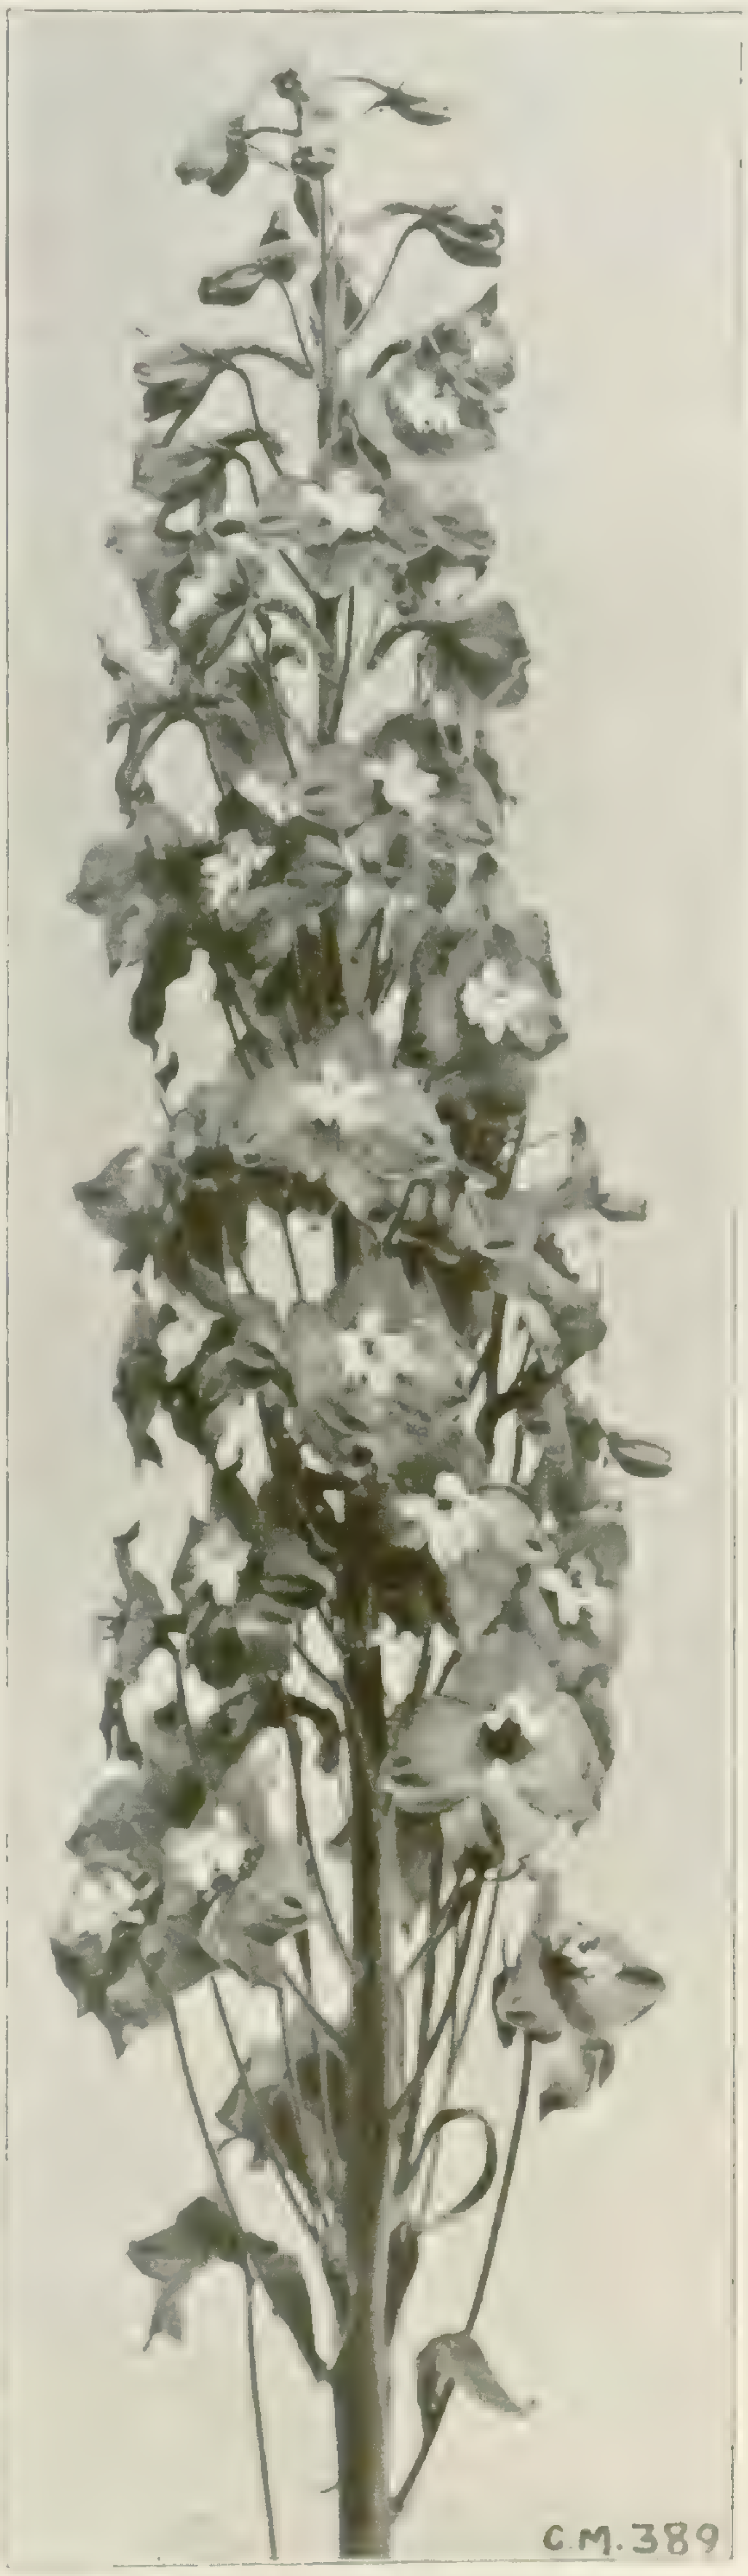
The "one cutting in a pot" method of propagation has much to recommend it, although roots are as quickly formed where cuttings are inserted several in one pot, or, indeed, not in a pot at all, but in boxes, or an open frame. When rooted singly in small pots there is no fear of a check to the growth by the removal of soil from its roots in the act of disentanglement, as is the case where they are growing several together. Clean pots, with a single crock in each, a small quantity of rough material at the bottom, and a sandy compost of loam and leaf-mould, are all that is necessary for the first stage. Firmly inserted in the pots, and kept pretty close for two or three weeks in a cool frame or under handlights in a cool house, the cuttings quickly make roots, and then should have abundance of air and a light position near the glass, still in a cool house, to be removed eventually to a cold frame or pit.

E. Molyneux.

"CHRYSANTHEMUMS AND HOW TO GROW THEM FOR EXHIBITION," by J. B. Wroe. Fifth Edition, revised to January, 1908, and including the new varieties.—Full details on timing and stopping for Northern, Southern, and Midland growers, selections of the best varieties, illustrated instructions on taking the buds, cuttings, staging, etc. Prices 1s. net, by post 1s. 2d.; cloth, 1s. 6d., by post 1s. 8d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

CATTLEYA DOWIANA AUREA

This is one of the floral gems of the autumn season. Originally introduced in 1864 as Cattleya Dowiana this orchid has now become established as a distinct species, at least it is now classed separately from C. Dowiana in all the leading trade catalogues. This autumn I have specially inquired from two or three well-known authorities what the difference is between C. aurea and C. Dowiana, and the replies have been rather vague, and to the effect that C. Dowiana has rather more yellow in the flower and is not so finely barred and striped as C. aurea.



DELPHINIUM CAMBYSES.
Flowers deep rich blue, white centre.

We find the period of flowering of C. aurea is from September to November. We have numerous specimens, and the first flowered in the former month, several in October, and on November 14 we cut the last flower. It is not a cheap orchid; there are no nice plants of it at 2s. 6d. No. at a sale of orchids a few days ago, at which orchids in variety were sold very cheap, a few specimens of C. aurea realised 27s. 6d. each. Small examples can be obtained from the leading orchid growers from 10s. 6d. to 15s. each. C. aurea is much used in hybridising, and is one of the parents of many grand hybrids. Some recommend that C. aurea should be suspended close to the glass to insure its blooming, but we find it succeeds well on the stages with Cattleya Mossiæ, and other cattleyas.

There are several varieties of this cattleya, and some seem more free flowering than others. We find some plants do not bloom at all regularly, but we had one plant that flowered for eleven consecutive years, and at last very obligingly flowered itself to death.

The ordinary compost that cattleyas succeed in suits Cattleya aurea, but it is not a very vigorous growing orchid, and does not require a very large pot or pan, indeed, sometimes the cause of failure is over potting, as then the compost becomes sour, and consequently the plant becomes unhealthy. A good time to repot is when growth is commencing, and if there are two eyes or breaks the plant can be divided, but this is seldom the case, and we have found back breaks are not produced at all freely, consequently its increase is slow, which fact no doubt accounts for the comparatively high price maintained.

Cheshire. W. M.

A FINE NEW DELPHINIUM.

Mr. Fred W. Smith, gardener to — Ferguson, Esq., The Hollies, Weybridge, has, so far as his opportunities permit, entered heartily into the work of plant improvement. He has produced several excellent single chrysanthemums, and some first-rate campanulas, including the hybrid C. Fergusoni. He has also worked hard to improve delphiniums, his aim being to secure free-branching, graceful spikes, rather than the solid-looking ones so many florists admire; large flowering white and yellow forms have also been worked for, as well as varieties in which the centre of the flower is of a colour contrasting strongly with the general colouring. That he has suceeded in a marked degree is evident to everyone who has seen the groups of delphinium spikes Mr. Smith has staged from time to time at the meetings of the Royal Horticultural Society. On June 23 last Mr. Smith had a most interesting group of seedlings, and one of these named Cambyses, figured herewith, was granted an Award of Merit. This is a very beautiful variety, and one that was greatly admired for its stately spike, fine habit, big double blooms, and wonderfully rich blue colouring. These handsome flowers were very distinct because each had a pure white centre that tended to increase the effectiveness of the deep rich blue colour around it.

Apple The Sandringham.—It seems a little strange when we realise that this apple succeeds better in the garden at Sandringham than in most other localities. Each year, when paying a visit to the Royal gardens, I have invariably found a full crop of fruit on the trees. As a rule this apple seldom misses a crop here in South Hants, and the fruit keeps well. The tree is of upright habit, vigorous, and clean in its bark. —E. Molyneux.

KITCHEN GARDEN WORK IN WINTER.

There is work to be done in this department at all seasons of the year, but by forethought and timely arrangement there is no need for a rush at any period. The work to be performed at the present time is as important in its way as that which has to be done in April or May, although of a different character. Gardens are so variously situated, and the soils therein so widely different, that it is impossible to lay down any hard and fast rules by which they may be all cultivated. In one, it may be, the soil is warm, light, and sandy resting on a subsoil of sand or gravel, where fruit trees will grow with but little attention, and bring their fruit to perfection. In others the soil is a stiff loam resting on a subsoil of clay, and is cold and retentive, and so close in texture that no water can pass through it, and in which vegetables grow rampantly in summer and autumn, only to be cut down by the first winter's blast. Again, some gardens are down in the valley, where the late spring and early autumn frosts play sad havoc with all tender vegetation. We have seen gardens in which it has been absolutely necessary to trench in all the old refuse that could be procured to keep the soil porous, and thus admit all the air possible, and where it has been actually necessary to lift the fruit trees periodically to keep them healthy. To state that a garden of a certain size should be worked with so many men is out of the question, for no one can know the requirements of an establishment unless he has had charge of it for a couple of seasons at least, therefore it is not well to be too wise in this respect.

Where a kitchen garden has good walls, with properly made borders, and the soil has been rendered porous by good cultivation, there will not be that necessity for fruit-tree lifting as is otherwise the case, therefore that particular portion of the autumn work in such places need not cause any anxiety; but there are other matters that will need special attention at this season. Many put off the nailing until severe weather sets in, but this in my opinion is a great mistake, as a man can do as much work of this kind in an hour when the weather is mild as he would in a day when biting east winds are blowing and the ground is frozen hard. With us it is a rule to nail the north walls first. Morello cherries occupy a space here of something like eight thousand superficial feet of wall, and although the trees are taken off periodically, we usually manage to have these pruned and nailed by the middle of December, so that if cold weather should set in, the border can be dug ready for a future crop.

Nailing the trees on the other walls is regulated somewhat by the crops on the borders. For instance, the south borders are usually occupied during the autumn with such tender plants as lettuce, endive, early broccoli, and the like; as soon as these are lifted, the surface is covered with manure, so as to exclude the frost, the trees being pruned and nailed as opportunity permits, the digging being done early in the morning when the weather is unfavourable for nailing. The other walls are taken in hand in like manner. Now a word or two as to pruning. In my opinion this operation received far more attention from our ancestors than it does at the present day. I notice that it is invariably the case when receiving fruit trees from a nursery that they have been pruned with a pair of secateurs, the cut being half an inch or more from a bud, no attention having been paid to how the bud was placed, hence the reason of many ill-shaped trees. When a lad I was taught to cut a shoot with a sharp knife, to place the blade within an eighth of an inch of, and below, the bud on the opposite side, and make a clean cut, so that the upper portion of the slant should just clear the top of the bud. By so cutting the wound made heals over the following season. Now we receive trees with dead scrags from half an inch to an inch in length, no regard whatever having been taken as to the position of the bud which was intended to form the leading shoot the following season.

When a boy I was instructed to cut all shoots on a fan-trained tree to a particular bud, that is, where a shoot was trained at any angle below 40 degs. it should be on the upper side, and above that angle on the lower side, so as to regulate the sap more evenly. We have lost the old form of apprenticeship, so that gardeners of the present day know nothing of the hardships that fell to the lot of youths a couple of generations back, and in a measure it is well that those times have passed into oblivion. Pruning and training at the present time is almost a lost art, for since the system of cordons and the craze for variety in the garden there is not the same care taken in training to please the eye as formerly was the case. Pruning and nailing are only two of the numerous operations to be performed in the kitchen garden during the winter.

When the ground is frozen trenching may be proceeded with provided the surface has been covered with manure so as to exclude the frost. Such work is far better performed when the soil is tolerably dry than when saturated, as is sometimes the case in the autumn. By trenching I do not mean just turning over a couple of spits of soil; this we do each time the ground is dug. Of course the depth to which the ground is broken up must in a measure be regulated by the quality of the soil; to bring up a spit of poor barren soil to the surface of that which has already been rendered fertile would not be sound practice, but to break up such subsoil and add manure would be another thing altogether. If one-tenth part of the money were expended on forming a kitchen garden, when laying out a place, as there is in shifting the thousands of tons of earth to form some of the unsightly formal gardens, a useful purpose would be served, and those who in after years are responsible for the care of such places would be relieved of much anxiety and trouble. There would also be a saving of the extra cost in bringing the fruit and vegetable crops to their proper size and quality.

There are many other kinds of work that require attention in this department during the winter if we would have the best results during the summer. It is not advisable to defer such work as preparing pea sticks until they are required for use, for when sharpened in winter before the wood becomes hardened more than double the amount of work can be done in a given time. It is also well where a large amount of forcing has to be done to have everything prepared well in advance of requirements. Seakale should be lifted in mild weather and be laid in under a north wall, where it can be protected in case severe weather sets in, and thus ensure the roots being available for forcing at any time. Asparagus beds intended for forcing should likewise be covered with litter to exclude the frost. Rhubarb should also be taken up in readiness for use, while such things as mint, tarragon, parsley, and the like, ought to be planted in boxes provided for that purpose.

Do not wait until such things as celery and endive are injured by frost before giving them due protection; have the material at hand in case it is required at short notice. Should the winter be severe there are many things to do, such as turning soil heaps, and wheeling material on to vacant ground, cutting hedges, gravelling walks, and making good any roads that need repair. H. C. Prinsep.

WYKEN PIPPIN APPLE.

This is one of the good old apples which seem to be slowly but surely going out of cultivation. It was a great favourite with our forefathers, and old standards of it, some of large size, are to be met with in old gardens and orchards all over Essex, where it is usually known as the Warwickshire Pippin. One seldom sees it on the exhibition table, even in the large collections of the leading nurserymen, and it is omitted from the list of the hundred best apples in Messrs. Bunyard and Thomas's "Fruit Garden." Yet in the report of the National Apple Congress held in Chiswick Gardens in 1883, this old variety stands well in the lists of dessert apples selected by experts for different counties of England. I doubt if one-half of the recent introductions are as good. I tried to get a tree of it from two different nurserymen recently, but without success. It is said to have originated at Wyken, near Coventry, from seed saved from an apple which Lord Craven ate on his travels through France and Holland. But few of us would have the good fortune to raise an apple equal to this if we saved a pip as a happy memento and planted it.

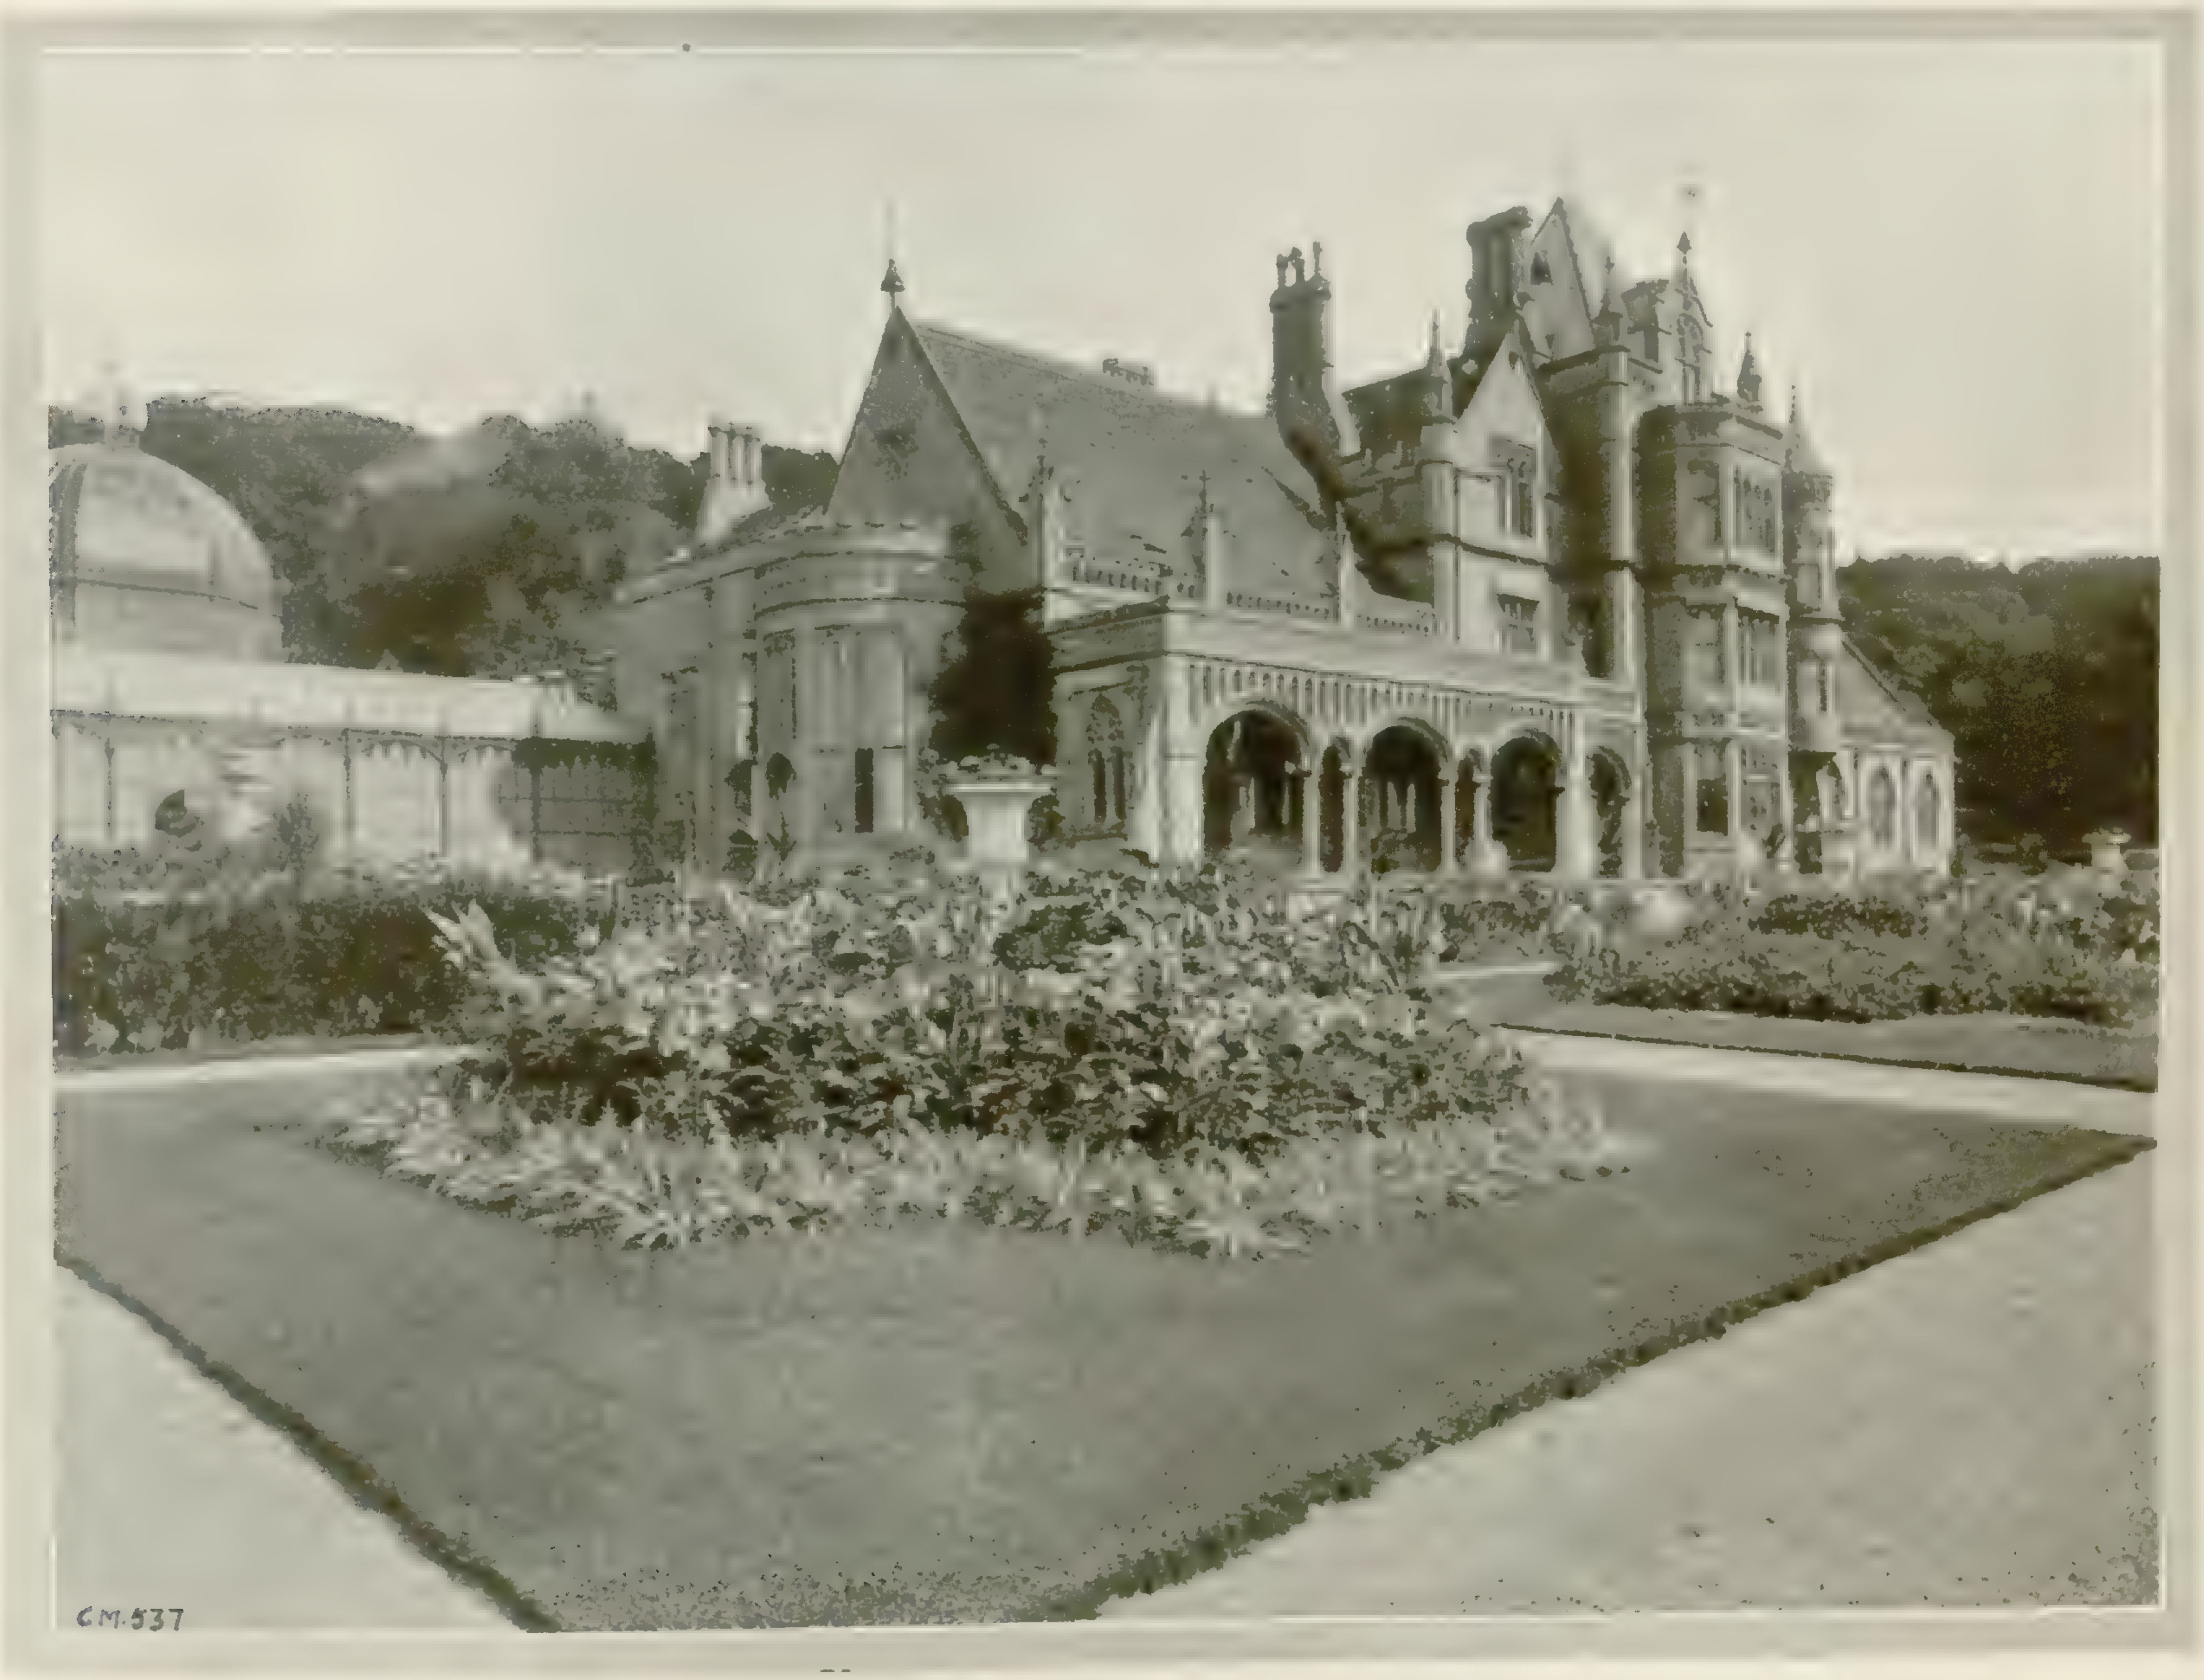
As one sees this variety growing in standard form, often completely covered with its golden fruit, it is a small flat apple, somewhat rough to the touch, running ten or twelve to the pound, but on the paradise, where it forms a compact and somewhat small pyramid, the fruit is much larger, running about six to the pound, with a clear yellow skin. It is at its best in December and January, and, if not gathered too early, as it often is from standards, it is of first-rate quality. The tree is a healthy grower and a good bearer, and the reason for its being supplanted by some of the modern varieties is hard to find, unless it is in the fact that they are for the most part better to look at and finer in colour and shape.

Alger Petts.

Vallota purpurea. — Just at this season of the year this handsome old bulbous plant may be often seen flowering in the windows of the cottager, who, in many instances, bestows but little care on it. Although an easily-grown plant, it does not follow that anyone can obtain anything approaching a good display of flowers by a system of indifference, and a more or less abundant supply of water at all seasons. By a little help in the way of some good sweet loam, and, above all, good drainage and firm potting, this old-fashioned flower may be made one of the most attractive of plants. The bulbs should be potted every second or third year, in August, at the same time sorting them into sizes. An amateur may soon possess a stock of bulbs that could not possibly all flower at the same time. Six large bulbs in an eight-inch pot would make a fine display, while the smaller bulbs may be planted six in a five-inch pot for future use. After a season's growth in this pot a shift may be given, and in this way clean flowering bulbs would result, instead of, as now, a crowded colony of undersized bulbs in a large pot, and only an occasional one producing a spike of bloom.—T. B.

SOME BRISTOL GARDENS—I.

When, earlier in the year, some accounts of several of the most important gardens situated in the Bristol district were given, accompanied by a number of illustrations, the hope was expressed that at an early date several other gardens within that essentially horticultural neighbourhood might be reviewed in these pages. The opportunity for fulfilling that hope has now arrived, but with it comes the conviction that even these two sets of notes by no means exhausts the garden attractions of the famous Western City, and one can but express a further hope that the fates will permit another visit, at no distant date, for the purpose of inspecting other beautiful gardens and interesting collections.



TYNTESFIELD, FLAX BOURTON, BRISTOL; THE MANSION AND WINTER GARDEN.

Tyntesfield.

Beautiful for situation is Tyntesfield, the very noble and handsome residence of George A. Gibbs, Esq., M.P. for West Bristol. It is situated a mile or two from Flax Bourton Station, and about double that distance from Barrow Court. The splendid garden front ends in a very large and highly ornamental conservatory or winter garden, while on the higher side a handsome church nestles right up to the mansion. A very broad terrace is carried along the lower side, and big beds of bold flowering and foliage plants are placed at suitable intervals along it.

There are really three terraces. The second one has a straight walk, running its whole length, with stately Irish yews alternating with great clumps of yuccas on either side from end to end. The yuccas (Y. gloriosa) are wonderfully fine, and they flower freely each year, and when they carry their tall and striking spikes of greenish-white flowers, the walk presents a very fine and uncommon picture. Broad flights of steps lead down from terrace to terrace, and tempt one to the lake in the spreading park below. Closely clipped and rounded heads of Portugal laurels are the feature of the lowest terrace, but the terrace walls themselves are of interest because of their architectural design and the choice shrubs they give shelter to.

It would appear that a great love for trees and shrubs is inborn in the members of the Gibbs family, and it finds expression in their gardens, whether these be at Aldenham or Tyntesfield. An idea of the extent and richness of the collection may be gathered from the observation that among the many occupants of these sheltering terrace walls and warm borders are to be found such plants as pomegranates, Choisya ternata, Solanum crispum, and the beautiful S. jasminoides, Edwardsia grandiflora, Zanthoxylum planispinum, Indigofera Gerardiana, and Myrtus Ugni, to name a few only.

The park is undulating and well wooded, and the lake will presently be a further attraction by reason of the moisture-loving plants that have recently been planted around its margin, under the direction of Mr. T. Wilkinson, who has charge of these gardens. Further evidence that the collection of trees and shrubs is no common one is to be found on the churchward side of the mansion, where the ground rises quickly to an elevated woodland, with its semi-wild garden, its spring flowers, and its beautiful views away to the Mendip Hills. Choice shrubs and trees abound, and full advantage has been taken of the wealth of flowering shrubs now, happily, obtainable. The display has not been confined to spring flowering subjects, lovely as these are, but care has been taken to provide for summer and autumn displays. Native plants are not ignored; indeed, the gorse and the heather on the steep banks where the drive curves round to the front entrance are in no way the least beautiful plants.

Beyond the winter garden and tennis ground, up through a goodly collection of alpine and herbaceous plants, is the rose garden, surrounded by a cupressus hedge that is quaintly cut at the entrance. The rose beds occupy the central portion of the garden, and around these, on the sloping banks, are more choice shrubs and strong growing herbaceous perennials, the whole providing a pleasant and fragrant retreat.

At a considerably lower level than the mansion and at some distance from it is another kind of garden altogether. This is enclosed by high walls and contains fine ranges of glass-houses. But, fortunately, outside the houses ample room has been allowed for the beautiful. A large and stately orangery occupies an almost central position, and contains big oranges, oleanders, camellias, etc., in large tubs. A broad path crosses the front of this house, but directly opposite the orangery doors is a straight flagged walk, broken in the centre by a circular lily pool, and festooned the whole of its length with arches of roses that are a fine sight in July and August. Borders, with an edging of box, are filled with carnations, pentstemons, antirrhinums, gladioli and the like, and these produce striking effects as they are planted in large quantities.

Many of the plant and fruit houses are of iron, and, while not a few gardeners have a strong dislike for iron houses, Mr. Wilkinson finds no fault with them. He points out, however, that as iron heats quickly, and cools as rapidly, the cultivator must begin to ventilate earlier than in a wood-built house, or scorching of tender foliage will inevitably follow. Some of the houses were built by Smith, of Ipswich, and others by Skinner, Board, and Co., of Bristol. The four big iron-built vineries are unusually spacious structures, and of their contents it is only necessary to state that in the fierce fights at Shrewsbury Fête Mr. Wilkinson gains honourable positions with grapes. Alicante, Muscat of Alexandria, and Black Hamburgh grapes are very fine in crop and bunch and finish. I was curious to know why a broad ring of stiff cardboard surrounded the lower portion of each vine rod, and learned that this simple device was a very necessary and effective one for keeping mice from climbing the rods and spoiling the grapes.

That Mr. Wilkinson is an able cultivator is obvious in flower garden and grounds, but nowhere is it more evident than in the houses. The peaches are as ably managed as the vines, and in the plant houses the really grand batches of flowering and foliage plants would do credit to a Baines or a Bause. Ivy-leaved pelargoniums, notably Souv. de Chas. Turner and Achievement, are splendidly grown in both pots and baskets. The elegant Lobelia tenuior and the graceful Francoa ramosa are not difficult to grow, perhaps, but spotless Malmaison carnations and beautiful and perfect specimens of Adiantum Farlyense are severer tests of skill. These, with such varied plants as coleuses, and calanthes, Begonias of the Gloire de Lorraine class, and poinsettias, justicias, and Begonia President Carnot, Cypripedium insigne, pancratiums, Cœlogyne cristata and eucharis, all demonstrate fully that Mr. Wilkinson is a plantsman of the first class. It must be remembered that these and other subjects are not grown in batches of a dozen or so, but there is usually a whole house or half a house full of each.

A point of no small interest to those who are frequent visitors to gardens, is the great affection different growers have for different varieties of fruits and flowers. Melons afford room for a wide difference of opinion, and Mr. Wilkinson's choice of these falls on the large-fruited Emerald Gem, and on Best of All and Royal Jubilee. The value of unheated houses is fully comprehended at Tyntesfield, and one very large and wide house of the peach-case order, unheated, has been planted with apricots, peaches, and nectarines. The slender pillars that assist in supporting the roof have each a strong T. or H.T. rose to support also, and along the front of the house tomatoes are grown. No room is wasted, and this house is one of the most productive of all, notwithstanding its lack of artificial heat.

Vegetables are cultivated on a scale and in a manner that is in keeping with the rest of the establishment. The kitchen garden is being extended, and new fruit trees planted, and one feels perfectly certain that the new portion, with its more utilitarian features, will presently come into line with the older portion and further enhance the reputation of Tyntesfield, its owner and its gardener.

AVENUE OF YUCCAS AND IRISH YEWS AT TYNTESFIELD.

The Holmes.

Although in no sense an extensive establishment, The Holmes is nevertheless a very interesting one. The gardens belong to H. M. Baker, Esq., and Mr. Cully, the hard-working and enthusiastic gardener makes the most of his opportunities. In a very few moments one finds that both Mr. Baker and Mr. Cully are keen gardeners, and that they are not satisfied with the mere commonplaces of gardening.

By the side of the front door of The Holmes is a very big loquat in splendid health, and close by is a splendid Magnolia grandiflora, reaching up to the eaves; this latter flowers freely, and when in blossom is very attractive. Cotoneasters flourish on the house front, C. horizontalis being particularly good. The whole of the walls of the house are covered with plants. Ceanothus azureus occupies a corner, and Escallonia macrantha, Clematis flammula, and honeysuckles occupy other positions. Turning along the side of the house towards the conservatory, one notices an iris border, and the beds along the terrace show that annual flowers are very popular. In a little field that skirts this terrace some twenty thousand daffodils are planted, and these must yield a fragrant and beautiful display each spring, to be followed in summer by an equally beautiful and fragrant display of roses on the terrace itself.

In a large corner, sheltered by the house and the conservatory, is a collection of very interesting plants, and one that is all the more notable because so entirely unexpected. Crinodendron Hookeri hugs the conservatory wall, and its companions are Berberidopsis corallina and Philesia buxifolia. In the semi-rock garden are colonies of Cypripedium spectabile, Saxifraga peltata, Rodgersia podophylla, and R. pinnata, while, higher up, are Ramondia pyrenaica and R. serbica—the pretty Pyrenean primroses, Haberlea rhodopensis, and a host of the finer mossy and encrusted saxifragas. The conservatory itself is almost given over to palms, ferns, and bamboos, and it serves as a pleasing extension of the drawing-room that opens into it.

A level, well-kept, and weedless lawn stretches away from this garden front, and it is terminated by a long and broad herbaceous border, in which, among other things, alstromerias, tritomas, and montbretias are especially good. Beyond this border is a little woodland, where the undergrowth has been either cleared or thinned out, and where Arundinaria Simoni, A. Veitchi, Phyllostachys aurea, Bambusa palmata, and other graceful bamboos have been largely planted; indeed, close behind the herbaceous border is a small bamboo grove. Foxgloves, bluebells, primroses, and daffodils abound in the woodland, and by the walk sides are to be found rambling roses, ribes, olearias, magnolias, and rhododendrons.

The woodland slopes sharply to the end of the garden, and here another surprise is found in a long, straight walk the whole width of the garden. On either side is a flower border, and at intervals over the pathway are arches of Lady Gay, Crimson Rambler, Dorothy Perkins, and other beautiful free-growing roses. Shrubs are not wholly excluded from these borders. Spiræas are a feature; Choisya ternata is very fine, and the Japanese Paulownia imperialis, and the beautiful Pear Bush (Exochorda Alberti) also flourish. There is nothing particularly rare among the herbaceous plants, but care has been taken to plant large irregular masses of good things, so that from early summer until late autumn there is a continuous floral display.

A giant oak ends the view along this flower-bordered path, and it is an enormous old fellow, with a huge trunk and big limbs. It is one of the many old giants in the West Country, and, like several of its fellows, finds mention in Domesday Book. All around this oak, in the grassy slopes, are thousands of anemones, crocuses, muscaris, and daffodils, so, it will be seen at once, that in addition to other claims to notice The Holmes must be a fairyland in springtime.

The Holmes garden is curiously divided. Entering the gates, the house and the gardens already described are all on the right hand, while the glasshouses and kitchen garden are on the left, hidden away behind old walls that give shelter to large numbers of pears, plums, nectarines, and peaches, the latter being particularly good examples. The shape of this garden compels Mr. Cully to exercise considerable ingenuity in the matter of cropping. He has made the best of things, and whether it be Ailsa Craig onions or the splendid rows of sweet peas, the bush apples or the beds of lily of the valley, the raspberries and gooseberries or the chrysanthemums that line the paths, the Brussels sprouts or the annuals for cutting, all respond well to his care and skill.

I am afraid I paid small attention to the inhabitants of the glass houses, but I remember that liliums and epacrises were well managed; that tuberous begonias from Sutton's seeds were providing a glorious blaze of colour; and that in one house was a splendid crop of tomatoes, the variety being Sutton's A1, which, as Mr. Cully puts it, "crops right from the bottom."

Those who frequently visit gardens must be struck with the fact that in some cases a comparatively small garden is made the most of, and is a source of great pleasure and enjoyment, while, in other cases, where there are finer opportunities, these are neglected, and one sighs over these waste places of the earth. The Holmes and its gardens occupy less than five acres, and it is the fault of the writer if it does not appear that these are brimful of horticultural interest.

ENTRANCE TO THE ROSE GARDEN, TYNTESFIELD.

The Zoo.

At the famous Clifton Zoological Gardens there are many attractions besides those of a purely zoological character. The gardens have a long frontage on Durdham Down, and the main entrance is not a very great way from the Clifton Suspension Bridge.

The grounds are well laid out, and also well planted. The extent is about twelve acres, and the position is a high one, a little to the north of Bristol proper. The original intention of the Bristol, Clifton, and West of England Zoological Society was to create a botanical as well as a zoological garden, and though this idea has not been carried out in its entirety, the gardens are, nevertheless, so attractive, and contain so many distinct features, that they merit a visit from every horticulturist who visits Bristol and Clifton, either for pleasure or business.

In addition to the elms, limes, chestnuts, etc., used to mark the boundaries of the garden and to provide effective groups around the various animal and bird houses there are a number of good specimens of coniferous and deciduous trees that were planted variously from thirty to eighty years ago, and are, therefore, in good condition. Among the conifers there are large examples of the Cedar of Lebanon and the Deodar, Pinus cembra, P. excelsa, P. laricio, P. nobilis, Sequoia gigantea, S. sempervirens, Cupressus Lawsonianus, C. torulosa, and also of Araucaria imbricata. Deciduous trees include a fine Tulip tree, the Lucombe oak, the Cork oak, the graceful fern-leaved beech, a shapely Pyrus baccata, a big scarlet sumach, and a spreading Pavia flava. These and many others stand out clearly, and show that they have received careful attention.

Hollies are conspicuous at the Clifton

Zoo, and the collection is one of the most extensive, probably the best, in the West of England. They grow very freely here, so much so that in some cases the finely variegated forms have become common shrubbery plants. In a few instances overcrowding has impaired the beauty of a specimen, but, on the whole, the hollies are in good condition, and the best of them are Ilex Dahoon, I. dipyrena, and such varieties of I. Aquifolium as angustifolia alba, argentea-regina, aureo-marginata, aurea medio-picta, balearica, ferox-argentea, fructo-lutea, Handsworthiensis, latifolia aureo-marginata, latispina, laurifolia, maderensis, ovata, and recurva. The finest examples are the specimens on the lawn, by the side of the broad Great Terrace, while others are most effectively grouped about the fine new Lion House and near the Reptile House, and at all seasons of the year the gold and silver variegation is very pleasing.

In the springtime the large beds along the terrace are gay with tulips, daffodils, hyacinths, polyanthuses, etc., and in summer they are filled with bright flowers and foliage. Between the large trees and the beds, during summer time, some noble agaves are stood, as well as several handsome palms, and these, with splendid specimen fuchsias, make the terrace a favourite promenade. The fuchsias are wonderfully well grown, many of them being 8ft. to 10ft. high, and completely clothed with foliage and graceful flowers from base to summit. Quite a number of the varieties grown are home-raised, for Mr. Harris has ever had an affection for fuchsias.

If choice hardy ferns were more popular then the Clifton Zoo would be a very Mecca for lovers of the cult. I very well remember the exhibits of hardy ferns arranged in the old Chiswick Gardens, in August, 1892, when, on the occasion of the Begonia Conference, prizes were offered for hardy ferns. Wonderful collections were then displayed by the late Mr. Lowe, of Shirenewton Hall, and by the Clifton Zoological authorities. Mr. Harris came up to Chiswick with the Clifton collection, and it was the remembrance of the ferns and Mr. Harris that induced me to trudge across Durdham Down to renew the acquaintance. It was pleasant to find oneself not forgotten even after fifteen years.

It would serve no useful purpose were I to give a list of the wonderful hardy ferns at Clifton Zoo, but it may be said at once that though familiar with the "West Country," I have never seen ferns doing so well, and certainly never such a fine collection of beautiful varieties. The frilled and crisped and tasselled Hartstongue ferns, and the exquisite beauty of the elegant Lady ferns, must all be seen to be duly appreciated. These two groups form the bulk of the collection that is arranged in low rockwork banks along the west side of the gardens. What a wondrous wealth of beauty these ferns yield, to be sure; and yet how slowly do they gain favour! The fuchsias and the hollies at the Zoo were often referred to by the horticulturists I met in and round Bristol, but of this especially fine collection of the finest varieties of hardy ferns, almost at their doors, never a word was said. Why is this thus?

Charles H. Curtis.

*** The second part of Bristol Gardens will appear in our next issue.

TYNTESFIELD: THE ORANGERY AND DIAL GARDEN.

MAXILLARIA PICTA.

There are many species of maxillaria, but a very small number of them find favour with orchid cultivators, because the majority are not showy and beautiful. M. picta is not strictly showy, neither is it very beautiful; and, moreover, it is not often seen nowadays. But for all that every visitor we have in the chrysanthemum season seems to appreciate it. It gives out a very powerful but pleasant perfume which everyone likes, and its orange and darkly spotted flowers make uncommonly neat buttonhole bouquets, and for that reason alone it is worthy of cultivation.

It is a very easy orchid to grow, the temperature of a vinery just suiting it. The treatment accorded Cypripedium insignis is just the treatment M. picta requires, and they are companion plants, in flower at the same time, though M. picta does not last so long as the cypripediums. But there is a succession of flowers which follow each other so rapidly that the flowering season extends over a fairly long period. Even in the summer time its intensely dark green foliage and healthy appearance make it a pleasant plant to look upon.

M. picta succeeds well in a mixture of peat, sphagnum moss, charcoal, and broken potsherds. The pots or pans should be filled with crocks to within a short distance of the surface, as it is a plant that does not require much compost to grow in. It is increased by dividing the plants when they commence growth in spring. During the growing season it requires a good supply of water, but during the winter a much less quantity will suffice.

M.

THE BERKHAMSTED NURSERIES.

A short time ago a very quaint pictorial advertisement appeared in the horticultural Press, depicting, in humorous fashion, the Berkhamsted Nurseries at the time of the Roman invasion. The queer mixture of old-time dress and modern glasshouses, and the irresistibly funny details of this quaint conception attracted a very great deal of attention, and reminded horticulturists that not only were the famous old nurseries still in existence, but that new life was stirring within them. After this attractive advertisement others followed depicting a heavily laden apple tree, from which depended a board carrying the legend:

H. LANE and SON.
FRUIT TREES, CONIFERS,
FOREST TREES, RHODODENDRONS,
VINES and FIG TREES.
ROSES OF ALL SORTS.
Gardens laid out and planted by competent workmen.
Estimates given.
THE NURSERIES, BERKHAMSTED, HERTS.

Many of our readers will remember the late Mr. F. Q. Lane, who for so many years carried on the Berkhamsted Nurseries that were instituted by his grandfather. He was a man of striking personality, with a patriarchal beard, and he for years was a regular attendant at the meetings of the Royal Horticultural Society. The present proprietor, Mr. B. H. Lane, is Mr. F. Q. Lane's son, and it is his keen interest in the business he has taken in hand that caused such a stir among advertisers and readers recently.

We paid a visit to the Berkhamsted Nurseries a week or two ago to see how matters were progressing. We were met by Mr. B. Lane, who drove us from the headquarters in the long High Street, up to the extensive Balshaw Nurseries, on the wide-spreading Berkhamsted Common. It was a glorious day, the sun shone brightly, touching the beeches and maples into deepest orange or brightest gold, the air was keen and bracing; it was a veritable "hunting morn," and soon we met the scarlet-coated huntsmen, the eager hounds, and a large following of riders on their way to find a fox in the not far distant coverts. Berkhamsted lies about two hundred feet above sea-level, but another three hundred feet must be climbed ere the Balshaw Nurseries are reached. Up here, with clear light, full sunshine, and fullest exposure to all the winds that blow, nursery stock is of the sturdiest and hardiest description: the wood is clean and good to look upon, the colouring of golden or glaucous leafage is wonderfully deep and bright, and the root system of every plant—and we saw hundreds lifted—is of a dense and vigorously fibrous-rooted character, that augurs well for their future welfare.

Messrs. H. Lane and Sons have several branch nurseries in Berkhamsted, but Mr. Lane is steadily concentrating his energies upon the big nursery on the common, gradually extending it as the smaller outlying branches are cleared and given up. This can be the more readily managed, because the larger nursery provides a considerable variety of soils, and its undulating character affords a variety of sites and positions for varied subjects. In a general sense, the Berkhamsted Nurseries have been most intimately associated with fruit tree production, and everyone knows that Lane's Prince Albert apple, raised here, and first exhibited before the British Pomological Society on October 26, 1857, is one of the finest of culinary varieties, a marvellous bearer, and a splendid keeper. Quite naturally this variety is largely grown, and there are fine breadths of all the leading apples, pears, plums, cherries, and other hardy fruits. Standard cherries are a very fine feature, and trained trees are also well done. We have nothing but praise for the fruit trees at Berkhamsted, for the small fruits, and particularly for the large numbers of splendid young vines so well grown here. Of the new Prince of Wales grape there is a grand stock, while of Muscat of Alexandria and Black Hamburgh, the numbers grown are as startling as the high quality of the rods.

But the two hundred and more acres directly under nursery stock contain many other things than fruit trees, and, good as are these latter, they are by no means the great distinctive feature of this extensive nursery. Flowering trees and shrubs in great variety fill large quarters, and nothing could be better than the standards of ornamental plums, cherries, almonds, and peaches, representing the best varieties, and all strong and healthy. Shrubby spiræas, deutzias, lilacs, philadelphuses, weigelas, and a whole host of charming deciduous flowering shrubs, are to be found in fine condition, and in the time of flowers they must present a fine sight. Magnolias do well here, and the firm has a very wide reputation for its young plants of M. grandiflora. Mollis and Ghent azaleas, too, are very fine, and grandly set with flower buds for next year's crop of bloom.

To us, however, good as the other plants are, the most striking feature of these nurseries lies in its magnificent collection of splendid evergreen trees and shrubs. Very rarely does one find these in such excellent condition, from the common privets, laurels, and aucubas, up to the choicest of choice conifers. In every case there are good blocks of plants, varying in size according to their age or habit, but all alike perfectly happy, shapely, clean, and bright. Rhododendrons occupy a large area, and all the best varieties are represented; while several big batches of seedlings have already given promise of excellent novelties. Hollies are also largely grown, and the colony of Golden Queen, Silver Queen, Golden Hedgehog, Milkmaid, and other variegated varieties was particularly striking. Cotoneasters succeed well here, and Azara microphylla is freely grown. Of berberises, notably B. Darwini, B. stenophylla, B. aquifolia, and B. Wallichiana, there are excellent breadths. Laurustinuses, especially the young bushy plants just opening their first flowers, were very pleasing. The firm has a fine stock of Portugal laurels, some of them being finely furnished specimens from 4ft. to 6ft. through.

THE DOMESDAY OAK IN THE HOLMES GARDENS, BRISTOL.

The "Blue" conifers have a very distinct blue shade running through their glaucous colouring, and this is especially bright in Cedrus atlantica glauca, C. Deodara glauca, and Abies Parryana glauca, and as each of these is represented by a quite considerable colony, the effect is very striking. The golden conifers are unusually brilliant, the golden yews being the finest we have seen for a long time. The Irish yews are splendid examples in various sizes. Among the cupressus, the several forms of C. Lawsoniana were the great attraction, and we were especially interested in the clean, vigorous stocks of such varieties as the glaucous Allumi, the erect growing erecta viridis, the graceful gracilis aurea and gracilis pendula, the silvery argenteo variegata, the elegant filifera, and such golden forms as aureo-variegata, lutea, and Stewarti, the latter a very brilliant and fine form of comparatively recent introduction.

We were interested to find Podocarpus andina doing well at this elevation, and to find such a quantity of beautiful plants of the retinospora section of cupressus, notably the coloured forms of obtusa, plumosa, and pisifera. Of the umbrella pine, Sciadopitys verticillata, there is a good stock of thrifty specimens, while among the larger-growing conifers we specially noted the Cedar of Lebanon, Abies grandis, A. concolor, A. Nordmanniana, A. Albertiana, hemlock and Norway spruces, and larches. The golden thuias, of both occidentalis, orientalis, and Lobbi types, were also very beautiful, and the coloured junipers appealed to us strongly.

The large stock of avenue trees is worthy of special notice, and no reference to the nurseries is complete without reference to the immense stock of standard, dwarf, and rambling roses they possess. Figs are well managed, and these, with the vines, are worthy of special attention, and they are grown in the home nursery. Here, too, are to be found several new plants, of which stocks are being propagated. Of the new rhododendrons we are not at liberty to write; but one attractive novelty the firm propose to distribute next year is a very sweetly fragrant variety of Clematis montana. The popularity of this climber is very great, but when delightful fragrance is added to its other good qualities, it becomes doubly useful.

Propagating Pelargoniums.—Northern growers have a lot of trouble in propagating bedding pelargoniums, sappy shoots being the rule rather than the exception. They invariably subject the cuttings when prepared to a hardening process, allowing them to lay for twenty-four hours spread out thinly; this allows all fresh wounds to dry over.—THOMAS SMITH.

WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

PHAIUS.—P. simulans, better known in gardens as P. tuberculosus, having now completed its growth, should be rested. I do not think it necessary to remove the plants to cooler conditions, but rather provide them with only sufficient moisture to keep the foliage and rhizome-like pseudobulbs in a normal condition. At this season the plants should receive the maximum amount of light available. I am certain a great deal depends on the proper maturing of the growths, both for the production of flowers and the future successful growth. This treatment can only be afforded between the periods of the completion of growth and when the flower scape makes its appearance. Many of the plants here have been in cultivation since the species was introduced, and they not only continue to grow satisfactorily, but many of them are far more robust than ever before. I have on previous occasions written as to the general methods of culture, so that I need not enlarge further on these particulars.

HYBRIDS AND SECONDARY HYBRIDS, such as P. Cooksoni, P. Norman, and P. Clive, are grown here with the winter-flowering cypripediums. These have completed their growth, and should also be treated as dormant plants. Only sufficient root moisture being necessary to keep the pseudobulbs and foliage plump, care at any rate should be observed to see that the potting compost becomes dry between the waterings. If excess of root moisture is given I find that instead of showing flower scapes the plants frequently produce growths. It is quite early enough to afford liberal treatment when the flower spike can be clearly discerned, in fact it is advisable not to encourage them, for there is a considerable advantage obtained in the quality of the flowers when these are able to expand under the more favourable conditions of the month of April. With drier conditions of the atmosphere it is advisable to keep the plants under close observation for insect pests. Red spider and scale are the most troublesome, and the plants should be carefully sponged whenever the pests make their appearance.

PHAIUS HUMBLOTI and its offspring always flower about two months later than the other section, and, consequently, they are in full growth for the greater portion of the winter, but as soon as growth is nearing completion it is advisable to keep the plants drier, as they are more apt to start into growth without flowering than the tuberculosus section. Atmospheric moisture should now be reduced to its minimum, and care should be observed to retain as little moisture as possible in the atmosphere during spells of cold weather or the prevalence of strong winds. There is nothing more liable to produce the disfiguring spot on Phaius than excessive moisture during the winter months. Stagnation in the atmosphere must be avoided by a discreet use of the ventilators whenever the outside conditions permit.—H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

BASKET FERNS.—This is not an ideal time for the disturbance of plants, but where a little extra warmth can be given there is no better time for filling baskets which are to be suspended from the roof, as they will have the full benefit of the light, and there is no danger of the sun being too powerful. There will also be sufficient time for the plants to become well established and hardened before the sun is too strong. The nephrolepises, davallias, etc., are the most suitable for baskets, but there are many others which may be used with advantage. In filling the baskets young, free-growing plants should be selected, and only a thin layer of moss should be used, for if too much space is taken up with it it will decay, and leave a space, and the soil will be loose. For covering the under-surface of the baskets there is no better material than Ficus repens, and if a few plants are put round the edge and pegged down they will soon form a good covering, and will help to keep the soil together without taking much nourishment from the ferns.

CAMELLIAS.—These will now derive great benefit from frequent doses of liquid manure and soot water, for the strain from the heavy crop of flowers which the plants carry will be great. More bud dropping and ill-health arises from underwatering than from any other cause. Other plants which will need feeding are early cinerarias and primulas, and as these will not dry quickly now it is better to give weak liquid at each watering than to give it stronger in doses alternately with clean water.

PALMS.—At this season of the year too much water at the roots is most injurious to palms, and every care should be taken to give sufficient only. The necessary moisture in the atmosphere should be provided by damping the floors and stages. The plants should be thoroughly overhauled and the foliage sponged.

DAFFODILS FOR FORCING.—Among flowers that may be forced into bloom quite early in the new year there are the single and double daffodils. These are without doubt among the most popular at this early season, and, unlike some other forced flowers, these daffodils, when properly managed, lose none of that exceeding beauty that graces their natural flowering in the open ground in the early spring months. On the contrary, the protection they receive when grown under glass rather adds to their beauty in at least two ways, first by the purity of the flowers, and, secondly, by a considerable addition to the length of the flower stems. To force daffodils successfully a moist atmosphere and a temperature of 40 or 45 degrees at night is ample, and this should only be very gradually increased as the growth becomes apparent under the early treatment. On no account should the pots be placed on open stages with hot-water pipes below. The syringe may be daily used to maintain a moist atmosphere, and as growth advances water may be freely given at the roots.

ROSES IN POTS.—A successional batch should be removed indoors, and but little fire-heat given at first. They should be syringed until the shoots are about an inch long; they must not be crowded in the early stages of growth, and should be kept rather dry, but as growth progresses the supply of water should be increased. A careful watch should be kept for insect pests, and prompt measures taken to eradicate them.—T. B. Field, Ashwellthorpe Gardens.

THE FLOWER CARDEN.

SNOW.—We are now liable to heavy falls of snow, and should such occur steps must be taken accordingly. First of all relieve all conifers and evergreens that are likely to be damaged by the weight of snow upon them; as many hands as possible should be provided with poles, preferably with forked ends; with these give all boughs a gentle lift upwards, shaking them so as to dislodge the snow, commencing at the bottom and working upwards. Having relieved all shrubs and trees, the carriage drives and walks must be next attended to, doing the most important first; where snow ploughs are used these should make the first round, sweepers and shovellers following. See that heaps are not made where vehicles of any sort might come in contact with them, for when snow is frozen serious damage might result. Always clear as wide a space as possible, and be specially careful to see that all drain grids are kept clear and open so that when snow is melting there is free access to the drains. Where there are ponds containing fish the ice must be broken at least once a day, and if frost is severe twice a day, to admit air for the fish.

GENERAL WORK.—While the weather remains open lawns and walks should be kept well swept and rolled, maintaining as neat an appearance as possible; all catchpits along sides of walks should be well cleaned out lest the drains become choked and useless. If the weather becomes too bad for outside work many things may be done under cover; all sheds should be cleaned out and limewashed where practicable; stakes may be sorted over, pointed, and tied up in suitable bundles ready for use another season. Proceed with any alterations on hand, and if autumn transplanting is not yet finished bring this to a close as soon as possible, though anxiety for an early finish never justifies careless planting. The mild weather has been specially favourable to the earlier planted things, enabling them to recover from the check of removal. Opportunity may also be taken to examine all plants and shrubs that are not on their own roots, for the removal of suckers, as these can now be more easily seen.

ROCK GARDEN.—Continue to pay close attention here, as the strong autumn gales generally blow a number of leaves into the nooks and recesses, which, if allowed to remain, may damage the plants underneath them, or perhaps destroy them altogether. Note where improvements may be made by spring planting; in some cases it can now be seen where an evergreen would greatly improve the appearance, but only the most suitable plants should be used. In the hardy fernery fallen leaves will be more beneficial than otherwise, unless their appearance is objected to, or wind could blow them elsewhere. They form a good protection from severe frosts, but they must be removed before growth commences in spring.

BEDDING PLANTS.—Examine and pay close attention to all summer bedding plants, both in cold and heated frames and houses; remove the lights from calceolarias, violas, pentstemons, antirrhinums, and other comparatively hardy things, as often as possible, keeping all weeds pulled out and the surface of soil pricked over. Should any have made much growth their tops may be pinched out. Avoid coddling. If there is likely to be a shortage of anything steps must be taken accordingly, and, where possible, arrange to commence propagating early in the new year. Hardy plants outside, in pots, should be plunged well below the rim of the pot in ashes, leaves, or soil, or frost may burst the pots and damage the roots.—E. F. Hazelton, Knowsley Gardens.

HARDY FRUITS.

BUSH APPLES.—In gardens where standard trees are not desirable the bush form is both interesting and profitable. Young healthy trees on the paradise stock, planted at a reasonable distance, and well managed, quickly come into good bearing, and the fruits are usually clean and well flavoured. When planting young bush trees by the side of walks in the vegetable garden they should be given ample room, although at the time of planting they may appear a long distance apart, as they soon fill up a good amount of space. On the other hand, if planted rather closely they become crowded, and to dig out every other tree would leave those remaining too far apart. The borders should be thoroughly trenched, and if the soil is in need of manure this should be thoroughly incorporated with the soil as the work proceeds, adding good fibrous loam, if obtainable. Select healthy, two or three-year-old trees, and set them out at twelve to fifteen feet apart, and about four feet from the side of the walks. Between the trees may be planted gooseberry or currant bushes to fill up space. Good varieties only should be grown, and that will maintain a long supply, such as Duke of Devonshire, Dumelow's Seedling, Bramley's Seedling, and Newton Wonder. When pruning the trees the aim should be to keep the heads nicely open, pruning to an outside bud those leading shoots required to form the future tree, the inner growth being spurred back to a couple of buds. Given careful attention the main branches should rope themselves with fruit buds and fruit. In the case of over-strong growth lift and prune the roots. Pruning of older trees should be pushed forward during fine weather, and when completed top-dress the ground; if required grafts should be selected at the time of pruning, and tied up in bundles, correctly labelled, and heeled in on a north border until they are required for use.

PLANTING.—Push forward with this work as fast as possible, while the weather keeps mild and open, for although planting may be successfully done up to the middle of March, it is better to bring the work to a finish now. Watch for ground game, and put strips of wire round trees in the open, otherwise in one or two nights some of the best young trees may be destroyed. When placing strips of wire netting round standards allow ample room for the growth of the stems for some years to come.

ESPALIER TREES. — When pruning these, if the branches have become very much crowded with long spurs a few ought to be cut away at each pruning, so that fruitful buds may be formed closer to the old wood. Cut them back or saw them off to within one inch of the old wood, and fresh buds, in most instances, will eventually form, and not only will the tree soon have a better appearance, but the fruits produced will be finer. Young trees that have not reached their limit need to be carefully pruned; the leader should be shortened just above where the next pair of branches is wanted, and at the next season's growth one shoot of the leader should be trained carefully upright, and those from the side branches be neatly preserved. See that all the labels are made good, and any suspended from the branches by wire must be examined and loosened if likely to cut the bark.—H. MARKHAM, Wrotham Park Gardens.

Apple Sales.—I think "H." (see p. 793) has but a superficial knowledge of the causes why apples sell badly, or, at least, he does not tell us all the causes if he thoroughly understands the business. I agree that the bad manner in which the fruit is sent to the market has much to do with the poor returns obtained by many growers. That, however, is not the only reason. When we hear one of the best of Kent cultivators of apples say, that in September he could not realise more than 3s. 6d. for Worcester Pearmain in first-class order, I wonder what "H." would say or do? This constantly bewailing bad packing, grading, and so forth is but a peg to hang an argument upon. The real cause of low prices at certain seasons—end of September especially—is overstocked markets. It is all very well to say that varieties like Bramley's Seedling, Wellingtons, and Blenheims should not be sold thus early, but many growers have little or no store space; and very often, too, the Michaelmas rent is a pressing argument for the early disposal of such sorts as those named. To make the best use of late varieties in their season recourse must be had to storage, and even then it is an open question if they can be advantageously placed. Where a grower has a private trade at hand he may then make the most of the late sorts of apples, but where no such favourable opportunity exists it is extremely difficult to obtain a moderately high figure in the open market after the American fruit enters into competition. Even then it is not the fault of the grower, but more that of the consumer, who sees the highly coloured fruits of the American apples and is infatuated with their appearance, to the detriment of home-grown fruit. The ordinary person, who purchases American examples of rich colouring, as a rule, does not trouble about flavour. All apples are alike to him.—E. M.

GRAPES AND HOW TO GROW THEM.—An illustrated guide to propagation, culture, and management in vineries, greenhouses, and in the open air. By J. Lansdell, F.R.H.S. Price 1s. net, by post 1s. 2d.; cloth, 1s. 6d., by post 1s. 8d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Royal Horticultural Society.

The meeting held on December 8 was chiefly notable for the displays of carnations brought up in view of the carnation show of the succeeding day. The hall was by no means full, but orchids were well shown, cypripediums figuring largely.

FLORAL COMMITTEE.

Phœnix Roebelini, a beautiful palm, was well shown by Messrs. W. Cutbush and Son, Highgate, who had a long bank of it, associated with crotons, azaleas, Otaheite oranges, ardisias, and daphnes. The Messrs. Cutbush put up a very tasteful display of carnations, showing large vases of Mrs. Lawson, Mrs. Patten, Winsor, Governor Roosevelt, Beacon, White Perfection, etc. Very bright were the poinsettias and Gloire de Lorraine begonias, set up by Messrs. H. B. May and Sons, Edmonton, and no less attractive were the handsome crotons and the useful solanums and veronicas.

Messrs. J. and F. Chatfield, Southwick, Sussex, showed a few bunches of finely-grown market chrysanthemums, notably Embleme Poitevine, Dr. Enguehart, Mrs. J. Thompson, Francois Pilon, Tuxedo, Mrs. J. Chatfield, and Winter Cheer. Messrs. W. Wells and Co., Merstham, showed a charming lot of single and market varieties of chrysanthemums that included the fine single Merstham Jewel and the splendid golden decorative R. F. Felton, and the large white single Dorothy Fortescue. Messrs. H. Cannell and Sons, Swanley, showed a very bright lot of cut zonal pelargoniums, setting these useful flowers up in their usual fine style. Mr. E. Potten, Cranbrook, Kent, showed a double-flowered variety of the renowned Paul Crampel pelargonium, a variety that ought to be very useful; it is bright scarlet.

Messrs. Hugh Low and Co., Bush Hill Park, Enfield, put up a bold and effective exhibit in the centre of the hall, thus taking a leaf out of the National Sweet Pea Society's book. This circular exhibit was wholly filled with carnations: carnations in stands, in vases of various sizes, and in suspended bowls and baskets. Ferns, asparagus, and smilax were used as greenery, and the whole display was an excellent one. A few of the leading varieties on view were Mrs. T. W. Lawson, Lady Bountiful, Winsor, Winona, Enchantress, Mikado, Britannia, Beacon, and other fine kinds. The Messrs. Low also contributed a group of cyclamens.

A very fine exhibit of winter-flowering carnations was made by Mr. Jennings, gardener to Leopold de Rothschild, Esq., Ascott, Leighton Buzzard. This consisted of batches of finely-grown and free-flowering plants of Mrs. T. W. Lawson, Winsor, Enchantress, My Maryland (very fine), Lady Bountiful, Cardinal, Robt. Craig, Flamingo, Victory, Mrs. M. A. Patten, Jessica, and Governor Roosevelt. Messrs. Bell and Sheldon, Castel Nursery, Guernsey, set up a charming lot of well-grown carnations, showing splendid bunches of fine flowers of Enchantress, Winsor, Beacon, The President, Mrs. Burnett, White Enchantress, etc., and the group was edged with small vases of winter-flowering sweet peas. Mr. A. F. Dutton, Iver, Bucks, exhibited winter-flowering carnations in good style, and Messrs. J. Peed and Son, Norwood, submitted a group of these flowers.

Winter-flowering carnations were largely and well shown by Mr. G. Lange, Hampton, and his set included fine bunches of Fair Maid, Beacon, Winsor, White Perfection, etc. Messrs. Blackmore and Langdon, Bath, showed a very rich carmine carnation named Mary Wilson. Messrs. R. H. Bath, Lim., Wisbech, showed chrysanthemum Ball of Gold (A.M.), a fine golden sport from the incurving Snowdrift.

The Misses Hopkins, Shepperton, sent a few alpines and hardy flowers. Messrs. T. S. Ware, Lim., Feltham, submitted a collection of alpines and hardy flowers, and a small group of carnations. Messrs. Jas. Veitch and Sons, Chelsea, contributed a splendid bank of winter-flowering begonias, the varieties Ensign and Winter Cheer being very fine, free, and brilliant. This firm also showed the sweet-scented Luculia gratissima, and a small display of carnations in pots, showing the habit and free-flowering properties of the popular sorts.

From the Garden City, Letchworth, Mr. Cole brought up a large number of plans of gardens, sent in for the competition instituted by the City Company; these were wonderfully varied, showing how widely diverse are the ideas concerning the way in which any given garden may be laid out. Madame Albert, Acton, sent a group of flower studies in oils and water colours. Paintings of flowers, chiefly tulips, and garden scenes were submitted by Mr. Frank Galsworthy, Chertsey. The tulips were, on the whole, particularly good.

ORCHID COMMITTEE.

Messrs. Sander and Sons, St. Albans, exhibited numerous cypripediums and several spikes of a very fine form of Oncidium varicosum Rogersi. Among the former we noticed C. Prospero majus, C. Swinburnei magnificum, C. Actæus nivalis, C. Leeanum Clinkaberryanum, C. Niobe pulcherrimum, C. Corneyanum the Duchess, C. Charlesworthi Temeraire, with a huge dorsal sepal, and C. Troilus Lord Nelson (A.M.). A fine feature of the group was the brilliant Odontoglossum crispum Diana. Messrs. Moore, Lim., Rawdon, Leeds, sent up a small contribution of cypripediums of various kinds, with a small central group of choice odontoglossums, such as O. Harryano-crispum, O. Vuylstekæ, and O. Loochristiense; there was also a fine form of Cypripedium Chamberlainianum in this group.

Mr. Hopkins, gardener to Francis Wellesley, Esq., Westfield, Woking, showed Cypripedium The Premier, a very richly-coloured, burnished flower of large size and great beauty. It is the result of crossing C. Mons de Curte and C. Mrs. Mostyn. Mr. Hopkins also showed the yellow C. Actæus Golden Gem. Mr. Black, gardener to R. Thwaites, Esq., Chessington, Streatham, sent a pretty form of Cattleya Maggie Raphael. A fine spike of Odontoglossum G. P. Walker was sent by Mr. Macgregor, gardener to G. P. Walker, Esq., Heatherwood, Putney Heath. Mr. J. H. Hill, Burgess Hill, Sussex, sent up Lycaste Skinneri alba, Odontoglossum constrictum, O. crispum, and numerous good cypripediums.

Messrs. Jas. Cypher and Sons, Cheltenham, staged a very attractive group of cypripediums; varieties of the insigne and Leeanum groups predominated, and there were goodly plants of C. insigne Sanderæ, C. i. Harefield Hall, C. Leeanum, C. Fairrieanum, etc., together with a few sprays of Dendrobium Phalænopsis Schroderianum, and some flowers of the Butterfly orchid, Oncidium Krameri. H. J. Bromilow, Esq., Rann Lea, Rainhill, put up a small group of choice cypripediums that included C. bellatulum album, C. Fairrieanum Fascinator, C. Germaine Opoix, C. Maudæ magnificum, C. Thalia Mrs. F. Wellesley, C. Fulshawense, C. Lord Ossulston, C. insigne Harefield Hall, etc.

Messrs. J. and A. McBean, Cooksbridge, Sussex, showed fine blooms of Cypripedium insigne Sanderæ, some charming spikes of Odontoglossum crispum in variety, and Vanda cærulea. Mr. Alexander, orchid grower to Lieut.-Colonel Holford, Westonbirt, Gloucester, brought up some cypripediums and a pretty Lælio-cattleya. Messrs. Hugh Low and Co., Bush Hill Park, Enfield, showed a small group of cypripediums, with Cycnoches chlorochilon, C. maculata, Dendrobium Cœlogyne (A.M.), and Oncidium varicosum Bush Hill var., with a bright red-brown base to the flowers. Messrs. Armstrong and Brown, Tunbridge Wells, contributed a large group of well-grown cypripediums, and C. Leeanum grandis, C. insigne Chantini, C. Minos Youngi, C. i. Sanderæ, C. Armstrongi (A.M.), and C. Leeanum superbum were particularly good.

Messrs. Charlesworth and Co., Haywards Heath, showed several beautiful orchids, including Phaio-calanthe Colmani, Odontoglossum Lambeauianum, O. crispo-Harryanum, O. ardentissimum, Lælia albida, L. anceps Waddonensis, Trichopilia suavis, Lælio-cattleya Golden Oriole, and the brilliant crimson Odontioda Bohnhofiæ, Brasso-cattleya Cliftoni (F.C.C.), a pretty hybrid from B.-c. Digbyano-Mossiæ and C. Trianæ Upland's var. Messrs. Heath and Son, Cheltenham, showed a small group of orchids and a few winter-flowering carnations.

MESSRS. HUGH LOW AND CO.'S GOLD MEDAL EXHIBIT OF CARNATIONS AT THE PERPETUAL-FLOWERING CARNATION SOCIETY'S SHOW ON DECEMBER 9.

FRUIT AND VEGETABLE COMMITTEE

A collection of well-grown onions, chiefly Excelsior, Cocoanut, Ailsa Craig, A1, etc., was shown by Mr. B. W. Bedford, gardener to R. H. Ling, Esq., The Braes, Berkhamsted.

MEDALS.

Silver-Gilt Flora.—Messrs. Hugh Low and Co., Enfield; Mr. Jennings, gardener to Leopold de Rothschild, Esq., Ascott, Leighton Buzzard.

Silver-Gilt Banksian. — Mr. H. Burnett, Guernsey; Messrs. H. Cannell and Sons, Swanley.

Silver Flora.—Messrs. Bell and Sheldon, Guernsey; Mr. Lange, Hampton; Messrs. Jas. Veitch and Sons, Chelsea; Messrs. W. Cutbush and Son, Highgate; Messrs. H. B. May and Sons, Edmonton; Mdme. Albert, Acton; Mr. F. Galsworthy, Chertsey; Messrs. Cypher and Sons, Cheltenham; Messrs. Sander and Sons, St. Albans; Messrs. Charlesworth and Co., Haywards Heath; Messrs. Armstrong and Brown, Tunbridge Wells; Messrs. J. and A. McBean, Cooksbridge; Mr. Bromilow, Rann Lea, Rainhill.

Silver Banksian.—Messrs. J. Peed and Son, Norwood; Messrs. T. S. Ware, Lim., Feltham; Messrs. Moore, Lim., Leeds; Messrs. Hugh Low and Co., Enfield (orchids); Mr. R. H. Ling, Berkhamsted.

CERTIFICATES AND AWARDS.

First-Class Certificate. — To Brasso-Cattleya Cliftoni, from Messrs. Charlesworth and Co., Hayward's Heath.

Award of Merit.—To Chrysanthemum Ball of Gold, from Messrs. R. H. Bath, Wisbech; Dendrobium Cœlogyne, from Messrs. Hugh Low and Co., Enfield; Cypripedium Armstrongi, from Messrs. Armstrong and Brown, Tunbridge Wells.

Winter-flowering Carnation Show.

A beautiful exhibition of perpetual-flowering carnations was held at the Royal Horticultural Hall, Westminster, on Wednesday, December 9, under the auspices of the Perpetual-flowering Carnation Society. The flowers were beautiful, reminding one by their colour and fragrance of summertime. Considerably less than ten years ago such a lovely display in December would have been impossible, and every lover of flowers must pay a tribute of thanks to those who have worked so hard to bring the flowers prominently before the public. We have but one word of criticism, and it refers to the large number of vases, in competition and otherwise, with unlabelled flowers. Naming should be enforced.

OPEN CLASSES.

There were four competitors in the leading class for a collection of cut blooms, arranged on a table space of 10ft. by 3ft., and here the premier award, a gold medal, was won by Mr. W. E. Wallace, Eaton Bray, Dunstable, with a bold and beautiful exhibit of fine flowers. The varieties, set up in large glass vases, included Mrs. T. W. Lawson, Lady Bountiful, White Perfection, Britannia, Enchantress, etc. Mr. C. F. Waters, Deanland Nursery, Balcombe, came second with a charmingly arranged display of good blooms associated with asparagus sprays; Victory, Lady Bountiful, Harlowarden, Afterglow, Enchantress, and Mrs. Burnett were very good in this exhibit. Mr. W. H. Page, Tangley Nurseries, Hampton, came third.

Mr. W. E. Wallace, Eaton Bray, had the finest vase of thirty-six blooms of a white variety, leading with White Perfection; Mr. Lange, Hanworth Road, Hampton, second; and the Newport Carnation Nursery Company, Newport, Essex, third, with the same variety. Enchantress was the best blush variety, and it was best shown by the Newport Carnation Nursery Company; Mr. W. H. Lancashire, Victoria Vineries, Guernsey, second; and Messrs. Bell and Sheldon, Castel Nurseries, Guernsey, third, in this class for a blush variety, each showing Enchantress.

Mr. Lancashire scored for a salmon or light pink variety with beautiful flowers of Mrs. Burnett; Messrs. Bell and Sheldon second with Winsor; and Mr. H. Burnett, St. Margaret's Nurseries, Guernsey, third, with Mrs. Burnett. Mr. Lancashire was first in the class for a deep pink variety, and he had a fine set of three dozen blooms of Mrs. T. W. Lawson, of fine size and colour; there was no other competitor.

In the crimson class Mr. W. H. Lancashire led with President, very rich; Messrs. Bell and Sheldon coming second with the same variety. Mr. Lancashire was a good first in the scarlet class with beautiful blooms of Robert Craig; Messrs. Bell and Sheldon second with Britannia. For a fancy variety Mr. C. Engelmann, Horneybrook Nursery, Saffron Walden, led with Imperial, a rose-pink variety with red flaking; Mr. Lancashire second with Empress, a new white seedling, very lightly splashed with rose.

SECOND DIVISION.

One section was arranged for vases of eighteen blooms, and from this section Channel Islands growers were barred. In the white class Mr. W. H. Page led with Lady Bountiful; Mr. D. M. Collins, Heathfield Nursery, Swanley, second, with White Perfection. Mr. Page led in the blush class with solid flowers of Enchantress; Mr. J. A. Witney, Cholsey, Berks, second. In the light pink or salmon class Mr. A. F. Dutton, Iver, Bucks, scored with Winsor; Mr. C. Engelmann second with the new pink Rex; and Mr. Page third with Winsor. For a deep pink or rose variety the Newport Carnation Nursery Company won first place; Mr. Page was second, and Mr. D. M. Collins, third. In the crimson class Mr. W. H. Page led with Harry Fenn; Messrs. B. and V. Haig, Castle Hill, Maidenhead, second.

Mr. Dutton led for eighteen blooms of a scarlet variety with beautiful flowers of Victory; Newport Carnation Nursery Company, second; and Mr. G. West, gardener to F. Ricardo, Esq., The Friary Gardens, Old Windsor, third. Mr. Dutton was also first in the "any other colour," or fancy class with Imperial.

GARDENERS AND AMATEURS.

In the gardeners' and amateurs' class for a collection of cut blooms, arranged on a space 6ft. by 3ft., Mr. A. E. Usher, gardener to Sir Randolf Baker, Bart., Ranston House, Blandford, Dorset, was a splendid first prizewinner, with large vases of fine flowers of Oriflamme, Britannia, Winsor, Lady Bountiful, White Perfection, Harlowarden, Enchantress, Mrs. T. W. Lawson, and Robert Craig; Mr. A. Grubb, second. Two pretty groups of carnations, in pots, were arranged, and the premier award fell to Mr. A. Grubb, gardener to C. F. Raphael, Esq., Shenley, Herts, who had a charming exhibit of well-grown plants, neatly edged with ferns; Mr. J. Vert, second. Mr. J. Vert, who is gardener to Lord Howard de Walden, Audley End, Saffron Walden, was the only exhibitor of a dozen plants in flower, and he was awarded the first prize for well-grown examples of Winsor, Mrs. Burnett, Beacon, Welcome, Salmon Lawson, and Britannia.

Mr. J. G. Weston, gardener to H. J. King, Esq., Eastwell Park, Ashford, Kent, had the best three blooms of a white variety, White Perfection, and with these he gained the special prize for the best vase in the three-bloom classes; Mr. J. Vert second, and Mr. Usher third. For three blush blooms, Mr. Usher led with Enchantress; Mr. Weston second, and Mr. Vert third. For three flowers of a light pink or salmon variety, Mr. Weston scored with Mrs. Burnett; Mr. Usher second, and Mr. Vert third. Mr. Vert led for three deep pink or rose flowers with Mr. Usher second, and Mr. West third with Mrs. T. W. Lawson. Mr. Vert led for three crimson blooms with Crimson Glow; Mr. Weston second, and Mr. West third. For a scarlet variety Mr. Weston scored with Britannia; Mr. Grubb second with the same variety, and Mr. West third with Robert Craig. Mr. Usher led in the fancy class, followed by Mr. Weston and Mr. Vert

The best vase of twelve blooms in not less than six varieties, was shown by Mr. A. E. Usher, and he had some beautiful flowers; Mr. Weston second, and Mr. Vert third; five entries.

SPECIAL AND DECORATIVE CLASSES.

Mr. E. G. Hill's special prize for Afterglow was won by Messrs. Bell and Sheldon with a pretty vase of blooms, and the same exhibitors won Mr. F. Dorner's prize for the best vase of Winona, and the F. R. Pierson Company's prize for Winsor. For a vase of carnations shown for decorative effect, Mr. D M. Collins led with Fair Maid, and Mr. A. E. Usher was second with Mrs. Burnett.

The best table decoration was adjudged to be the one set out by Mrs. Robinson, Norhyrst, Park Hill, Carshalton, who had a light design in Enchantress flowers; Messrs. R. F. Felton and Son, Hanover Square, second with a beautiful low arrangement of lovely blush and heliotrope blooms; Mr. Usher third with a design composed of Mrs. Burnett. Mr. Usher had the best three ladies' sprays, and in this class Messrs. B. and V. Haig came second, and Mr. A. Grubb third. For gentlemen's buttonhole bouquets Mr. Grubb led with some fine blooms; Mrs. C. Robinson, Norhyrst, Park Hill, Carshalton, second, and Mr. A. E. Usher third.

NON-COMPETITIVE.

A considerable number of exhibitors held over their displays from the previous day, and these are commented upon in our R.H.S. report. The exhibitors were: Mr. Jennings, gardener to Leopold de Rothschild, Esq., Leighton Buzzard; Messrs. J. Veitch and Sons, Chelsea; Messrs. T. S. Ware, Lim., Feltham; Messrs. J. Peed and Son, Norwood; Messrs. W. Cutbush and Son, Highgate; Messrs. Bell and Sheldon, Guernsey; Mr. H. Burnett, Guernsey; Messrs. H. B. May and Sons, Edmonton; and Messrs. Hugh Low and Co., Enfield.

From the American Carnation Nursery (Mr. W. Kiner, manager), Sawbridgeworth, came a charming exhibit of carnations, facing the hall door. The flowers were well grown, and the dainty disposition of the blooms over white paper, and with asparagus and smilax, was delightful; Enchantress, Mrs. Burnett, Afterglow, Mrs. Lawson, Winsor, Beacon, and Imperial were well shown, among many others. Mr. C. Engelmann, Saffron Walden, showed a fine lot of blooms, and had some interesting yellow seedlings on view. Mr. Lange, Hampton, put up a nice group of good blooms of the leading varieties. Mr. W. H. Lancashire, Guernsey, had a whole group of his new, soft rosy-red variety, named Rose Dorée, and this fine carnation was the only one that passed muster with the Floral Committee; it was granted a First-Class Certificate. Mr. Jas. Green, Reliance Works, March, showed good carnations, and wires for flower and plant supports.

MEDALS.

Gold.—Messrs. Hugh Low and Co., Enfield; Messrs. Bell and Sheldon, Guernsey; Mr. Jennings, gardener to Leopold de Rothschild, Esq., Leighton Buzzard.

Large Silver. — Messrs. W. Cutbush and Son, Highgate; Mr. H. Burnett, Guernsey; Mr. Lange, Hampton; Mr. C. Engelmann, Saffron Walden.

Silver.—Mr. James Green, March; Mr. W. H. Lancashire, Guernsey; Messrs. J. Peed and Son, Norwood.

Smithfield Club Show.

Fat cattle was, as usual, the main feature of this show, but there was, nevertheless, much of interest to the gardener to be seen in the gallery, which runs round the four sides of the spacious Agricultural Hall. The exhibits represented the utilitarian rather than the decorative side of horticulture, but from an educational standpoint, there can be no doubt as to the value of the display of vegetables and roots. We were gratified to see that gardeners as well as farmers attended in goodly numbers to inspect the exhibits in this section. Messrs. Sutton and Sons, Reading, made a most imposing display of turnips, potatoes, swedes, mangels, and popular garden vegetables. To mention in detail the many good things to be seen on this stand would occupy much space, and it must suffice to say that everything shown was of a high degree of excellence. A distinct note was struck by the introduction of several groups of finely-grown cyclamen, which afforded a welcome break from the prevailing vegetables.

Messrs. J. Carter and Co., High Holborn, maintained their reputation by staging a remarkable array of farm and garden roots and vegetables. The mangels exhibited were quite exceptional in regard to their size and form, and colour, demonstrating high cultivation in conjunction with purity of stocks. Among the vegetables Carter's Record onion was conspicuous, and Carter's Orange Giant carrot was represented by excellent roots.

Messrs. Harrison and Sons, Leicester, occupied a large space with their fine exhibit of vegetables, roots, and cereals. Of greater interest to our readers were the excellent examples of Harrison's Intermediate, Early Market, and Exhibition carrots, three quite distinct varieties. The onions were of great merit, and included Ailsa Craig, Excelsior, and Improved White Spanish.

Messrs. John K. King and Sons, Coggeshall, put up a capital collection of vegetables. Potatoes were represented by Mighty Atom, a good, heavy cropper, King John, a large oval; and Senator, a variety of handsome appearance, and well recommended for flavour. Among onions Nulli Secundus and Exhibition Globe were conspicuous.

Messrs. Webb and Sons, Wordsley, Stourbridge, occupied their usual position, and on their elaborate stand was a great display of roots, vegetables, and seeds of high quality. The potato New Empire was shown in capital form, and has great promise. Messrs. C. Fidler and Sons, Reading, showed a fine collection of potatoes, comprising over sixty varieties, prominent among them being Fidler's Invincible.

Messrs. Wm. Davie and Co., Haddington, N.B., brought down a number of the newer potatoes.

Messrs. E. W. King and Co., Coggeshall, contributed farm and garden produce of high quality.

A good collection of fruit was staged by Messrs. W. and J. Brown, Stamford. Messrs. W. Horne and Sons, Cliffe, Rochester, staged apples in about twenty varieties, all excellent fruits. Messrs. Dicksons, Lim., Chester, had a number of good varieties of apples, also potatoes and samples of grass seeds.

Potato Show, Bingley Hall, Birmingham.

NOVEMBER 30—DECEMBER 3.

The potato competitions, held in connection with the 60th annual Fat Cattle Show, on the above dates, resulted in a good average display, the season having been generally conducive to a fine development of the noble tuber. Among the 2,600 specimens submitted there were but few of those forms which were boomed some seasons back, but there were many very attractive collections, several of the awards in the higher classes going to a well-known amateur cultivator in Bucks.

Ten classes were provided for, and eight collections were entered for twelve dishes, distinct, twelve tubers each, the champion award, £5, falling to Mr. W. Coleman, 13, Hunters Street, Buckingham, whose collection comprised handsome and bright tubers of Lord Roberts (W.K.), Eightyfold (C.R.), Sir John Llewelyn (W.K.), Duchess of Cornwall (W.K.), Purple Perfection (P.R.), Ninetyfold (W.K.), Snowball (W.R.), Superlative (W.K.), Factor (W.K.), King Edward VII. (C.K.), Windsor Castle (W.R.), and Million Maker (W.K.); the second prize of £3 went to Mr. Benjamin Parker, Scotforth, Lancaster, whose best varieties were Crimson Beauty (C.K.), Epicure (C.R.), The Dean (P.R.), Midlothian Early (W.K.), Early Rose (C.K.), British Queen (W.K.), Red Ashleaf (C.R.), Nobleman (W.K.), Satisfaction (W.K.), Lowser (C.R.), King Edward VII., and Duchess of Cornwall. Mr. T. Bannister, Malthouse Farm, Marston Green, Birmingham, was third with samples of most useful table size and shapely, those claiming notice being Lord Tennyson (C.R.), Lymm Gray (W.R.), Factor, Windsor Castle, Up-to-Date, Scottish Triumph (W.K.), and Beautiful (W.K.), excellent. For six sorts Mr. Coleman again headed the list, Factor, Dalmeny Beauty, and Peckover (W.R.) being very attractive dozens; Mr. Bannister second, with fine tubers of Factor, Table Talk, and Duchess of Cornwall; Mr. B. Parker third, having remarkable dishes of Midlothian Early and Talisman (W.K.) For four varieties Mr. Coleman headed the list with Queen of the Veldt (P.K.), Factor, Duchess of Cornwall, and Mr. Bresee (C.K.); Mr. J. W. Needham, Wildsworth, Gainsborough, Lincoln, second, his dozen of King Edward VII. being shapely and very highly coloured; His Grace the Duke of Portland, Welbeck Abbey, Notts, third, having, among others, a grand dozen of Mr. Bresee. For four varieties suitable for farm or field culture Mr. Coleman once again scored a premier, putting up noble specimens of Factor, Scottish Triumph, Duchess of Cornwall, and Up-to-Date. Mr. Bannister followed closely, substituting Table Talk for Scottish Triumph, otherwise the varieties were the same. Mr. Parker third, his best dish being Satisfaction. For two dishes, long or kidney shape, Mr. Needham led with large examples of King Edward VII. (eyes somewhat deep), and Empress Queen (W.K.); Messrs. Coleman and Bannister taking the lower awards, each submitting Factor and Up-to-Date. For two dishes of round varieties, Mr. Bannister led with perfect specimens, Table Talk being specially good. Mr. John Neaverson, Eye, Peterborough, second, with Gold Mine and Reading Russet, Mr. Needham third, for Marsland Queen and Monarch. For a single dish, long or kidney shape, Mr. Coleman put up Factor, and Mr. Bannister staged Up-to-Date, and for one dish of rounds the awards fell to Messrs. Bannister and Neaverson, who submitted Table Talk and Satisfaction, while for the handsomest dish of tubers Mr. Bannister secured the first and second places with Table Talk and Duchess of Cornwall.

Varieties not yet in commerce were limited, the first prize going to Mr. Parker for Royal Albert, an early white round, somewhat pebble-shaped, with a beautiful netted skin, the second award going to the Duke of Portland's Welbeck Abbey, a broad flattish white tuber with squarish ends and smooth skin.

Non-competitive displays were scarcely as numerous as usual, but Messrs. Webb and Sons had a grand collection, artistically arranged, of grass seeds, specimen mangolds, swedes, turnips, wheat, barley, and oats, choice potatoes, including several seedlings, and very fine examples of onions, carrots, parsnips, beet, and leeks. Messrs. Dicksons, Lim., Chester, made a remarkably fine show of apples, potatoes, grasses, and farm seeds; and Messrs. Dickson and Robinson, Manchester, had fluted columns of swedes and mangolds, in addition to their tastefully posed grasses. Messrs. Harrison and Sons, Leicester, had a choice assortment of mangolds, swedes, peas, and other vegetables. Messrs. Little and Ballantyne, Carlisle, had seeds and potatoes. Messrs. W. R. Green and Son, Wisbech, contributed potatoes; and Mr. Scarlett, Edinburgh, staged Scotch-grown seed potatoes, etc.

Reading and District Gardeners' Association.

At the fortnightly meeting held in the Abbey Hall on November 30, Mr. Tunbridge (chairman) presided over the largest assembly of members during the present session.

The subject of the evening was "Cyclamen," by Mr. Goatley, head gardener to Lord Northcliffe, and representative of the Guildford and District Gardeners' Association.

In calling upon the lecturer, the Chairman remarked that Mr. Goatley needed no introduction to the Reading Gardeners' Association, and that he remembered the time, now some years since, when, as a young man, Mr. Goatley first volunteered to read a paper before this society, and he congratulated him on the high position he now held in the profession. The lecturer, who has earned a reputation for cyclamen growing, dealt fully with each phase of the subject.

Referring first to the composition of the soil required for raising cyclamen from seed, then to the care and treatment of the young plants until the formation of a number of leaves, he afterwards specially emphasised the necessity of frequently syringing the plants while in active growth, this operation not only keeping them moist and cool, but also proving a great preventive from such pests as thrips and greenfly. In his opinion, it was not desirable to keep plants longer than three years, and he could safely say that the best blooms were always obtained from seedlings, which in his houses flowered continually for eight months of the year. He did not, however, recommend that the plants should be allowed to bloom so long if flowers were required the second year. Mr. Goatley not only treated fully the culture of the plants, but also endeavoured to trace the history of the now popular Cyclamen persicum. As the name implies, a native of Persia, it was interesting to note the many countries that have contributed to the advance of this favourite flower. It was introduced into England from the Island of Cyprus in 1731.

A prolonged and animated debate followed the lecture, among those taking part being the Chairman (Mr. Tunbridge), Messrs. Wilson, Hinton, Exler, Neve, Harris, Loader, F. Townsend, Judd, Fry, Wynn, Durbidge, Wicks, etc.

The exhibits were appropriate to the evening, Mr. D. Harris (gardener to the Hon. A. Mills, Mapledurham House), was awarded a certificate for an exceedingly beautiful display of well-grown cyclamen. The non-competitors, who were accorded a vote of thanks, were Mr. F. Townsend, gardener to the vice-president, L. G. Sutton, Esq., group of very fine cyclamen, and a lovely basket of Begonia Gloire de Lorraine; Mr. Exler, gardener to Rufus Isaacs, Esq., K.C., M.P., large collection of berried solanums, from seed sown in February; and Mr. H. C. Loader, gardener to Mrs. Anderdon Weston, Holme Grange, Wokingham, vase of Iris stylosa.

Hearty votes of thanks to the lecturer and chairman concluded the meeting. Two new members were elected.

National Chrysanthemum Society.

A meeting of the General Committee was held at Carr's Restaurant on Monday, December 7, Mr. T. Bevan in the chair. Ordinary routine business occupied most of the time. It was interesting to learn that all the available space on the Holme's Memorial Cups has been used for engraving winners' names upon, so that a silver band on the plinth will be needed to record future winners. Provisional arrangements were made for the society's summer outing and a water trip will probably be part of the programme.

After this meeting the annual dinner of the members of the Floral Committee was held, under the chairmanship of Mr. D. B. Crane. There were about two dozen present, and a very bright and pleasant evening was spent. The speeches were short, and the stiffer style of a more formal meeting gave place to a good deal of pleasant humour. The various toasts were "The King," "The National Chrysanthemum Society," "The Floral Committee," "The Trade Growers," "The Market Men," "The Horticultural Press," "The Chairman," and "The Secretary." The speakers were Messrs. D. B. Crane, T. Bevan, T. W. Sanders, McKerchar, Witty, Curtis, Ballantine, Wells, Ingamells, and Prickett. Songs and humorous stories were sandwiched between the short speeches, and Messrs. Crane, Howe, Tyler, H. Sanders, Curtis, Harman Payne, and two friends of Mr. Wells gave help in this part of the programme.

Many wise things were said, and many useful suggestions were made in the various speeches, and it will probably happen that this pleasant little function, with its easy freedom from the cast-iron restrictions that prevail at so many meetings, will prove of considerable value to the future well-being of the society.

OBITUARY.

MONS. CHARLES BALTET.

France has lost a great horticulturist by the recent death of M. Chas. Baltet. Born at Troyes in January, 1830, M. Baltet came of a long line of horticulturists, and he early showed a keen interest in the progress of his chosen profession. When only 26 years of age he presided at the first congress held by the French Pomological Society, and he has been intimately associated with every great horticultural movement in France ever since. As a writer, M. Baltet has been widely read and appreciated, and his best-known work, in this country, is "The Art of Grafting." As a raiser of new fruits, M. Baltet will long be remembered for his peaches Baltet and Prècoce de Croncels, for his pears Charlet Ernest and Virginie Baltet, and his apple Transparent de Croncels. The foundation of the Versailles School of Horticulture was due chiefly to M. Baltet in conjunction with his friend M. Pierre Joigneaux. He also founded a very interesting prize in connection with the Société Horticole de l'Aube, to be given, biennially, to the father of a family who had trained his children in the practice of horticulture. A fine man in every sense of the word was M. Baltet, for, in addition to his general horticultural activities, and his work as a nurseryman, he did not neglect his duties as a citizen, and he was for a long time the doyen of the Municipal Council of Troyes. The funeral took place at Troyes on November 28. It was of a public character, and it was attended by a very large number of the leading horticulturists of France.

FORTHCOMING ENGAGEMENTS.

WEDNESDAY, December 16.—Royal Society of Arts, Meeting at 8 p.m.

TUESDAY, December 22.—Royal Horticultural Society: Committees meet at 12 o'clock; General Meeting at 3 p.m.; Scientific Committee at 4 o'clock.

FRIDAY, December 25.—Christmas Day.

SATURDAY, December 26.—Bank Holiday.

NEW BOOKS.

HOLLY, YEW, AND BOX.

By W. Dallimore. (John Lane, The Bodley Head, London). Price, 7s. 6d.

The holly, yew, and box occupy such prominent positions in garden scenery, and have so much that is of interest associated with them, that the work now before us is especially welcome. A few other classes of evergreens, such as the laurels, heaths, ivies, are included, but these are dealt with more briefly than the shrubs which form the title of the work.

The chief value of the book consists in the information it gives on the holly, yew, and box, and this is very great; so great, in fact, that the book should have a place in all garden libraries. As an indication of its scope we would mention that the section devoted to hollies extends over 144 pages, and contains all the information, clearly and pleasantly stated, the planter or garden lover could wish to know, relating to these shrubs. There is, for example, a general description of the holly family, and chapters on propagation and general cultivation, the uses of hollies, hollies as specimens, and as town trees, the making of hedges, and on Ilex aquifolium and its varieties, and other species. There are also chapters on the history and poetry of the holly which are admirably done, and form highly interesting reading. The species mentioned and its numerous forms occupy seven chapters, and the descriptions, which are mostly based on those prepared by the late Thomas Moore, are so full and accurate that they cannot fail to render valuable assistance in the identification of doubtful forms, and in determining the suitability of any particular variety for a certain position. In addition to the letterpress description, illustrations are given of the leaves of the majority of the varieties. There are also illustrations of specimens, and of groups of hollies from photographs taken in the Royal Gardens. The sections devoted to the yew and box are not less remarkable for their usefulness and interest, and the planter can turn to them with the assurance that he will obtain the information necessary to clear up any point about which he may be in doubt.

Except that the design on the cover does not appeal to one, the book is admirably produced, and the publisher may be congratulated on the results.

THE FLORIST'S BIBLIOGRAPHY.

By C. Harman Payne, F.R.H.S. (William Wesley and Son, 28, Essex Street, Strand, W.C.)

We have no information as to the price of this admirable work, but were we to make a guess, we should not hesitate to say that the charge made for it inadequately represents the care, thought, and time that has been devoted to its preparation. But few readers of books have a full appreciation of the judgment required, and the time involved in the compilation of a bibliography of a subject having so wide an area as that of florists' flowers. Still fewer are those who have the ability and the courage to engage in work so difficult and so little likely to bring a full measure of praise or profit, however well it may be done. Happily for themselves and for students bibliographists regard their work as a labour of love, and filled with a desire to afford all the assistance they can to those who in their course of reading may desire to consult those of an early period, as well as those of modern date, they are amply satisfied if they accomplish their object. It was, we doubt not, in such spirit as this that Mr. Payne entered upon the preparation of the work now before us, and laboured with such assiduity to make it as perfect as is possible for a book of this class to be. The author speaks of his "Florists' Bibliography" as "this little book," and were we to judge it with the aid of a tape measure, we should probably express our agreement with him; but when we open the book and carefully examine the thousand or more entries of books relating to floriculture, we are disposed to think that a wholly different term might be applied to it. It certainly represents a great effort satisfactorily accomplished, containing as it does practically all the books on floriculture, except those relating to roses, that have been published during the past three centuries, and carefully classified with the name of the author, date of publication, etc. The omission of the rose from the work because a bibliography of the flower in the Spanish language was published some years ago, is, in our opinion, a mistake on the part of the author, and we shall hope to see in the second edition of "The Florist's Bibliography" the rose occupying its proper place within the covers.

HANDBOOK OF HARDY TREES AND SHRUBS.

By George Bunyard, V.M.H. (George Bunyard and Co., Lim., Maidstone.) Price 3s. 6d.

This practical work on the selection and planting of trees for the garden and park makes its appearance at an opportune moment, and can hardly fail to receive a hearty welcome from those engaged in planting operations. In a series of well-arranged chapters, the author passes under review park and paddock trees, specimen trees for lawns and gardens, coniferous trees, evergreen shrubs, deciduous and other shrubs and trees remarkable for the beauty of their flowers, and bamboos and ornamental grasses. In the course of the review the kinds of special excellence are indicated, and the positions pointed out for which they are best adapted. There are also selections of trees and shrubs specially suited for the seaside, for chalk soils, for rockeries, for positions where rabbits abound, and for hedges and shelter. The book is an excellent guide on all that relates to the selection and planting of trees and shrubs, and its value is materially enhanced by the illustrations, which are reproductions of drawings from Nature by Miss Frances L. B. Bunyard. It would have been an advantage had the inscriptions to the illustrations been in ordinary type, for the written inscriptions in a large hand somewhat detracts from their appearance.

BEAUTIFUL FLOWERS.

By Horace J. Wright and Walter P. Wright. (T. C. Jack and E. C. Jack, 16, Henrietta Street, W.C.) Price, 1s. per part.

As there is some difficulty in forming a correct estimate of a serial publication, whether relating to gardening or any other subject, from the first part, we have thought it advisable to wait until we had sufficient material on which to base an opinion before referring to "Beautiful Flowers." We are, of course, well acquainted with the high position of the publishers, and the ability of the authors, and were, therefore, not apprehensive as to any material falling off. But we know from experience that the first part of a series is not always the best of the issues, and that when the opinion is wholly based upon it, there is a risk of an injustice being done to the work. We have now the first four parts before us, and can speak in unqualified terms with regard to the work, and say that it is deserving of the warmest commendation, both as regard its plan and execution.

The aim of the book we are told in the introduction to the first part is essentially practical. It does not attempt to teach systems of gardening, but the endeavour of its authors is to place its readers in possession of the information necessary to enable them to cultivate a considerable number of the most beautiful of the flowers available for adorning the garden, the greenhouse, and the window. The plan adopted has been to select one hundred of the most beautiful of the more popular plants, and then to give all the particulars relating to their cultural requirements that are essential to success in growing them. Advice is also given, in the case of hardy flowers, on their arrangement in the garden with a view to the production of tasteful effects. While the treatment of the several subjects is in no way wanting in scientific accuracy, the letterpress is in a popular style and provides interesting as well as useful reading.

A great feature of the book is formed by the full-page illustrations in colours of the flowers included in the plan, and these for the most part show the plants as growing in the garden, and are useful as suggestions for the effective grouping of the several subjects. Five page illustrations in colours are given in each part.

LIFE HISTORIES OF FAMILIAR PLANTS.

By John J. Ward. (Cassell and Co., Lim., London, E.C.)

The object of this book is to assist the large and growing class of non-professional Nature investigators, who derive pleasure from seeking the why and the wherefore of details in plant structures, and the relationship of these details to animal life, and Mr. Ward has performed his task in so successful a manner that there can be no question as to this object being accomplished. In a series of eighteen chapters the author gives the details of the life histories of a large number of plants that are familiar to those who take an interest in the flowers of the garden, the meadow, and the wayside, and he does so in so interesting a manner as to at once obtain the attention of the reader. We know of no book relating to Nature study to equal Mr. Ward's work, and we heartily commend it to all who are interested in plant life, and desire to obtain accurate information relating to the many and varied forms in a manner that renders the study a pleasant one.

CATALOGUES RECEIVED.

F. C. HEINEMANN, ERFURT, GERMANY.—An interesting catalogue of seed novelties for 1909, and one specially got up for retail seedsmen. It contains vegetable and annual flower novelties chiefly, but perennial greenhouse and other plants are included, notably the scarlet cineraria.

Books as Christmas Presents.—In the Christmas Catalogue issued by Messrs. W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London, will be found a wide choice of suitable books for presentation to friends whose interests lie in the garden, greenhouse, poultry, live stock, or other rural pursuits. A full description of the contents of each book is given in the catalogue, a copy of which will be sent by post on application to any reader.

No Garden can be Productive if Pests of the Soil Prey upon the Plants.

The growth of the garden is checked and retarded, and its life weakened, by the myriad insect pests of the soil that fatten upon plants and flowers.

Prompt treatment of the soil with the only absolutely effective pest-killer yet produced—

Kilogrub

Is the only way to remedy this evil.

Work "KILOGRUB" well into the soil, using only 2 or 3 ounces to a square yard—and let it do the rest.

It throws off poisonous fumes which are fatal to insect life, but cannot harm plants or animals.

"KILOGRUB" has been thoroughly tested, and hundreds of gardeners are glad they've tried it.

Prices, cash with order, carriage paid:—

ANSWERS TO CORRESPONDENTS.

CHRYSANTHEMUM CUTTINGS.—G. N., Taunton: An article on this subject appears in the present issue.

GREEN ON FLOWER POTS.—F. E. S., Leicester: We have not tried the following recipe for the prevention of the formation of the green, mossy coating that so frequently comes upon flower pots in use in greenhouses, but we are assured it is a good one. Having washed the pots perfectly clean and allowed them to dry, soak them in a solution of ammoniacal carbonate of copper, made by putting one ounce of copper carbonate in sufficient ammonia water to dissolve it, and then adding eight gallons of water. It is necessary to soak the pots about once a year to keep them from becoming green.

THE LARGEST GOOSEBERRY. — M. E. M., Keighley: So far as we are able to gather, the largest-berried gooseberry is London, a variety raised by Banks. According to the late Dr. Hogg (Fruit Manual, 1884), this variety grows in various forms, in consequence of its being tender when in bloom, often suffering from the early spring frosts, which cause it to be deficient of seed, consequently the berries will be short and deformed; but when perfect it is a fine long-formed berry. The two-veined ones are rather flat-sided, with broad raised shoulders, the seed-veins a little sunk towards the stalk, with plump, nicely-rounded nose; the three-veined ones are very long, and rounder than the two-veined, and are generally pretty near the same diameter throughout. Skin, smooth, deep purplish red. Flavour, good, but not first-rate. In 1852 it weighed 37dwt. 7gr.; in 1864, 36dwt. 4gr.; in 1865, 33dwt. 12gr. It ripens quickly, and does not hang long, it being an especial favourite with wasps and birds; nor does it succeed well until the plants are strong; it will then grow and bear freely, making long, vigorous shoots (a little pendulous), with but few thorns, and forms a large spreading bush. This is the largest gooseberry at present proved, having held its own for nearly half a century against all former varieties, and hundreds of others sent out since its introduction.

DISEASED CHRYSANTHEMUMS. — We shall be glad if those correspondents who recently sent us examples of diseased chrysanthemums, i.e., specimens with badly shrivelled and blackened leaves, will send us further specimens, including the roots of diseased plants. We can obtain plenty of mycelium, evidence of fungus attack, but not the fruiting stage, and hence the pest cannot yet be identified.

WASTE PETROL IN THE GARDEN. — "Hibernia" writes: "The query regarding waste petrol, on p. 907, of your issue of November 28, recalls to mind some experiments I carried out fifteen years ago with petroleum in order to prove its value as an aid to plant growth. Perhaps by giving the reason which led me to make those experiments, and the results I obtained, may interest, if not instruct, your Dorset correspondent regarding the use of his waste petrol in the garden. About the period referred to a friend was much troubled with earwigs destroying his chrysanthemum blooms, and in order to destroy the former he poured petroleum into the bamboo stakes used in supporting the chrysanthemum growths. This not only cleared out all the earwigs, but also acted as a manure to the plants. On learning this, and knowing that petroleum was a compound of hydrogen and carbon, essential elements in the food of plants, I determined to test its value as a food for vines. The garden I then had charge of was on the top of a hill, and in this position I had considerable difficulty in colouring my grapes, and getting anything like the same results I met with in a valley. The density of the atmosphere at this considerable altitude was less than in the lower-lying district, from which I had just come, and, consequently, the amount of carbonic acid gas in a given volume of air was smaller than at a lower level. I concluded that the difficulty in colouring grapes was partly due to an insufficiency of this gas in the atmosphere, and this induced me to employ petroleum in the vineries from sunrise to sunset. I certainly obtained finer foliage, and better-coloured berries the year I used the petroleum, than any other year, and, rightly or wrongly, I attributed the improvement to the presence of that volatile liquid. The same year I sprinkled my carrot ground with petroleum and water, and forked it in just before sowing the seed, and the leaves of the plants were of a much darker green that year than I had ever had them. Judging from these results, I think your Dorset correspondent need not be afraid to employ his waste petrol in the garden. As it is very volatile I would advise putting it nine inches below the surface of the ground. In this position the gas will have to pass through the particles of soil, and is likely to be decomposed by coming into contact with substances which have a strong chemical affinity for one or other of its elements. I should not think petrol gas will have any effect on insect life in the soil, but as your correspondent has more of this compound than he requires, and evidently a garden at his disposal, let him conduct experiments with it, and give the readers of the GARDENERS' MAGAZINE the benefit of any of them that prove to be valuable aids to the growth of plants or destruction of insect pests."

SPOTTED CŒLOGYNE LEAVES.—J. W., Chesterfield: So far as we can gather from your letter, the method of cultivation followed is a good one, and the fact that flower spikes are being freely produced is also evidence of good culture. We incline, however, to the belief that a little too much water has been used at the roots and in the atmosphere, but a good deal may depend upon the position of the home, for evaporation is much slower in some places than others. Cut off the damaged ends; maintain a buoyant atmosphere; only water sufficiently to keep leaves and flowers fresh; and sponge the leaves with weak sulphide of potassium solution.

CARNATION MAGGOT.—W. G., Weston: This pest is the larva of Hylemia nigrescens, which deposits its eggs in summer and autumn on the leaves of carnations. Spraying as a preventive appears to be of little or no use. The only way of dealing with the pest is to keep a sharp look-out for its appearance, and pick out the maggots with the aid of a sharp pointed knife as soon as seen. If the maggots are caught and killed the plants may live, but if not, the plants are sure to be killed. Patience and keen eyesight are the best means of combating carnation maggot.

NAMES OF PLANTS.

E. B., Effingham.—1, Lantana hybrida; 2, Luculia gratissima; 3, Ardisia mammilaria.

T. B., Knowsley.—If you send us flowering specimens we will do our best to identify them.

G. M. R., Northampton.—1 Linum trigynum; 2, Eupatorium ianthinum; 3, Panax Victoriæ.

D. C. L., Taunton.—1, Citrus trifoliata; 2, Calceolaria Burbidgei; 3, Primula floribunda; 4, Lonicera sempervirens.

T. T. G., Worksop.—1, Skimmia japonica; 2, Cotoneaster Simonsi; 3, Cupressus Lawsoniana Allumi; 4, Berberis Wallichiana.

NAMES OF FRUITS.

E. M. C., Belfont.—1, Newton Wonder; 2, Bramley's Seedling; 3, Mabbott's Pearmain.

L. F. H., Canterbury. — 1, Reinette du Canada; 2, Norfolk Beefing; 3, Hormead Pearmain.

F. E. C., Winchelsea.—1, Nancy Jackson; 2, Lane's Prince Albert; 3, Bess Pool; 4, Cox's Pomona.

D. N., Hertford.—1, Lady Henniker; 2, Gravenstein; 3, Court of Wick; 4, small specimen, probably Calville Blanche d'Hiver.

H. H. G., Tewkesbury.—1, Hollandbury; 2, Emperor Alexander; 3, Betty Geeson; 4, Blenheim Pippin; 5, not recognised; 6, Beurre d'Aremberg.

SANDER and SONS,
St. Albans,
LARGEST IMPORTERS AND GROWERS OF ORCHIDS IN THE WORLD.

TO DAY! AND FOR YEARS AND YEARS PAST the XL ALL Specialities are and have been the best on the market. Where is the Gardener who does not pin his faith to one or the other of these celebrated Insecticides or Fertilicers? XL ALL FERTILISER has pleased all who have used it this season. The Sales of XL ALL FUMIGATOR prove that it is more popular than ever. XL ALL LIQUID NICOTINE INSECTICIDE is always spoken of by gardeners and growers as the most deadly to Mealy Bug, Thrip, etc. XL ALL WINTER WASH for dormant Trees acts like magic, clearing the Trees and Bushes of all Insects' Eggs, Moss, and Fungoid Growths. XL ALL LAWN SAND, a weed eradicator and fertiliser for weedy and poor lawns. XL ALL WEED KILLER used once a year. "No weeds can live." Please ask your Nurseryman, Seedsman, or Florist for a copy of my small pink list, giving particulars of these and many other XL ALL Preparations, which can be obtained from the Horticultural Trade throughout the World. G. H. RICHARDS, Manufacturer and Patentee, 234, Borough High Street, London, S.E.

Situations Wanted.

ADVERTISER seeks ENGAGEMENT as HEAD WORKING GARDENER; 17 years' experience Inside and Out; good reference (4½ years) from last employer; disengaged; age 35; married, no family. A. B., Office of this Paper.

GARDENER (Head), where two or more are kept; thorough knowledge of gardening generally, both Inside and Out; life experience; good references; abstainer; age 31, married, no family. L. A. KETTEL, 33, Adelaide Road, Chislehurst, Kent.

GARDENER.—A. STARMER, The Grange, Walton-on-Thames, would be glad to get engaged as HEAD; acting now as Foreman; age 34; could enter on duties at once; character vouched for by present employer; past references available.

GARDENER (Head Working). — Major WITHINGTON can highly recommend his GARDENER, who has been with him five years, to a lady or gentleman requiring a thorough practical man; 23 years' experience in all branches; age 37, married. EDWIN LEE, Thelveton Grange, Scole, Norfolk.

GARDENER (Head Working, of four or five). —Mr. SMITH, Colston Bassett Gardens, Notts, can with confidence recommend his FOREMAN (H. ASBURY) as a steady, reliable man; well up in all branches; life experience; age 30; married when suited. Address as above.

GARDENER (Head Working, or good Single-handed, with help); good practical experience in all branches; interested in bees; good references; age 37, married, two children. Abstainer. ELLIS, Beenham Grange, Reading.

GARDENER (Head Working), where more are kept; 25 years' practical experience all branches, Inside and Out, early and late Forcing, Vines, Cucumbers, Melons, Stove, and Greenhouse Plants, Herbaceous Borders; thoroughly reliable; highly recommended; married, without encumbrance. WOODHOUSE, Eastwood Road, Bramley, Surrey.

GARDENER (Head Working), age 47; good practical experience in all branches, Inside and Out; many years as Head; can have good references. H. TURNER, Fineshade, Stamford.

GARDENER (Head Working, where two or more are kept); 16 years' good practical experience in all branches; thorough knowledge of grapes, melons, cucumbers, stove and greenhouse plants, flower and kitchen garden; age 30; married when suited; good ref.; 2½ years in last place. B. BROOKS, Minerva Cottage, Elm Grove, Worthing.

GARDENER (Head Working), married, age 41; abstainer; over 25 years' experience; 15 years as Head in good gardens. Disengaged when suited. CHEAL, Rose Cottage, Cliffe, Lewes.

MR. FULCHER, Head Gardener to Sir A. H. Brown, Broom Hall, Holmwood, Surrey, will be pleased to recommend his FOREMAN, well experienced in Carnations, Fruit, and the general requirements of good establishment; 2 years with the above; age 26; 2 years at Poltimore Park.

MR. HEATH, The Gardens, Aldwickbury, recommends his late INSIDE FOREMAN; experienced Fruits and Plants, Decorations, Forcing, etc.; Bothy preferred; no circulars. Apply, P. ANDREWS, Old Road, Holcombe, Ramsbottom, Lancs.

GARDENER (Inside and Out); experienced; steady; industrious; good references from present employer; leaving for no fault. RICHARDSON, 65, Maynard Road, Walthamstow, N.E.

GARDENER (Second, where three or four are kept); Inside and Outside; life experience; 6½ years' character from last place; single; age 32. G. EUSTON, Shrubbs Hill, Sunningdale, Ascot, Berks.

GARDENER (Second or Single-handed); Vines, Melons, Flowers; married, one child; 7 years' experience; good references; age 24. A. BEACHER, Albert Road, Rustington, near Worthing, Sussex.

GARDENER (Under), age 19, seeks SITUATION; five years' experience Inside and Out; three years' good character. A. WORSFOLD, Benenden, Cranbrook, Kent.

GARDENER (Under) seeks SITUATION in Kitchen Garden or Pleasure Grounds; well used to Scythe, Horse Machine; good references; bothy preferred; age 28. W. FULLER, Caxton, Cambs.

TO HEAD GARDENERS.—SITUATION WANTED as UNDER-GARDENER; aged 24; good reference; no previous experience; accept small wages—13s. for start. Willing to give bonus. J. D., 14, Park Hall Place, East Finchley, N.

GARDENER (Under), Second of two or three; 26, single; good references; disengaged; recommended by Lady F. Blunt. H. JENNINGS, Watson Road, Westcott, Dorking.

WANTED, SITUATION as UNDER GARDENER; 18 months' experience; leaving for no fault; age 20; first-class character. Apply F. BAKER, Compton Pauncefote, North Cadbury, Somerset.

ROCK and WATER GARDEN EXPERT, Designer of Japanese Gardens, offers services for such work; 18 years' experience. Address, MIMOSA, 99, St. Thomas' Road, Finsbury Park, N.

LAD, age 18, seeks SITUATION as IMPROVER, in Gentleman's Garden; Inside or Out; Bothy preferred; 18 months' excellent character. Apply, A. KEYS, Whitford Holywell, Flints.

MR. J. WOOD highly recommends B. TINDALL, age 20, for Situation as PROPAGATOR in Alpine and Herbaceous Nursery; 4 years' experience. B. TINDALL, Boston Spa, Yorks.

YOUNG MAN seeks SITUATION in small Nursery (Inside), in or near London; willing to accept low wages. CHAS. COLES, 199, Camberwell New Road, London, S.E.

Situations Vacant.

WANTED. – KITCHEN GARDENER: must be a first-class vegetable grower, accustomed to early and late forcing. Good wages, and cottage found. Only first-class men need apply, with full particulars to A. GRUBB, Porter's Park, Shenley, Herts.

SITUATION COUPON

To the Advertisement Manager of "THE GARDENERS' MAGAZINE,"
148 & 149, Aldersgate Street, London, E.C.

For DECEMBER 26, 1908.

Please Repeat my Advertisement.

Name..

Date..............................

THIS COUPON, duly filled up, should be forwarded not later than Tuesday for the next issue.

V1 FLUID
THE WINTER SPRAY FLUID.
V1 FLUID CLEARS THE TREES OF MOSSES, FUNGI, AND LICHENS.
Easy to Mix. Easy to Apply. A Powerful Cleanser & Invigorator.
HAMPTON LOADE, NR. BRIDGNORTH. Sept. 1st, 1908.
Dear Sirs,—I may say your V1 Fluid has exceeded my expectations, foliage very dense and apples a lot larger, in fact I have some trees which only bore small ones but this season good bold fruit, which speaks for itself; trees very healthy. I may say I left some unsprayed, and it does not need pointing out which they are.
Yours faithfully, GEOFFREY BOOTH.
1 Gallon of this Fluid makes 100 Gallons of Spray Mixture.
Prices and Descriptive Booklet on application to: Wm. COOPER & NEPHEWS, BERKHAMSTED.

Six Pounds Offered
at the PERPETUAL FLOWERING CARNATION SOCIETY'S SHOW in December, 1909, for THREE SEEDLING CARNATIONS grown from my Seed.
2/6 per packet of about 50 Seeds, all obtained from guaranteed hand-fertilised crosses of the best Perpetual Flowering varieties. Only direct from
C. ENGELMANN, *Carnation Grower,*
SAFFRON WALDEN.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

The Cult of the Rose.

MR. G. B. DAVISON.

As will be gathered from the report which appears in another part of this issue, the Committee of the National Rose Society was able to present to the members assembled in annual meeting an eminently satisfactory account of the work accomplished during the year, and inferentially to show that the cult of the rose enjoys a higher degree of popularity than at any previous period in the history of the flower. The society had held three exhibitions during the year, and these, the report states, were attended with a full measure of success as great demonstrations of roses and rose culture. The first of the three exhibitions, which was held in the gardens of the Royal Botanic Society, established a record, inasmuch as it was the largest of the Metropolitan shows held by the society. The temperature was, unfortunately for the roses, exceptionally high, but the fine weather was favourable to a large attendance, and as the rose-loving public were careful to take advantage of their opportunities, the receipts for admission were larger than on any previous occasion. The other two shows possess points of interest, as will be seen from the report, but not of such outstanding importance as to necessitate special reference being made to them. Suffice to say the whole of the exhibitions, both in their inception and the carrying out of the details, were beyond praise, and we mention this all the more readily because the society did not by any means concentrate its efforts wholly upon the competitive gatherings. It accomplished much other work, and this of so useful a character as to justify our pointing to the society as setting an example that might, as far as practicable, be followed by some other of the special societies. Among other of its operations outside the exhibition tents it conducted an election of garden roses, with a view to determine the finest of the varieties in the several classes and colours. In carrying out this work the society derived immense assistance from the generosity of Mr. Nickerson, who bore the cost of twelve silver cups and double that number of diplomas for presentation to the raisers of the thirty-six roses that obtained the highest position in the ballot. Credit, however, is not less due to the committee, for its members at once accepted Mr. Nickerson's generous offer, and proceeded to devise the best means of carrying out his wishes. There was not, as there might have been, any suggestion that the series of handsome cups should be diverted to the purposes of the schedule, and in carrying out Mr. Nickerson's wishes the committee rendered a service of much value to lovers of roses who grow them simply for beautifying the garden and home. Another accomplishment in which the society may be heartily congratulated, is the publication of the book dealing with the fungoid and insect enemies of the roses. Some such book was much wanted, and as its relative cost would be too heavy to admit of its preparation and publication in the ordinary way, the members have had a good service rendered them. It would have been well had the cost of this work and the "Rose Annual" been set out in the balance-sheet, as the members would then have been in a better position to more fully appreciate the value of what they have in return for their subscriptions than is now possible. That the members appreciate what they receive annually in addition to the tickets of admission to the exhibitions is proved to demonstration by the large increase in membership, yet such important matters as this cannot be made too clear. The increase in membership from 1,004 to 3,150 in five years may well be regarded as evidence that the members do appreciate the endeavours that are being made to assist them in points of practice; but it would hardly be wise to attribute too large a share of the success to its literature. The generous encouragement that is given to garden roses has contributed in no small degree to the great numerical progress that is being made, for as the result thereof the exhibitions are made more attractive and rendered of greater educational value by giving visitors opportunities for becoming acquainted with the charms of varieties that are the best suited for the production of continuous displays throughout the summer and autumn. The balance-sheet is of special interest, as indicating the growth of the society, the cost of a vigorous policy, and the proof it gives of the desire of the committee to form an adequate reserve fund. We hope, and we have no apprehensions with regard to its realisation, that the importance of a substantial reserve fund will be constantly kept in view. The responsibilities of a society of the proportions which the National Rose Society has assumed are great, and there should be no relaxation of endeavour until the reserve fund exceeds £1,000. Double that amount would be more in accordance with our ideas; but there is no occasion to labour this point in view of what the committee has already accomplished in this direction.

Mr. G. B. Davison, head gardener to Colonel B. J. Petre, Westwick, Norwich, is one of the most able gardeners of the present time, and one whose fame is great throughout East Anglia. But Mr. Davison is also well known far beyond the Eastern Counties, for he has raised an entirely new race of montbretias that has given varieties of the greatest beauty, fine size, and vigorous habit, far surpassing anything of the kind hitherto seen. For this reason alone Mr. Davison would be fully entitled to recognition in the front rank of florists, but he has other claims upon our notice. He is a very great lover of all hardy flowers, and in few other gardens in the kingdom can these be seen so finely grown as at Westwick; Mr. Davison also raises many of the kinds from seed, and has, as a consequence, several unusually find forms of erigerons, etc. Mr. Davison grows Orchis foliosa as no other person we know is able to do. Besides his love for hardy flowers and his ability when dealing with the ornamental side of gardening, Mr. Davison is also an adept at fruit culture. Black and red currants are grown extensively and well on the Westwick estate, and most of our readers know that with apples and pears, notably pears, Mr. Davison is always to the fore at the London and other competitive displays. It is a matter of interest to note that Mr. Davison commenced his career at Westwick under his father, he then went to Messrs. J. Veitch and Sons' Chelsea nursery, and presently came back to Westwick for a time; his next move was to Castle Ashby, where he became foreman, and from whence he again returned to Westwick, where he has been head gardener for eighteen years. Mr. Davison's family has had the position of head gardener to the Petre family for three generations, and Colonel B. J. Petre, the present owner, is the fourth generation to hold the estate since the first of the Davison family became head gardener early in the nineteenth century. We sincerely hope that for many generations to come the Davisons may continue to serve the Petres as ably as they have done in the past.

Tunbridge Wells Gardens.—In the issues of the Gardeners' Magazine for January 2 and 9 next, we shall give profusely illustrated accounts of the most noteworthy gardens round Tunbridge Wells, which has long been famous as a gardening centre. The gardens that will be described and illustrated comprise those of Eridge Castle, Buckhurst Park, Ely Grange, Leyswood, Broom Hill, Penshurst Place, Swaylands House, and Glen Andred.

Home-made Raisins.—Mr. Bennett-Poë recently exhibited a portion of a bunch of excellent raisins. Last year (1907) two bunches of black Muscat Mrs. Pince had been placed in bottles in a dark cupboard. They had been forgotten, but were found in November of this year, when it was seen that each of the stems had sent out roots, which had died owing to the subsequent drying up of the water. The grapes had dried up, and become converted into raisins of excellent appearance and flavour.

Horticultural Congress in Paris, 1909.—Marked progress is being made with the preparations for the Horticultural Congress to be held next year in Paris, under the auspices of the National Horticultural Society of France. The subjects to be discussed are, briefly: The Influence of Magnesia upon Plants, especially Roses; Culture of Carnations under Glass; Study of Plant Diseases Caused by Nematodes; Researches into the Question of Heredity, on Mendelian Lines; Action of Sulphate of Iron, When Used as an Injection, for the Cure of Chlorosis in Trees; Means of Hastening Fruitfulness of Seedling Fruit Trees; Cold Storage and Retardation of Plants; Edible Fungi, other than the Common Mushroom; and School and Workmen's Gardens. All the papers on these subjects to be read at the congress must be sent to M. Georges Truffaut, at the society's office, Paris, before February 15, 1909.

Japanese Fruit Scale in Argentina.—The Board of Agriculture intimate that they have received, through the Foreign Office, a copy of an Argentine law, dated August 31, 1908, authorising the payment of a reward of 50,000 dollars paper currency (£4,327) to the person who shall discover the most economical and efficacious procedure for destroying the Japanese fruit scale insect, Diaspis pentagona. It is believed that this pest was introduced into the Republic some four or five years ago from Europe, and it has spread with astonishing rapidity. An account of this insect scale will be found in Newstead's Monograph of the British Coccidae, Vol. I., p. 173.

"The Gardening Year Book," 1909.—The issue of this highly popular annual for 1909, will be published on Monday next, and as many alterations and additions have been made, with a view to still further increase its usefulness, we suggest that orders should be given without delay. The section devoted to "The Year's Work in the Garden" has been enlarged, and those devoted to garden pests, fungoid diseases, and garden recipes have been extended. The chapters devoted to hardy border flowers, beautiful bulbs, conservatory, and greenhouse plants, choice fruits, and useful vegetables have been thoroughly revised, and the reader placed in possession of the most up-to-date information on points of practice and the best kinds and varieties to grow. The directory of horticultural societies has been subjected to the most thorough revision; and an important directory of public parks and gardens in the United Kingdom has been added. As the whole of the entries are based upon recently obtained information, the directory will be found thoroughly reliable.

Leaf-cutting of Anthurium.—Mr. F. J. Chittenden recently showed to the members of the R.H.S. Scientific Committee a specimen illustrating a method of reproduction in Anthurium Duchardi. Mr. Blakey, at the Wisley Gardens, had inserted a leaf taken off the plant with its base intact, but without any part of the stem, in a propagating pit. Four buds had been produced on the inner surface of the basal part of the leaf, and numerous roots had developed. Two of the shoots had grown out into rhizomes 10in. to 12in. in length, bearing at their tips well-developed plants, and the other two shoots had grown out for a short distance.

Banana Culture in Queensland.—The recent exhibition of Colonial fruits at the Royal Horticultural Hall reminds us of the many countries in which the banana is grown for commercial purposes. In this country we are most familiar with the bananas grown in the West Indies and the Canaries, but in the tropical parts of Australia they are largely and most successfully grown. The production of bananas forms an important industry in North Queensland, and we are informed by a correspondent that virgin jungle land of the most fertile character is considered essential. Such land is obtained on lease for five years on terms which vary in different districts. The clearing of the land costs not less than £10 per acre, for all the smaller stumps are grubbed, while the surface must be kept free from strong-growing and other weeds. Two hundred strong suckers are planted, and these plants take root forthwith, and under favourable conditions evince tropical haste in development. Before the plant flowers and bears its fruit suckers start from its base, two or three of which are permitted to grow in succession. Each, as its bunch matures, is decapitated, and for five, and even six and seven years, there is a series of suckers, and, of course, bunches. The establishment of a banana plantation will costs £20 per acre before a bunch is ready for cutting, and at the end of five years ordinary land is considered to be exhausted for banana growing. But some jungle soils have grown bananas continuously for thirteen years without the stimulus of manure. The grower's profit begins in eighteen months from date of planting, and at the termination of his lease he will have cut 2,200 bunches per acre. Calculating the wholesale market value at the rate of 1s. per bunch, his land has earned £110 per acre; but he will have worked hard in carrying out the various details.

A New Species of Butea.—In the current issue of the "Kew Bulletin" Lieut.-Colonel Prain briefly revises the Genus Butea, which was proposed by Koenig to accommodate the "Palas," or "Dhak," a well-known Indian tree, and to commemorate the services rendered to botany by the third Lord Bute, and describes a hitherto unknown species. This, we learn, was sent from Patwa Dangarh, near Naini Tal, in the Kamaon Himalaya, by Captain C. A. Sprawson, I.M.S., to Sir J. D. Hooker, who named it B. pellita, and presented the material to Kew. Captain Sprawson states that the plant is known locally as "Patwa," a name that in the plains of India is applied to the Rozelle (Hibiscus Sabdariffa); that it gives its name to the place—Dangarh denotes a small plain among the hills—in which it grows; that the natives say the plant is limited to this particular hill-top and cannot be found elsewhere. Captain Sprawson is satisfied that whether it occurs in places more remote or not, it is certainly restricted in the neighbourhood of Naini Tal to the particular area, less than a mile square, whence his specimens come. Lieut.-Colonel Prain observes that probably the plant is at least local in its occurrence, and this may partly explain the absence of so striking a species from previous collections.

"The Florist's Bibliography."—Referring to our notice of this useful little handbook we are informed that the price is 3s. 6d. nett. It can be obtained of the publishers, Messrs. W. Wesley and Son, 28, Essex Street, Strand, W.C., or through any bookseller.

Gardeners' Magazine Almanack, 1909.—With our issue for January 2 next will be presented an almanack for 1909. This will give the dates of all the more important exhibitions and horticultural functions during the year, and will be embellished with an illustration in colours of a beautiful gold medal rose. The issue will contain the first of two illustrated articles on the gardens in the Tunbridge Wells district and other features of special interest.

NOTES FROM KEW.

◆

Senecio canalipes.

Trained up a rafter of the Succulent House this climbing member of the Groundsel family is, and has been for some time, in full flower. Judging also by the number of unexpanded buds, it is likely to continue in bloom for a long time yet. The genus Senecio is a very extensive one, and a section thereof consists of climbing plants of which the so-called German ivy (Senecio macroglossus) is the best-known example. To this same section S. canalipes belongs. It is a fairly vigorous climber clothed with lobed heart-shaped leaves of a thick and partially succulent character. The flowers, which are disposed in large branching, loosely disposed terminal corymbs, are individually about three-quarters of an inch in diameter. The guard petals are of a rich yellow colour, while the comparatively small disc is of a deeper and somewhat dull tint. As a rafter plant for a sunny greenhouse, under which conditions it thrives at Kew, this senecio is seen to very great advantage, and is a valuable addition to winter-flowering climbers. I am not aware that it is as yet in the hands of the trade, and a search through the "Dictionary of Gardening" and the "Kew Hand List" failed to find the name. It, however, appears to be of ready propagation and comparatively easy culture, so that we shall doubtless see it more generally distributed before long.

Plectranthus crassus.

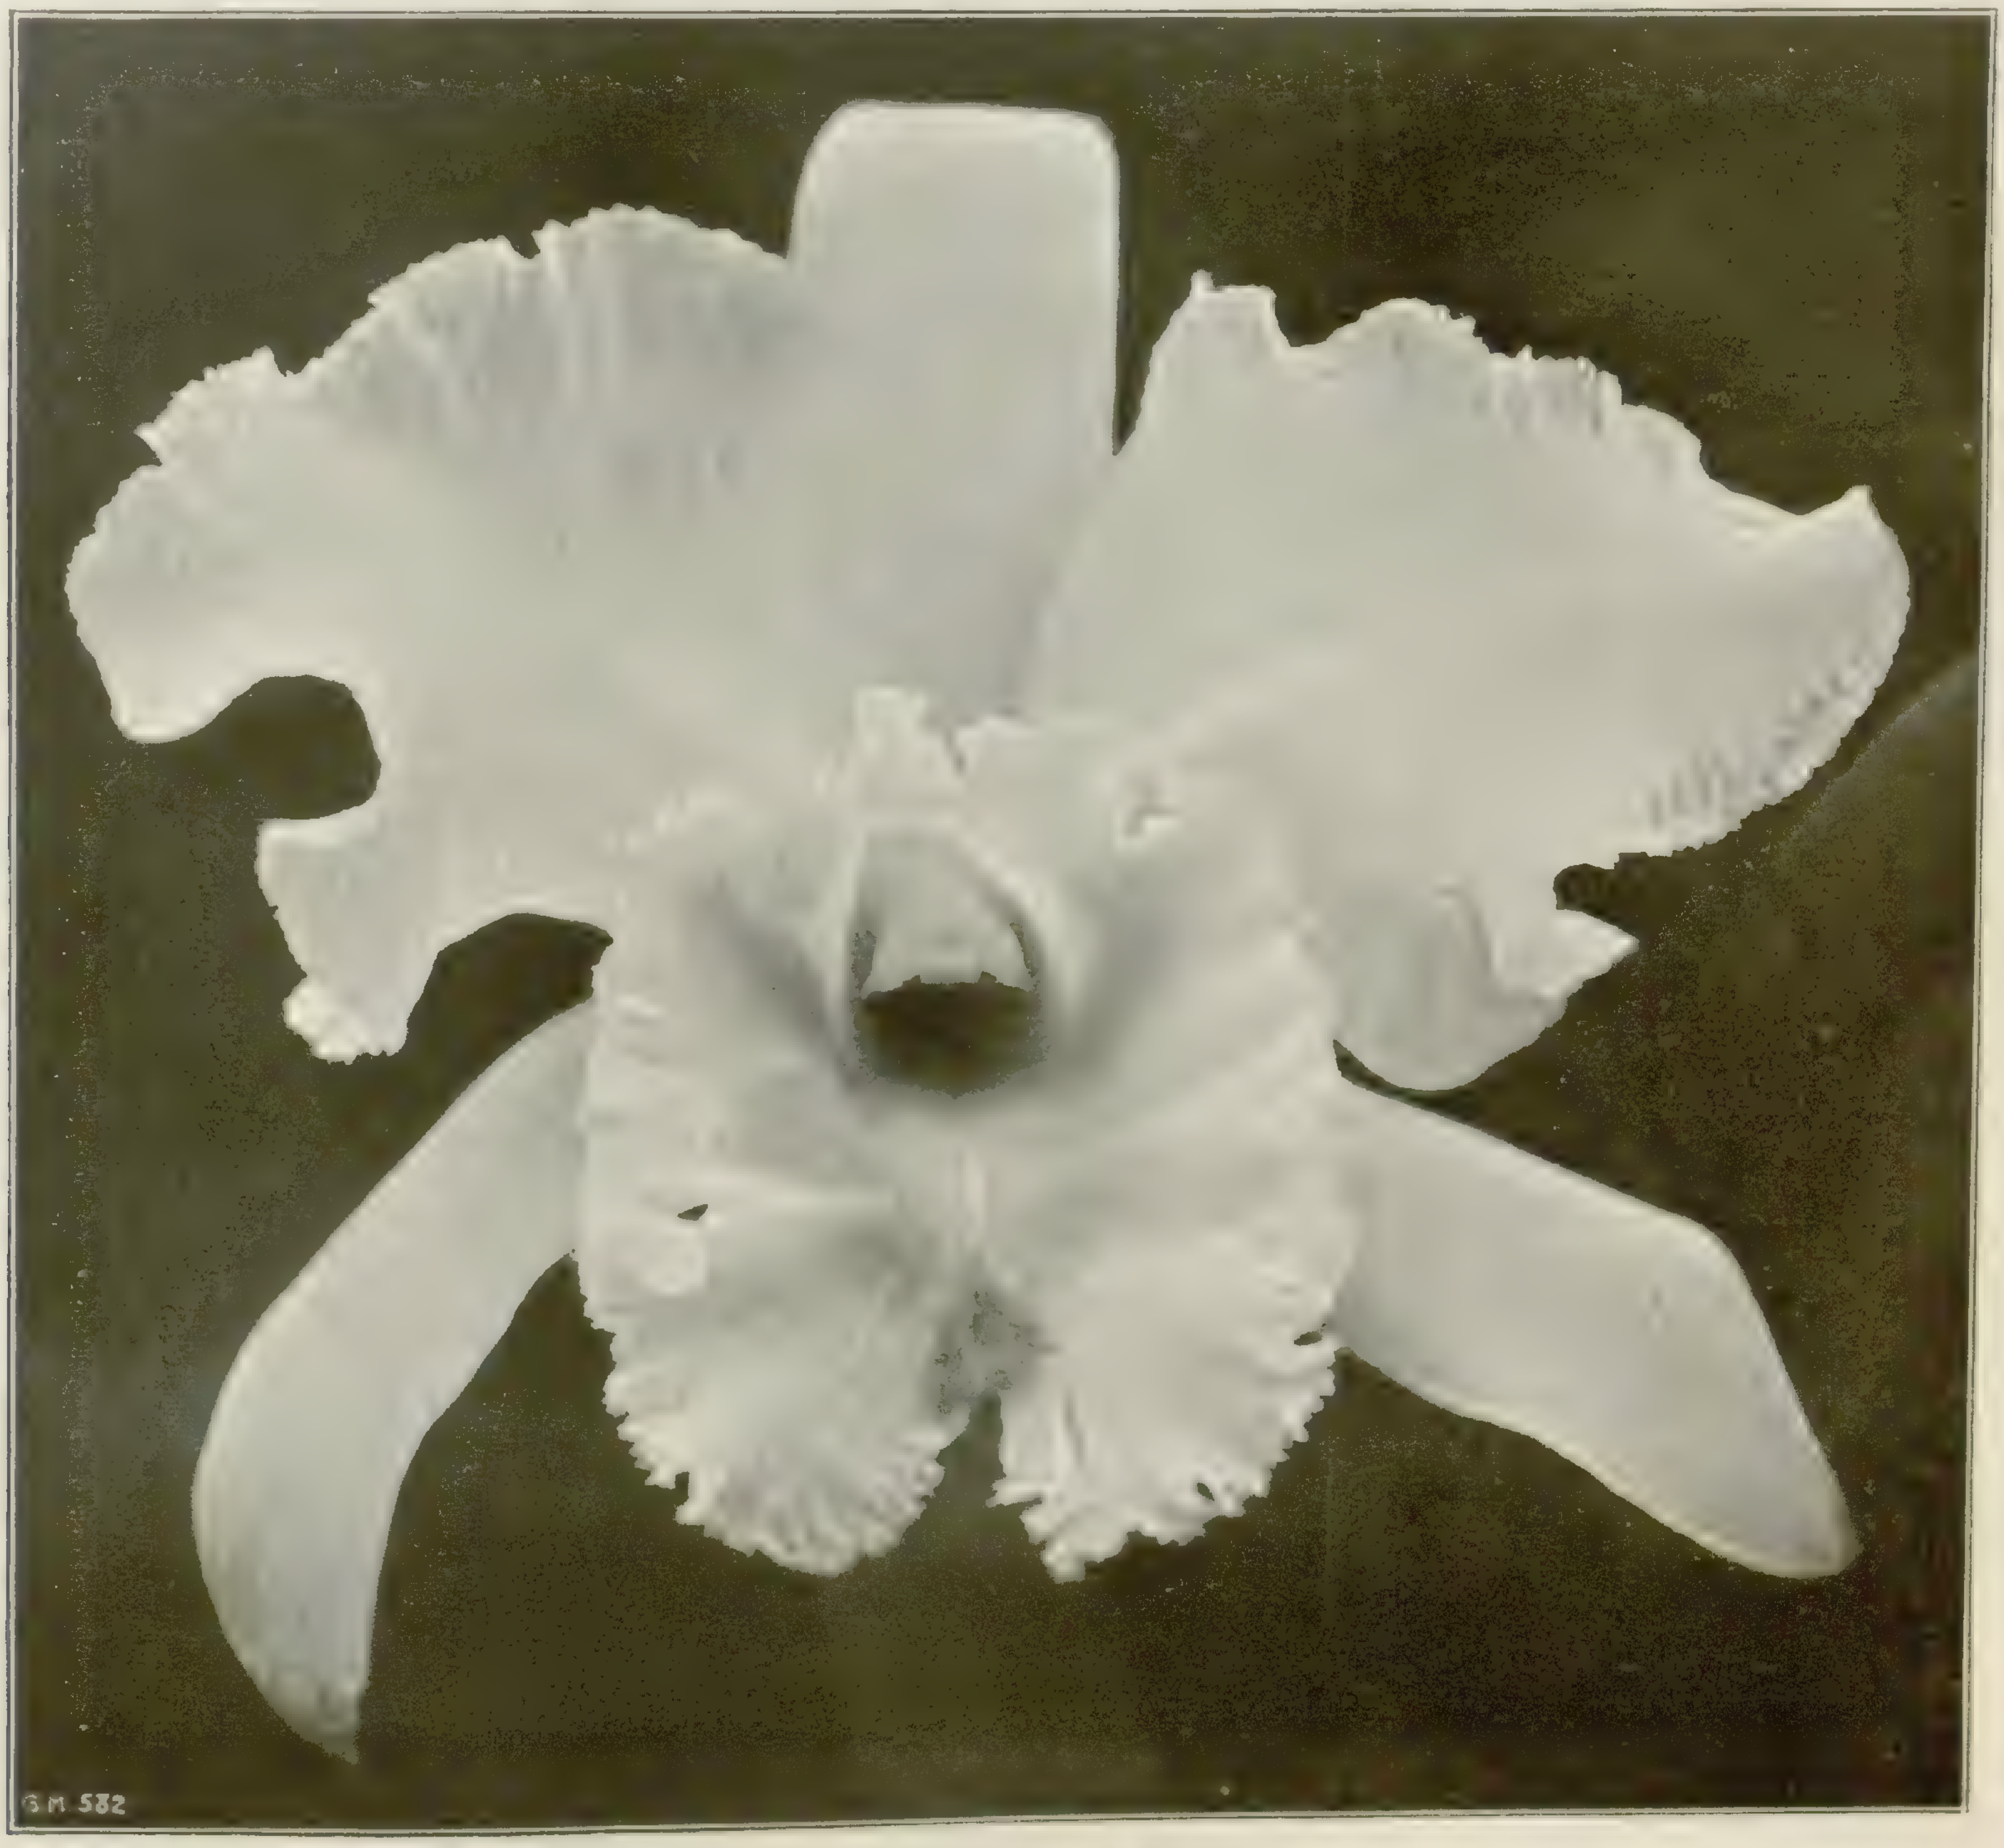
This is one of the several ornamental labiates that we have received from Central Africa within recent years. The best known of them all is Coleus thyrsoideus, which is now a general favourite in many gardens. The plectranthus is certainly not so showy as the coleus, but at the same time it is very pretty, and blooming as it does at this season the flowers are additionally welcome. It forms a stout-growing plant which reaches a height of eighteen inches to two feet, the stems being clothed with ovate leaves about four inches long and half as much in width. In colour they are pale green. The flowers are arranged in long narrow terminal spikes, and a succession is kept up from each one for a considerable time. The colour of the blossoms is a kind of lavender blue. A group of this plant is just now in full bloom and very effective.

Hippeastrum procerum.

This has been before now referred to as the Blue-flowered Amaryllis, but, though the colour is difficult to describe, it is, I should say, of a purplish lilac hue. In general appearance this species in no way suggests the ordinary garden varieties of hippeastrum, forming as it does a long-necked bulb without any pronounced swelling at the base, the whole suggesting a much nearer relationship to the genus crinum than to that of hippeastrum. The strap-shaped leaves are disposed in two opposite rows at the upper part of the stem, while the flower scape, which well overtops the foliage, is terminated by an umbel of blossoms. A specimen is now in flower in the Succulent House, and, though decidedly less showy than many other hippeastrums, it is both interesting and ornamental.

Jasminum Maingayi.

Although this species does not occur in the "Dictionary of Gardening" or in the "Kew Hand List," a specimen trained to the roof of the intermediate portion of the T range is flowering freely. It is in this stage highly ornamental, and can be recommended for a situation like that it now occupies. This species is a native of Penang, and was named in honour of its discoverer, Dr. Maingay, who first found it many years ago. It is a plant of slender scandent habit, furnished with ovate acuminate leaves of a particularly firm texture. The flowers, borne in terminal clusters produced on short branches, are individually about one inch across, and composed of a varying number of narrow-pointed segments. Though it cannot in a general way be obtained from nurseries, the winter-flowering qualities of this jas-



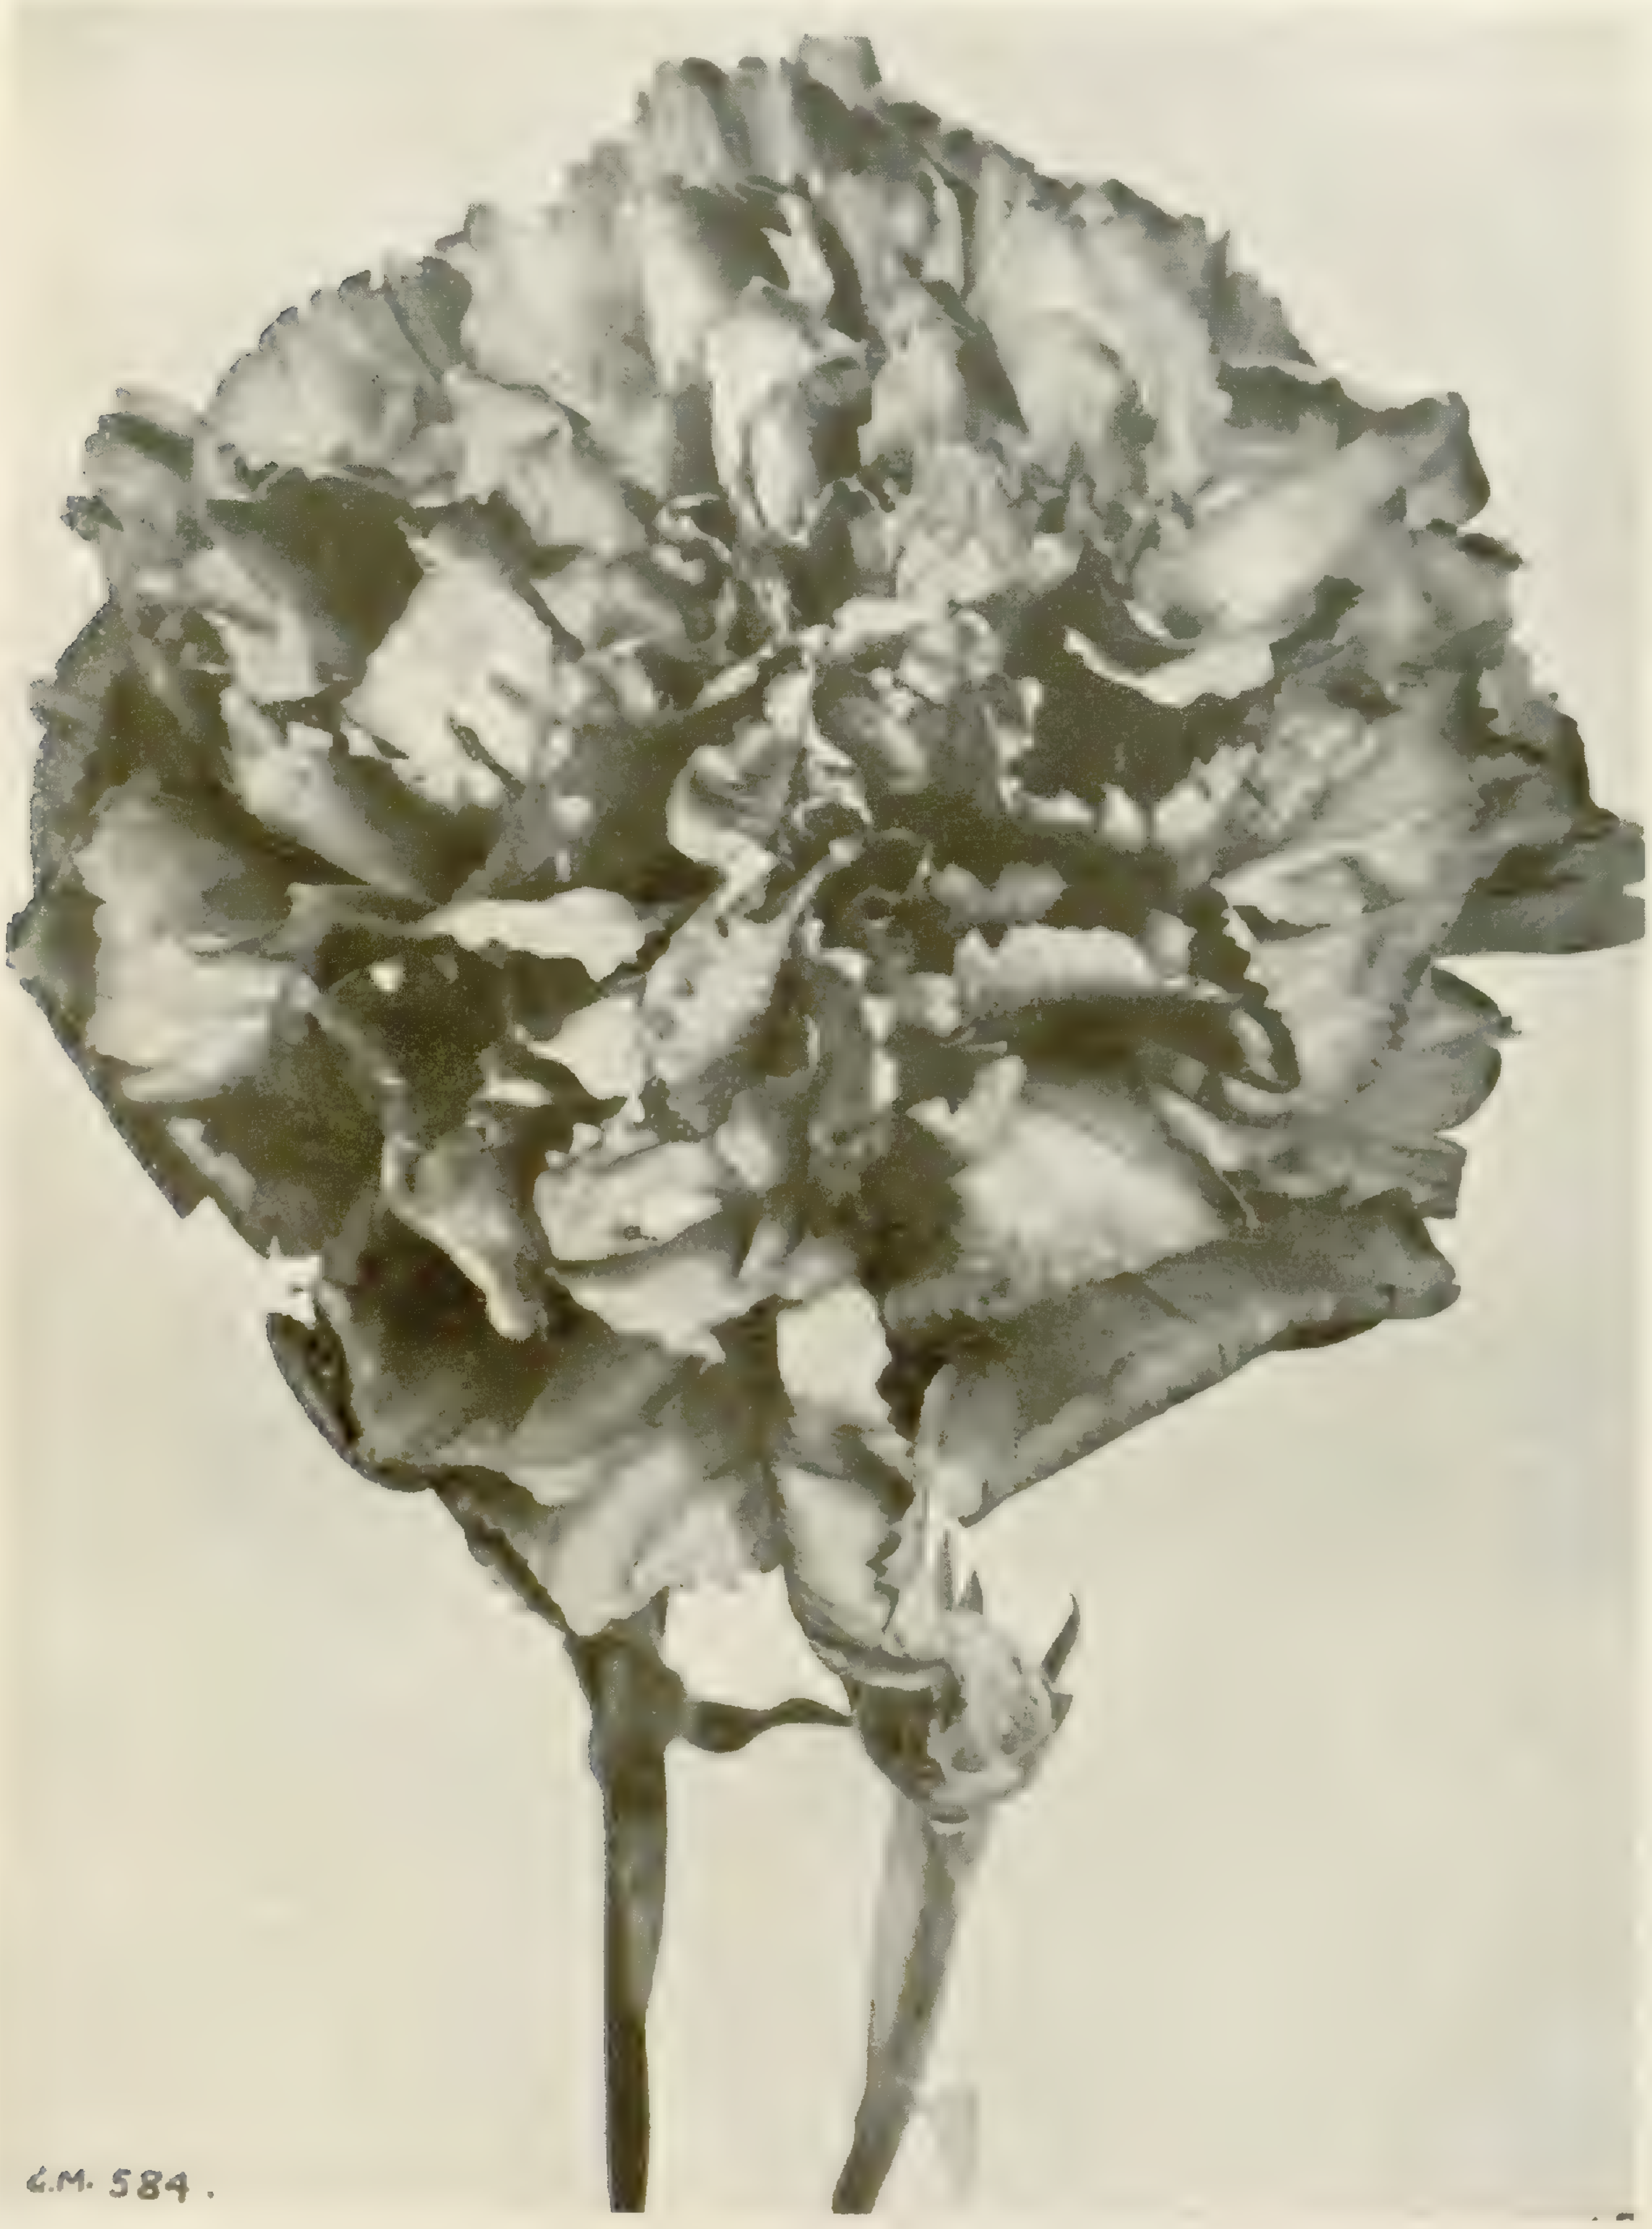
BRASSO-CATTLEYA CLIFTONI.

Exhibited by Messrs. Charlesworth and Co. at R.H.S. Meeting on the 8th inst., when it received a first-class certificate. Colour, blush, white, and yellow.

mine should lead to its more general distribution.

Caraguata cardinalis.

For some reason or other bromeliaceous plants are not at all popular in this country. The cause of this neglect is difficult to account for, as many of them are decidedly ornamental from a foliage point of view, and particularly showy when in bloom. To this latter section belongs Caraguata cardinalis, for, though the flowers, borne in a compact head, are not at all showy, they are surrounded by a whorl of large leaf-like bracts of a bright scarlet colour. In the tropical portion of the T range it forms just now a bright and effective feature. It is a native of Colombia; indeed, the greater number of the species occur in South America.



NEW PERPETUAL-FLOWERING CARNATION ROSE DORÉE.
Exhibited by Mr. W. H. Lancashire at the Perpetual-Flowering Carnation Society's Show, December 9, when it received a first-class certificate. Colour, rose cerise.

Ruellia macrantha.

Few, if any others, of the extensive order Acanthaceæ bear such large flowers as this, and certainly none of the genus to which it belongs. Like most of its allies it forms a somewhat upright habited plant, of a sub-shrubby character, while the solitary flowers are produced from the axils of nearly every leaf towards the upper part of the stem. They are trumpet-shaped, slightly curved, from four to five inches long, and nearly three inches across the expanded mouth. The colour is a kind of rosy purple, veined with a deeper tint. Though often treated as a warm house plant, this ruellia is in very good condition in the cool portion of the T range; indeed, so situated, the flowers are richer in colour than they are in a warmer structure.

Exacum macranthum.

The rich blue-purple flowers of this exacum, with their conspicuous bright yellow anthers, have few, if any, rivals in colour at this season of the year. Associated as it is at Kew with the white-flowered form of Begonia Gloire de Lorraine, this exacum is particularly noticeable. It has sometimes been referred to as an annual, but cuttings can be readily struck, and effective plants can be grown therefrom. A native of the mountainous districts of Ceylon, Exacum macranthum does not need for its successful culture as high a temperature as one might suppose. During the summer it requires only the temperature of the greenhouse.

Azalea obtusa.

At one time this pretty little azalea was regarded as a distinct species under the above name, but it is now considered to be a variety of Rhododendron (azalea) indicum. At all events, it is a well-marked form, which naturally assumes the character of a low-growing dense bush, and when absolutely covered as is its wont with its small bright red flowers, this azalea is very telling. In the greenhouse both the ordinary kind and its white variety are just now at their best. K.

NEW PLANTS, ETC.

BRASSO-CATTLEYA CLIFTONI.

This is a bold and beautiful hybrid raised by crossing Brasso-cattleya Digbyano-Mossiæ and C. Trianæ Upland's var. It is a very fine orchid, shapely, and large. The sepals and petals are silvery-blush, while the lightly-fringed and rounded lip is white, tinted blush, and with a yellow throat. F.C.C., R.H.S., December 8. Messrs. Charlesworth and Co., Hayward's Heath.

CYPRIPEDIUM TROILUS LORD NELSON.

A bold cypripedium derived from C. insigne Harefield Hall and C. nitens Sander's var. The flower is large, and the broad dorsal sepal has a pure white apex with a yellow-green base, the latter portion being handsomely spotted with purple. The petals and lip are yellow-green with brownish shading. A.M., R.H.S., December 8. Messrs. Sander and Sons, St. Albans.

CYPRIPEDIUM ARMSTRONGI.

This is probably a natural hybrid, and one in which the influence of the second, and unknown parent, is very small indeed. The plant indicated in its flowers a very close likeness to C. Spicerianum, but the leaves differed from those of the latter species. It was first labelled as a variety of Spicerianum, but the title was subsequently altered to that of C. Armstrongi. It is a glorified C. Spicerianum with a green base and a purple median band on the white dorsal sepal. A.M., R.H.S., December 8. Messrs. Armstrong and Brown, Tunbridge Wells.

DENDROBIUM CŒLOGYNE STRIATUM.

This differs from the type in having dark brown-purple stripes on the tawny sepals and petals. The lip is, as usual, deep blackish-brown. A.M., R.H.S., December 8. Mr. H. A Tracey, Twickenham.

CHRYSANTHEMUMS.

Ball of Gold.—A very fine and useful late-flowering incurving variety that promises to be of great value for market or for the conservatory. It is a bright yellow sport from the popular and serviceable Snowdrift, and is its counterpart in all but colour. A.M., R.H.S., December 8. Messrs. R. H. Bath, Lim., Wisbech.

Kathleen May. — A magnificently-coloured decorative variety of the most brilliant crimson hue. This variety has several rows of fairly long florets, and it has a partially-developed anemone-centre, though the latter is not cushion-like. It is wonderfully attractive, and though difficult to classify, it bids fair to be very popular as a late decorative sort. F.C.C., N.C.S., December 2. Mr. Pestifield, Crockenhill.

Aurore Boreale. — A very pretty large-flowering single variety, of golden-orange colour, beautifully shaded with crimson. A.M., R.H.S., December 2. Mr. Norman Davis, Framfield, Sussex.

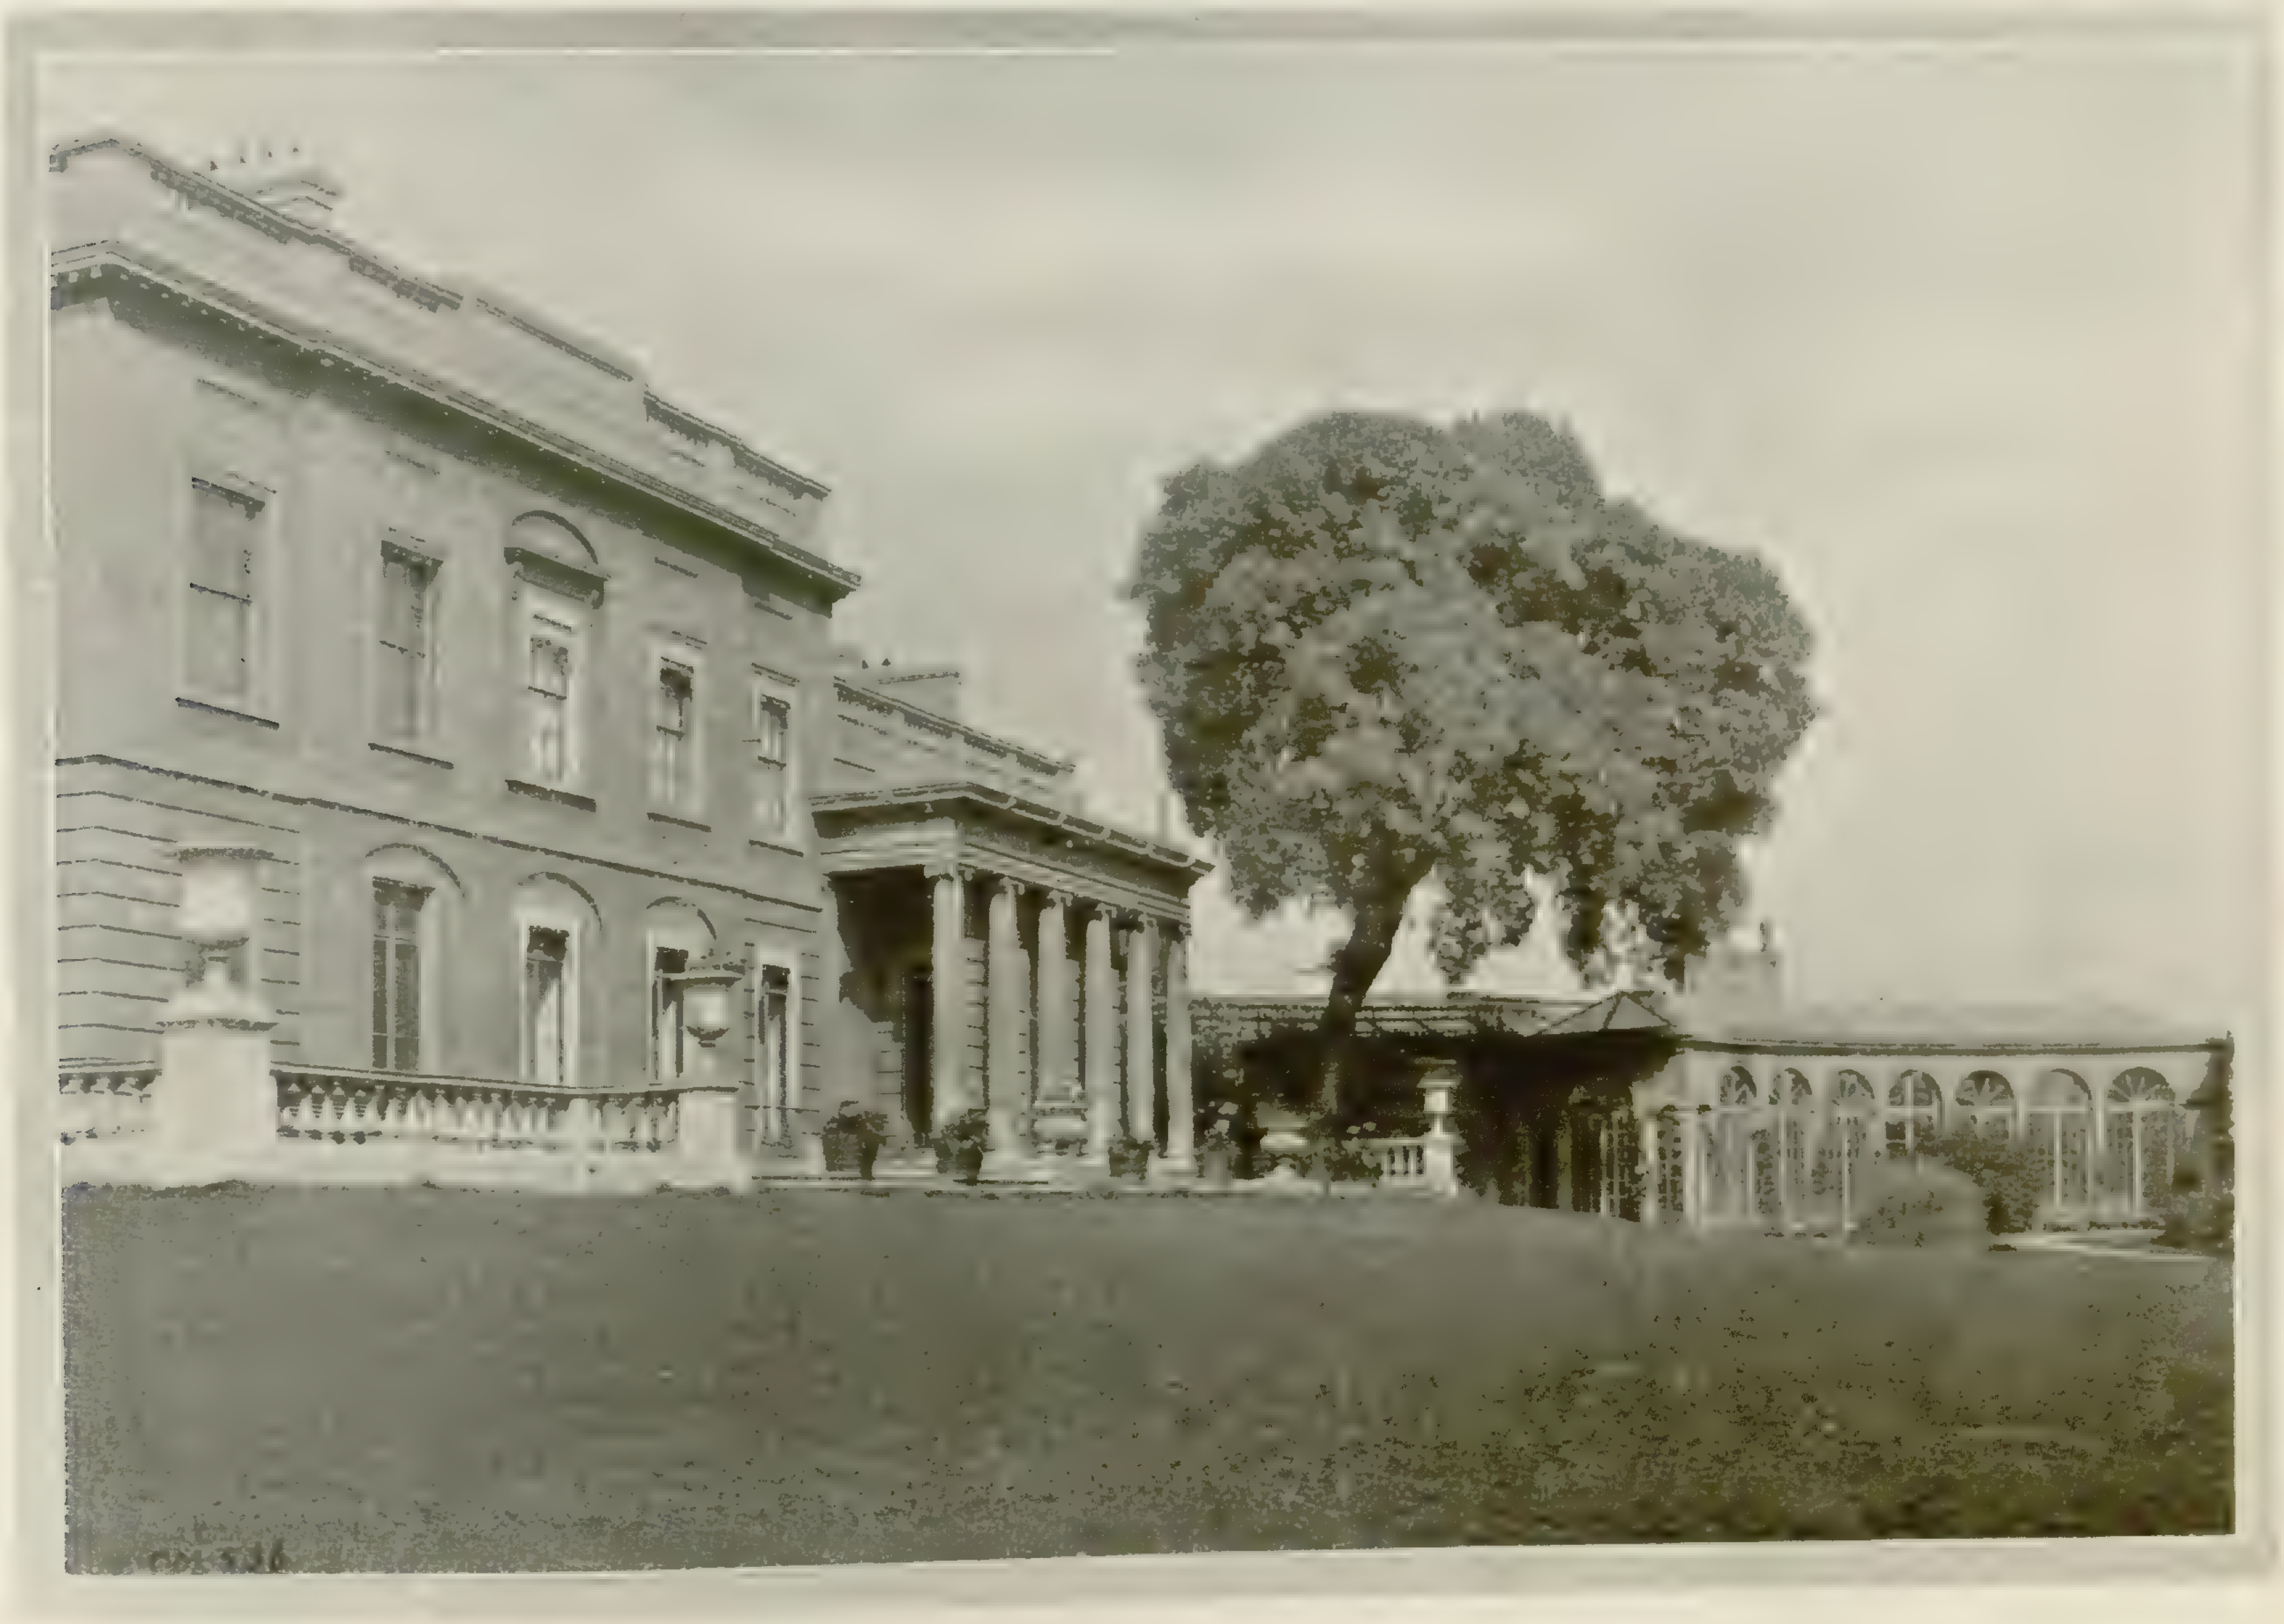
CARNATION ROSE DORÉE.

This is a fine new winter-flowering variety with bright rosy cerise coloured, or rosy-salmon blooms, of good size and form. The flowers are very full; in fact, almost too full, if we may venture a slight criticism. The blooms are on fine long stems, and the calyx in every case does not burst. F.C.C., P.F.C.S., December 9. Mr. W. H. Lancashire, Guernsey.

SOME BRISTOL GARDENS—II.

Blaise Castle.

Among the many delightful estates round about Bristol few can vie with Mrs. Harford's park and grounds at Blaise Castle for natural beauty. There are spreading fields, a wide park, grand old trees, wooded heights, and bold limestone escarpments, and deep valleys with the water running through, and with the sides all glistening with the enormous quantities of hartstongue and other hardy ferns. Within the house are many well-nigh priceless works of art, especially among them being paintings by Salvator Rosa, Raphael, Vandyck, Carle Guido, and artists of the time of Michael Angelo. Mrs. Harford's husband, the late J. S. Harford, Esq., was an enthusiast in the world of art, the biographer of Michael Angelo, and friend of Wilberforce; hence the array of choice pictures in the gallery that opens into the conservatory.



BLAISE CASTLE, BRISTOL; MANSION AND CONSERVATORY.

Blaise Castle is about four and a-half miles northward of Bristol, in the parish of Henbury, and a little to the west of Westbury-on-Trym. The substantial house stands on rising ground overlooking the park, and commanding fine views of the wooded hills beyond. At a short distance from the front of the house there is a large group of giant elm trees that are a great feature of the park. Around the house, on the steps, and at points of vantage along the terrace, big agaves, agapanthuses, and hydrangeas in tubs stand all the summer through. Curiously placed at one corner of the house, close to where the long, ridge-roofed, old-time conservatory joins it, is a large evergreen oak with a big mop head; standing all alone in this position, one wonders how it came there, and why it was allowed to remain. Doubtless it owes its life to sentimental considerations on the part of the members of Mrs. Harford's family.

Not very much is attempted in the way of flower gardening. The border in front of the conservatory is kept gay in summer by means of begonias. Groups of rhododendrons, and azaleas, and pampas grass adorn the sloping lawns, and roses find a place here as everywhere.

A very pretty picture is formed by the heavily thatched dairy, set amid a little garden of its own not far from the end of the conservatory, but quite screened from it by evergreen trees and shrubs. There is here a little pool for water lilies, surrounded by a small, simple, but very charming low rock garden, wherein herbaceous plants, flowering shrubs, and ferns all find a suitable home. All around are roses, lilacs, philadelphuses, rhododendrons, and many another kind of flowering shrub, and cut out of the lawn itself are a few small flower beds, where cannas, herbaceous lobelias, Koniga maritima, pelargoniums, marguerites, and begonias provide a summer display.

But pretty as this spot is it has a further attraction, and this is the tree that occupies the centre of the accompanying illustration. The Maidenhair Tree (Ginkgo biloba), is a very graceful and effective deciduous conifer, and one that is by no means so freely planted as it deserves to be. Here, at Blaise Castle, is one of the finest specimens of this splendid species, perhaps it is the finest in the country. It is certainly the largest I have ever seen, and it is in perfect health, and furnished with its graceful branches from quite near the ground upwards. This handsome example is charming when its new leaves expand in spring, it is noble when in full leafage, and it is brilliantly coloured in late autumn. Lovers of trees should endeavour to see this ginkgo, and inspect the beautiful woods at Blaise Castle; permission to do so can be obtained on application.

The glass department is small, but Mr. James Barrett, the head gardener, grows good grapes, has a large collection of ferns, including a wall covered with nephrolepis, and maintains ample supplies of melons and tomatoes. The kitchen and fruit gardens are in several portions, and are surrounded by high, strong walls, that afford plenty of opportunity for the cultivation of peaches, pears, cherries, nectarines, and plums, and some of the wall trees are of great age and size. Bush fruit trees, notably apples, are largely grown, and I was especially struck by the shapeliness and beauty of several heavily-cropped trees of Worcester Pearmain, a well-known early variety that does well all down the West Country. One part of the kitchen garden is divided from the rest by the high road that leads to Shirehampton, and the connection is by means of a wide tunnel passing under the road.

Just beyond this isolated portion is the very interesting little "village" designed by Nash. There are ten cottages, all of different design, built in 1810, and placed around a sloping lawn, with a fountain in the centre, and tall trees around. This little group of cottages has been described as the beau-ideal of a village, consisting of "a group of houses of different forms, styles, and materials, stone, brick, wood, etc., roofed with thatch, tile, or slate, each surrounded with different trees, and enwreathed with clematis, rose, honeysuckle, or vine. The inhabitants are all poor families, settled here by the bounty of the proprietor." For a very long number of years this little "village" has been a great local attraction, and its fame has spread far and wide, chiefly because the houses and their disposition are so utterly unlike anything else of the kind.

DAIRY GARDEN AND FINE GINKGO BILOBA AT BLAISE CASTLE.

Leaving the gardens proper, and plunging into the woodlands at the foot of the pleasure grounds, one quickly comes to the exquisitely beautiful Gorge of the Trym, a wooded ravine, with the limestone rocks rising on either side, and, in some places, reaching a great height. The winding roadway, cut along the face of the slope, well above the chattering little river, is a very long one, and it provides scores of delightful views, forward or backward, as it twists about in conjunction with the turn of the stream. Birches, alder, chestnut, lime, and oaks are abundant all along the way. Hardy ferns, chiefly hartstongues, lady ferns and the common lastrea, flourish amazingly, the former growing in enormous quantities, and making huge masses of long translucent frondage. Presently, turning off from the roadway, we come suddenly upon a broad, silent pool nestling amid trees and shrubs at the foot of a towering mass of limestone rock. Wild plants fill every nook and cranny of the soft stone, and small shrubs and trees have obtained a precarious footing wherever possible, so that the whole scene on a summer day is a fine one. This is known as the Lover's Leap.

Further ahead, and winding away upward, a path leads to the summit of Blaise Hill, where once existed the hermitage of St. Blaise. In 1768 Mr. Thomas Farr, then the owner of the estate, built the triangular castellated building that now crowns this high point. A magnificent view is obtained from this little ivy-clothed castle, and one can well believe it forms a pleasant retreat for the members of the Harford family. It should be mentioned that the woods are thrown open to the public one day a week, and the Bristolians, taking advantage of Mrs. Harford's kindness, make this castle or prospect house their objective when rambling through the estate.

Almost opposite Blaise Hill, across the other side of the gorge, and only arrived at after a good deal of healthy climbing, is another fine mass of rocks standing clear out from among the beech and Scotch firs around. The peculiar formation of the upper part of this rocky eminence has caused it to be called the Giant's Chair, or Giant Goram's Chair. The legend goes that Giant Goram and his rival, St. Vincent, could not agree as to the course the river Avon should take, but one day the saint found the giant fast asleep in his great rock chair, and taking advantage of this opportunity to fulfil his own wishes without opposition, he settled the long-disputed question by clearing the ravine through which the river now flows.

A further climb and the soil increases in depth, and here rhododendrons abound, and hazels, arbutus, Portugal and common laurels provide an abundant undergrowth for game. We caught sight of one very beautiful bird, a fine Reeve's pheasant, in our passage through these upper woods. Soon we strike the roadway, and this gradually descends, passing two of the lodges, and finally emerging on Henbury Hill, a good mile and more away from the entrance to the gardens. When we left the pleasure grounds Mr. Barrett asked me, "Can you climb?" As this question was practically a challenge, I assented, but that long morning's climb and ramble left me with little superfluous energy, as I found when a good sprint became necessary to catch the motor 'bus at Westbury, on the return journey into Bristol. But I was very glad to have seen Blaise Castle and the wonderful combination of rock and water and sylvan beauty that Mrs. Harford's estate possesses.

Henbury Hill House.

Northward of Bristol, a mile or so beyond the limit of Durdham Down, is the village of Henbury. Henbury Hill, with its long, tedious climb, is well known in the district, as also are the several interesting gardens that skirt it. Henbury Hill House, the residence of A. Baker, Esq., stands on the crest of the hill, and its gardens slope westward. They are well wooded, and full advantage has been taken of these wooded portions by providing spring flowers in abundance beneath the trees, and hardy ferns along the margins.

A feature is made of plants in tubs, and during the summer a large number of palms, ferns, eucalyptus, hydrangeas, and dracænas are arranged around the summerhouse at the bottom of the lawn, where, backed by tall trees, and sheltered from wind, they produce a distinct, pleasing and sub-tropical effect. Another feature of the gardens, and a more permanent one, are the hillside herbaceous borders. Here on either side of a rather steep walk, all the best of the hardy herbaceous plants are cultivated in goodly masses. Delphiniums are largely cultivated, and their varied shades and stately spikes give character to the general display. The new Astilbe Davidi and the older A. grandis flourish finely, and the veronicas, big and little, seem very much at home. Campanulas, too, are good, and Artemisia lactiflora has done very well indeed since its recent introduction.

Flowers are grown in very large quantities at Henbury Hill House. Every member of Mr. Baker's family is fond of flowers, and so flowers are used in almost every room in the house. Besides the flowers in beds and borders, Mr. Orchard, the head gardener, provides great batches of annuals and perennials in the lower part of the kitchen garden, and here the ladies of the house may cut and come again all the summer long. A few of the subjects so largely grown are poppies, Grindelia cunifolia, sweet peas, candytufts, lavateras, godetias, Nigella Miss Jekyll, delphiniums, heucheras—very fine, lily of the valley, statices, clarkias, seedling carnations—particularly good, Moon daisies, and early chrysanthemums.

Mr. Orchard is a keen vegetable and fruit cultivator, and the peach trees on the old walls give evidence of his skill. He is a strong believer in the method of treating strawberries as annuals—a plan first advocated in the Gardeners' Magazine—and he produces large supplies of first-class dessert fruit by this method. Royal Sovereign is the favourite variety. Espalier-trained apples and espalier and cordon gooseberries, and cordon currants are other excellent features, and the small fruits are unusually prolific. La Constant red currant is found to be very useful because of its lateness. In front of the espaliers, in the borders between them and the paths, are more flowers, notably montbretias, gladioli, asters, gypsophila, salpiglossis, stocks, campanulas and pentstemons. Considering its extent, there can be few gardens that yield so many flowers as this.

Roses have their place, and they are especially evident in the centre of the kitchen garden, where the four paths meet under long arches of rambling roses in great variety.

A large span-roofed greenhouse is used as a conservatory, and at the time of my visit it was very gay with a splendid batch of tuberous begonias, representing Messrs. Blackmore and Langdon's well-known strain. To every rafter a fuchsia was trained, and the pendant clusters of flowers were very pretty. Campanulas, Kalanchoe flammea, Lobelia tenuior, Trachelium cæruleum, and coleuses were other conspicuous subjects associated with a variety of foliage plants. Several low houses or pits serve admirably for the production of table plants, for melon culture, and for gloxinias. The latter are very popular, and special pains are taken with them. Peed's strain is the one used, as it is especially rich in large-flowered and beautifully netted and spotted varieties.

One other attraction of these gardens must be mentioned, and that is its collection of tree pæonies. These are planted in beds on the lawn, and against the background formed by a fine old Cedar of Lebanon, they look very well.

[I much regret to have to state that Mr. W. J. Orchard has died since my visit to Henbury Hill House, and the penning of these notes. Mr. Orchard has been succeeded by Mr. Charles M. Holt, who had already made a reputation in the Henbury district.—C. H. C.]

LOVER'S LEAP AND POOL, BLAISE CASTLE.

Tramore, Henbury.

Only an enthusiastic amateur can fill a modest garden brimful of interest. A professional gardener would never think of putting so much in so little. There is always a danger that the amateur, led on by his successes and gathering enthusiasm, will override his hobby. Mr. Budgett, who has a small garden at the foot of Henbury Hill, is in constant danger of overplanting his garden, but he avoids the danger by ruthlessly excluding the less interesting plants and the never-do-wells as fast as he introduces new and finer plants.

The old-fashioned house is smothered in climbing roses, which are allowed more freedom than they usually receive, and amongst these ramble many interesting climbers, such as Akebia quinata, Ampelopsis sempervirens, several varieties of hardy smilax, and Tropæolum speciosum, the last flowering well in an east aspect. In the warm border on the south side of the house, and sheltered by large bushes of Choisya ternata, which here proves one of the hardiest of evergreens, are specimen plants of Abelia sinensis, Cæsalpinia japonica, Carpentaria californica, Perowskia atriplicifolia, a myrtle, and the hardy citron, Citrus trifoliata. Around the little lawn, on tall rough wooden pillars, are single climbing roses, many kinds of honeysuckle, and clematis, as well as ornamental vines. Vitis Coignetiæ being especially beautiful.

A considerable portion of the lawn is occupied by a rock garden and small pool of water. The rock garden is Mr. Budgett's special hobby. He has been careful to avoid piling up great rock masses, and the rockwork has a stratified and quite natural appearance, providing ample nooks and crannies, and pockets and ledges, for the alpine plants he so greatly loves. Hardy heaths, such as Erica codonodes, E. Veitchi, E. arborea, E. stricta, and E. australis grow out of a carpet of Erica carnea which is carefully clipped over every year directly after flowering. Ramondias, primulas, the rarer sorts of dianthus, androsaces, sedums, cobweb house leeks, statices, gentians, cyclamen, and the pretty Ourisia coccinea are other favourites, and all are cared for with an amateur's love and pains.

In the lower parts of the rock garden, planted in peaty beds, are Gaultheria Shallon, now getting too large for the space allotted it, three or four other gaultherias and Iris Kæmpferi. On the more prominent points are phormiums in variety, Japanese maples, beautiful alike in their summer and gorgeous autumn foliage, and shrubby veronicas curiously mimicking many a genus to which they have not the slightest relationship. Here, too, the rare Edwardsia Macnabiana seems quite at home, as well as a number of New Zealand shrubs, which have proved themselves well adapted for such a situation.

PROSPECT HOUSE ON THE SUMMIT OF BLAISE HILL.

In the little pond are red, yellow, and white hybrid water lilies, and Aponogeton distachyon, which yields its white flowers over the greater part of the year. Beyond the pool and the higher part of the rock garden Mr. Budgett has long irregular borders full of herbaceous plants and flowering trees and shrubs, where cytisus, berberis, and spiræas in great variety add their brightness in the spring. On the south side of the garden there are grassy hillocks, where many kinds of bamboo always look very graceful and green, and especially good is a huge mass of B. palmata, which is here a rampant grower. Hardy fuchsias, the blue Solanum crispum, and Pyrus japonica in many colours, are especially attractive.

Mr. Budgett also finds time to grow a few orchids, and he has two or three quite tiny houses filled to overflowing with well-grown cypripediums and odontoglossums, both of which provide a large amount of pleasure and interest, and cost no more to manage than many less beautiful and useful plants.

Charles H. Curtis.

Single-flowered Chrysanthemums.—I cannot but deplore the too rapid increase that has of late been made in this section of the chrysanthemum. The aim of raisers seems to be to obtain as many sorts as possible, irrespective of quality. Many now shown are not single at all, but really semi-double, having as many as three or more rows of florets. There seems such a wish to increase the number of varieties that very soon this section will be as confused as are the incurving varieties. A wholesale disqualification at some leading show of objectionable varieties would do much to check the present evil.—E. M.

NEW HERBACEOUS CLEMATIS.

The little group of herbaceous clematis, which of late years has met with some appreciation for the decoration of hardy flower borders, should receive additional marks of public favour once the newer hybrids come into general cultivation.

Two of the best known of the older forms are C. recta, which forms an upright, bushy growth about three feet in height, clad with a wealth of small white blossoms during June and July, and the violet-blue C. integrifolia, with its sturdy growth and bell-shaped flowers. The double form, C. recta flore plena, is somewhat rare, but its pleasing double white flowers, in dense heads, its freedom, and general appearance should ensure it a place in every garden. C. Durandi, an earlier and more continuous flowering form of D. integrifolia, is also deserving of notice, and may be regarded as superior to that species.

Of the quaint C. heraclesæfolia, a Chinese species, with handsome foliage and purplish hyacinth-like blossoms, it is unnecessary to enter into detail, but its variety, C. h. Davidiana, with its sweetly-scented pale blue blossoms, is a very useful border plant. It is this same C. Davidiana which, in conjunction with C. Stans, has been the means of producing an entirely new series of hybrid forms, which should be of value for garden purposes. When it is borne in mind that there is a series of floriferous late-flowering forms of varying shades of blue and lilac, it will be seen that they will help to extend the reign of the herbaceous plants in late summer. Groups of well-foliaged, flower-clad plants will certainly be of service in most gardens, especially as the display of herbaceous flowers tends to weaken in late August and September, when these new clematis are at their best.

The new group constitutes one of the best sets of novelties introduced by the well-known raiser M. V. Lemoine, of Nancy, and the varieties in question are worthy of an extended trial by hardy plant growers. One of the best is Azur, a pretty floriferous variety, with large panicles of hyacinth-shaped blossoms, rising in blue pyramids among the dark foliage; the blossoms are clear blue, but the centres and stamens are white. Columbine is a pleasing gem, possessing a shapely habit, with panicles of large blossoms surmounting the wealth of foliage; the colouring is soft violet. Somewhat taller than either of these is Crepuscle; this produces a multitude of long-tubed flowers, arranged in panicles well above the foliage; it is pale blue in colour, darkening at the centre. Cypris is a large-flowered variety, producing large bunches of long-tubed reflexed blossoms, of a clear turquoise blue colour, and is rather tall in growth. Fraicheur has a dwarf, bushy habit, but the flowers are large, with the inflorescences rising clear from the foliage, and the colouring is pale lilac, shading to whitish-blue.

Other interesting varieties, which follow in their main features more closely to C. Davidiana, are Iris, a brilliant blue, producing its blossoms in a series of whorls and forming a shapely medium-height plant. Phare is hyacinth blue, with the blossoms produced in close bunches near to the stems. Hybrida is very compact in growth, the blossoms pale blue, very small, and freely produced. Gerbe Fleurie is very like C. Davidiana; the flowers are large, of a pretty shade of porcelain lilac, while in Profusion we note a floriferous blue, with a pale creamy centre.

P. S. Hayward.

NOTES ON SOME NEW ROSES
No. II.

In treating of the new roses of 1908 one approaches the subject with a certain amount of diffidence. We cannot make positive statements, their acquaintance has been but brief; we can only give first impressions. Until these roses have been grown under personal observation, or have been seen in cultivation in their respective homes and climates, nothing definite can be said. For descriptive purposes a new rose will come under two heads: (1) Those which have been grown by the writer, or seen on the plants in the garden elsewhere, and (2) those that have come before us at the exhibitions either as cut flowers or in pots. And kindly bear in mind there are other varieties perhaps equally as good as those tabulated in the following list; the writer does not attempt to give more than a selection. These will be treated in alphabetical order, taking those first that come under the first head, those which the writer has seen growing.

Dr. O. Donel Browne, H.T. (A. Dickson and Sons).—Colour carmine-rose, growth sturdy, flowers erect, well-formed, full, large, late-flowering. Although classed as a hybrid tea, it is evidently closely bordering on the hybrid perpetuals. In its general outline, both of plant and flower, it reminds one of that old rose Star of Waltham. It appears to be a most promising variety, and, from an exhibitor's point of view, one of the best of 1908.

Earl of Gosford, H.T. (S. McGredy and Son).—Bright rose-red, flowers carried on long foot-stalks, deep petalled, but lacking substance. Awarded a Card of Commendation, N.R.S., Manchester.

Florence Edith Coulthwaite, H.T. (A. Dickson and Sons).—Colour, deep cream shaded to centre with orange-rose. Very free flowering, of good constitution, useful for the garden, but unlikely to surpass Earl of Warwick, a variety which it closely resembles.

George C. Waud, H.T. (A. Dickson and Sons).—Colour difficult to describe, bright light crimson suffused with orange. A new shade altogether amongst roses. Flowers medium size, well formed, high centred, and full. Very fragrant. Its popularity is assured on account of its colour. A row of it amongst other roses, when seen at Newtownards in August, was very striking. Award of Merit, R.H.S.; Gold Medal, N.R.S., Manchester.

Grace Molyneux, H.T. (A. Dickson and Sons).—Colour deep cream-pink, flowers semi-double, produced on long upright stems; fragrant. Suitable for the garden on account of its freedom in flowering. Card of Commendation, N.R.S.

John Cuff, H.T. (A. Dickson and Sons). —Colour carmine-pink. Very free both in growth and flowering. Blooms finely formed, full. A good rose for exhibition and garden.

Lyon Rose, R. Pernetiana (Pernet Ducher).—Colour coral-red, fairly full, erect, vigorous, and free. The raiser describes it as being "a cross between Madame Melanie Soupert, H.T., and an unnamed variety, itself the direct offspring of Soleil d'Or." It has all the characteristics of a hybrid tea. It is useful for the garden. As seen at the Franco-British Exhibition, closely massed, it was attractive.

Lady Ursula, H.T. (A. Dickson and Sons). Colour flesh pink. Flowers of good substance, high centre. Vigorous.

Mrs. David Jardine, H.T. (A. Dickson and Sons). Colour clear soft rose-pink. Flowers of perfect shaps. Highly spoken of in the United States, and by the raisers as destined to supersede Catherine Mermet for forcing purposes. Its perfume is delicate, a real tea-scented rose. Award of Merit, R.H.S.

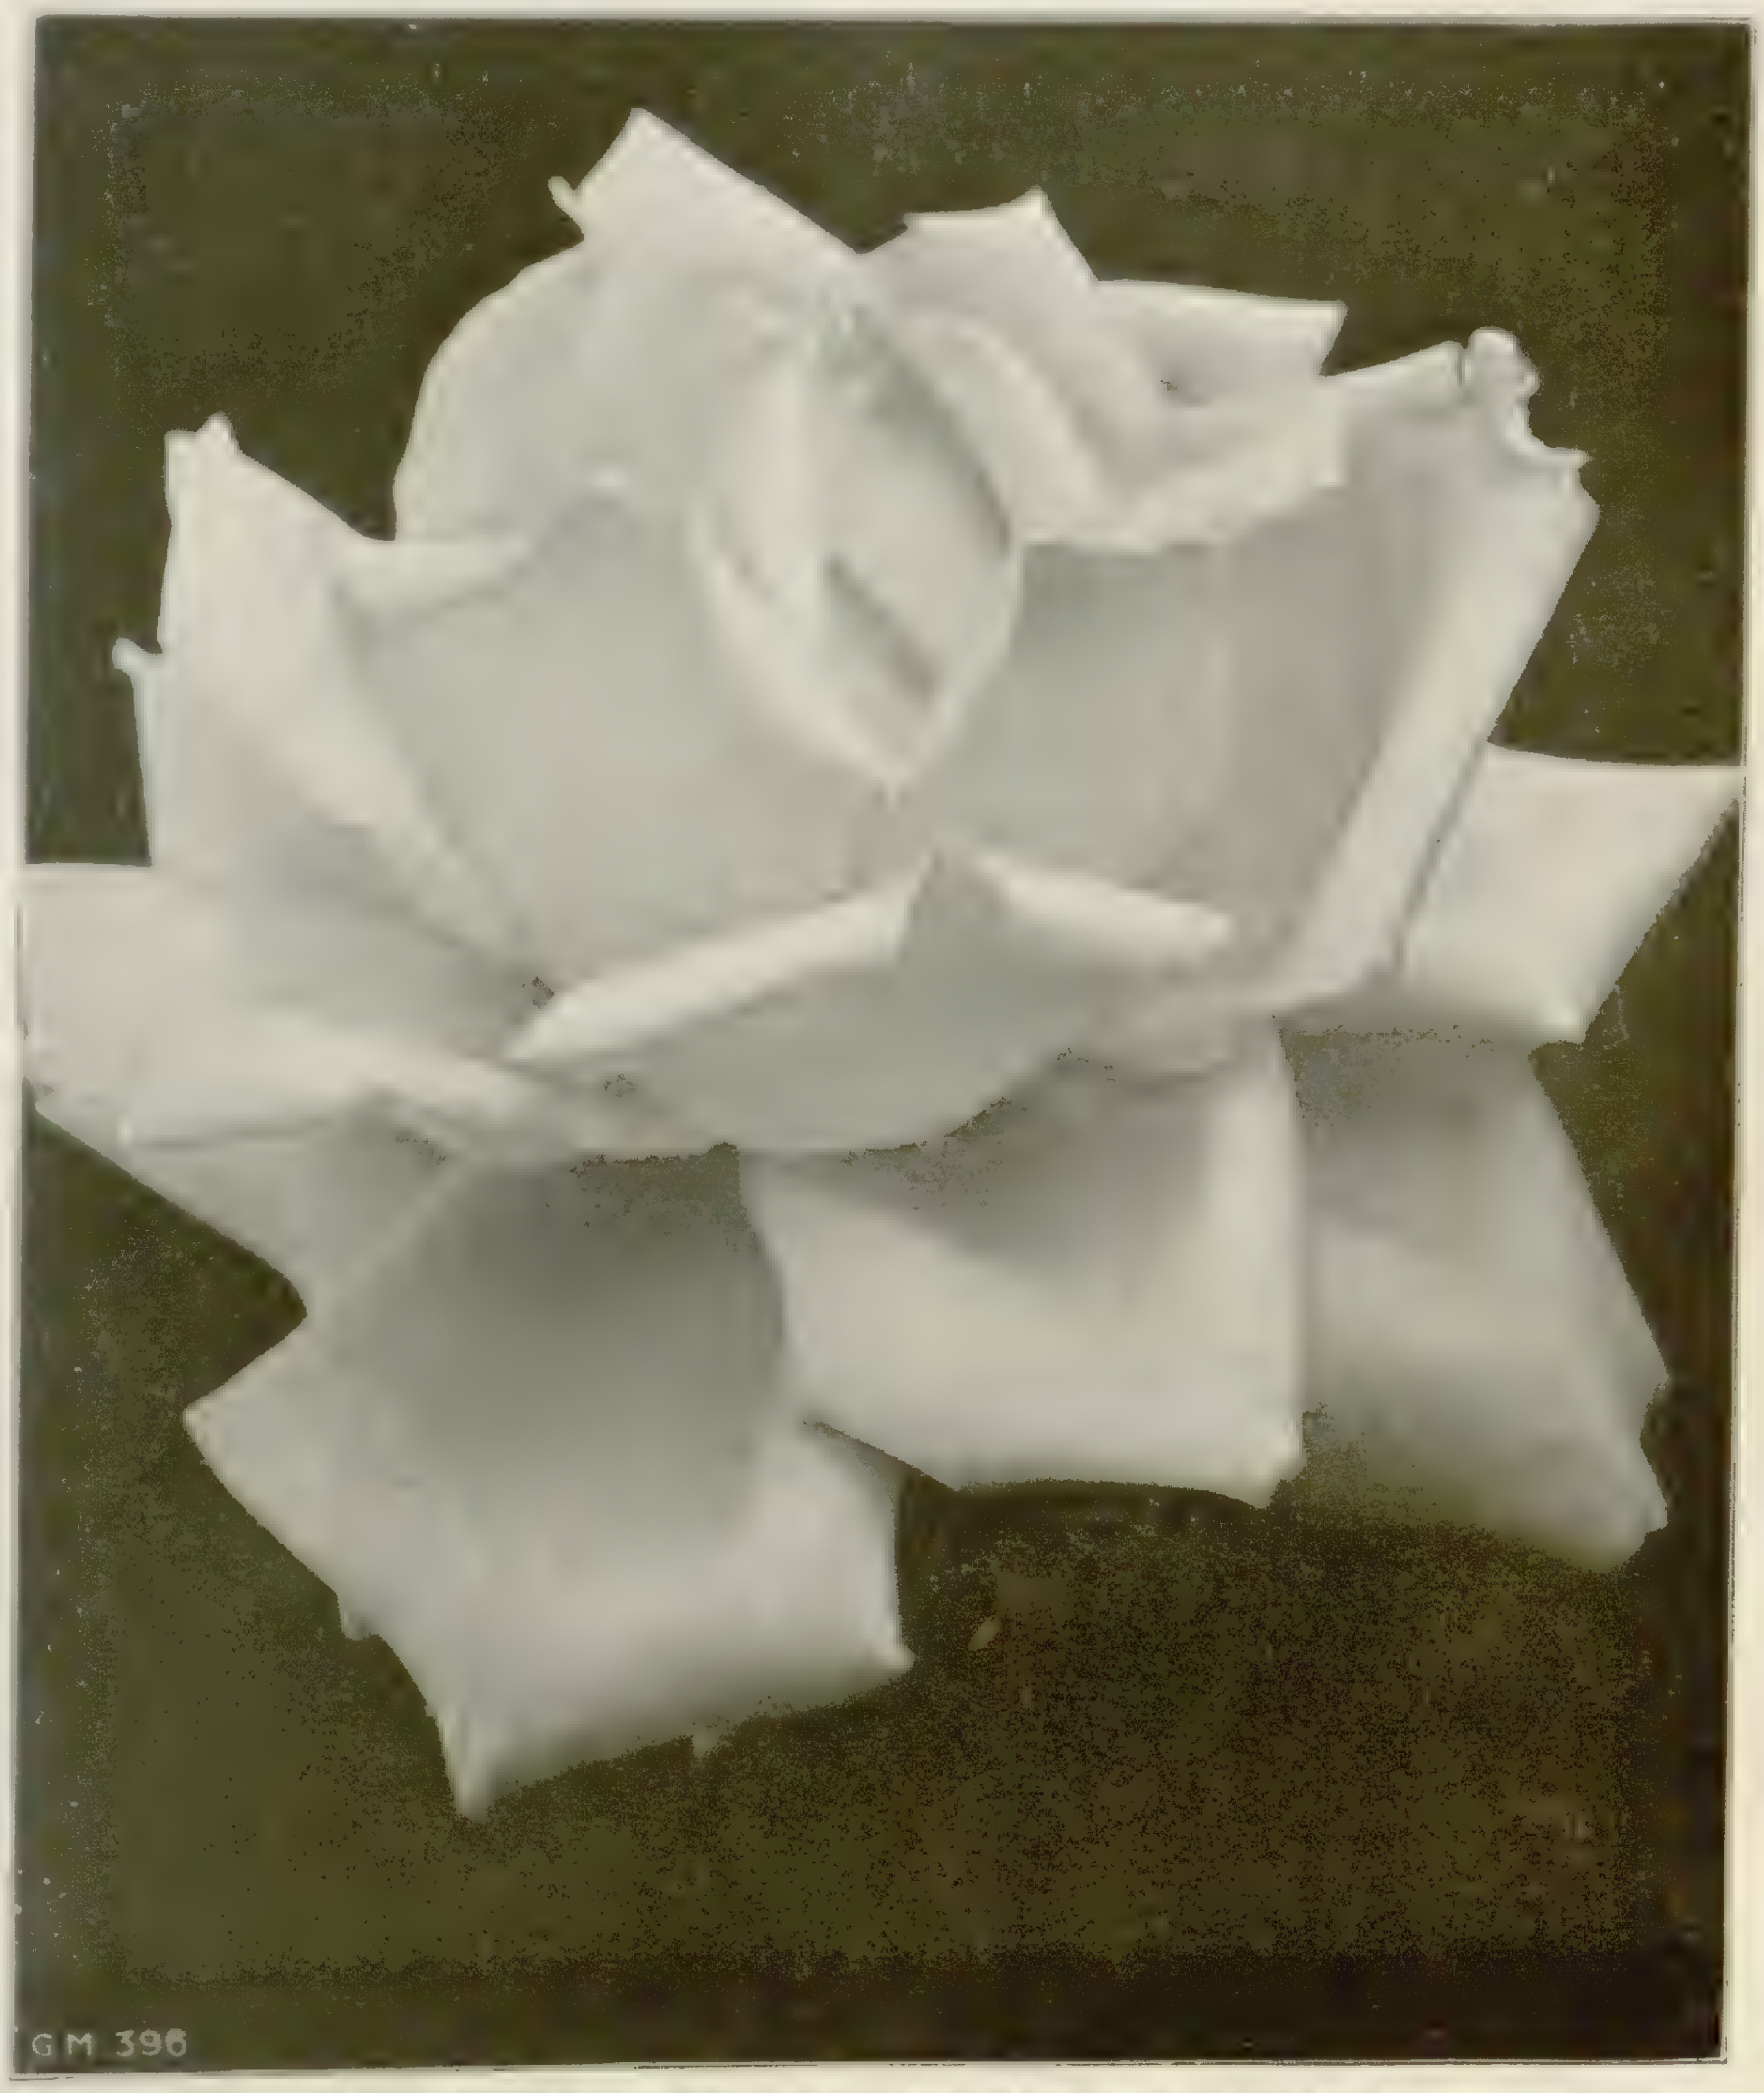
Molly Sharman-Crawford, Tea (A. Dickson and Sons).—Colour pale creamy-white. Flowers full, with high centres, and beautifully formed. Very fragrant. Growth vigorous. Destined to occupy a prominent position among the exhibition teas, and at the same time an acquisition to the garden. One of the best of the year. Award of Merit, R.H.S.

Simplicity, H.T. (Hugh Dickson).—Colour pure white. Flowers, which are almost single, and as large as Frau Karl Druschki, with golden stamens, are produced after the manner of Kaiserin A. Victoria, of which it is a seedling. The petals are thick and leathery. A most striking variety as staged at Manchester, and as seen growing in masses at the home of the raiser. Gold Medal, N.R.S., Manchester.

W. R. Smith, Tea (Smith).—Introduced by Mr. Hugh Dickson.—Colour creamy-white suffused with pink, tips of petals outlined with rose after the style of Madame de Watteville. Said to be a seedling from Maman Cochet, which, in form of flower, wood, habit, and foliage it closely resembles. A very attractive stand of this rose was staged in the class for twelve of one variety at Wolverhampton Show on July 7 last, and after inspecting it in the rose grounds of the introducer in August, when a bunch of finely developed flowers were gathered, I have every cause to think that it will prove to be one of the best sent out during the last three or four years. Card of Commendation, N.R.S., Regent's Park.

Havering. JOSEPH H. PEMBERTON.

Phlox canadense Laphami (Perry's Variety).—The rich lavender flowers of Plumbago capensis are always admired, indeed among plants suitable for summer gardening the colour is unique. Yet though frequently employed in this way, it flowers so late that it is but rarely a success when planted out. As a gain in this colour I think the above-named phlox a sterling success; the plant is absolutely hardy, grows freely, flowers lavishly, and continues so for several months, being at its best during June and July. Many readers of the GARDENERS' MAGAZINE are already familiar with its good qualities, as it has frequently been exhibited at the Temple Shows; to those who have not yet seen it, I recommend it as one of the best recent additions to hardy plants. Cuttings should be obtained now, and inserted in rich, light soil in a cold frame; every tiny scrap will root, and if planted out nine inches apart in spring a rare and novel colour effect will result. The flowering stems are light, supporting trusses of bloom often a foot across, the height when in flower averaging twelve to fifteen inches.—THOMAS SMITH, Walmsgate Gardens.



NEW HYBRID TEA ROSE GRACE MOLYNEUX.
Raised by Messrs. Alex. Dickson and Sons. Colour deep cream suffused with pink.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

WINTER - FLOWERING CYPRIPEDIUMS. — The species and hybrids that have recently passed out of flower may now be examined to see what repotting requirements may be necessary. It is advisable, however, where convenient to defer the repotting of this section until the month of February. There is generally so much needing attention just at that time in a general garden that one has to study and push forward all the work that can possibly be done at this season. I certainly think that, where it is intended to make divisions of any of the plants, the sooner it is done after the plants have passed out of bloom the better, as the roots are more or less active, and soon push into the new compost. The potting compost for the plain-leaved section of cypripediums must be varied, according to the conditions under which the plants have to be grown. In a pure atmosphere, where there is no obstruction to light, the potting compost may consist of about one-half turfy loam and the remaining portion of fibrous peat; polypodium or osmunda fibre, may, however, be substituted for the peat if considered desirable. Chopped sphagnum moss, with sufficient coarse sand and broken crocks, should be added to render the compost porous.

IN THE NEIGHBOURHOOD OF LONDON and other large towns, where the light is so poor that the drying of the compost during the winter takes a considerable time, I would suggest that the compost should be of such a nature that it may become dry within a reasonable period; and therefore it is the discarding of the loam that will best facilitate this desirable end. Some may claim to have produced more robust constitution in their plants from the use of loam in the potting compost, but even that is only a matter of opinion; but in unfavourable districts I certainly think it is best to leave it out of the potting composts. The pots should be clean, and filled to about one-third their depth with clean crocks. The compost should be made firm about the roots and base of the plants. Where the roots have become adhered to the sides of the pots there is often a difficulty in removing the plants from them. It is a very good plan to give the plants a thoroughly good watering a few hours before they are wanted for repotting; this is a considerable advantage, and induces the roots to part more readily from the sides. I have on previous occasions pointed out the advisability of treating this section of cypripediums liberally, as I am quite certain no advantage can be claimed by annual repotting of such varieties as C. insigne, C. Leeanum, etc. For large specimens of these kinds I consider once in three years quite often enough to disturb them, and, by judicious top-dressing and proper attention to watering - requirements, they will even remain in the same pot for a longer period than that mentioned. When potting large plants, all the very old growths should be carefully removed. If it is desirable to increase the stock, the growths thus removed may be potted up in the usual way, and, if placed in a warm, moist position, they will soon produce new growths.—H. J. Chapman, Oakwood Gardens, Wylam-on-Tyne.

STOVE PLANTS.

EUCHARIS AMAZONICA. — Specimens that have been cultivated expressly for autumn and winter flowering usually commence growth again almost immediately they have bloomed, and it is therefore necessary to divide the large plants before the roots become active, if one desires to increase the stock. At this season the operation must be carried out most carefully, and as much soil as possible retained on the roots. The bulbs may be potted up into various-sized pots, according to their size and strength. Use a compost of strong fibrous loam, with a few rough lumps of peat, and as much charcoal, sand, and mortar rubbish as will keep the compost thoroughly porous; these should be well mixed together and placed in the same temperature as that in which the plants are growing previous to potting. Use clean and well-drained pots and pot firmly, but carefully avoid injury to the roots. If convenient, plunge the pots up to their rims in tan, bark, or leaves, over a bottom heat of 70 to 75 deg., but do not give overmuch water until the roots become active and the plants are growing freely again. A gentle dewing over by means of the syringe will generally suffice throughout the winter months.

FICUS ELASTICA.—These plants form useful subjects for conservatory and house decoration, and they will thrive well in a temperature ranging from that of a warm greenhouse to the intermediate stove. In the latter position they are well worth growing, and will develop into useful sized specimens as quickly as any foliage plant with which I am acquainted. The bold, glossy leaves and vigorous constitution thoroughly recommend it as the best room plant in cultivation. Spring is the most suitable time for propagation, as then it will readily root from cuttings made from the young growth, if confined in a moist, close atmosphere, and given bottom heat. Plants may also be raised from eyes, which should be cut from lengths of the stem, placed flat in shallow pots or boxes, and treated as advised for cuttings. Pot the plants singly as soon as they require more space.

GENERAL REMARKS.—Throughout the winter months care of temperature and watering are most essential, because now is the resting period of most of the occupants of the stove. If great fluctuations of temperature are allowed there may be premature and stunted growth, and the plants do not start freely into growth when the proper season arrives.—John Donoghue, Bardon Hill Gardens.

HARDY FRUITS.

GREEN GAGES.—These, although rather shy in bearing until the trees have attained reasonable size, require very carefully pruning, and if the wood inclines to coarseness root lifting must be practised. It is an excellent plan when pruning green gage trees to preserve at intervals medium-sized shoots, and secure them to the walls or wires. These young growths frequently produce excellent fruit when spurs fail. All fore-right growths need pruning back to within a couple of eyes of the older wood. Two years' old growths which may have borne fruits, should, if not wanted for filling up, be shortened, so that the whole of the trees may be clothed with both spurs and young suitable shoots. When planting young trees see that there is ample drainage provided, and the soil composed of good rough loam with plenty of old brick mortar, wood ashes, etc., thoroughly mixed, and made nicely firm before spreading out the roots. When planting wall trees allow ample room between the walls and the stems, so that the latter can thicken without being injured by pressure against the brickwork. Other plums need pruning in the same way as the green gage. All our trees are fan-shaped, a method of training I have practised for many years, and have every reason to be well satisfied with the results. Watch for bullfinches and other birds destructive to the buds.

PEACHES AND NECTARINES. — The pruning and nailing of these we usually leave until the month of February. No removal of the shoots from the walls is ever practised, but as soon as the flower buds begin to expand protection is afforded, and I have no reason to alter this course, which I have adopted for many years in succession. When planting peach trees, if the soil is thought to be deficient in lime a little should be added. A strong rich soil should be avoided; use a sweet fibrous loam, not too fine, with burnt earth and wood ashes, old plaster, and a sprinkling of bonemeal. If the soil is short of fibre, and is likely to run together very closely, add a little half-decayed manure, charcoal, mortar rubble, etc., so as to keep it open.

CORDONS. — In unfavourable districts, where the climate and condition are far from satisfactory for dessert kinds, and if there is wall space available, cordon apples might be profitably planted. Such varieties as Cox's Orange Pippin, Allington Pippin, May Queen, Scarlet Nonpariel, Worcester Pearmain, Egremont Pippin, Claygate Pearmain, and Duke of Devonshire, if worked on the paradise stock, and planted on a well-drained border, should give good fruits. When planting cordons it is always advisable to grow enough of one kind in preference to many varieties.

STAKES AND FRAMEWORK for raspberry canes should be put into good order, and the canes carefully tied according to the different methods of growing and training them. Do not allow too many canes to remain. They need not be topped at the present time, but simply tied in, shortening the canes being best left till spring. Those planted this season should be mulched. In fact, all raspberries require a liberal dressing of manure, as they are gross feeders, and suffer quickly from drought. Do not at any time dig deeply between the rows, being content with pricking over the surface about three inches deep; digging deep amongst raspberries frequently ends in the loss of canes and crop. — H. Markham, Wrotham Park Gardens.

THE KITCHEN GARDEN.

FRENCH BEANS.—Continue to make sowings at intervals to keep up a succession. If the amount of space is limited, the pots containing the seeds may be placed under the stages or on the sides of the paths—in fact, any corner will suit them where there is sufficient heat to induce the seeds to germinate. But as soon as they appear through the soil they must be given a light position well up to the glass. A little ventilation should be admitted in favourable weather to maintain a sweet atmosphere. Cold air should not, of course, be allowed to pass directly over the plants.

TOMATOES.—Some growers prefer to raise the plants from cuttings that are required to provide an early supply. Should they be rooted, pot them off, using three or four-inch pots, and place them on a shelf in a warm house close to the glass. Admit a little air when the weather is mild, and keep the atmosphere of the house a little drier. Sow a few seeds to form a succession, and keep the growth as sturdy as possible.

PEAS IN POTS.—Some early dishes may be obtained by sowing a good batch in eight or nine-inch pots. In preparing the pots place one large crock over the hole, and upon this put a two-inch layer of decayed manure. Then fill up to within one-inch of the rim with a light mixture of loam and old mushroom-bed manure. Put nine or ten peas in each pot, and cover them with about two inches of soil. Stand them close together on the border in a vinery or peach house that has just been started. When the seeds have germinated, and the young plants have made two inches of growth, they must have a light and cool position near to the glass, to prevent them becoming weak and drawn. They will not require much water for some time, but as the haulm increases in height more liberal supplies of water will become necessary. They will also be benefited by occasional watering with weak liquid manure.

EARLY POTATOES.—The first batch of tubers should now be planted, and if frame room is limited a goodly number of eight-inch pots should be used in raising the indoor crop. Place one good set in each pot, on three or four inches of soil, and then add enough soil to fill the pots to about half their depth. The remaining space can be filled when the growth is advanced. These can be put in any fruit house that has a temperature of 50 to 55 deg. Sharpe's Express, Sharpe's Victor, and Ninetyfold are good forcing and useful varieties.

CUCUMBERS.—In establishments where cucumbers are required throughout the year it taxes the grower to the utmost to maintain a regular supply at the present time, and for the next three months. Plants that have been in bearing for some time should now have placed over their roots a top-dressing composed of light turfy loam, leaf-soil, and mushroom manure, with a sprinkling of old soot. Great care should be exercised in watering and ventilation during these dull, short days.

WORK IN GENERAL.—The fine, open weather that we have had, and are still having, has been favourable to the pushing on of such work as trenching, manuring, and dressing. Prepare each plot according to the kind of crop with which it is to be occupied. If new asparagus beds are to be prepared on heavy soil for planting next spring no better time is more favourable than the present for putting the work in hand. The frosts will then have full play upon it, and make the soil in good condition for planting the crowns when the time arrives.—T. W. Birkinshaw, Hatley Park Gardens.

NOTES OF OBSERVATION.

Chrysanthemum J. Wynn. — This is a new seedling incurved variety of great promise. It was raised by Mr. Wynn, of Sedgeford Hall Gardens, King's Lynn, and exhibited at the late Cambridge Chrysanthemum Show, where it received a first-class certificate. It is a very strong grower, of medium height, white, beautifully-tinted with mauve; it is a deeply built flower, truly incurved, and with very fine petals. It will unquestionably take a conspicuous position among the leading incurved varieties in the future. It is the result of a cross between J. Agate and Mrs. F. Judson, the latter being the seed-bearing parent.—E. Beckett.

Aster amellus Seedlings.—At Aldenham this year quite 500 seedlings have been on trial, raised from the Amellus type by careful crossing of selected seedlings during the last two or three years. The collection is of interest, and although there is nothing to cause a sensation in the way of colour, size, or habit of growth, the collection abounds in variety of form and colour. Mr. Beckett is working for a pure white form, and has strong hopes of success in the near future. In colour there is much variety, pale and dark blue, mauve, and pink, with cup-shaped, reflexed, stellate, and circular blossoms.—E. M.

Rose Lady Quartus Ewart.—I must thank Mr. Jefferies for his note in your issue of December 5, but he must remember it was not my own selection entirely that I gave. Doubtless the fact that Lady Quartus Ewart was so new, introduced in 1904, and ten years younger than Madame Joseph Combet, was the reason the majority did not select it. I can endorse all Mr. Jefferies says of this grand rose, and it has been indeed fine with us during the past summer and autumn. It is certainly on the small side, but this is a good point in the estimation of many, especially when, as in this instance, the flowers are produced so freely.—A. Piper.

Artemisia lactiflora is a vigorous and effective perennial, which, in flower, and seen from some distance, has a spiræa-like appearance. The flowers are creamy-white, borne upon erect, branching spikes, which frequently attain a height of seven feet in moist, rich soil. The whole beauty of this plant lies in planting it in a good deep mass, and being really one of the latest perennials to flower, it forms a conspicuous object in the border, and is, therefore, a decided gain in the autumn border. The artemisia is a perennial, growing quickly at the root, and can readily be increased by division.—Thomas Smith, Walmsgate Gardens.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

National Sweet Pea Society.

The members of this young and vigorous society gathered in considerable numbers on Friday, December 11, at the Hotel Windsor, on the occasion of the annual meeting, which was presided over by Mr. Wm. Cuthbertson, J.P., the president for 1908. After the usual preliminaries, the hon. secretary, Mr. C. H. Curtis, read the report and balance-sheet for the year 1908. The following is an abridged account:

COMMITTEE'S REPORT FOR THE YEAR 1908.

The presentation of this report by the committee will serve to show that the activities of the National Sweet Pea Society have increased during the year under review. It is a pleasing feature of the work of the society that growers and raisers have every confidence in the conduct of the Reading Trials, in the absolutely impartial judgment of new varieties of sweet peas, and in the go-ahead policy of the officers and committee.

The London Exhibition, on July 24, was the prettiest yet held by the society. The flowers were of good quality, the competition was keen, especially in the small growers' section, and, owing to the reduction of the number of classes, there was comfortable room for the disposal of the flowers. The attendance was good, and £30 was taken at the doors. The Dublin Show was a great success, so far as the flowers and competition were concerned, and Mr. F. W. Moore, Mr. Knowldin, Mr. Digges, and other friends did all in their power to make the function a financial success, but the committee regrets to learn that the Royal Horticultural Society of Ireland experienced a considerable loss on the undertaking, notwithstanding the double attraction of their own and the sweet pea classes. The president, with Mr. H. J. Wright, and the hon. secretary, attended the Dublin Show, and, together with leading growers present, acted as judges.

The work of the Floral Committee, and the trials at Reading, continue to provide the great and most important part of the society's proceedings. From all parts of the world sweet pea lovers are now looking to us to solve questions of nomenclature and priority, the bracketing of too-much-alike varieties, the deletion of old and useless sweet peas, and the careful distribution of awards to the finest varieties. Under the chairmanship of Mr. Walter P. Wright, the Floral Committee inspected the three hundred trials at Reading University College. Remembering the distances they have to travel, and how readily the members give their time and expert knowledge to the society, it is only right that an expression of deepest gratitude to them for their splendid work should here be recorded. The trials of sweet peas ably conducted by Mr. Charles Foster in the gardens of the University College, Reading, proved very interesting and instructive. They were largely visited by members and non-members, many Continental and American friends finding them of immense value for purposes of comparison. The trials were well grown, and continued attractive and useful right through the summer. In future the committee proposes to receive new varieties only from the raiser or introducer for the purpose of these trials, but it is arranged that a further set of trials will be held at Reading next year, under the committee's direction, for the sole purpose of testing the correctness and purity of stocks of sweet peas that may be sent by seedsmen. For the special trials of new sweet peas the committee proposes to make a charge of 2s. 6d. per variety, while for testing stocks of older varieties a charge of 5s. per stock will be made.

An unusually large number of members attended the "Outing" to Reading on July 10, to inspect the society's trials, and see the varieties that had secured the recognition of the Floral Committee. More or less wet weather prevailed all day, but this did not materially decrease the pleasure or profit of the visit. The thoughtful generosity of Mr. Leonard Sutton in providing luncheon, and of Mr. Owen Ridley, chairman of the College Council, in providing tea, merit and receive the sincerest thanks of the members. On July 11 a large party visited Kelvedon, and, after being photographed in front of Mr. N. N. Sherwood's house, proceeded to inspect Messrs. Hurst and Sons' very extensive trials of sweet and culinary peas, etc. Mr. Sherwood generously entertained the party at luncheon. A pleasant drive from Kelvedon brought the party to Marks Tey, where the splendid sweet peas grown by Messrs. Dobbie and Co. were inspected, under the guidance of the president, Mr. William Cuthbertson, and where a brilliant "outing" was brought to a pleasant conclusion by a "strawberry tea," presided over by Mrs. and Miss Cuthbertson.

The committee has been especially fortunate in its officers during the year. The president, Mr. Wm. Cuthbertson, has worked hard and enthusiastically for the society, and his reward is found in the increase of membership and the great progress made. Mr. E. T. Edwards, chairman of committee, has proved a generous supporter of the society, and his gift of the Provincial Cup will long keep in mind his year of office. The return of health to the hon. treasurer, Mr. N. N. Sherwood, has given great pleasure to the committee and members. Mr. Edward Sherwood has continued as acting treasurer, and his services are gratefully acknowledged. The hon. secretary has had a strenuous year's work, but his chief anxiety is for more members and more work.

One of the most pleasing events of the year was the presentation of some substantial tokens of recognition of their valued services to our worthy hon. secretary and his wife, at the dinner following the great summer show. The President (Mr. Cuthbertson), on behalf of the society, handed to Mr. C. H. Curtis a cheque for £60, which amount had been voluntarily subscribed by sweet pea lovers in different parts of the world, and which was intended to express their warmest appreciation of his untiring energy and devotion to the interests of the society, and their heartiest thanks for the good work already accomplished. A handsome gold bracelet was presented to Mrs. Curtis by Mr. Edward Sherwood, on behalf of the society, as a token of high personal regard and grateful thanks for the great help she had rendered to her husband in the arduous duties devolving upon the office he so ably fills.

At the annual meeting of 1907 there were six hundred and two members. Since then no fewer than two hundred and seventy-nine new members have joined the society, twenty-two of these joining for 1909. There have been numerous losses through death, etc., and at present there are seven hundred and seventy-nine members, and fifty-one societies in affiliation.

The financial position of the society was never better than now. Liabilities, with the exception of those connected with prepaid subscriptions, are nil. The present modest balance on the right side is a solid one, and in addition to this the society possesses considerable assets in its store of tiered staging and vases.

Although the return from the sale of "Annuals" was rather less in 1908 than in 1907, it must be remembered that new members and new societies in affiliation took well over three hundred copies, and in scores of instances the "Annual" has been the direct means of securing new members. The "Annual" for 1909 is being prepared by the society's editors, Mr. Chas. H. Curtis and Mr. Horace J. Wright, and it promises to be as interesting and useful as any of its predecessors.

Considerable progress has been made already in the work for 1909. The London Exhibition has been fixed for Friday, July 23, and the Provincial Show will be held at Saltaire, Yorks, on July 13.

Those who have given special prizes and donations to the prize fund, contributed to the trials' expenses, sent articles and photographs for the "Annual," or acted as judges at the London and Dublin Shows, all merit sincerest thanks. To the Horticultural Press for valuable assistance, and to the Horticultural Club for the use of its rooms for committee meetings, and to the officers of the Royal Horticultural Society, and the Royal Horticultural Society of Ireland, for many kindnesses, the committee tenders its best thanks. In conclusion, the committee would press the need of personal endeavour to obtain new members, because it is only as membership increases that the society's usefulness can be advanced.

The President moved the adoption of the report, and, in so doing, briefly touched upon the chief features of the year's work. Referring to the presentation to Mr. and Mrs. Curtis, he said he now had great pleasure in handing a further £10 5s. 6d. to the hon. secretary, the balance of the presentation fund. Mr. Cuthbertson spoke highly of the trials and Floral Committee work, and urged everyone to help the society in its endeavour to prevent multiplication of names, etc., and to secure new members. He was proud of the advances made during his year of office. Mr. Alex. Dean, V.M.H., seconded the adoption of the report, and added his tribute of praise to the work done. The motion was carried unanimously.

A great deal of formal business had to be transacted, but it was all done in an exceedingly pleasant manner. Mr. Cuthbertson (president), and Mr. C. T. Edwards (chairman for 1908) were heartily thanked for services rendered, as also were Mr. N. N. Sherwood and Mr. Edward Sherwood, the treasurers, and these two latter were unanimously re-elected. Sir Randolf Baker, Bart., of Blandford, Dorset, was elected president for 1909, and Mr. Horace J. Wright, chairman of committee. Mr. Wright returned thanks for the honour, and said he would present a twenty-one guinea challenge cup to the society for the small growers' section. Mr. R. Gluyas was reappointed auditor, and Mr. C. H. Curtis was re-elected hon. secretary, and voted an honorarium of 25 guineas. Mr. C. Foster was heartily thanked for his services as trials superintendent.

It was agreed that the date of subscriptions due be altered from February 1 to January 1, but the suggestion that Rule 6 be altered so as to prevent the re-election of non-attending members of committee was not adopted, because it was thought all members should be notified of such proposed alteration previous to the next annual meeting. The election of the General Committee followed. A few old members retired, and there were other losses notified, but those remaining were re-elected, and Messrs. H. Shave, H. Tigwell, E. H. Christy, W. Deal, W. Lumley, H. Till, S. Cole, R. F. Felton, and Wm. Cuthbertson were added to the committee.

Several interesting points were raised by various members, and those who took part in the proceedings included, in addition to those mentioned, Messrs. J. Collingridge, H. J. Wright, H. K. Judd, J. Clayton, S. B. Dicks, A. Clarke, W. Lumley, E. F. Hawes, W. Nutting, H. Perkin, W. Deal, A. Ireland, H. Tigwell, J. Brunton, R. Sydenham, C. W. Breadmore, C. Foster, T. Stevenson, A. Watkins, A. Davis, and Commander Humphrey.

The meeting concluded with a vote of thanks to the President.

At the subsequent committee meeting the Executive Committee was elected, with very little alteration from the composition of 1908, and the Floral Committee was re-elected with Mr. W. P. Wright as chairman, and one amateur—Mr. E. H. Christy—added.

National Rose Society.

There was a large attendance at the Westminster Palace Hotel on Thursday, December 10, when Mr. E. B. Lindsell, the president of the society, presided over the annual meeting of the flourishing National Rose Society. There were several ladies present, and most of the leading trade and amateur rosarians from all over the country.

On opening the business, Mr. Lindsell asked that the circular calling the meeting and the minutes of the previous annual general meeting be taken as read, and to this the meeting promptly agreed. Messrs. H. Darlington and John Green were then elected scrutineers of the ballot for officers and committee. The hon. secretary, Mr. E. Mawley, V.M.H., then read the annual report, as follows:

REPORT OF THE COMMITTEE FOR THE YEAR 1908.

The report which the committee have now the pleasure of presenting is the most favourable that has yet been placed before the members, and more particularly as regards the increase in membership. In 1903 the number of members for the first time reached one thousand; in 1906, three years later, two thousand; and now, two years later, they have to record a membership of over three thousand.

Three exhibitions were, as usual, held. The Metropolitan Show again took place, by the kind permission of the president and council of the Royal Botanic Society, in their beautiful gardens in the Regent's Park, on July 3rd. It was noteworthy as being the largest which the society has yet held, 8,500 blooms of "exhibition" roses being staged, in addition to the numerous stands of decorative roses and other interesting exhibits. As in the three previous years, Her Majesty the Queen, who is the society's Royal Patroness, visited the show, and, as the Royal visit was made shortly after the hour for opening, this honour was especially appreciated by the members and visitors present.

The committee, in carrying out the arrangements for the Metropolitan Exhibition, were, as on previous occasions, ably supported by the secretary, assistant secretary, the superintendent of the gardens, and other members of the staff of the Royal Botanic Society.

The provincial show was held at the White City, Manchester, on the site of the gardens of the Royal Botanical and Horticultural Society at Old Trafford. This exhibition was of less than average extent, but the quality of the blooms was good, and they retained their freshness very much better than at the Metropolitan show, which, unfortunately, was held on what proved to be the hottest day of the whole year. The thanks of the committee are greatly due to Mr. James Brown, one of the society's vice-presidents, for the active part he took in furthering the success of the Manchester exhibition.

The fifth autumn show of the society took place in the Royal Horticultural Hall, Vincent Square, Westminster. This exhibition was not quite so large as that of the previous year, but the general quality of the blooms was surprisingly good, considering the trying character of the season. Now that this exhibition is becoming generally known it is attended by the members in largely increasing numbers.

The twelve five guinea silver cups, so generously presented last year to the society by Mr. W. E. Nickerson, of Cambridge, Massachusetts, U.S.A., for the raisers of respectively the best white, the best pink, the best crimson, and the best yellow dwarf and climbing roses for general cultivation—those which came out first in the ballot instituted by the committee—have been duly awarded. Also, as far as possible, the twenty-four handsome diplomas, likewise the gift of Mr. Nickerson, for the raisers of the roses which obtained the second and third positions in the ballot. The official report of the ballot will appear in the Society's "Arrangements for 1909." An article on the thirty-six roses, to the raisers of which awards were made, will be contributed to the "Rose Annual for 1909," which will be sent to the members in February next.

The society's new and important handbook, entitled "The Enemies of the Rose," which is of interest as being the first publication issued by this society with coloured illustrations, and also the "Rose Annual for 1908," were forwarded to the members in April last.

It is with much regret the Committee have to announce that Mr. H. E. Molyneux has found himself reluctantly compelled to resign the treasurership, a position which he has so ably filled for the last four years. During the past year seven rose and other horticultural societies have become affiliated, bringing up the total number of societies in affiliation with the National Rose Society to 52.

The amount received in gate-money from the general public at the society's exhibition in the Royal Botanic Gardens was somewhat larger than in any year since the exhibition has been held in those gardens. The receipts from all sources during the past year, including a balance from the previous year of £291 9s. 4d., amounted to £2,666 9s. 9d., and the expenditure to £2,239 1s. 7d., leaving a balance at the banker's and in the treasurer's hands of £427 8s. 2d. Considering the great expense incurred in bringing out "The Enemies of the Rose," the cost of the enlargement of the "Rose Annual," and the placing of a further sum of £150 to the reserve fund, this balance must be regarded as eminently satisfactory. The reserve fund now stands at £450.

During the past year 785 new members joined the society, or 200 more than in any previous year. Allowing for the losses by death and resignation, the total number of members is now 3,150. Taking the year as a whole, two new members a day have, on an average, been added to the list of membership.

The Metropolitan Exhibition will again be held in the Royal Botanic Gardens, Regent's Park, the date fixed for the exhibition being Friday, July 2. The Provincial Show will take place at Luton, in conjunction with the Luton Sweet Pea and Rose Society, on Wednesday, July 14 or 21. Arrangements have again been made with the Royal Horticultural Society to hold the autumn show in the Royal Horticultural Hall, Vincent Square, Westminster, on Thursday, September 16.

In February next year members will receive a new and enlarged edition of the "Handbook on Pruning Roses." This has been thoroughly revised and will contain several new features and also directions for pruning about 200 more varieties than were included in the previous edition. At the same time will be issued the society's "Rose Annual for 1909," containing many articles and illustrations of interest to all classes of rosarians.

To the donors of special prizes, the committee offer their grateful acknowledgments and also to the hon. local secretaries for their zeal and activity in promoting the interests of the society. They especially desire to mention Mr. E. A. Earl (Bromley), Mr. O. G. Orpen (Colchester), Mr. Colin Romaine (Windsor), Mr. R. E. West (Reigate), and Dr. A. H. Williams (Harrow), as having been most successful during the past year. The society is also greatly indebted to Miss Willmott, V.M.H., one of its vice-patronesses, for the continued kind and valuable assistance rendered by her.

Reserve fund, invested in £513 19s. 10d. Consols, cost £450, worth about £433.

The President congratulated the members upon the great increase of membership, and the fine balance at the bank that Mr. Molyneux leaves on his retirement from the office of hon. treasurer. He then moved the adoption of the report and balance-sheet. Mr. Chas. E. Shea seconded the motion, and urged that, though the society was progressing famously, it was necessary to go forward on the present basis, in fact, to walk by sight rather than by faith. He referred to the proposed formation of several sub-committees to relieve the work of treasurer and secretary, and said that in future he hoped a much more detailed balance-sheet would be submitted.

The Rev. J. H. Pemberton brought up the subject of the society's meetings, and regretted that the meetings were not now held, as formerly, at the Hotel Windsor. He thought that as the Hotel Windsor, with its Horticultural Club, was the centre of horticultural life in town, the meetings should be held there, and he hoped the society would see its way to go back again, as he understood that ample accommodation would be supplied. He, therefore, proposed that the annual meeting, dinner, and other meetings be held at the Hotel Windsor. Mr. Cecil Cant seconded the motion. Mr. Holland, Mr. F. Cant, Mr. G. Gordon, and Mr. Mawley all spoke on this matter, and the general opinion seemed to be that the present arrangements were the most convenient.

Mr. G. W. Cook proposed that the accounts be audited by a chartered accountant selected by the General Committee, and suitably remunerated, and that words to that effect be added to the report; the mover and seconder of the adoption agreed to this, and Mr. Lindsell said the committee was agreed on this point.

One member, Mr. Butler, spoke rather strongly concerning the catering at the London Show, and hoped that a considerable improvement would be made next year. Several spoke on this point, but no real solution of the difficulty was brought forward. It was stated that the society was bound by the R.B.S. contract. A great deal of disapproval was expressed, and the President said that he was sure the committee would do all in its power to improve matters in future. The report and balance-sheet were then unanimously adopted.

The President then referred to the great work of Mr. Mawley as hon. secretary of the society, and, in accordance with a resolution passed by the General Committee, moved that £100 be presented to Mr. Mawley as an honorarium; this was seconded by Mr. G. Paul, V.M.H., and carried unanimously. Mr. Mawley, who had left the room, had a very hearty reception on his return, and when the President asked him to accept the honorarium, Mr. Mawley feelingly acknowledged the presentation.

Mr. George Gordon, V.M.H., proposed, on behalf of the committee, a resolution to the effect that the vice-presidents should be ex-officio members of the General Committee, but for the purpose of keeping the sub-committees within reasonable limits, only the president, treasurer, and secretary should be ex-officio members of such bodies. Mr. Prince seconded the motion, and it was carried unanimously. An alteration of Rule 10, proposed by Mr. E. J. Holland, was to the effect that general purposes, publication, finance, and exhibition sub-committees be appointed by the General Committee. The motion was seconded by Mr. H. Mount, and carried unanimously. The motion to hold the principal metropolitan show not earlier than July 1, and not later than July 9, was moved by Mr. Orpen, and having been duly seconded, was carried. Mr. Holland explained that this motion was really one to permit the show being held on July 2, and thus avoid clashing with the Holland House Show.

Dr. Williams proposed the thanks of the members to the officers and committee for their services during the past year. This was seconded, and carried unanimously. Mr. Mawley acknowledged the vote of thanks, and spoke highly of Mr. Molyneux's services as treasurer. Mr. Molyneux also said a few graceful words of acknowledgment, and stated how deeply he regretted the necessity for resigning his office of treasurer, and how much he rejoiced that Mr. G. W. Cook had consented to act in his place.

The scrutineers having declared the house list adopted, Mr. Lindsell called upon the Rev. F. Page Roberts to fill the chair as the newly-elected president. Mr. Page Roberts was heartily welcomed, and he acknowledged the honour conferred.

Mr. C. E. Shea very ably moved a vote of thanks to the retiring president, Mr. E. B. Lindsell, and this was seconded by Mr. Cecil Cant, and heartily accorded. Mr. Lindsell acknowledged the vote, and the proceedings then closed.

ANNUAL DINNER.

The annual dinner was well attended, and presided over by the Rev. F. Page Roberts, the newly-elected president, who was supported by influential rosarians, and had on either hand Sir Daniel Morris and Sir George Watt, the guests of the evening.

After the usual loyal toasts, Mr. Felton was very heartily thanked for decorating the tables so beautifully with roses, carnations, and violets. In proposing "The National Rose Society," the Rev. Page Roberts was at his best, and his witty sallies and humorous anecdotes proved a fine corrective to the serious business of the annual meeting. He was very sincere in his thanks for the honour conferred upon him. Mr. E. Mawley responded, and briefly reviewed the work of the year. Mr. G. W. Cook proposed "The Ladies," and mentioned that the society had about 1,000 lady members. Mr. George Paul proposed "Our Guests," and Sir Daniel Morris and Sir George Watt both responded, and each told of the fine growth of some roses in the West Indies or India. Sir George Watt referred to Rose gigantea, and said he hoped it would be tried again in this country, as he felt sure it would be useful to hybridists. Mr. E. J. Holland proposed "The Chairman." Vocal and instrumental music added to the pleasure of the function.

National Dahlia Society.

Under the presidency of Mr. E. Mawley, V.M.H., the members of the National Dahlia Society gathered at the Hotel Windsor for the purposes of the annual general meeting, resolved themselves into a special meeting for the purpose of amalgamating with themselves the London Dahlia Union. There were twenty-three present. Consequently, Mr. John Green proposed that the London Dahlia Union become amalgamated with the National Dahlia Society on the lines already laid down by the Joint Committee of both bodies. This was seconded by Mr. S. Mortimer, and, after Mr. H. H. Thomas had read the particulars of amalgamation, the motion was carried.

The annual general meeting was then declared open, and the minutes of the previous annual general meeting were read and confirmed.

Mr. Brousson at once proposed, and Mr. Stredwick seconded, that the amalgamation of the London Dahlia Union and the National Dahlia Society, as already agreed at the special meeting, be confirmed.

The hon. secretary, Mr. H. H. Thomas, then read the report of the committee for 1908.

REPORT OF THE COMMITTEE FOR THE YEAR 1908.

The past season was favourable to the cultivation of dahlias and an unusually fine display was expected at the annual exhibition, which this year, for the first time, was held in the new hall of the Royal Horticultural Society. Unfortunately a severe storm was experienced a few days before the show, and much damage was done in gardens. Owing to this a few exhibitors who had entered were unable to compete, and some who had entered in several classes were not able to show in all of them. Amateur exhibitors were again numerous, and the classes in the amateur section were generally well contested. The four classes open to amateurs who have never won a prize at any previous exhibition of the society, again brought numerous entries. In 1906, in these four classes, there were 28 entries; in 1907, 35; and in 1908, 32. The total number of entries for the show in 1908 was 303, as against 255 in 1907, but the bad weather just before the show prevented some of those who had entered from competing.

Some seventy new varieties were submitted to the inspection of the judges, who awarded certificates to eleven of them. On September 29 a Joint Committee of the National Dahlia Society and the Royal Horticultural Society met for the purpose of making awards to new dahlias. Certificates were awarded to nine varieties. The total number of certificates awarded in 1906 was 15; in 1907, 15; and in 1908, 20.

The Silver Challenge Cup, value fifteen guineas, in Class 6, for eighteen bunches of cactus dahlias, was won outright by Messrs. Stredwick and Son, and the silver challenge cup, value five guineas, in Class 15, for twenty-four blooms of show or fancy dahlias, was won outright by Mr. Thomas Jones. Subscriptions are invited to replace these, and should be sent to the hon. treasurer, by whom they will be gladly acknowledged.

The committee desire to convey their best thanks to the donors of special prizes, viz., The President, Messrs. J. Burrell and Co., Messrs. J. Cheal and Sons, Messrs. Dobbie and Co., Mr. T. Hobbs, Mr. J. F. Hudson, Mr. S. Mortimer, Messrs. J. Stredwick and Son, and Mr. John Walker.

The number of new members joining the society in 1908 was 28; in 1907 there were 28; in 1906, 38; and in 1905, 32 new members. Thirty-nine members have resigned during the past year. The committee regret that their appeal to obtain new members has not met with the support they anticipated. They would impress upon members the necessity of individual efforts being made in this direction.

The trial of garden cactus dahlias was again held at Wisley. Two visits were made by a Joint Committee and certificates were awarded to twenty varieties. The trial of dahlias will be continued in 1909, by the courtesy of the Royal Horticultural Society, but cactus dahlias of any kind, either garden or exhibition, will be excluded.

Mr. E. Mawley moved the adoption of the report, and expressed regret at the non-success attending the holding of the 1908 show in London. He felt that the amalgamation of the two societies was a fine move in the right direction, and should prove a concentration of effort for the advantage of the dahlia and all dahlia lovers. Mr. George Gordon seconded the motion, and expressed his pleasure at the amalgamation, the more so that the business of each society was of the same kind, and carried on by practically the same people. He hoped that in future the old lines followed would be altered, and that new life and novelty might be introduced. He urged greater interest in dahlias for beautifying the garden, without losing sight of the exhibition blooms, and he pointed out that florists' societies which had followed on the rigid lines of exhibition blooms alone had soon passed out of existence. He also urged that literature should be published for the benefit of those members who were not competitors. He also urged that the amalgamated society should conduct trials of dahlias, over which it had full control, and for the purpose of bringing into prominence the varieties specially adapted for garden decoration.

Mr. Brousson observed that the N.D.S. had already issued lists of good varieties and notes on cultivation, but acknowledged that it was necessary the "Culture Guide" should be brought up to date. Mr. Stredwick also referred to the "Culture Guide." Mr. W. Cuthbertson said that he thought there were not many better garden dahlias now than in the days of his youth. The trouble was that visitors to shows selected varieties there seen and were intensely disappointed with the result, because while the variety might be excellent on a show board, it would often be useless for the garden. He found in his trial grounds that 95 per cent. of cactus dahlias had flowers that looked downwards.

The report was then adopted.

Several alterations of by-laws and certain additions necessary as following on the amalgamation were put to the meeting, and adopted. These are not in any sense revolutionary.

Mr. E. Mawley was re-elected president unanimously, and he acknowledged the honour. Messrs. J. T. Bennett-Poë, J. F. Hudson, W. Marshall, Rev. O. Bridge, F. Hobbs, J. Green, W. Cuthbertson, H. L. Brousson, F. W. Fellowes, and George Gordon, were elected vice-presidents.

Mr. Mawley proposed that Messrs. H. H. Thomas and E. F. Hawes be joint hon. secretaries of the society; this was adopted unanimously. Mr. J. Green proposed, and Mr. J. T. West seconded, that Mr. Wilkins be re-elected hon. treasurer; this was carried unanimously. Mr. W. Stephens was elected auditor of the society's accounts.

The General Committee was then elected, and to the existing body the following were added: Messrs. J. Emberson, J. B. Riding, G. Caselton, F. Curry, C. H. Curtis, and Lockyer.

A vote of thanks to the officers for their services during the year, concluded the proceedings.

At a subsequent meeting Mr. G. Gordon, V.M.H., was elected chairman of the Executive Committee.

Royal Horticultural Society.

SCIENTIFIC COMMITTEE, December 8.

Present: E. A. Bowles, M.A., F.L.S. (in the chair), Messrs. G. S. Saunders, W. C. Worsdell, W. Fawcett, J. T. Bennett-Poë, A. Worsley, J. Douglas, W. Hales, J. Odell, G. Massee, J. Fraser, and F. J. Chittenden (secretary).

EGGS OF EARTHWORM. — Mr. G. S. Saunders showed some of the egg capsules of the earthworm—small, roundish, or ovoid sacs of a yellowish-white colour, each containing a few fertile eggs.

GREASE BANDS.—Mr. Voss again showed a grease band taken from the same tree as that shown at the last meeting. A few male and female specimens of Cheimatobia brumata had been captured during the past fortnight.

PROLIFERATION IN PEAR.—Mr. W. C. Worsdell showed a pear having a second pear developed from the apex just within the calyx.

RHIZOPHORES OF SELAGINELLA. — Mr. Worsdell also showed specimens of Selaginella inæqualifolia having rhizophores developed into leafy shoots. In this species the rhizophores are dark brown, and are borne normally at the fork of the stem, one on the upper and one on the under surface. In several instances in the specimens shown the rhizophores had become changed into leaf shoots, sometimes partially, sometimes entirely. Mr. Worsdell said this could be induced if the two branches of the forked stem are cut off just above their place of origin in their young state. In some plants of S. Mackeni at Kew growing in a pan, those parts which were moist bore rhizophores in the normal manner, while in the upper part where the atmosphere was drier, instead of rhizophores, leafy shoots had developed.

STAMENS OF ORCHIDS VARIABLE IN NUMBER.—Mr. W. Fawcett showed drawings of the orchid Epidendrum Ottonis made from plants occurring wild in Jamaica. The flowers always there have three stamens, while in Trinidad five stamens are developed in the same species, and in Venezuela the structure (according to Reichenbach) is normal.

NERINE HYBRIDS.—Mr. Worsley showed inflorescences of two nerines to illustrate the fact that the plant sent out as Nerine tardiflora is a hybrid, having N. flexuosa var. pulchella as one of its parents. He also showed part of the scape of a marica, on which numerous small plants had developed, and stated that plants raised from these buds took longer to arrive at a flowering stage than those of the same species raised from seed. In some species of Marica, however, there is no retardation of flowering following vegetative reproduction.

INTERESTING ORCHIDS. — Mr. F. Moore, of Glasnevin, sent two very interesting orchids, Arachnanthe Lowi and Angræcum caudatum. In the former the first three or four flowers of the very long inflorescence are somewhat smaller and of a quite different colour from those of the rest, from which they are separated by a considerable length of stem. No satisfactory suggestion as to the cause of this difference was given. The flowers of Angræcum caudatum are remarkable for the extraordinary length of their spurs—quite 12in. in one of the flowers, and nearly as much in the others on the same inflorescence.

POINCIANA REGIA.—Mr. E. H. Jenkins sent a specimen of this rarely seen plant. It was raised from seeds received from the Gold Coast, where it is known as the Pride of Barbadoes (it is also called Barbadoes Fence Flower and Peacock Flower). The seed was sown in March, 1907, and was raised by Mr. Edward Barber, The Gardens, Brentor, Surbiton. The yellow-flowered P. Gillesi, raised from seeds by the late Rev. H. Ewbank, Ryde, took twelve years to reach the flowering stage. It is also interesting to note the sensitiveness of the plant, the leaves folding in a downward direction when exposed to cold, and so remained when placed in warmth till the stem was split at the base. When this was done the plant showed signs of reviving within an hour or so.

Birmingham Chrysanthemum Society.

The annual dinner was held at the Exchange Restaurant, and was well patronised by the committee, exhibitors, and friends. Mr. Walter Jones (the chairman of the society), presided. Mr. W. H. Dyer (one of the oldest members and exhibitors of the past), in toasting "The Society and Officers," descanted upon the progress of the chrysanthemum, and said the society, which started in a very humble way, had now become probably the largest in the kingdom. He also briefly adverted to the financial status of the society, and regretted that it was not so good as desirable, and that the receipts this year were considerably below par, thus placing the committee in a somewhat perilous position. He deplored the lack of assistance from the wealthy in and around Birmingham, but they had no reason to complain of the assistance of the working classes who attended the show. Mr. Thos. Humphreys, the treasurer of the society, in responding, remarked that the society was inaugurated forty-eight years ago, and that the efforts of its promoters had culminated in a successful issue so far as the cultivation and exhibition of the chrysanthemum was concerned. The society had experienced both fat and lean years; the present, however, appeared to be somewhat of a hybrid, but they hoped for the best. Out of Birmingham's vast population they had fewer than 350 subscribers, and their total subscriptions amounted to about £112. That amount paid only for the lighting and use of Bingley Hall, whilst the exhibitions cost the society from £750 to £900. This year only £387 was taken at the gates, which was £52 less than last year. In conclusion, Mr. Humphreys advocated the formation of a reserve fund, and expressed a hope that the exhibitors and other supporters of the society would endeavour to make concessions in their favour.

Mr. John Pope proposed "The Exhibitors," and the toast was responded to by Mr. A. Cryer and Mr. J. H. Goodacre. "The Non-competitive Exhibitors and Special Prize Donors" was submitted by Mr. A. D. Christie; Mr. C. B. Bick and Mr. Pressley (representing Mr. Robert Sydenham) responded. The other toasts were: "Our Visitors" and "The Chairman."

During the evening the first prize and large silver trophy, won for the group of chrysanthemums, was presented by the chairman to Mr. Alfred Cryer (gardener to F. A. Kenrick, Esq., Berrow Court, Edgbaston), and remarked that those who were well qualified to form an opinion expressed the view that the group was the finest ever seen at the Birmingham shows, and that was saying a great deal. Acting upon the suggestion that a reserve fund should be formed, several of the leaders and well-wishers present guaranteed £5 each.

Woolton Gardeners' Society.

A meeting was held on the 12th inst. at the Mechanics' Institute, when Neil Gossage, Esq., presided over a good attendance, and Mr. Ben Ashton, of Lathom Gardens, read an excellent paper on "Vegetables for Exhibition, and Their Culture." The selections of the best varieties were submitted under each head, with full cultural notes, as followed by this successful exhibitor, together with directions as to gathering and staging. The various kinds, with the number of points allowed under the Royal Horticultural Society's "Code of Judging," were stated, and in reply to a question by the Chairman, the best six kinds were enumerated for summer and autumn shows.

The excellence of the paper proved a bar to discussion, but many points of interest were added by the questions which were asked, especially one as to the value of the new French system. The lecturer gave his opinion that it could not be successfully carried out in the North, or, at least, only to a limited extent.

A cordial vote of thanks was tendered to Mr. Ashton for his valuable paper, and to the chairman for presiding.

East Anglian Horticultural Club.

The annual meeting and election of officers of this club was held at the Boar's Head Hotel, Norwich, on December 9. The report, as presented by Mr. W. L. Wallis, secretary, stated that the club was to be congratulated upon its continued success. The membership now stands at 343, as compared with 331 in 1907, and the balance in hand has increased to £139 16s. 6½d. The monthly exhibitions show continued signs of activity. The honour of championship in this section falls to Mr. W. Shoesmith, gardener to F. W. Harmer, Esq., Cringleford, and he is to be congratulated upon the excellence of his exhibits. Lectures, essays, and debates have done much educational good to the members. The large library has proved most useful to those members seeking information. The auditors—Messrs. J. F. Betts and H. Perry—gave their report, which was as favourable as one could wish.

The election of officers resulted in Mr. J. Powley being president; Mr. T. B. Field, acting-vice-president. The vice-presidents elected were Messrs. F. Atkinson, H. Batchelor, John Green, J. W. Church, G. Daniels, H. Perry, E. Peake, Robt. Holmes, F. Piper, G. Davison, and J. Ruymp; hon. treasurer, Mr. Chas. Daniels. Mr. W. L. Wallis, during whose term of office the club has had such continued success, and who is untiring in doing everything in his power to make it popular, was unanimously re-elected secretary; his address is 11, Royal Arcade, Norwich. The vacancies on the committee were filled by Messrs. H. Goude, C. Hines, W. Rush, H. J. Cowell, E. Goldspink, and R. Abel. The auditors, Messrs. J. F. Betts and H. Perry, were also re-elected.

The meeting next proceeded to adopt various alterations to rules and exhibition schedule, of which notification had been given. It was announced that Mrs. Dawson Paul, Eaton, had kindly presented a silver challenge cup to replace the one that Mr. W. Shoesmith had won outright after a keen fight. There was a good display of flowers, fruits, and vegetables upon the tables, special mention being due to the fine blooms of Cypripedium insigne, brought up by Mr. T. B. Field, gardener to the Baroness Berners, Ashwellthorpe Hall.

Chester Paxton Society.

The annual general meeting was held in the Grosvenor Museum on Saturday, and presided over by Mr. A. W. Armstrong. The Hon. Secretary and Treasurer (Mr. G. P. Miln), presented the annual report and financial statement, which indicated that the exhibition held in November was the largest and most successful held in connection with the society. The finances were also in a satisfactory condition. Officers and committee for the ensuing year were elected as follows: President, T. Gibbons Frost, Esq., C.C.; vice-presidents, Major MacGillycuddy, J.P., and James G. Frost, Esq., J.P.; chairman of committees, Mr. A. W. Armstrong; hon. members, Messrs. J. D. Siddall, J. Jackson, and A. Ellams; Executive Committee, Messrs. N. F. Barnes, J. Clack, O. Edwards, W. Evans, T. Gilbert, H. Lawson, H. G. Little, G. Lyon, S. May, W. Pringle, W. Reeves, Jos. Ryder, W. Seddon, E. Stubbs, R. Wakefield, J. Weaver, and J. Wynne; consulting naturalist, Mr. R. Newstead, M.Sc., A.L.S., etc.; hon. secretary and treasurer, Mr. G. P. Miln.

It was decided to hold the next exhibition of fruits, chrysanthemums, etc., on Wednesday and Thursday, November 17 and 18, 1909. A course of winter lectures was also arranged for.

Oxfordshire Horticultural Society.

On Friday, December 4, the seventy-ninth annual general meeting of subscribers was held in the Committee Room, Municipal Buildings, Oxford, when there was a good attendance. James H. Morrell, Esq., Headington Hill Hall, presided. The annual report referred to the serious losses sustained during the past two seasons, traceable to a diminution of subscriptions and other causes. The statement of accounts showed that the income had been £336 17s. 8d., and the payments £379 7s.; the reserve fund standing at £74. In moving the adoption of the report, the Chairman said it was deplorable that circumstances had been so adverse again this year; in 1907 they lost £90, and this season £12, and this at a time when special efforts had been made to make the exhibitions more instructive and attractive to visitors.

Montague Wootten, Esq., White Lodge, Headington, moved a resolution to the effect "That the meeting stand adjourned with the view of the new committee investigating the affairs of the society, and reporting as to whether any, and, if so, what alterations in the rules are desirable, and also the best methods of combating the losses which are gradually depleting the society's accumulated funds." The report and accounts were passed, and the following officers for 1909 were elected, viz.: President, J. H. Morrell, Esq.; treasurer, Herbert Parsons, Esq.; hon. secretaries, Messrs. M. Wootten and John Thomson; auditor, Mr. W. S. Carver, F.S.A.A.; acting secretary, Mr. W. Greenaway (29th year); Messrs. A. Adams, W. F. Cross (chairman), J. Fortescue, F. Harris, J. E. Jefferies (vice-chairman), J. Johnson, W. T. Mattock, S. Mold, W. R. H. Powell, H. Smart, J. C. Tayler, and R. Wadham, to form the committee of management. June 22 and August 26 were fixed for the shows of 1909.

ON JANUARY 2 will be Published
THE
NEW YEAR NUMBER
OF THE
GARDENERS' MAGAZINE.

The special features will include:—
GARDENS AROUND TUNBRIDGE WELLS,
Illustrated and Described
A RARE OLD FLORIST'S FLOWER.
GREENHOUSE ANNUALS
STEWING AND BAKING PEARS
GOLDEN-LEAVED TREES.
A FAMOUS GARDENING VILLAGE
LATE SINGLE CHRYSANTHEMUMS
GARDEN ROOT CROPS.
POPULARITY OF FIGS.
Also a Double-page
ALMANACK FOR 1909,
WITH AN ILLUSTRATION IN COLOURS OF A GOLD MEDAL ROSE.

¶ This Number, which will be a very attractive one, will have a large additional circulation, and will therefore be of great importance to Advertisers.

Announcements for this issue should reach the Publishers by Tuesday, December 29.

Offices: 148 and 149, Aldersgate Street, London.

OBITUARY.

◆

EARL OF ANNESLEY.

We learn, just as we go to press, of the death on December 15, of the Earl of Annesley at Castlewellan, Ireland. The Earl was devotedly attached to his famous Irish garden, wherein he brought together and grew finely one of the most extensive collections of choice trees and shrubs to be found in the United Kingdom. Many of the less hardy trees and shrubs flourished at Castlewellan, so that in many respects the collection was an unique one.

MR. JOHN CARDER.

A famous collector of orchids, especially of odontoglossums, Mr. J. Carder was for many years with the late Mr. Wm. Bull, and with Mr. Shuttleworth, another old collector. he subsequently set up in business. Eventually this business arrangement was dissolved, and Mr. Carder took up the work of introducing a very fine strain of Odontoglossum crispum. He was well known and thoroughly well liked by all who knew him. He was at the R.H.S. meeting on Tuesday, November 24, and at the Sale Rooms on December 4, apparently in good health, but died suddenly on December 7.

Vine Propagation.—This should now have consideration, as the eyes should be selected from the vines when pruned, and those well ripened, labelled and tied up, and placed in ashes in a cool place. The Mill Hill Hamburgh is not one that will readily force, but it is a good variety for the second house; the berries are large, come of good colour, and have the appearance of being hammered at the ends, and it is a splendid grape for exhibition. The old Black Hamburgh is the best for forcing, and should be labelled as such. If grafting is to be done, growths of good length should be selected. Muscat of Alexandria should be selected from medium-sized, well-ripened wood.—A. B. WADDS.

Books as Christmas Presents.—In the Christmas Catalogue issued by Messrs. W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London, will be found a wide choice of suitable books for presentation to friends whose interests lie in the garden, greenhouse, poultry, live stock, or other rural pursuits. A full description of the contents of each book is given in the catalogue, a copy of which will be sent by post on application to any reader.

ANSWERS TO CORRESPONDENTS.

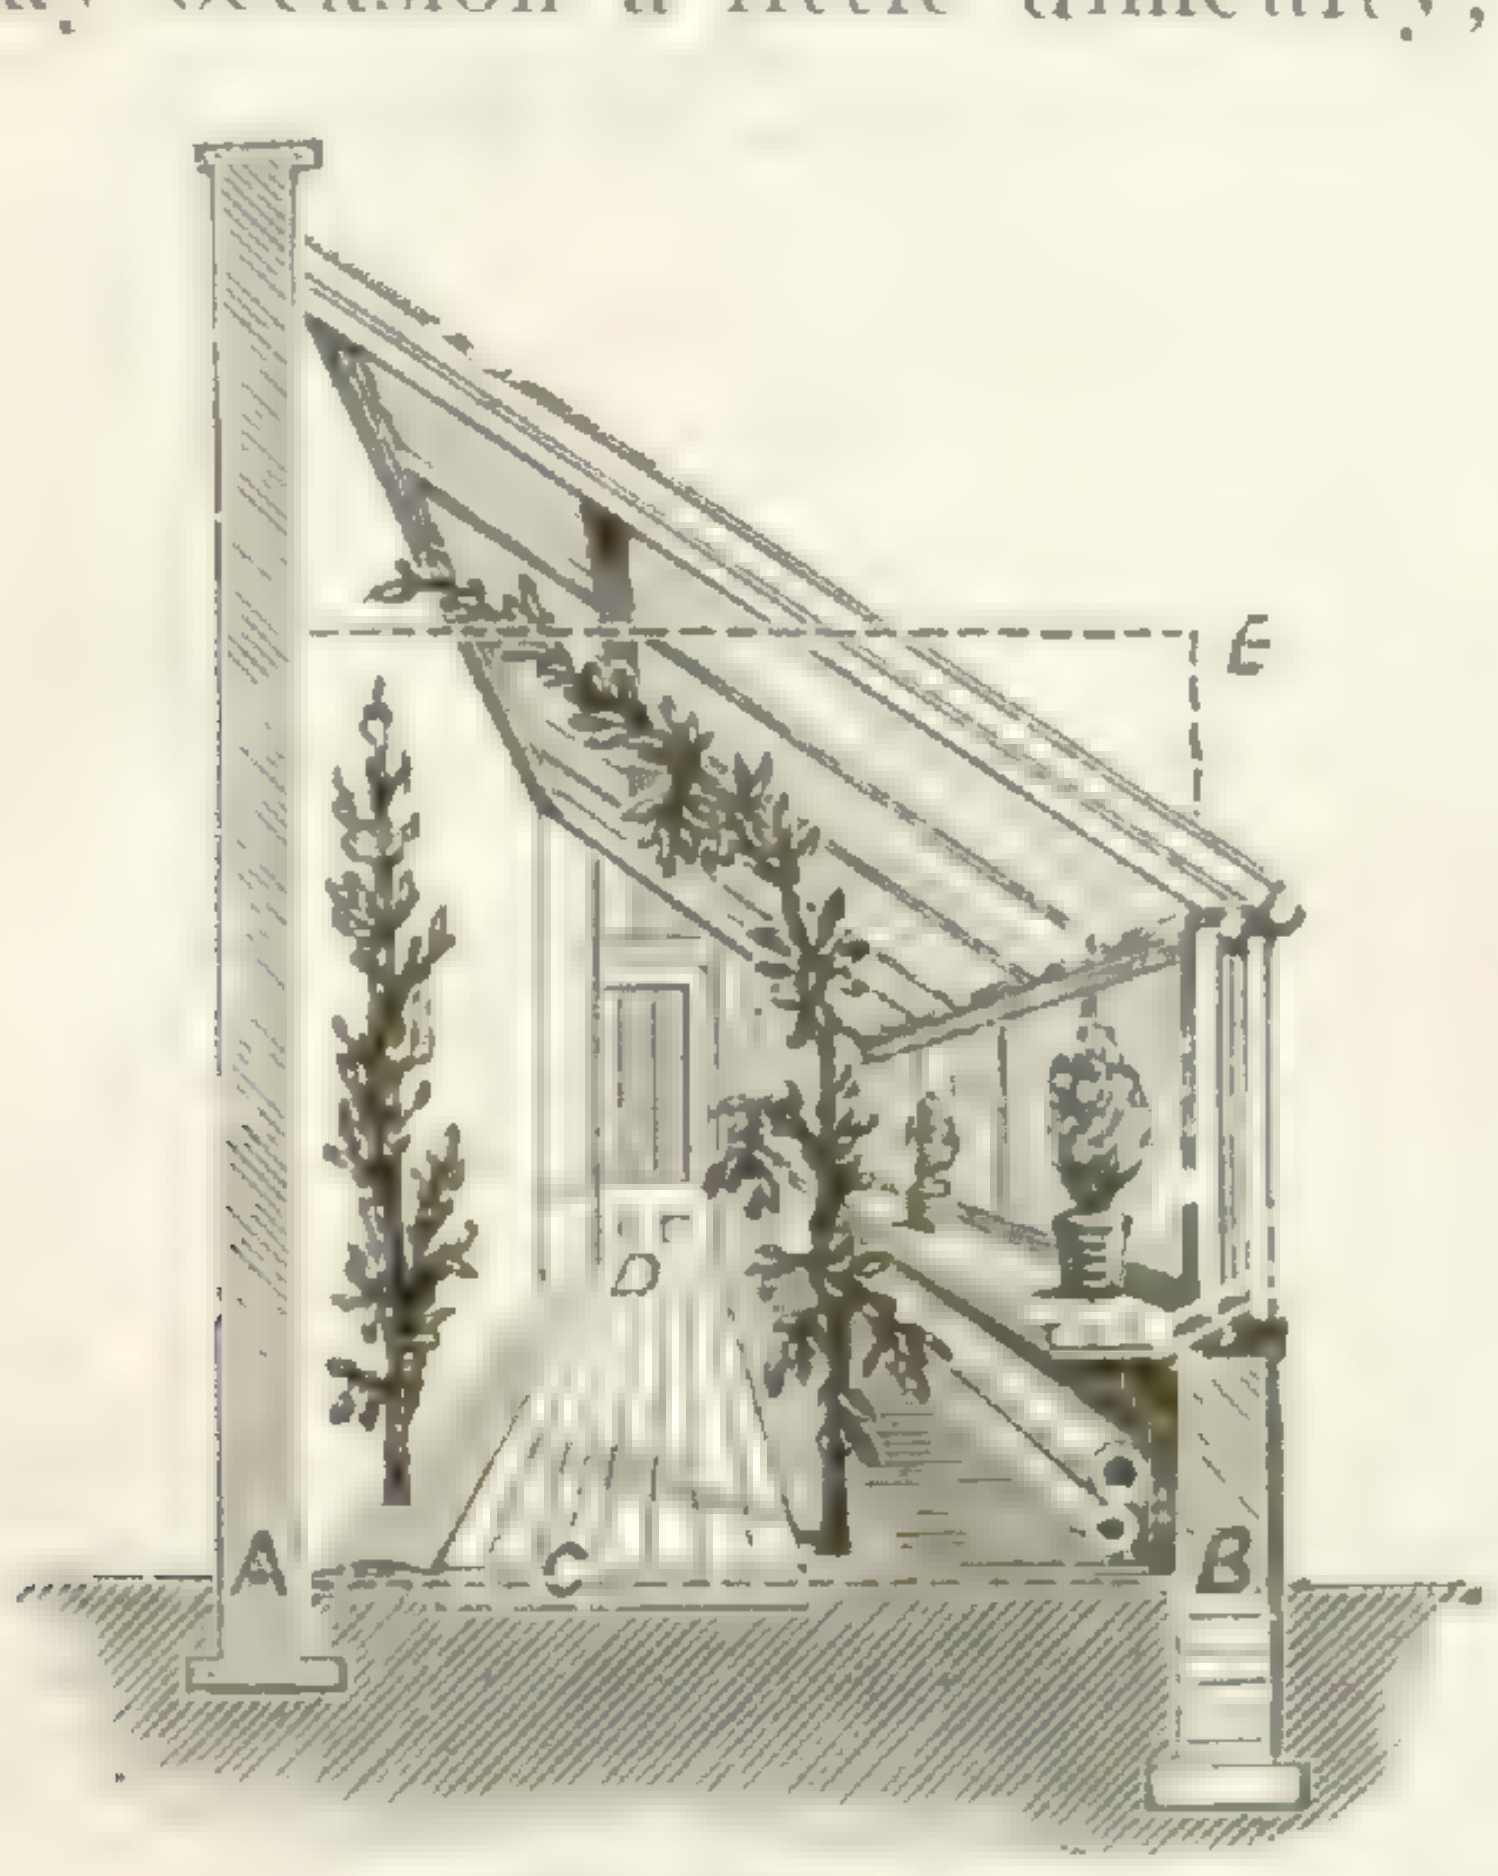
Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

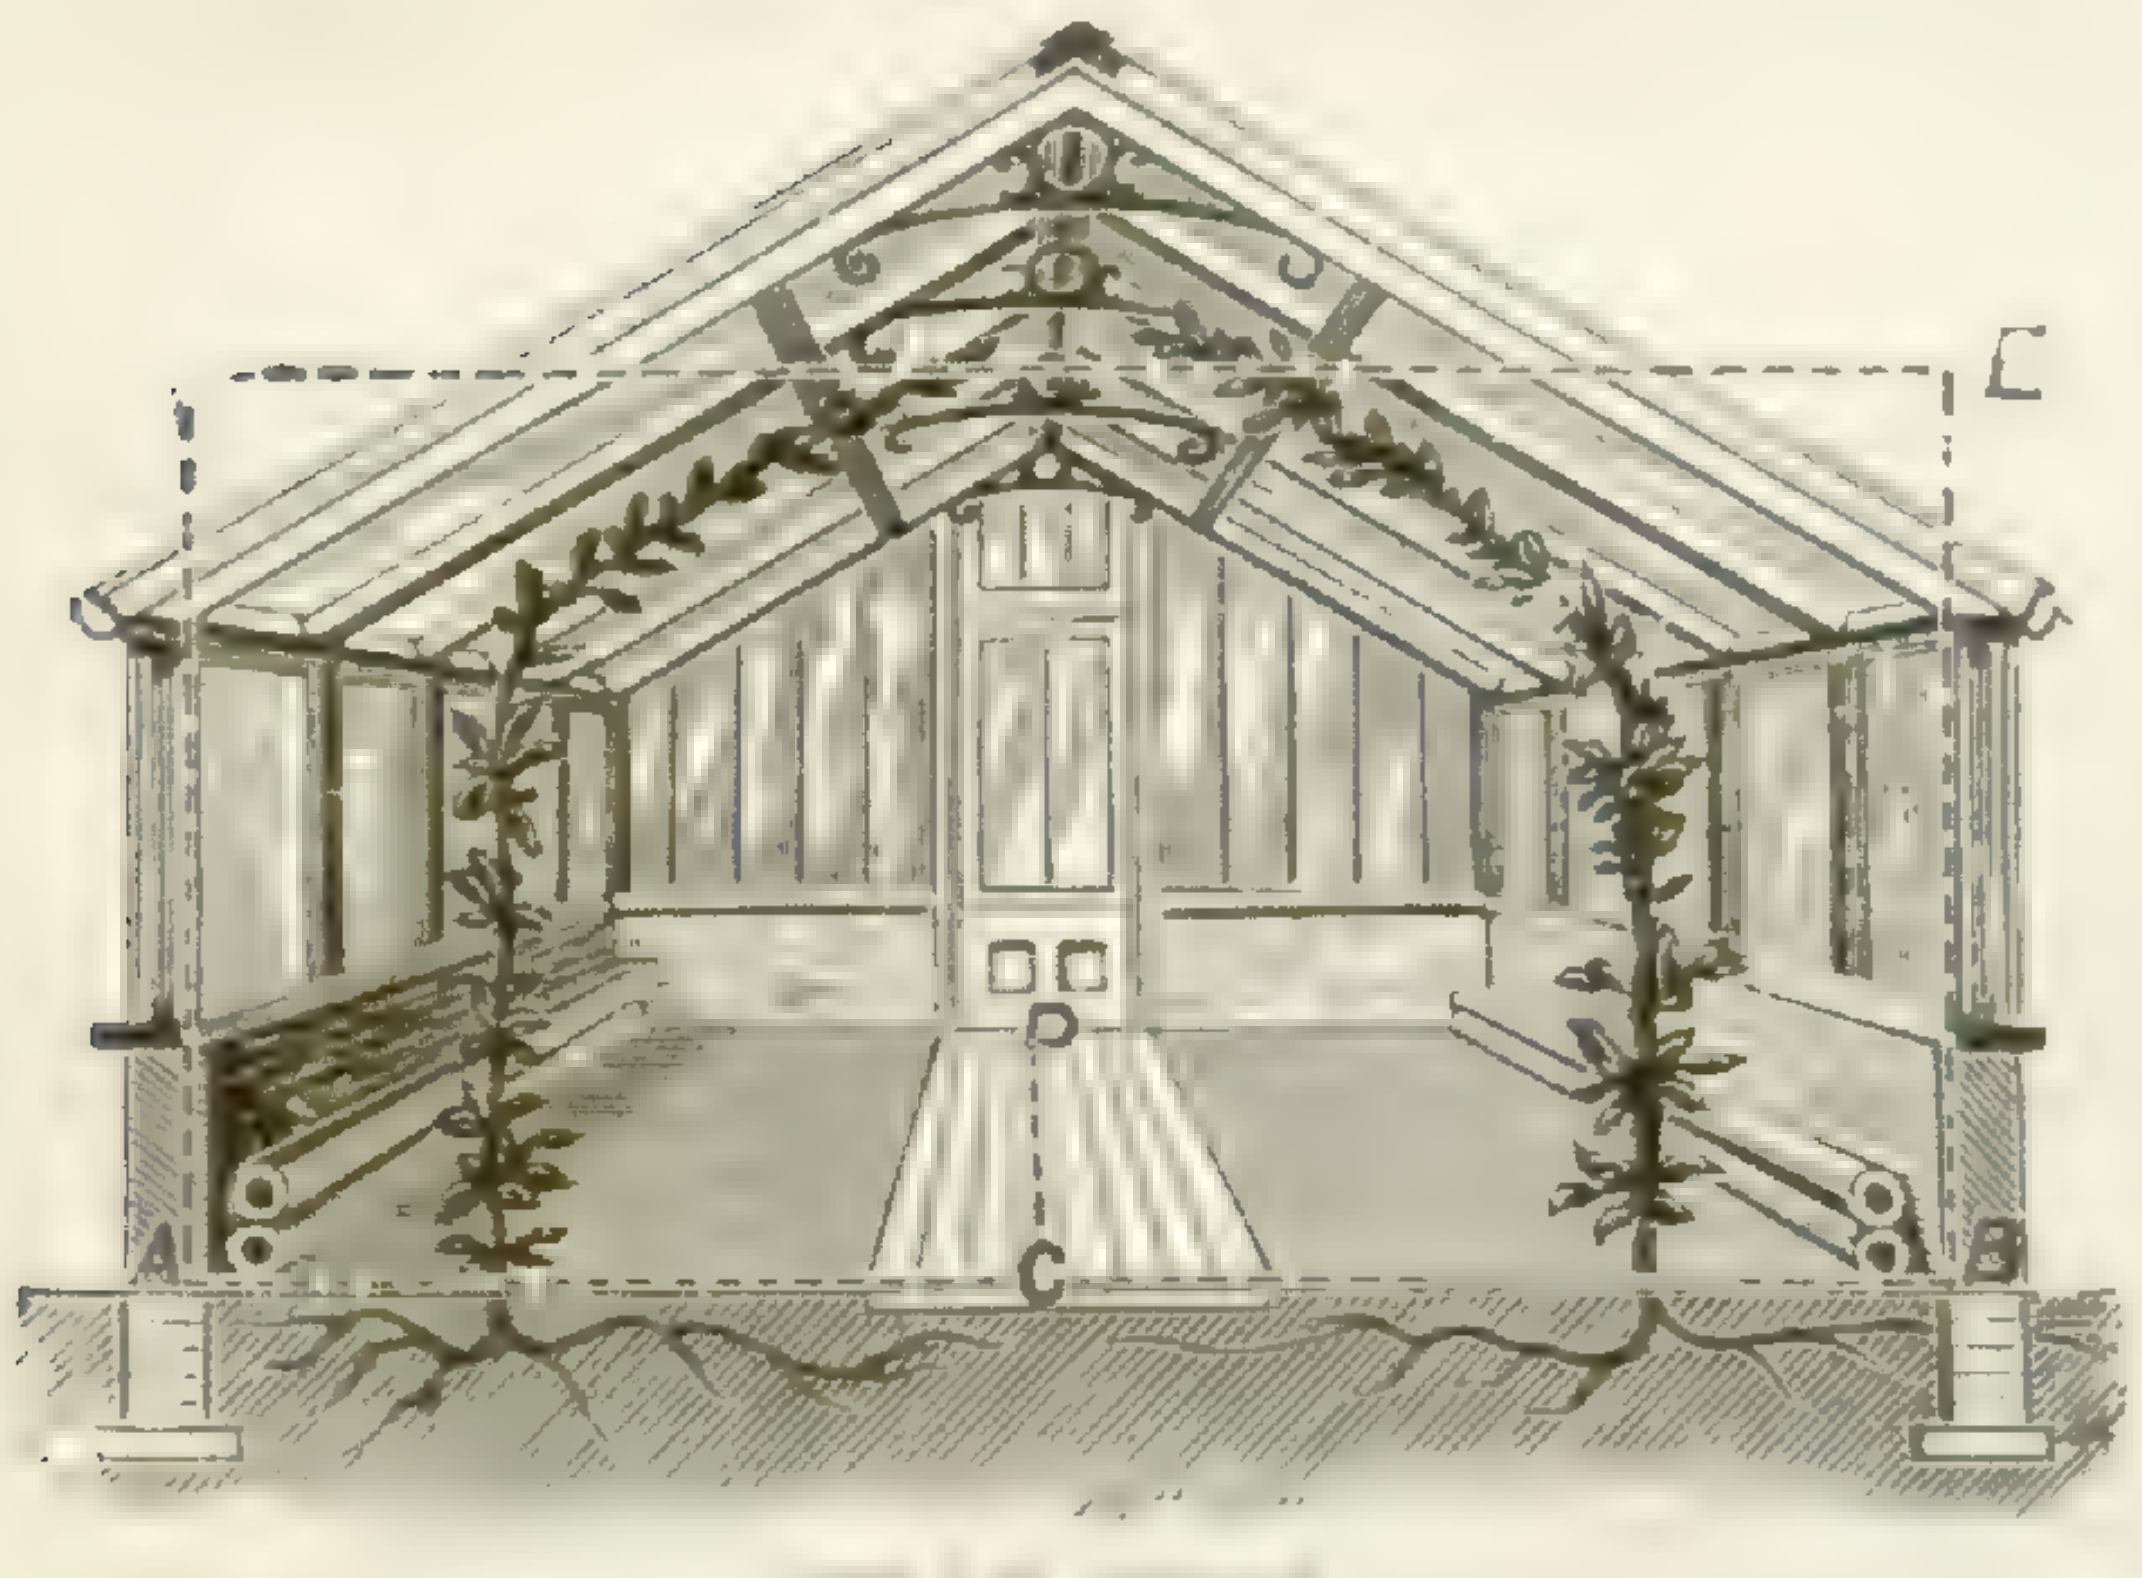
Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

CUBIC CONTENTS OF GREENHOUSE.—J. N., Monmouth: It is some time since we had to answer a similar question, hence we reproduce the accompanying diagrams again, as they will help to elucidate what, after all, is a very simple matter. To find the cubic contents of a greenhouse, you multiply the length of the house by its breadth, and then the result by the average height. The latter point may occasion a little difficulty, but it is solved by adding the extreme height of a lean-to, or span house, to the height to the eaves, and then halving the total. Thus, supposing the span-roofed house is 20ft long and 10ft. broad, these figures, multiplied together, give us 200ft.; then the height to the ridge is, say, 12ft., and height at eaves 6ft., making a total of 18ft., which, halved, gives an average height of 9ft., therefore we multiply the 200ft. by 9, and obtain 1,800—the cubic contents, in feet, of the house. In the case of the lean-to house, precisely the same method of calculation is followed, thus: length, 30ft.; breadth, 12ft.; extreme height, 15ft.; height at eaves, 5ft.; 30ft. × 12ft., gives 360ft.; 15ft. + 5ft. gives 20ft.: which, halved, leaves 10ft.; then 360ft. × 10ft. gives 3,600ft.—the cubic contents of the house.



LEAN-TO.



SPAN-ROOF.

DIAGRAMS SHOWING HOW TO MEASURE THE CUBIC CONTENTS OF GREENHOUSE.

RICHARDIA MRS. ROOSEVELT.—E. P., Warwick: This richardia is a hybrid between R. Elliottiana and R. albo-maculata. It was raised in America, and was figured and described in our issue of January 9, 1904. This hybrid has been exhibited on many occasions during the last two or three years. We have not seen it flourishing so well as we had hoped, and it certainly is not hardy except in very favourable districts. Even an unheated greenhouse is scarcely sufficient protection for it during winter, if we are to judge from two specimens we had a couple of years ago.

JERUSALEM ARTICHOKES.—J. A. D., Derby: If for the purpose of crop rotation you find it desirable to lift and store the crop of Jerusalem artichokes, you may save a good deal of time and trouble by at once planting the bed for next year's crop. Select medium sized tubers for planting, and plant them in good soil, because, though often sadly neglected, few crops pay better for good culture.

AN EASILY-GROWN GENTIAN.—A. C. S., Carnarvon: There is little doubt that the easiest of gentians to grow is Gentian asclepiadea, a native of Eastern Europe, and a more or less popular plant since 1629. It will grow from six inches to two feet high, but it is at its best when not too strongly grown. The flowers are deep blue, and borne in clusters during July and August. Any good soil, where hardy flowers do well, will suit this gentian, but it must not be allowed to suffer from lack of moisture during the summer months.

NAMES OF PLANTS.

J. N. M., Ingatestone.—Acalypha Macafeeana.

C. L., Gloucester.—1, Viburnum Tinus; 2, Eleagnus longipes.

T. B., Salisbury.—1, Cypripedium Leeanum; 2, C. callosum; 3, C. insigne, a good variety.

E. V. J., Warminster.—1, Peristrophe speciosa; 2, Cupressus Lawsoniana filifera; 3, Adiantum capillus veneris imbricatum.

B. T. G., Ilkley.—1, Dendrobium phalænopsis Schroderiana; 2, Lycaste Skinneri; 3, Lantana hybrida; 4, Pinus cembra; 5, Libonia floribunda.

NAMES OF FRUITS

G. T., Alford.—1, Keddleston Pippin; 2, Alfriston; 3, Winter Nelis.

H. C. C., Horsham.—1, Beurre Diel; 2, Passe Crasanne; 3, not recognised.

J. G., Marlow.—1, Hollandbury; 2, Sturmer Pippin; 3, Lord Derby; 4, Dutch Mignonne; 5, Catillac.

M. S. P., St. Ives.—1, Cornish Aromatic; 2, Ribston Pippin; 3, Beauty of Kent; 4, Bramley's Seedling; 5, a small Blenheim Pippin.

CATALOGUES RECEIVED.

SUTTON AND SONS, READING.—A large, finely printed, and beautifully illustrated catalogue of flower and vegetable seeds.

WILLESDEN DISTRICT COUNCIL.

The WILLESDEN DISTRICT COUNCIL are prepared to RECEIVE TENDERS for the SUPPLY and PLANTING of 225 TREES upon the various Highways in their District.

Copies of the Conditions and Forms of Tender may be obtained on and after Monday, December 21st, 1908, upon application to Mr. O. Claude Robson, M.Inst.C.E., Engineer to the Council, Public Offices, Dyne Road, Kilburn, N.W.

The Tenders, endorsed "Tender for Trees," to be delivered at the Offices of the Council not later than 4 p.m. on TUESDAY, January 5th, 1909.

A £10 note to be enclosed with each Tender, which will be returned to all unsuccessful Contractors immediately tenders are accepted, and to successful Contractor after execution of Contract and Bond.

The Council do not bind themselves to accept the lowest or any Tender.

By order,
STANLEY W. BALL,
Clerk to the Council.

Public Offices,
Dyne Road, Kilburn, N.W.
December 15th, 1908.

LARGEST IMPORTERS AND GROWERS OF ORCHIDS IN THE WORLD.

CLAY'S MANURES, CRUSHED BONES. (See back page.)

CLAY'S FERTILIZER is UNSURPASSED for all Horticultural Purposes. CLAY and SON, Stratford, E.

TO-DAY! AND FOR YEARS AND YEARS PAST the XL ALL specialities are and have been the best on the market. Where is the Gardener who does not pin his faith to one or the other of these celebrated Insecticides or Fertilisers? XL ALL FERTILISER has pleased all who have used it this season. The Sales of XL ALL FUMIGATOR prove that it is more popular than ever. XL ALL LIQUID NICOTINE INSECTICIDE is always spoken of by gardeners and growers as the most deadly to Mealy Bug, Thrip, etc. XL ALL WINTER WASH for dormant Trees acts like magic, clearing the Trees and Bushes of all Insects' Eggs, Moss, and Fungoid Growths. XL ALL LAWN SAND, a weed eradicator and fertiliser for weedy and poor lawns. XL ALL WEED KILLER used once a year "No weeds can live." Please ask your Nurseryman, Seedsman, or Florist for a copy of my small pink list, giving particulars of these and many other XL ALL Preparations which can be obtained from the Horticultural Trade throughout the World. G. H. RICHARDS, Manufacturer and Patentee, 234, Borough High Street, London, S.E.

(Rose Growers by Appointment to His Majesty the King.)

SYDNEY SMITH,
TANSLEY OLD NURSERIES,
Near MATLOCK, DERBYSHIRE.

SPECIAL OFFER.

First-Class Stuff, Satisfaction Guaranteed.

CUPRESSUS, in sorts, 4-5ft. at **10/-** and **12/-** dozen.
ELDER, GOLDEN, 2-3ft., **1/6** doz., **8/-** 100, **70/-** 1,000.
" 3-4ft., **2/-** doz., **12/-** 100 "
HOLLY (common), 1-1½ft. **4/-** doz., **28/-** 100 "
HYPERICUM CALYCINUM, nice plants, **2/6** doz., **14/-** 100.
HONEYSUCKLE (late), nice plants, **3/-** doz., **18/-** 100.
LAURELS (common), **CAUCASICA, COLCHIC,** and **ROTUNDIFOLIA,** 1½-2ft. **8/-** 100, **70/-** 1,000; 2-3ft. **15/-** 100.
LILAC (Purple), 3-4ft. **5/-** doz., **3 /-** 100, strong and bushy.
THORN (double Pink), 5- ft. **1/3** each, **12/-** doz.
" (Crimson), 5-6ft. **1/3** each, **12/-** doz.
VINCA (Periwinkle), in sorts, nice plants, **12/-** 100, **£5** 1,000 (suitable for covering banks, and does well under the drip of large trees).
IVY (Irish), 2 years, 9-18in., **3/-** 100, **20/-** 1,000.
GORSE (double flowering), trans. Spring 1908, 1½-2ft. **6/-** doz.
AZALEA PONTICA (sweet Yellow), nice plants, **3/-** doz., **20/-** 100.
ERICA (Heath), all the best varieties, from **3/-** to **12/-** doz. I can supply **100 Hardy Heaths** in 10 good sorts for **18/-**.

Lowest Prices quoted for other hardy trees and Shrubs.

These Nurseries have been famed for sound plants for over 80 years.

Catalogues free by post.

Please address all letters, etc., in full as above.

250 ACRES TO SELECT FROM

Trees, Shrubs, Conifers, Rhododendrons, Heaths, Azaleas, Fruit Trees and Roses, in First Class Variety.

SPECIAL NOTICE **SWEET PEAS** FOR 1909.

IF YOU WANT

REALLY GOOD SWEET PEAS

AT MODERATE PRICES, send to

ROBERT SYDENHAM, LIMITED, 33, Tenby St., Birmingham.

No Flowers give so much cut bloom at so little cost and trouble as Sweet Peas.

SPECIAL COLLECTIONS FOR 1909.

For fuller descriptions of the varieties mentioned in this list, and all other known varieties, we refer our friends to the little book, **"ALL ABOUT SWEET PEAS,"** revised and corrected to end of 1908. **Price 6d.**

The seeds in these Collections are all carefully hand picked; only plump, round seeds sent; all small, poor, or doubtful ones are taken out, which we do not think is done by anyone else in the trade; eighty to ninety per cent. guaranteed to germinate if treated as instructions sent with each collection.

EACH PACKET in Nos. 1, 2, and 3, CONTAINS 50 PLUMP, ROUND, SELECTED SEEDS.

Buyers not wanting any collection complete, may select their own varieties from EITHER COLLECTION, where priced at prices mentioned, and have 2s. 6d. worth for each 2s., or five packets of any one variety at price of four.

COLLECTION No. 1.—Twelve Useful Varieties, 1/3.

Coccinea, dark carmine scarlet; **Dainty,** white, with slight pink edge; **Dorothy Eckford,** white; **Evelyn Byatt,** orange and crimson bicolor; **Henry Eckford,** orange scarlet; **Hon. Mrs. Kenyon,** pale primrose; **Miss Willmott,** salmon-red; **Mrs. A. Watkins** or **Gladys Unwin,** waved pink; **Navy Blue,** deep violet blue; **Prince of Wales,** rich rosy crimson; **Romolo Piazzani,** rich blue; **Salopian,** deep mulberry red.

COLLECTION No. 2.—Twelve Good Varieties, 1/9.

A. J. Cook, pale lavender purple; **Black Knight,** bronzy chocolate; **Countess Spencer,** large wavy pink; **Duke of Westminster,** rosy violet; **Herbert Smith,** orange and crimson bicolor; **King Edward VII.,** rich crimson; **Lady Grisel Hamilton,** pale lavender; **Mrs. Collier,** pale primrose; **Nora Unwin,** waved white; **Queen of Spain,** salmon-pink; **Sybil Eckford,** creamy buff, flushed pale pink; **Triumph,** rosy salmon and blush.

SINGLE PACKETS OF ANY VARIETY IN COLLECTIONS Nos. 1 and 2, 2d. each.

COLLECTIONS Nos. 1 and 2, when bought together, will be 2/6,
and a packet of "Millie Maslin" and "John Ingman Seedlings" will be added free of charge.

COLLECTION No. 3.—The Twelve Best Varieties, 2/-.

Clara Curtis, syn. **Primrose Spencer,** waved primrose; **Etta Dyke,** syn. **White Spencer,** waved white; **Frank Dolby,** waved lavender; **George Herbert,** waved carmine and rose; **Helen Lewis,** waved orange and rose; **Helen Pierce,** marbled blue; **Jeannie Gordon,** carmine and buff; **Lord Nelson,** dark blue; **Mrs. Hardcastle Sykes,** waved blush pink; **Mrs. Walter Wright,** rich rosy mauve; **Paradise,** rich pink, the best of the **Countess Spencer** type; **Queen Alexandra,** the best crimson scarlet.

SINGLE PACKETS OF ANY VARIETY IN COLLECTION No. 3, 3d. each.

COLLECTIONS Nos. 2 and 3 may be had together for 3/-,
and a Packet of "Phenomenal" and "Agnes Eckford" will be added free of charge.

SPECIAL PRICE FOR THE THREE COLLECTIONS, 4/-

and when bought together, the four added packets, and a packet each of the four best striped varieties, **Jessie Cuthbertson, Mrs. J. Chamberlain, Marbled Blue,** or **Hester** and **Unique,** will be added free of charge, making 44 of the very best varieties in cultivation, at an average cost of about one penny a packet.

PRICE OF EITHER OF THE EIGHT ADDED VARIETIES, IF WANTED ALONE, 2d. EACH.

COLLECTION No. 4.—The Twelve Newest Varieties, 4/-,

or what we consider the best of the Newest.

SPECIAL NOTICE.—The number of seeds in each packet in Collection No. 4 varies. The number is stated in black figures after each name, and where the packets can be sold separately the price is stated as well. There are about two thousand packets of these priced varieties, apart from what is anticipated will be sold in the collections. When these are sold orders can only be taken for the full collection, which is put at a specially low figure. Any variety not priced cannot be sold apart from the collection.

Apple Blossom Spencer (20), rosy pink and blush, waved, **6d.**; **Audrey Crier, (10),** bright rosy pink, waved; **Evelyn Hemus (15),** waved primrose, with picotee edge of pink, **6d.**; **Jet (50),** the darkest of all Sweet Peas, **3d.**; **Mother o' Pearl (Aldersey) (25),** a beautiful silvery lavender, slightly hooded and sweetly scented, **4d.**; **Mrs. Routzahn Spencer (10), the gem for 1909,** a buff or pale primrose ground shaded with salmon pink, a much improved **Mrs. Henry Bell, 6d.**; **Paradise Carmine (15),** a large waved, carmine and rose; **Queen Victoria Spencer (10),** a waved deep primrose, slightly shaded pale rose; **Saint George (15),** a grand orange scarlet, **1s.**; **Sutton's Queen (25),** a buff ground **Countess Spencer, 4d.**; **The King (12),** a fine waved form of **King Edward VII.**; **The Marquis (12),** large waved rosy mauve.

COLLECTIONS Nos. 3 and 4 may be had together for 5/-,
and a packet of the New White Everlasting Pea, WHITE PEARL, 25 seeds, added free of charge.

SPECIAL PRICE FOR THE FOUR COLLECTIONS, 7/-

which, with the nine added varieties, will be 57 in all, and making it the best collection, considering the varieties, ever offered for the money.

A few packets of Mr. Hugh Aldersey's celebrated SYEIRA LEE (20 Seeds), 1s.; sold as not quite fixed.

Mr. Malcolm's MRS. A. MALCOLM (25 Seeds), 1s.; (10 Seeds), 6d.; CHRISSIE UNWIN (20 Seeds), 6d.; JOHN INGMAN (50 Seeds), 3d.; re-selected, but not guaranteed as quite fixed. ROSIE SYDENHAM (20 Seeds), 4d.; not quite fixed; also ROMANI RAUNI (Aldersey) (20 seeds), 1s., sold as not quite fixed.

THE GEM for 1909 is MRS. ROUTZAHN SPENCER,
this should be ordered at once. 6d. a packet of 10 Seeds, or 5 packets, 2s.

CHOICE MIXED SEEDS of most of the above, and other varieties, 2d. per packet of about 100 seeds; 6d. per ounce of about 350 to 400 seeds; 1s. 6d. per ¼ lb., or 5s. per lb. of about 5,000 to 5,500 seeds.

ALL OTHER SEEDS EQUALLY CHEAP AND GOOD.

FULL LIST POST FREE ON APPLICATION.

VOL. LI.—No. 2,878. SATURDAY, DECEMBER 26, 1908.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Roots and Leaves.

Undoubtedly one of the most wonderful features in plant development is that curious differentiation of the formative cells in the seed which determines that one set shall plunge downward into the soil while the other shall rise upwards to seek the light, the former shaping the root system, and the latter that of the foliage. This difference is determined almost immediately after the embryo seed is fertilised, and as it perfects finds expression in the formation of one or two primary leaves or cotyledons, and a root point, which is the first thing to emerge when the seed is sown, penetrating the soil as speedily as possible, in order to commence its work of supplying the infant plant with moisture and nutrition. The function of the root is entirely different from that of the foliage, as different indeed as its structure. Ordinarily, it ramifies into a great number of branches, consisting of innumerable growing points, formed of delicate multiplying cells which are enabled to push themselves through the soil undamaged by means of a sort of protecting sheath, and having penetrated between the tiny soil fissures, the rootlets thicken, and thus, wedge fashion, facilitate further progress. In process of time, as we see in trees, this thickening process results in forming a great expanse of woody roots, constituting with their minor ramifications terminating in millions of minute feeding points, a rough parallel with the leaf system above, with its branches, twigs, and twiglets. In both cases we see an approximation to the water or gas systems of supply to a city—main pipes leading into secondary mains, and these branching off into the smaller supply pipes of house or factory. There must, however, be a fundamental difference between these artificial systems and the root and foliar systems of a tree, for while in the former the entire flow is one way, in both the latter there is a flow and return. In the root system every tiny feeder absorbs water and soluble salts, which are sent up to the foliar system for consumption by the growing cells in conjunction with the gaseous material absorbed by the leaves. The bulk of the water supply is evaporated through the leaf pores, and the earthy salts are used up by the cells for structural purposes. This process represents in the roots an inverse circulation to that seen in our water or gas systems, it being a collecting system, but on entering the trunk it becomes a similar one, i.e., a distributing system. Since, however, all the fabric of a tree, roots included, is built up of material prepared in the leaves by the action of light upon the chlorophyll or green colouring matter, it is obvious that there must be a return flow of elaborated sap through all the channels of supply of what we may term raw sap, in order not merely that the aerial branches and twigs, and the trunk itself, may be strengthened, but also that the underground root system may be likewise extended, and fortified to withstand the strain of wind and weather undergone by the tree as we see it. This interchange or counter current must be of a very subtle character. We should search in vain through either the root or the foliar circulatory systems for anything clearly analogous to main pipes or minor ones. All this work, and in a large tree it is an enormous work, is effected by transmission from cell to cell, the active building ones beneath the bark or elsewhere taking up what they need, and passing on the balance, it may be, through their walls or by capillary attraction through minute spiral vessels, which form the nearest approach to tubes which can be detected. It is in the leaves themselves that we see most in evidence a circulatory system. Their veins forming a network, usually of great complexity and beauty, clearly indicate how the sap supply is distributed, first through the stalk, then into the central main rib, and from that laterally on smaller and smaller lines, until the cell walls themselves complete the network. It is seen from this that there is also a fundamental difference between the vein systems of the animal and vegetable kingdom, since in the former there are distinct flow and return pipes, so to speak, while in the latter a similar operation is effected on less definite lines, minus anything analogous to that great animal force pump, the heart.

MR. JOSEPH CHEAL.

Mr. Joseph Cheal, head of the firm of Messrs. J. Cheal and Sons, of Crawley, whose portrait we have much pleasure in presenting to our readers, is famous in many ways. He occupies a high and very honourable position in the nursery and seed trades, and unusually good feelings exist between the members of his firm and their employees. Mr. Joseph Cheal has all along been very closely associated with the British Fruit Growing Movement, and his book on "Fruit Culture" is an excellent contribution to our knowledge of this subject. Among dahlia lovers Mr. J. Cheal is also well known, and while he does not neglect other sections he has taken particular interest in the single and pompon sections, and has raised and distributed a number of very fine varieties. But it is, perhaps, as a landscape gardener that Mr. Joseph Cheal is best known, for to this ever-extending department of the firm's work he has given special attention, and he has now the assistance of his eldest son in this work. As time permits Mr. Joseph Cheal makes trips to other lands, and as he is a clever photographer he invariably brings back a host of views, many of which are useful to him in his landscape work. He has visited Canada, United States, Italy, France, Algiers, and the Canary Islands, and his several visits have formed the basis of several welcome lectures, illustrated by his own lantern slides, before the Royal Horticultural Society and the Horticultural Club. We may add that Mr. J. Cheal is a vice-chairman of the R.H.S. Fruit and Vegetable Committee.

Our New Year's Number.—As will have been gathered from the announcement made in our issue of the 19th inst., the Gardeners' Magazine for January 2 will be of quite exceptional interest to all who are interested in the various aspects of horticulture. The contents will include the first of two profusely illustrated articles on the more noteworthy of the many fine gardens in the district of which Tunbridge Wells is the centre, and a considerable number of contributions from the leading experts on matters of special interest at the present season of the year. With the issue will be presented an almanack for 1909, which will give the dates of all the more important exhibitions and horticultural functions during 1909, and be embellished with an illustration printed in colours of a beautiful gold medal rose. As there is invariably a very large demand for the issue containing the almanack, we strongly advise those of our readers requiring additional copies to send their orders as soon as possible.

French Gardening at Tiptree.

M. Aquatias, the well-known French gardener, has accepted an engagement to forthwith undertake the development of French gardens at Tiptree, Essex. Tiptree is a place noted for small holdings, there being no fewer than two hundred and fifty small holders there, operating areas varying in extent from one to fifty acres, and growing chiefly fruit, seeds, and flowers. The laying out of three French gardens has already been begun at Tiptree, and in a few days M. Aquatias will personally superintend the creation of a fourth. The introduction of this system into Tiptree by Mr. F. Mynott, of Brook Hall, has provided employment for wnat is usually a slack season of the year, more than fifty men having been engaged laying water mains, building houses on small holdings, and preparing the soil for French gardens during the last three months.

Christmas Fruits.—The Christmas fruit trade always makes an interesting study. Our supplies come from many colonies and many countries not attached to our Empire, and all quarters of the Globe are laid under tribute to provide our Christmas dessert. Of apples there are larger numbers than usual of home growth, and a slight shortage of imported material, but ample supplies for all who can buy. A great and pleasing feature has been the small boxes of choice dessert home-grown apples, notably Cox's Orange Pippins; 24 fruits in a box have easily sold for 2s. to 3s. per dozen, and in some cases for 4s. per dozen. It is estimated that a quarter of a million bushels of American and Canadian apples have been disposed of during the week, and about 10,000 boxes of home-grown dessert apples. Jamaica bananas are very fine, and oranges have seldom been so good as this season, Mandarins and Cape Naartjees selling at capital prices, showing that the public will pay well for anything novel or of extra quality. The best grapes are a trifle dear, but Almerias are cheap and excellent. Pears are especially good, whether home grown, French, or Californian, and the principal varieties are Glou Morceau, Doyenne du Comice, Winter Nelis, and Beurre Diel. Nuts are plentiful and fairly cheap, though Kentish cobnuts are rather dearer. Beyond those staple kinds of Christmas fruits there have been good consignments of mangoes, grenadillas, Avocada pears, persimmons, medlars, and pineapples, indeed we may say that the variety and quality of the Christmas fruits of 1908 have never been excelled.

R.H.S. Fortnightly Meetings of 1909.—The following are the dates for the Royal Horticultural Society's meetings in 1909: January 12 and 26; February 9 (annual meeting) and 23; March 9 (spring bulb show) and 23; April 6 and 20 (auriculas); May 4, 18 (tulips), 25-27 (spring show); June 8 and 22 (the first Masters Memorial Lecture, by Professor Hugo de Vries); July 6, 7 (Holland House show), 20 21 (carnations), and 23 (sweet peas); August 3, 17, and 31; September 14, 16 (rose show), and 28 (the second Masters Lecture, by Professor Hugo de Vries); October 12 and 26; November 9, 23, and 25-26 (Colonial fruit show) (or possibly 30 and 31); December 7, 8 (carnations), and 21.

Sweet Pea Trials for 1909.—The committee of the National Sweet Pea Society will continue its series of trials at the gardens of the University College, Reading, in 1909, and will test novelties, and grant awards and certificates according to merit. No awards or certificates will be granted to sweet peas unless they are sent for trial at Reading. For these trials the varieties will be accepted only from the raiser or introducer; a charge of 2s. 6d. for each variety will be made. At the request of numerous seedsmen the committee will conduct a further and distinct trial solely for the purpose of testing correctness and purity of stocks of sweet peas. A charge of 5s. per variety or stock sent for trial will be made. Sweet Peas for these trials should be sent to Mr. C. Foster, University College Gardens, Reading, not later than January 25, 1909. For the novelty trials not less than fifteen seeds should be sent, and for the purity trials, not less than two dozen seeds of each variety or stock. At the same time a list of the varieties, together with the amount due for trial charges, should be sent to the hon. sec., Mr. C. H. Curtis, Adelaide Road, Brentford, Middlesex. The proceedings of the Floral Committee will be printed in the autumn of 1909, and a copy will be sent to every person or firm sending seeds to either or both of the sets of trials. A special and detailed report of any variety will be supplied to the sender of such variety at a charge of 2s. 6d.

December Flowers at Leonardslee.—Mr. W. A. Cook, gardener to Sir Edmund Loder, Bart., Leonardslee, Horsham, has sent us a small box of flowers culled from the open in the famous garden of which he has charge. They included primroses and polyanthus, Rhododendron dahuricum, Azalea amœna, periwinkle, several roses, including Leuchtstern, Azalea mollis, myrtle, Colletia cruciata, and Erica lusitanica. Mr. Cook writes: Colletia cruciata is finely in flower during the second and third weeks of December, and our specimen measures about 6ft. 6in. by 8ft.; the rambling rose Leuchtstern, on its own roots, a three-year-old plant, is quite full of bloom; a plant of Azalea amœna is blooming in the rock garden, and Rhododendron dahuricum is very pretty now though it does not usually bloom until February. I also enclose a Mdme. Abel Chatenay rose to show that this variety is still giving good blooms. Iris stylosa has given us numbers of beautiful blooms for several weeks and will doubtless continue to flower for awhile. Vinca alba is particularly floriferous, while polyanthuses and primroses are quite plentiful. A few veronicas continue to bloom, the Spanish Heath is charming, and we have a Bottle Brush (Metrosideros) in flower. Altogether this is evidence of an unusually mild season; moreover, I could easily find many more subjects in flower though those mentioned are the most notable.

Perpetual-flowering Carnations.—Mr. W. H. Page, Tangley Nurseries, Hampton, was remarkably successful at the recent exhibition of perpetual-flowering carnations at the Horticultural Hall. In the class for eighteen blooms of a white variety Mr. Page was first with Sarah Hill, a new flower of much merit, and in the class for the same number of a crimson variety he obtained premier honours with Governor Roosevelt. The names were not attached to the vases when they were seen by our representative.

The "Masters" Lectures.—Our readers will remember the intimate connection with the Royal Horticultural Society of the late Dr. Masters, F.R.S., who did much for horticulture by drawing constant attention to the various ways in which scientific discovery and research might be made serviceable to gardening; and it will also be remembered that a fund was established by subscriptions to perpetuate his memory in connection with the society and to carry on in some degree his work of science in relation to gardening. "The Masters Lectures" have accordingly been founded, and the first two are to be given during 1909 by the well-known Professor Hugo de Vries, of Amsterdam, on (a) "Masters' 'Vegetable Teratology'" (June 22), and (b) "The Production of Horticultural Varieties" (September 28).

The French Horticultural Society of London will hold its twentieth anniversary dinner, under the presidency of Sir Albert K. Rollit, D.C.L., LL.D., at the Café Royal, 68, Regent Street, on Saturday, January 23, 1909. This annual function is invariably an interesting and well-attended one.

Flowers from Scilly.—The continuance of mild weather has favoured the daffodil growers in the Scilly Isles, and already large quantities of Scilly White and Soleil d'Or daffodils, of the polyanthus or Tazetta type, have arrived, and the prospects of an early and good flower season for the islanders are excellent.

National Chrysanthemum Society Fixtures for 1909.—Mr. R. A. Witty kindly sends us the following arrangements for 1909: Exhibitions, October 6 and 7, November 3, 4, and 5, and December 1 and 2. Executive Committee: September 20, October 25, November 15, December 13, and January 17, 1910. Floral Committee: September 20, Essex Hall; October 6, Crystal Palace; October 25, Essex Hall; November 3, Crystal Palace; November 15, Essex Hall; December 1, Crystal Palace; and December 13, Essex Hall.

THE DANDELION-LEAVED EVENING PRIMROSE.

Dowdy though they look in early morning and in the forenoons, the true evening primroses (by which I differentiate those which bloom in the evening from the day flowerers) are charming things in late afternoon, early evening, and during the twilight hours, when they are fully open and reveal their distinctive beauties. There are a few of this class in cultivation, and some are a little troublesome to establish, while others are too tender for the average garden in this climate of ours.

One of my favourites, both on account of its beauty and because of the ease with which it can be raised from seeds should it fail one during a hard winter, is Œnothera taraxacifolia, whose popular specific name is a literal translation of the botanical one. It may not be the finest of the white-flowered œnotheras, but it is certainly one of the best; while it is so distinct in its style that it may well find a place even where Œ. cæspitosa or eximia is cultivated.

Its foliage shows how apt is the specific name of taraxacifolia, as in form it resembles that too familiar enemy of the garden, the dandelion. Indeed, this resemblance is so great that I have more than once caught a weeder in my own garden, whose zeal was greater than his knowledge, rooting out this œnothera for a dandelion, much to his own satisfaction, until convinced of the enormity of his deeds. Yet one cannot be too censorious in a case of this kind, for, to tell the truth, one has nearly committed the same offence, when forgetting the position occupied by a young plant, on its first showing growth in spring. The foliage is greyer than that of the dandelion, but otherwise the resemblance is most marked.

As for the flowers, they are lovely things, which open up a pure white, and gradually assume a pale rosy tint as they age. By the morning they are quite a rose-colour, and are shrivelled up in decay. The plant itself grows only about six inches high, but is of trailing habit, so that it is quite a good subject for trailing over a bank or rockwork.

The cultural requirements of Œ. taraxacifolia are not too exacting, and could we only be assured that it would stand every winter we would have an ideal plant of its kind. But the fact that we cannot be confident that this evening primrose will not vanish during a severe season is the fly in the pot of ointment to the cultivator in British gardens. Time after time has one plumed oneself on having established this lovely flower; and then a hard winter came, and all our self-satisfaction vanished under the stern influence of the fact that this evening primrose was no more.

Yet, after all, the loss is not irreparable, for no plant is more easily raised from seeds, and the seedlings, if put early enough under weigh, will even bloom late in the same year. A suggestion made a number of years ago in "Alpine Flowers" is still worth considering for those who have no rockwork. This is, to raise seedlings of Œ. taraxacifolia in early spring, and to prick out the seedlings on rose beds between the roses, when they will flower the same autumn.

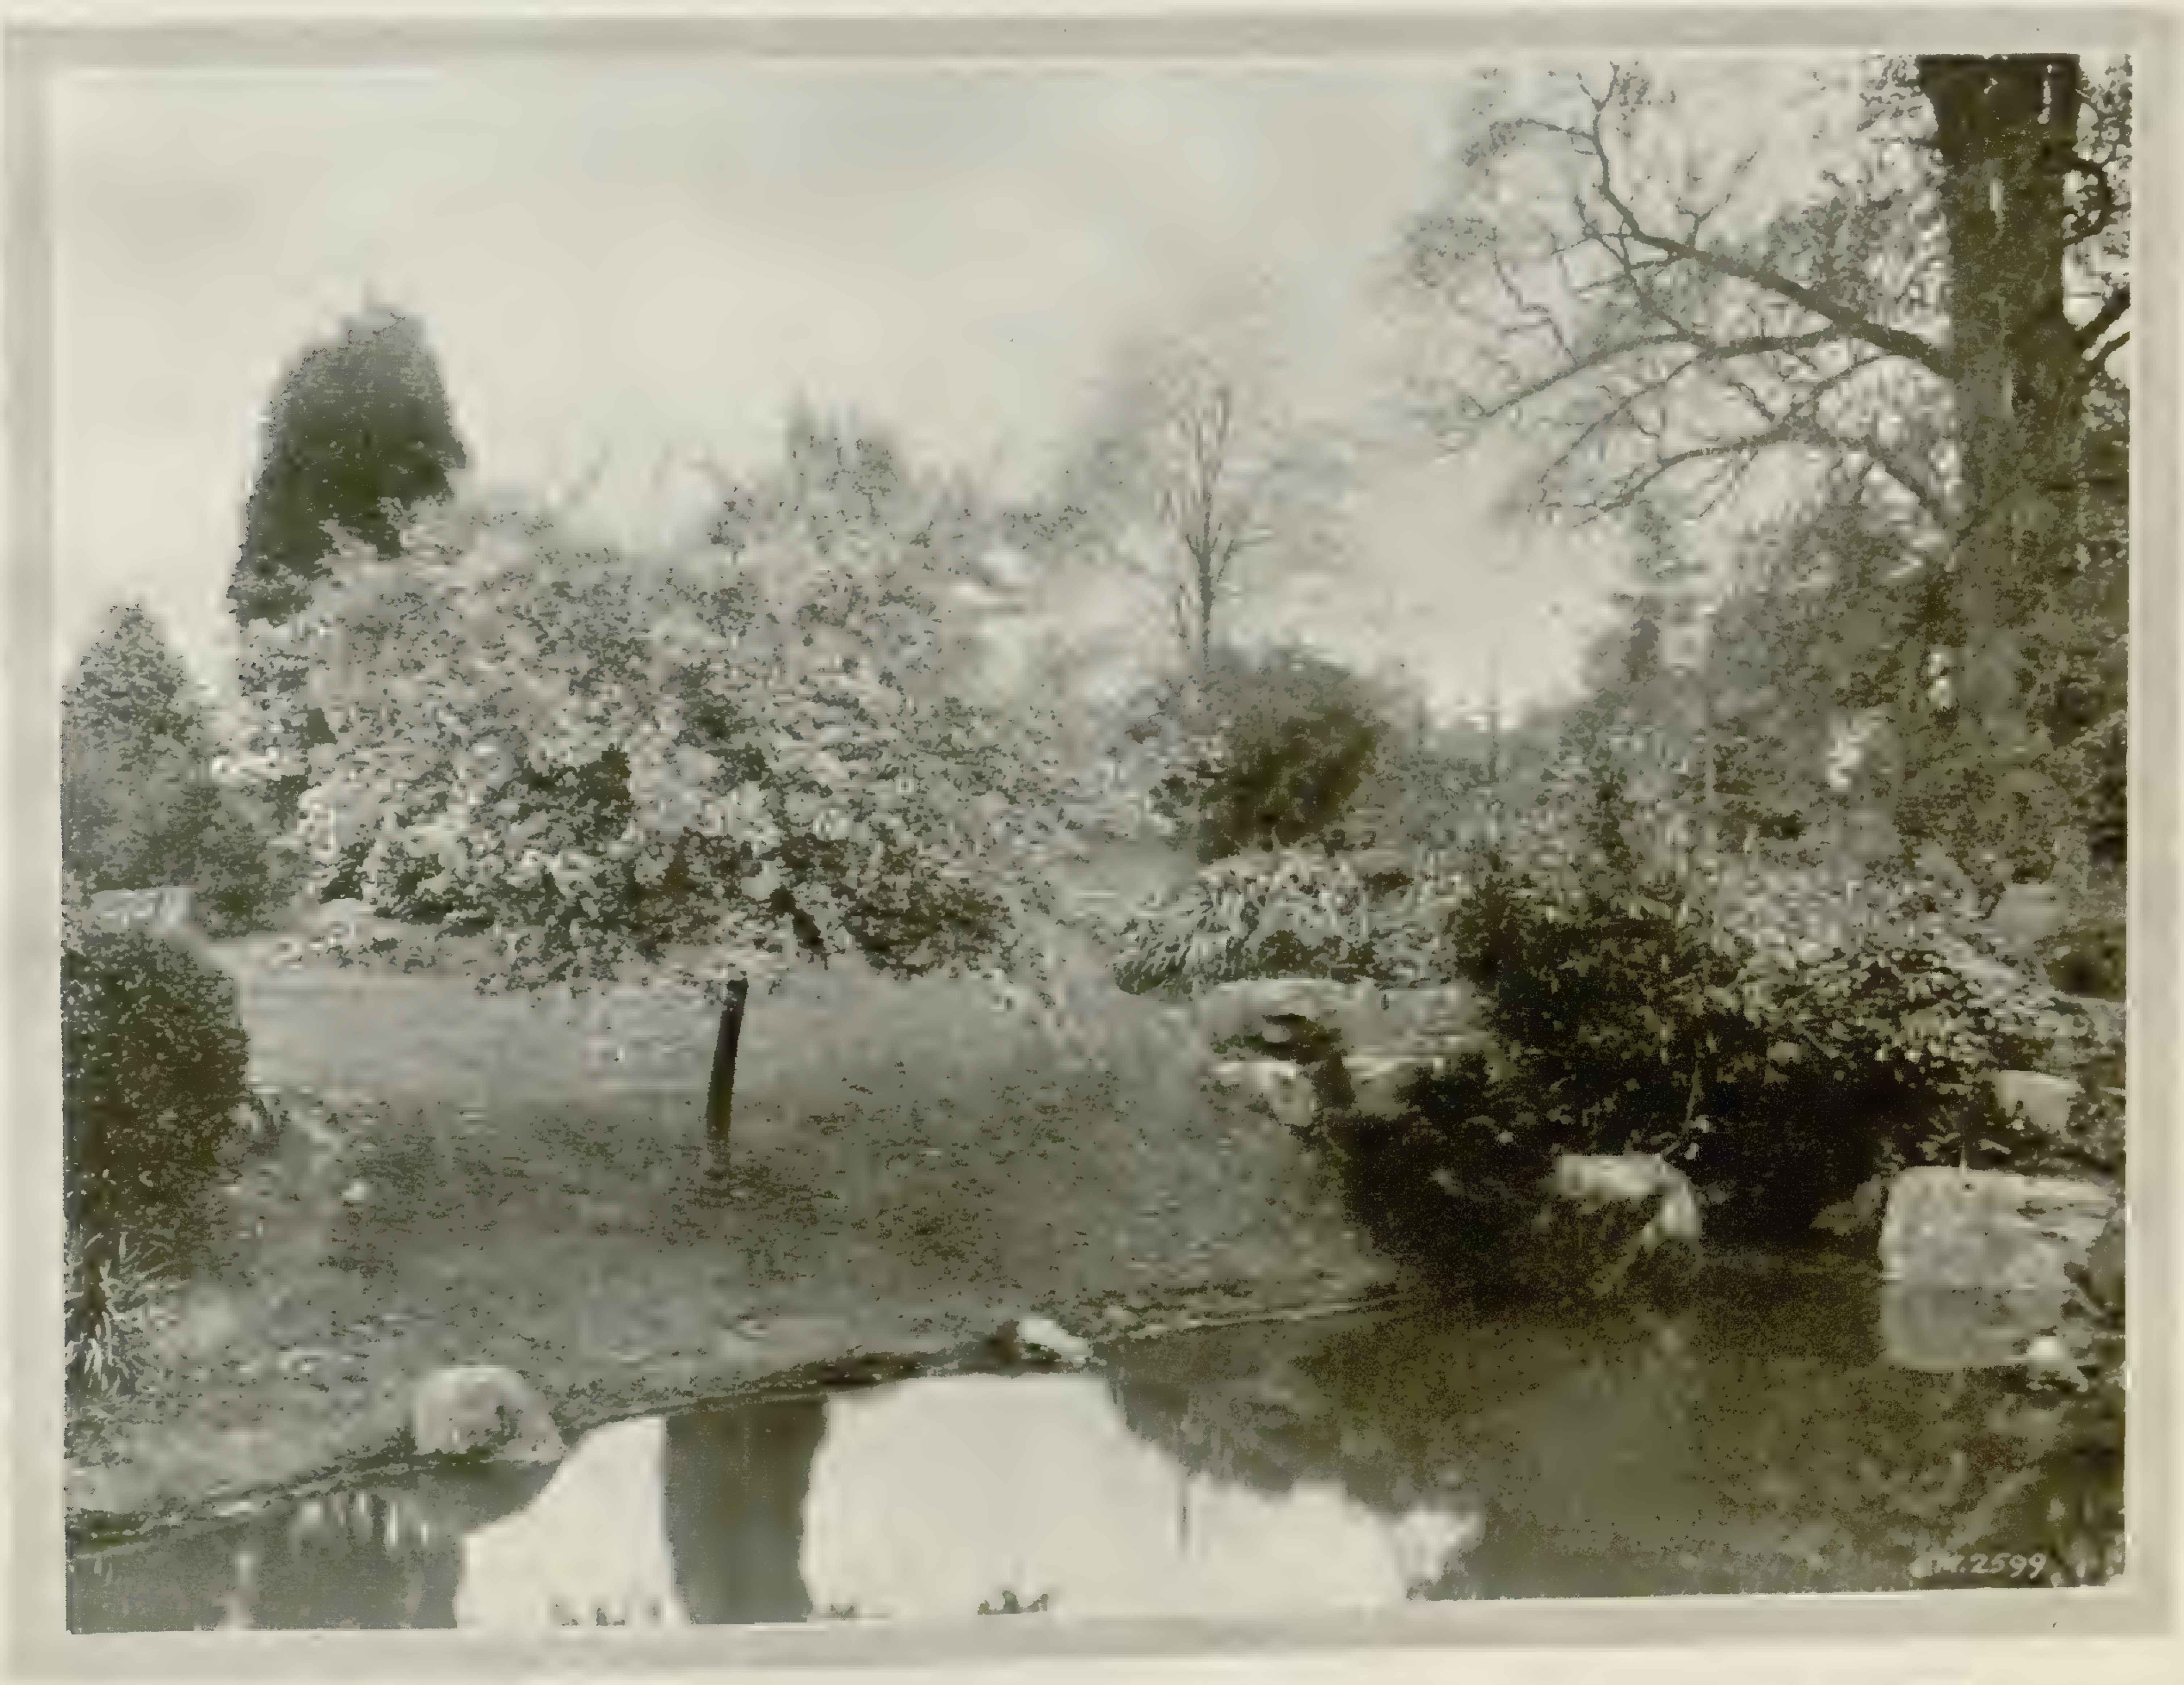
I prefer to sow the seeds under glass, and to prick the young plants out early in the season.

If required to stand the winter, plants ought to be set in a rather dry position; and in severe winters have an inch or two of ashes or litter put over them.

S. Arnott.

PYRUS MALUS FLORIBUNDA.

Among the many beautiful early flowering trees, few can surpass Pyrus Malus floribunda when in full bloom. It is suitable for planting in all parts of the pleasure grounds, but in no place does it present a more pleasing and natural appearance than when planted on the banks of a stream, lake, or any form of ornamental water. The accompanying illustration depicts a tree which was planted in its present position about fourteen years since, and has never failed to produce a wealth of blossom each year.



PYRUS MALUS FLORIBUNDA GROWN AS A STANDARD TREE AT ALDENHAM HOUSE.

The charm of this tree is that long before the flowers fully open it is most conspicuous, and the flowers themselves last for a considerable time. The tree, even when not in flower, owing to its pretty pendulous habit, is always an object of beauty, and later on in the year when covered with its tiny, crab-like fruits, it is very beautiful again. Far too often one sees this pyrus crowded in amongst other trees and shrubs where it has no chance whatever of assuming its natural habit, and then, except when in flower, it is hardly noticed or recognised.

Pyrus Malus floribunda atrosanguinea is a very deeply coloured form of the above, and is equally valuable.

E. Beckett.

Aldenham House Gardens.

IN A CHRISTMAS GARDEN.

A scent in the air of newly-turned earth, enriched by decaying leaves, so unlike the crisp rustling carpets that clothe the land elsewhere in ruddy brown; a corn-coloured glory where bracken fern appears among evergreens in the many-berried shrubbery; a background of maroon where the sunset glow rests on the wall cloaked with Hedera helix purpurea; hope shown by the swelling green tips of the lilacs, the white among the spears of the snowdrops, and sung by the hymn of the robin. Christmastide is beautiful in a garden to all who are true country-lovers.

In the orchard the gardener's skilled eye can prophecy which trees will be best decked with the blossoms that bitter spring may perchance scatter like snowflakes, and here it is, too, that the apple trees support their white-berried sycophant, who feigns to cling gladly to arms less strong than those of forest giants. Is it not recorded in verse:

> "But the Mistletoe—Oh! it was perhaps but
> a joke—
> Thought himself once a king, so he crept up
> an oak;
> But he found it so lonely that soon he stole
> out,
> And now every Christmas goes prowling
> about."

There are lessons for floriculturists written large in this garden, which boasts a collection, lovingly gathered together, of most of the trees, shrubs, and plants that look fair at this season; not only are they present, but so well arranged that southern suns and winds can alone reach the more delicate species. Note how a hedge of plain laurel, and aucubas with shining fruits, intercepts both north and east gales before they can breathe ever so lightly upon the clumps of laurustinus, between which the Christmas roses spread elegant leaves and raise up silver blossoms. Violets nestle right under the branches of the flowering shrubs, kept company by hartstongue ferns, which, in these nooks, are never out of foliage; a foreground carpet of variegated vinca has been trained and pegged with a precision that has no stiffness, but serves to show off each graceful trail, and already there are sword-like growths rising from the pale gold expanse, proving that the early native daffodil will soon be budding.

There are walls around a border of late herbaceous plants, on three sides of it at least, and the aspect is due south, so no wonder there are Michaelmas daisies and chrysanthemums still lingering, with a scattering of the yellow viola Ardwell Gem, that seems most constant and hardy of any. Asters Novæ-Angliæ roseus and ruber, valued little in October, when they commence, now offer precious trusses of dull pink and red-crimson florets. Aster polyphyllus has a greater charm even than these latter, since its pure blooms are gifted with clear gold centres. The finest white aster of any stands by itself in a mass tied back to fill a wall corner, opening buds still at the summit of its five-foot stems, although it began to unfurl large lower flowers in September. Truly there should be no garden without Aster Novæ-Belgæ White Spray.

It is a holly hedge that flanks the path by this border, and careful planting has located crimson chrysanthemums furthest away from it, lest the scarlet of Saturn's berries should clash with their harmony. Who remembers now that in days of old Christians were accustomed to decorate their homes with this evergreen, not as now to please all, but in order to escape imprisonment, torture, and death?. The Romans kept their gods' festival at the time of our Christmas, so the holly that seemed to be set up for Saturn was, in countless instances, homage to the King who came in the humble manger of the Bethlehem stable.

One of the best of the late crimson outdoor chrysanthemums is William Holmes, but Julia Lagravière is brighter. White Quintus stands here against the red wall, Source d'Or gives dull orange, and there are yet blush blossoms upon Madame A. Nonin. All around may be noted a carpet of winter aconite, snowdrop sprinkled, and at the border ends Tussilago fragrans spreads and thrives, calling attention by its heliotrope fragrance to lilac spikes that would be, no doubt, despised at other seasons.

Surely no praise can be too great for the clear yellow stars of winter jasmine? It is difficult to believe that any garden can be without them. Train it out on a south wall, cluster it to the verandah pillars on north and west, bind it to arches in the open, stretch its luxuriant growth across an east trellis, so you shall have it, as visible this December, flourishing in all stages of floral development. The summerhouse, designed more for use in frost time, is just a bower of Jasminum nudiflorum and silver-variegated ivy, clustered round by large-fruited rugosa roses, the lavish Snowberry (Symphoricarpus), and the bold Berberis aquifolium. One more colour show remains to be greeted; it is formed by an unfamiliar climber on the southern house front, the drooping purple Lardizabala biternata; beneath it golden privets have succeeded in retaining leaves bright as flowers.

Indeed, where gardens are well planted and assiduously tended they can charm in winter even town worshippers, to whom pavement and chimney generally represent comfort. The swept and constantly rolled turf may keep some moisture throughout both day and night, but the gravel that is devoid of weed or rotting leaf lies a smooth and inviting track, flecked over by shadows and sunshine that play as jubilantly now as when the roses of July are present.

Is there a nipping blast? If so, it serves to brace the nerves and tonic every system. So let us welcome "chill December," who, when he came, as Spenser tells us,

> . . . "Through merry feasting which he
> made,
> And great bonfires, did not the cold remember,
> His Saviour's birth his mind so much did
> glad."

M. H.

ROSES GATHERED IN A YORKSHIRE GARDEN IN OCTOBER.

LATE ROSE BLOOMS.

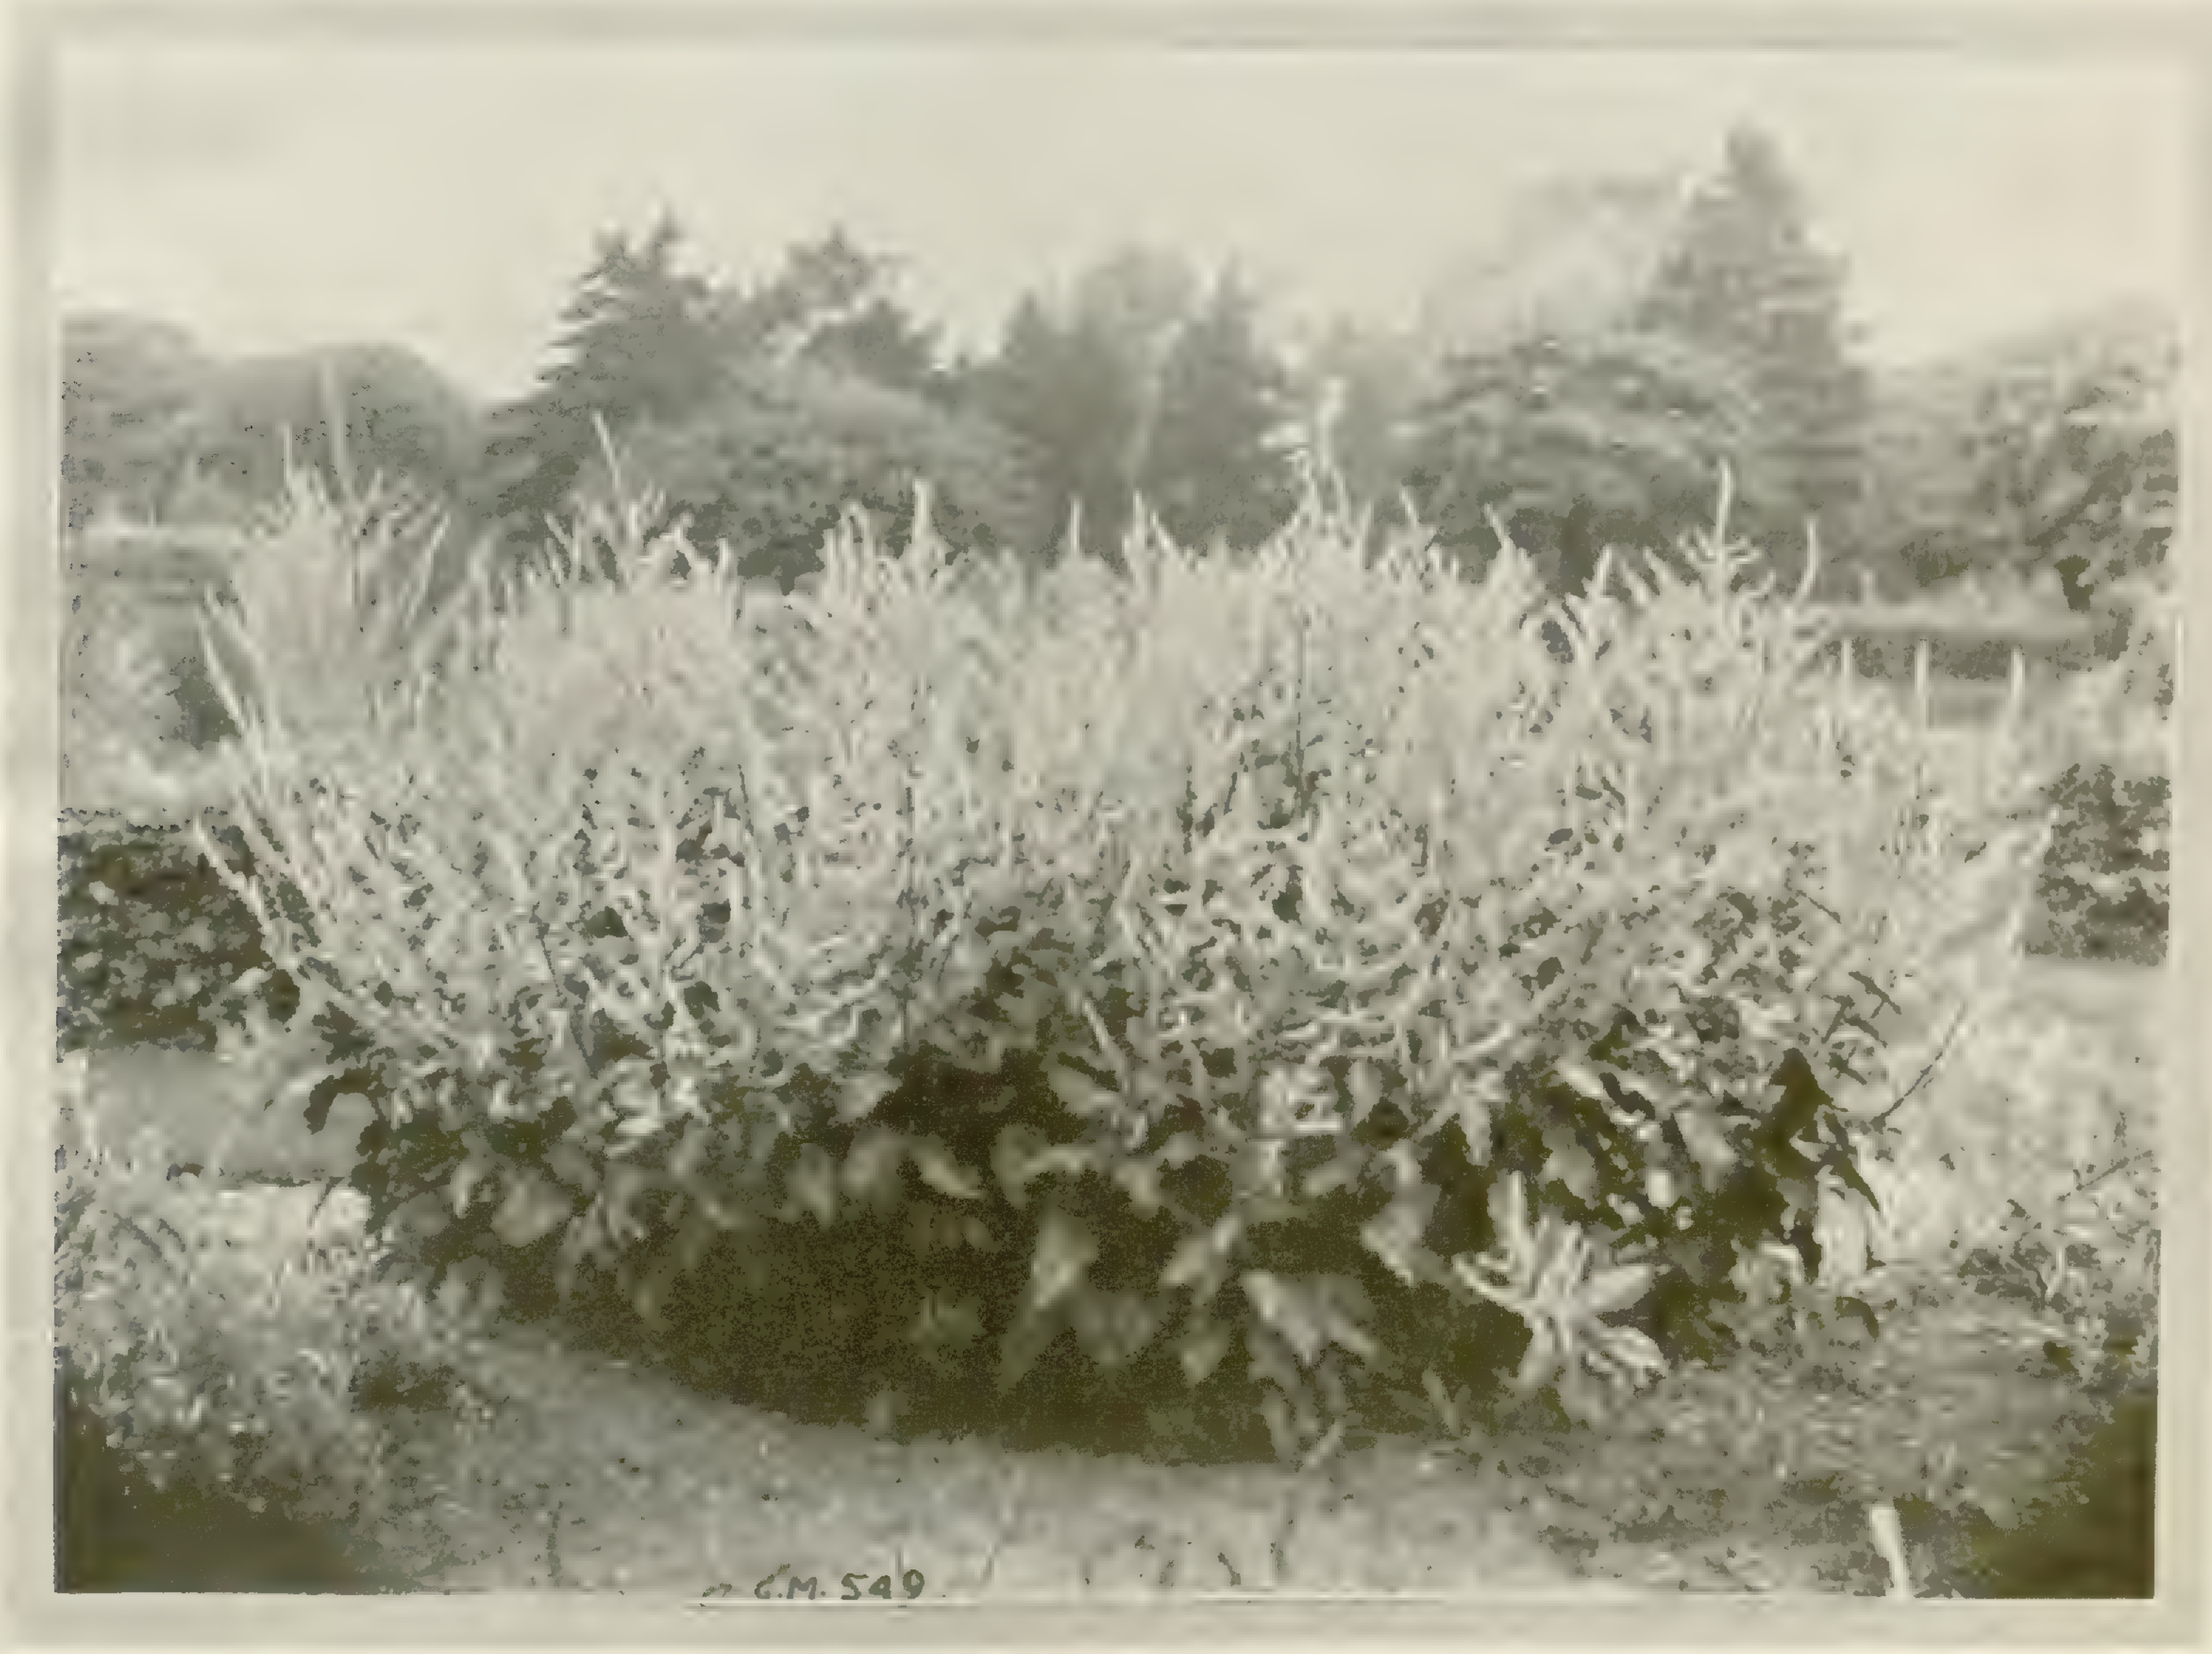
Most of our readers have heard of the roses that Mr. Mawley, Mr. Orpen, and the Rev. J. H. Pemberton are sometimes able to gather out of doors at Christmas time, but we do not expect roses to remain very late in bloom in Yorkshire. It is therefore the more interesting to learn from Mr. W. Taylor, of Ferniehurst Gardens, Baildon, Yorks, that he was able to gather fine roses during mid-October, as evidenced by the photograph of a vase of blooms herewith reproduced. Mr. Taylor states that it is rarely such good blooms are to be obtained at so late a date; the gardens are only three miles from Bradford and near to several other big manufacturing towns, so that the conditions are not the most favourable.

Roses may be grown to perfection by following the instructions given in Roses and Their Cultivation, by T. W. Sanders. A selection is given, with description of all the best varieties, and full details for culture outdoor and under glass. Price 2s. 6d. net, by post, in box, 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

NOTES FROM KEW.

Impatiens Holsti and its Varieties.

When the vermilion coloured Impatiens Holsti was first introduced from East Africa anticipations were indulged in that apart from its own intrinsic merit it might prove of considerable value to the hybridist, and perhaps lay the foundation of a new race of balsams. These anticipations have, at least to a great extent, been realised, and in the greenhouse there is a group of distinct forms with the habit of I. Holsti, but whose flowers vary from white through several shades of pink, red, and violet. They are certainly a decided acquisition for the embellishment of the greenhouse at this season, for they are of easy culture, quick growth, and very floriferous. They may be readily increased from seeds or cuttings.



GROUP OF THE HUNGARIAN BEET (BETA TRIGYNA) IN THE CAMBRIDGE BOTANIC GARDENS.

Platytheca galioides.

This is one of the most graceful and continuous flowering of the so-called New Holland or hard-wooded plants. It is at the present time very conspicuous among the varied occupants of the greenhouse. Known also as Tetratheca verticillata, and Tremandra verticillata, it forms a slender growing plant, whose long, wiry stems are clothed with very narrow leaves, arranged in whorls of eight or ten. The saucer-shaped blossoms, which are of a beautiful shade of blue, are drooping, and hang suspended by long slender stalks. As the lowermost flowers pass out of bloom the shoots continue to lengthen, and produce flowers for a long time.

Pinguicula caudata.

Referring to my previous note regarding this pinguicula, which appeared in the Gardeners' Magazine for November 14, page 855, I may mention that the specific name of cordata, which was in use at Kew, has now been altered to caudata, so that the old name remains undisturbed. Reference to the "Botanical Magazine" convinced me that the specific name of caudata was the correct one, unless our botanical friends had been indulging in another of their favourite pastimes of changing old and well recognised names.

Hippophæ rhamnoides.

This, popularly known as the Sea Buckthorn, forms one of the brightest outdoor features at the present season of the year. It is a willow-like shrub, clothed with peculiar greyish-green leaves. Just now the slender wand-like shoots are furnished for some distance with a closely-packed mass of bright orange-coloured berries, and when a quantity of plants are grown together as on the bank of the lake near the Palm House, the effect as viewed under the influence of the winter's sunshine is a really delightful one. In planting the Sea Buckthorn, it is very essential to note that the male and female flowers are borne on different plants, so that it is necessary to plant about one male to half a dozen females, in order to ensure fertilisation.

Celastrus articulatus.

This vigorous climbing shrub, which is a native of China and Japan, is not adapted for training to a wall or any position where it has to be kept within certain bounds. Given a place, however, where it can be allowed to run wild over other trees or shrubs, which may be either dead or alive, it is seen to very great advantage. Just now it is at its best, the long thong-like shoots being clothed for a considerable distance with brightly coloured fruits. These fruits, which are borne on short stalked clusters, are yellow when ripe, after which they split open and expose the bright red seeds, after the manner of the euonymus, to which, indeed, the celastrus is nearly allied. In the "Forest Flora of Japan," Dr. Sargent refers to this celastrus as one of the commonest plants on the mountains of Japan, and states that the leafless branches covered with fruit are sold in the autumn in great quantities in all Japanese towns, where they are used in house decoration, for which purpose they are admirably suited, as the brightly coloured fruit remains on them for many weeks.

Cotoneaster rotundifolia.

Perhaps the finest of all the shrubby cotoneasters, this has up to now retained nearly, if not quite, the whole of its leaves, and the bright scarlet berries nestling among them form a charming feature. This cotoneaster should be more often planted than it is, but the fact that the less showy C. buxifolia sometimes does duty for it has probably led to it being less appreciated than would otherwise be the case.

K.

THE HUNGARIAN BEET.

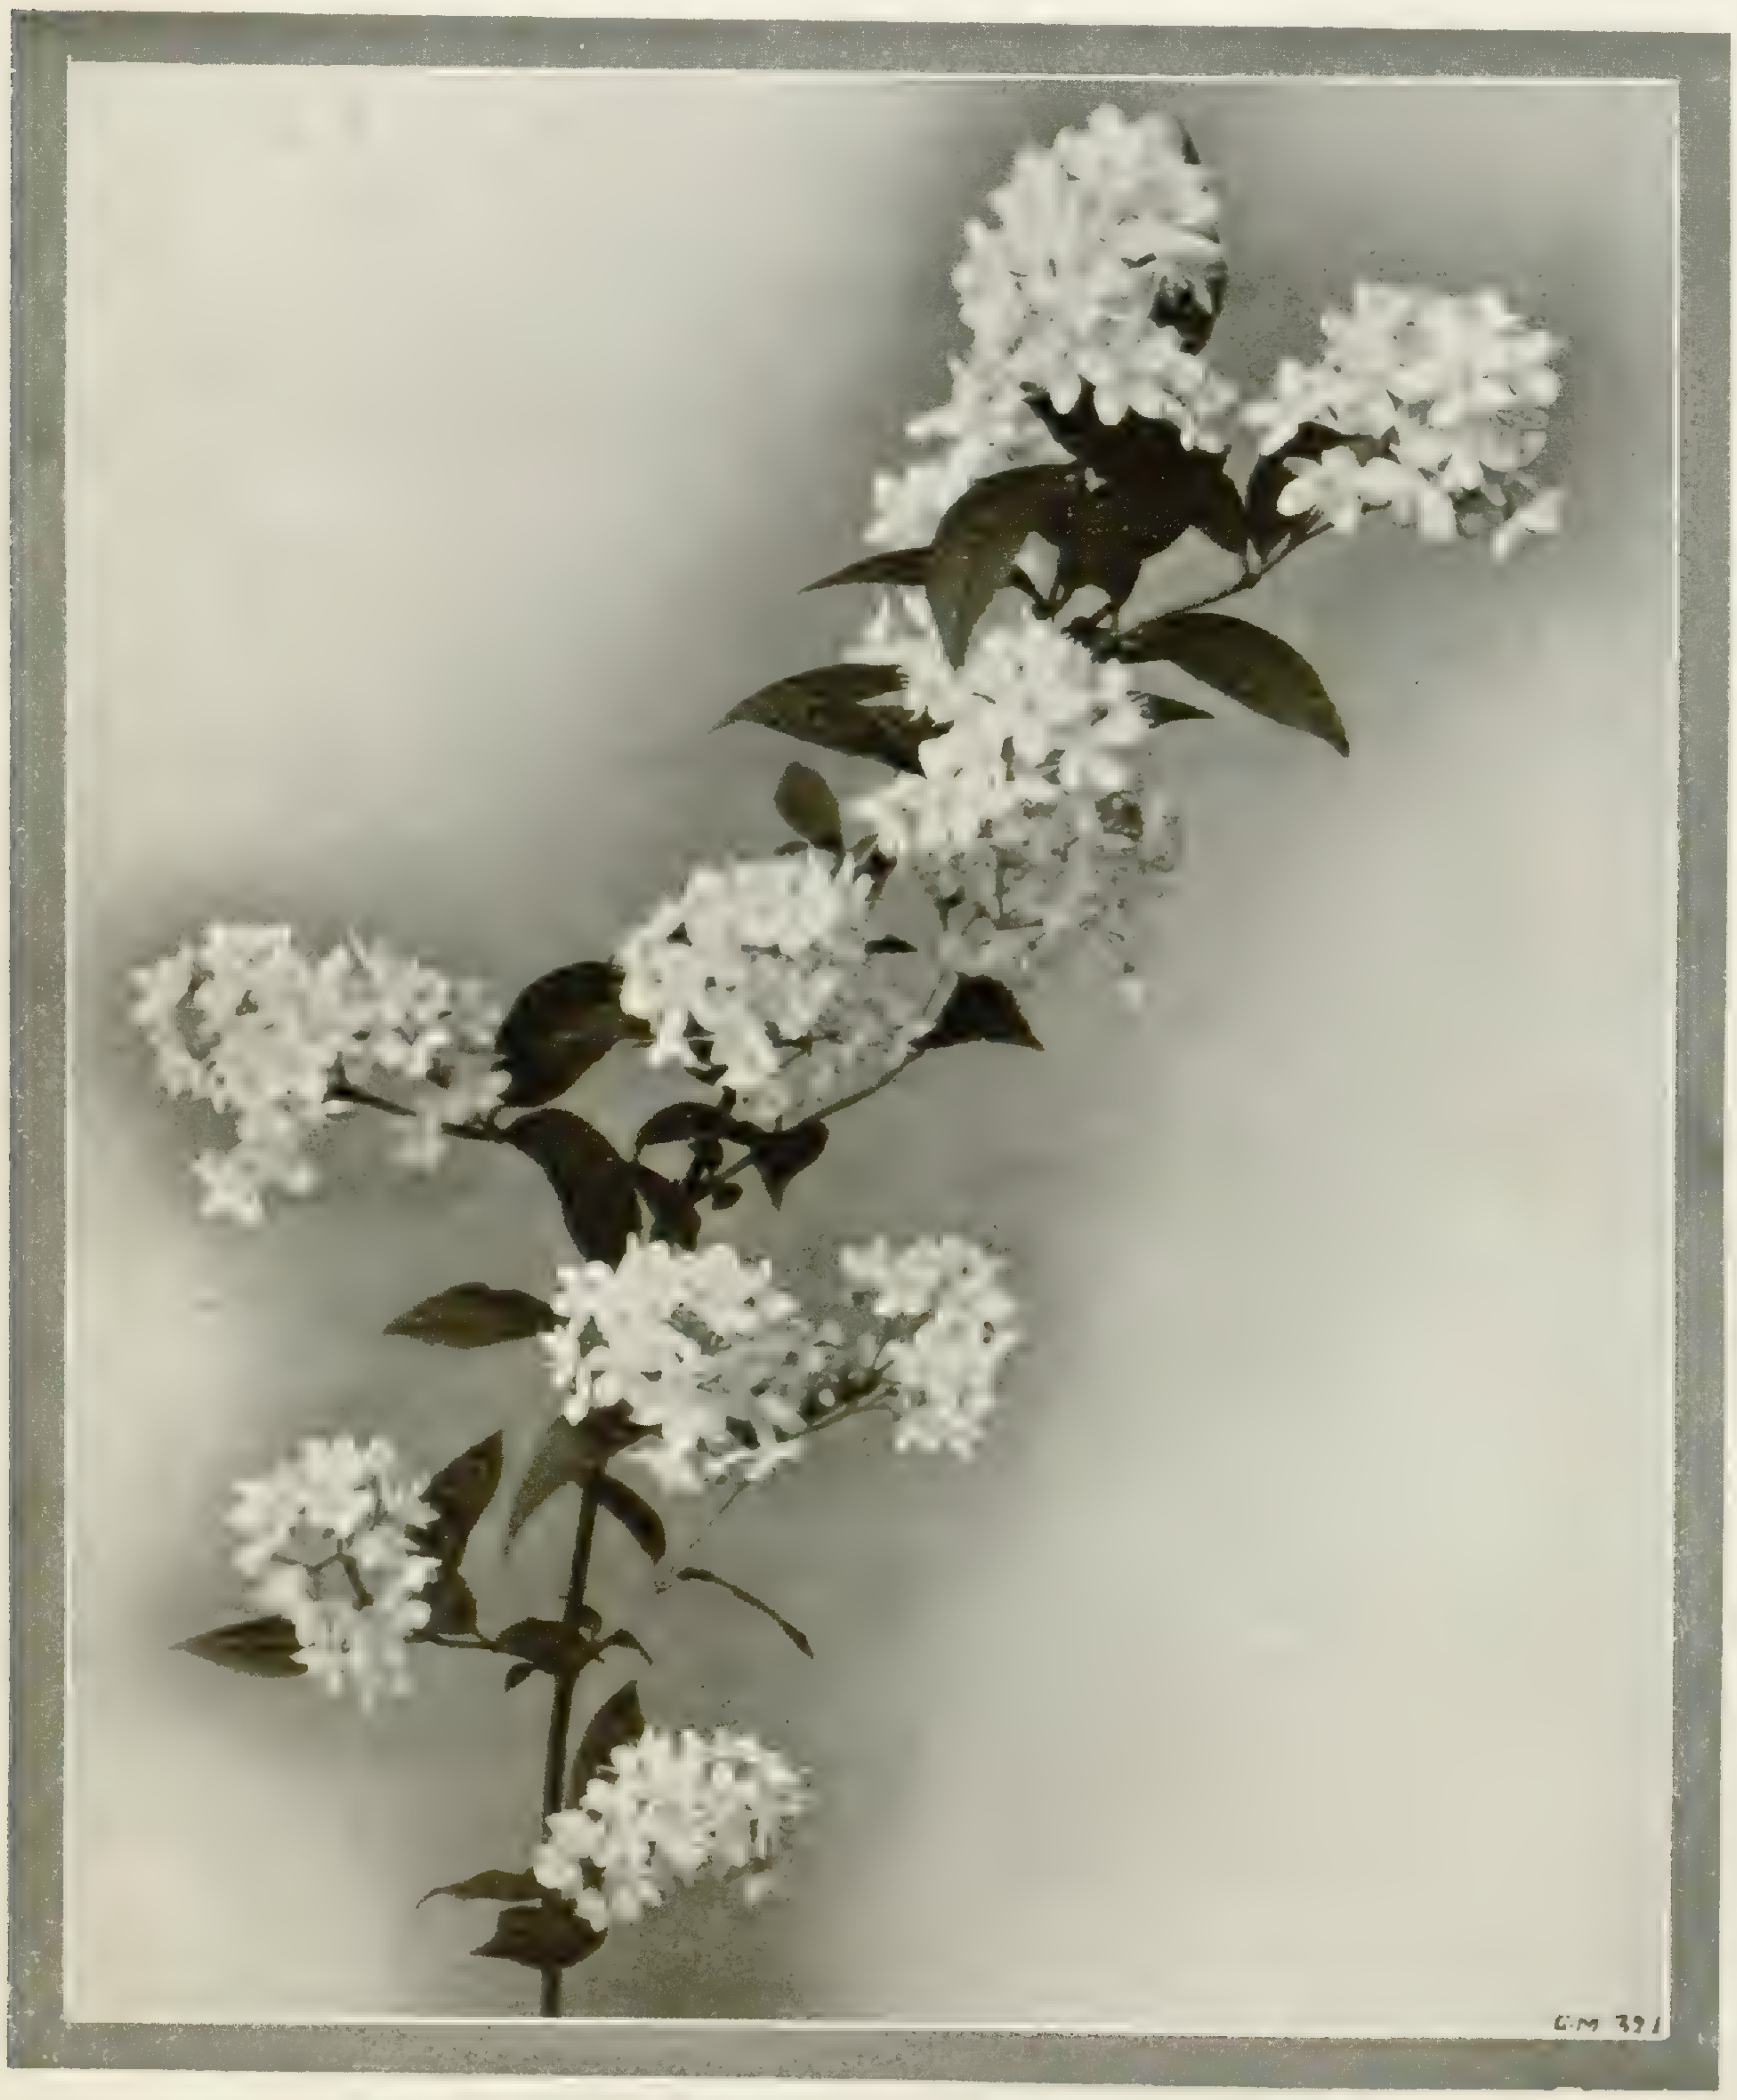
Unlike the forms of Beta maritima and B. Cicla, which are grown for their roots or foliage, the subject of this note—Beta trigyna, is valuable as a flowering plant in the herbaceous border. It is a perennial, growing four feet high, and producing large panicles of greenish-white flowers during July and August. The accompanying photograph represents a most effective clump in the Cambridge Botanic Garden, which measured six feet through, and over four feet in height. The stems are stout and strong, and seldom require the support of stakes. Neither does the plant require any special treatment, being quite happy if undisturbed for some years.

E. J. Allard.

Cambridge Botanic Gardens.

THE MISTLETOE.

The festivities which attend the anniversary of Christmas are not considered complete except a bunch of mistletoe be included amongst the various evergreens which are introduced into the house for decorative purposes. How or when the custom originated of decorating houses with evergreens is opén to conjecture, but it appears to have been in vogue at the time when the Roman Empire was supreme, for the Romans are stated to have used evergreens freely in the decorations attending their various festivals. Some historians affirm that the custom of using evergreens for Christmas decorations is the outcome of the custom of the early Christians who used them when celebrating the Christmas festival, so that they should not be conspicuous amongst others who were at the same time celebrating the feast of the Saturnalia.



SPRAY OF DEUTZIA LEMOINEI.
Flowers pure white.

However it occurred, these decorations appear to still exercise the same hold on people, and it is probable that more cut evergreens are used at the present time for decorative purposes than ever before. So much discrimination does not, however, appear to be made now in the selection of evergreens as was the case in the past, for some kinds were considered of far greater importance than others, probably on account of their mystic and legendary associations. For instance, the holly occupied a more important place than the ivy, the former being used in the festal hall whilst the latter was consigned to passages and places of little account. The yew was not supposed to be used for Christmas at all, its proper time being from Palm Sunday to Easter. Other evergreens also were apportioned their correct seasons, but a few appear to have always been accorded a prominent place at Christmas, and of these the mistletoe is one.

Various legendary associations are attached to the mistletoe, some of which are worth recording. The following one bearing reference to the mistletoe's parasitic nature is recorded in several old books, and may also be seen in "Folkhard's Plant Lore": "According to Scandinavian mythology Baldr (the Apollo of the north) was rendered by his mother Frîgg proof against all injury by the four elements, fire, air, earth, and water; Loki, the evil spirit, however, being at enmity with him, fashioned an arrow out of mistletoe (which proceeded from neither of the elements), and placed it in the hands of Hödr, the blind deity, who launched the fatal dart at Baldr, and struck him to the earth. The gods decided to restore Baldr to life, and as a reparation for his injury the mistletoe was dedicated to his mother Frîgg; whilst, to prevent its being again used adversely to her, the plant was placed under her sole control, so long as it did not touch the earth, the empire of Loki. On this account it has always been customary to suspend mistletoe from ceilings; and so, whenever persons of the opposite sexes pass under it they give one another the kiss of peace and love, in the full assurance that the plant is no longer an instrument of mischief."

According to an old legend current in some of the western counties of England the mistletoe at one time grew in the ground, and formed a tree of considerable size, but, on account of the wood being used to form the cross for the Saviour's crucifixion, the tree was henceforth condemned to grow as a mere parasite.

The mistletoe was also considered to be endowed with magical properties in the days of witchcraft, and was used by witches in their spells and incantations. In the event of young ladies wishing to know something about their prospective sweethearts, these went in batches of three to a witch. She formed a chain of holly, mistletoe, and juniper berries, with an acorn forming the end of each link. This chain was wound round a log of wood, and then burnt, with certain magical rites and incantations. As the last acorn was burnt each of the three maidens would see her future husband walk across the room, or if she were doomed to live an old maid's life, a coffin or misshapen form would appear.

Mistletoe was also considered useful, if treated in a proper manner, for engendering dreams of a person's future destiny. This charm was to be worked in the following manner: On Christmas Eve, or the first and third evenings of a new moon, nine fresh mistletoe berries must be gathered. These must be steeped in a liquid composed of equal parts of wine, beer, vinegar, and honey, and then be taken as pills. Providing the person went to bed before midnight, and the pills were taken on an empty stomach, his future destiny would be revealed to him in dreams. The mistletoe was at one time also credited with possessing miraculous medicinal properties; it was said to possess the power of opening all locks, and the carrying of a sprig protected the wearer against the machinations of witches. Culpeper prescribed the powdered leaves and berries taken on forty successive days as a sure cure for apoplexy, palsy, and falling sickness.

As a rule, the mistletoe is found in the greatest profusion on the branches of apple trees in the western counties, being very abundant in the cider districts. It, however, grows on many kinds of common deciduous trees, such as poplar, lime, pear, birch, willow, and mountain ash. It is occasionally met with on oak, and on this account it was held in high esteem by the Druids. The oak was endowed with an air of sanctity by the Druids, and when they found an example with mistletoe growing on its branches they are recorded as having at once stamped it as a holy tree, and considered the mistletoe as a divine gift of peculiar holiness, only to be gathered with befitting ceremonies on the sixth day, or at the latest on the sixth night, of the sixth moon after the winter solstice, when the year commenced. Pliny refers to the Druids selecting oaks with mistletoe on as a place for the performance of their sacred rites, thinking "that the mistletoe on the oak is sent from heaven, and that it is á sign that God has chosen the tree."

The ceremonies performed by the Druids in gathering the mistletoe were peculiar. A feast was prepared, and two white bulls were obtained for sacrificial purposes. The high priest ascended the tree, and, with a golden pruning hook cut off the branch, which was allowed to fall into a white sheet below. The bulls were then sacrificed, the priests and people meanwhile praying that God would bless his own gift to those on whom he had bestowed it. The branches were then steeped in water, and the liquid was afterwards distributed to persons who deserved it, and its retention by those persons was considered a safeguard against the spells of witches. It was imperative that when being gathered the branches should not come into contact with the earth, for the moment a branch touched the ground its magic virtues departed.

Although the mistletoe (Viscum album) grows so abundantly in some parts of the country, it has been found to be difficult to establish in others. The best way to propagate it is to rub the seeds into crevices on the rough bark of apple trees, and leave Nature to do the rest. In some Continental countries other kinds of mistletoe exist, notably Loranthus europaeus, which grows on the oak in Southern Europe, and bears bright yellow berries; and Viscum cruciatum, with red berries, which appropriates the olive for a host plant. W.

DEUTZIA LEMOINEI GROWN AS A POT SPECIMEN.

This splendidly flowered specimen was shown at the Ghent Centennial Exhibition, in April last, and had a diameter of over six feet.

Herbaceous borders may still be dug and attended to, but where there are bulbs in the borders great care must be taken not to damage these, as they are now in quite active growth, the tops of many of them already showing well above ground. In favoured districts the earliest snowdrops will soon be in bloom, hellebores are already giving of their beauty, while in the wild garden periwinkle, Tussilago fragrans, aconites, etc., will soon commence the glories of another season.—E. F. HAZELTON.

DEUTZIAS.

Within the last fifteen years a number of very pretty hybrid deutzias have been raised and distributed by Mons. Lemoine, the eminent French hybridist, of Nancy, and these, together with several varieties of well-known species, constitute a group of shrubs of some considerable importance in gardens. The deutzias are closely related to the Mock Oranges, or philadelphuses, but are less useful for general outdoor decoration on account of starting into growth early; and although the flowers do not usually expand before May or June, the buds are sufficiently advanced in early April to make them the prey of late spring frosts, and it is only about one year in four that a full crop of flowers is matured in the neighbourhood of London. When, however, they are seen at their best their beauty is surpassed by no other flowering shrub, and for this reason their value is sometimes a little overrated.

Apart from outdoor use, however, these hybrid deutzias have found for themselves a place in the garden for which they are eminently suited, and for which there are no better plants. This purpose is forcing for indoor decoration. Perfectly hardy, so far as winter cold is concerned, young plants may be left out of doors all the winter, be cut back in March, and allowed a long growing season. They then form shapely bushes of strong, well-budded shoots, which may be depended on to produce good blooms throughout the greater part of their length. These plants, lifted carefully in October, and potted, may be forced into flower by Christmas, or soon afterwards, and a succession of the most lovely flowering shrubs imaginable can be had from that time onwards for three months.

For house decoration the long, slender, flower-laden, wand-like shoots are peculiarly appropriate, whether used alone or intermingled with other flowers. After the flowers are over the forced plants should be gradually hardened off, the flowering growths meanwhile being cut back to within a few buds of the base. The plants should eventually, say, about the end of April, be planted out in a border of rich loamy soil, and allowed to form fresh shoots. Some plants will grow well enough to warrant them being forced the following spring, whilst others may have to remain for another year. As a rule it is inadvisable to retain the same plants very long, those three to six years of age being the most serviceable. Cuttings of young shoots root readily indoors, so there is no reason why a succession of young plants should not be arranged for. Specimens growing in the open ground require rich soil, and are benefited by being given a generous top-dressing of well-decayed manure every spring. For districts where spring frosts are not prevalent all the deutzias may be introduced into the garden with advantage, the only drawback to their culture in other districts being occasional cold nights and biting winds.

The species that have been used most successfully in the production of hybrids are D. gracilis, D. discolor, and its variety purpurascens, and D. parviflora.

D. gracilis is a well-known Japanese species of slender habit, which grows about two feet in height. It was first brought to notice in 1835, and is recorded as having been introduced by M. J. Baumann, a Ghent nurseryman. It has small, ovate, acuminate, serrated leaves, and bears a dense, short raceme of pure white flowers from almost every bud on the preceding year's shoots. For many years it has been held in esteem for forcing, and was popular before many of the subjects used for the purpose in the present day were tried. Several well-marked varieties are known; some of the best being foliis aureis, marmorata, and variegata, all of which are distinguished by their variegated leaves.

D. discolor is usually represented in gardens by the variety purpurascens. It is a stronger growing shrub than the last-named, attaining a height of three or three and a-half feet. The leaves are more or less ovate, and finely serrated. The flowers are borne somewhat similarly to those of D. gracilis, in axillary racemes, and are very similar in size, but deeply flushed with rosy-purple. It is a Chinese plant, and is found in company with many other interesting shrubs in Yunnan. A later variety is known as grandiflora. This has larger flowers and inflorescences, and more vigorous growths. It promises to be a valuable shrub.

D. parviflora is likewise a Chinese shrub. It was discovered in Northern China, in the Amoor country, and was first introduced to the St. Petersburg Botanic Garden. From there it was sent to the Arnold Arboretum, and from there it was distributed to various American and European gardens. It is a strong-growing shrub, four to five feet high, with elliptical or lanceolate leaves with serrated margins. The flowers are white, and borne in axillary and terminal corymbs.

Hybrids.

The happy idea occurred to M. Lemoine in 1891 of crossing the last-mentioned species with D. gracilis, D. parviflora being the female plant. From this cross plants were obtained which flowered in 1894. On April 12 of that year these were exhibited under the name of D. Lemoinei at one of the meetings of the Société Nationale d'Horticulture de France, where they caused a great sensation. D. Lemoinei had by 1895 attained a height of three feet, and each plant was estimated to carry from 1,000 to 1,500 blossoms. Mature plants attain a height of five feet, with elliptical or lanceolate leaves, and a profusion of inflorescences of pure white flowers, intermediate in form between those of the two parents, the individual flowers being large. When at its best the branches are literally covered with flowers. A variety called compacta, of dwarfer habit, but equally floriferous, was subsequently introduced.

On the introduction of D. discolor purpurascens M. Lemoine quickly recognised its qualifications as a probable parent, and succeeded in obtaining a race of beautiful hybrids between it and D. gracilis. These are all very floriferous, and are distinguishable by reason of their purple-flushed flowers, and, in some instances, campanulate or evenly-shaped corollas. Of this set two of the best are D. campanulata and D. kalmiæflora. The undersides, especially of the petals, in both cases, are flushed with rosy-purple. If forced in much heat a great deal of the colour is undeveloped; if, however, the plants are allowed to come on in a moderate temperature a richness of colouring almost equal to that produced by plants out of doors is obtained.

From the accompanying illustrations of a plant and spray of D. Lemoinei a good idea can be gained of the floriferous character of this plant. W. Dallimore.

Royal Gardens, Kew.

WARNER'S KING APPLE.

This apple seems to be fast on the wane, not only in popularity, but in its constitution also—presuming that there is such a possibility in an apple. This is not a fanciful idea of my own, but in conversation with several fruit experts, including Mr. Woodward, at the late show of the R.H.S., they all agreed the results from this variety in crop and quality of the fruit at the present time are indeed poor as compared with what they were fifteen years ago. My experience of this apple, with several hundred trees, is that we obtain quite fifty per cent. less of satisfactory fruits than formerly. Scarcely ever do we have a season when there is a full crop set, and when we do have one three parts of the fruits drop instead of taking on their first swelling. Seldom, indeed, do we find a tree free from apple scab, in spite of careful spraying. The leaves, quite early in the season, become infested with dark brown fungus-like growths, which eat into the leaf tissues, rendering them useless as an aid to the tree in swelling its fruit. Quite frequently, too, when the trees are in full bloom we experience a spell of cold, depressing, sunless weather, and this they do not appear able to withstand.

It is not so with other varieties like Lord Grosvenor, Bramley's Seedling, and Lane's Prince Albert. I find, too, that some other apples grafted on to Warner's King do not flourish as they do upon other varieties. The branches have a knack of dying off in various parts of the stock, which is a loss to the newly worked varieties. Some suggest a new strain of seedlings from this variety to give a fillip to its constitution. At the shows one notices an absence of that quantity of fine fruit so common fifteen years since.

What is the experience of readers? According to the late Dr. Hogg, Warner's King is fully a hundred years old. I am quite aware I am advancing a new theory, which may not meet with even general support; but the fact remains. Encouraged by the results from trees planted here thirty years ago, I, in 1890 planted two hundred trees of Warner's King, and for a few years these were a success, the fruits large, quite clean in the skin, and of a good colour for the variety. Although this variety is liable to canker seriously in some soils, I do not complain of that evil.

Swanmore Park. E. Molyneux.

Kirengeshoma palmata.—One of the probable results from the rise of Japan will doubtless be the larger introduction of plants from that country bearing Japanese names, but it is devoutly to be wished that few will carry such troublesome ones as this one, which is as yet but little known, although it has been cultivated at Kew for at least six or seven years. Such names as this are great obstacles to the popularity of even a good flower with the many, who like to have a name for any plant they grow, but who either will not, or cannot, negotiate these designations of such length and formidable appearance. This by way of protest, and now for a short note upon this flower, which belongs to the great natural order of Saxifragaceæ, and has pretty creamy-yellow flowers and ornamental palmate foliage. It has not been much grown in this country, but so far as I have met with it the plant reaches from a foot to a foot and a-half in height. It flourishes in common soil in a border, but I have seen it doing particularly well in a low corner of a good rock garden, and in a position where the soil would be kept moist by the surplus water draining down from above. It is a hardy plant, and is being offered by one or two nurserymen in this country.—S. Arnott.

HEPATICAS.

Several flowers that were favourites in English gardens for untold years have quite gone out of fashion in recent years, and of these the hepatica is one, rarely being seen now in any but old-fashioned country gardens. Apart from the unaccountable changes of fashion, the reason of this neglect of such a beautiful flower is doubtless to be found partly in the early season of its flowering—sometimes as early as February—when we make but little use of our gardens—and partly in the fact that it is not showy enough to make any display, unless in very large masses, and these, by reason of the slowness of its increase, it is not easy to secure. We cannot have it in our summer beds and borders within view of our windows, as it does not like annual transplanting, and thus the field for its use is limited. Add to this the fact that it is a plant which will not thrive everywhere, and one may well ask—why say anything about it?

The answer must be that some varieties of it are among our very few sky-blue flowers, and, in the sunshine of early spring, one of the most beautiful. Without going so far as to say that it is one of those flowers which should be in every garden, at least one may say that where the conditions are just suited to it so that it not only increases at a moderate rate but seeds itself, advantage should be taken of this fact to grow it.

The hepatica is generally considered to like a deep, rich, loamy soil, one that is porous, or inclined to lightness, and yet I have known gardens in heavy clay districts where it has formed very large clumps, though I cannot say how many years have been necessary for this. It is best left for years undisturbed, as it is a very deep rooter, and it is doubtless owing to this that it is generally such a failure on retentive soils. I used to know a garden where it seeded itself about the garden paths, and yet one never sees its seeds mentioned in any nurseryman's catalogue. The situation in which it is most likely to do well is on made banks, where it will sometimes hold its own with the primrose and the violet, all three preferring somewhat shaded and sheltered positions. Hence, conditions of soil being favourable, it is well adapted for growing under deciduous trees, where it will get the early spring sun to open it and show it up—as it is like the crocus in this respect—and at the same time will have shade in summer.

Another good place for it is on the rockery, but it must not be overrun by other things in the summer or it will disappear altogether. Like some bulbs, it seems to like the company of the roots of other and stronger plants and shrubs, probably because they help to keep the soil open and free from excess of wet in the winter. Though it likes a porous soil, and is a deep rooter, it will not stand excessive drought, and the difference between success and failure may sometimes be brought about by placing small stones round the plants to retard evaporation and keep the surface soil moist. The best time, or, rather, the safest time, to plant is in February, when it is already getting ready to flower. As one scarcely knows until one tries it whether it will succeed or not, it would be best to begin with a few plants and see how the conditions suit it.

As to varieties, I still consider the best, taking all things into consideration, is the old single blue. This, and the double red are the two best known, but there are also a double blue, a single red, and a white. There is also the H. angulosa, known as the great hepatica, a large-flowered single blue form, and very beautiful, but in my own experience not so free-flowering as the older and smaller single blue.

Alger Petts.

THINK AND THANK.

We stand at the close of another year. The gate is shutting behind us, and in thought we look back through the bars and see our successes and failures. If work has been well and faithfully done then the measure of our success has been large, and there comes a feeling of devout thankfulness for the health, strength, and opportunity that have been ours. Of course, there was something we might have managed better, but of this we say as little as possible, though in brain and book there are notes very boldly made, and, all being well, we shall avoid that mistake in the year that is dawning. Successful gardening consists largely of doing the right thing at the right time; a large measure of that success is also obtained by the avoidance of previous mistakes. Failure to profit by past experience makes many a garden dull and uninteresting, and it is very regrettable that not seldom "knowledge comes but wisdom lingers." It is a fine thing to start the New Year with high resolves and new resolutions, to start with the proverbial clean sheet. In our younger days we blotted the exercise book badly, but the experienced teacher taught us how to hold the pen properly, and there was punishment for the untidy writer. The garden year that is closing, shows, let us hope, fewer mistakes than the previous one. A good teacher, our own experience, and a fountain pen, have reduced blots to a minimum; so, in the garden, with Nature's book ever open, the memory of difficulties overcome, and proper tools to work with, the prospects are distinctly good.

Here we stand then, at Think and Thank Gate. We think of the past because we want to think for the future. We are thankful for the fine long summer, and warm autumn, for the beautiful flowers and abundance of fruits, for ample supplies of vegetables, for the new introductions from far-off lands, and for the new plants and flowers given us by the combination of keen mind and skilful hand of the hybridiser. It is good to be alive. We have no use for the "good old days." The more we think the more shall we thank Him who first "planted a garden eastward in Eden," even though the lines may not have fallen unto us all in pleasant places. We all hope for better things, but as "seed time and harvest, summer and winter" have never failed us, and never will, we think of the old year without any trace of bitterness, and of the new one without any suggestion of despair. We will do our duty to our employers, our duty to those we employ, better in 1909 than in 1908. We will not forget the orphan and the widow, or those who have fallen in some wayside garden, or those who are struggling in the waste places, so that when again we come to "Think and Thank," we shall see more of beauty and of sunshine in the garden of our own heart.

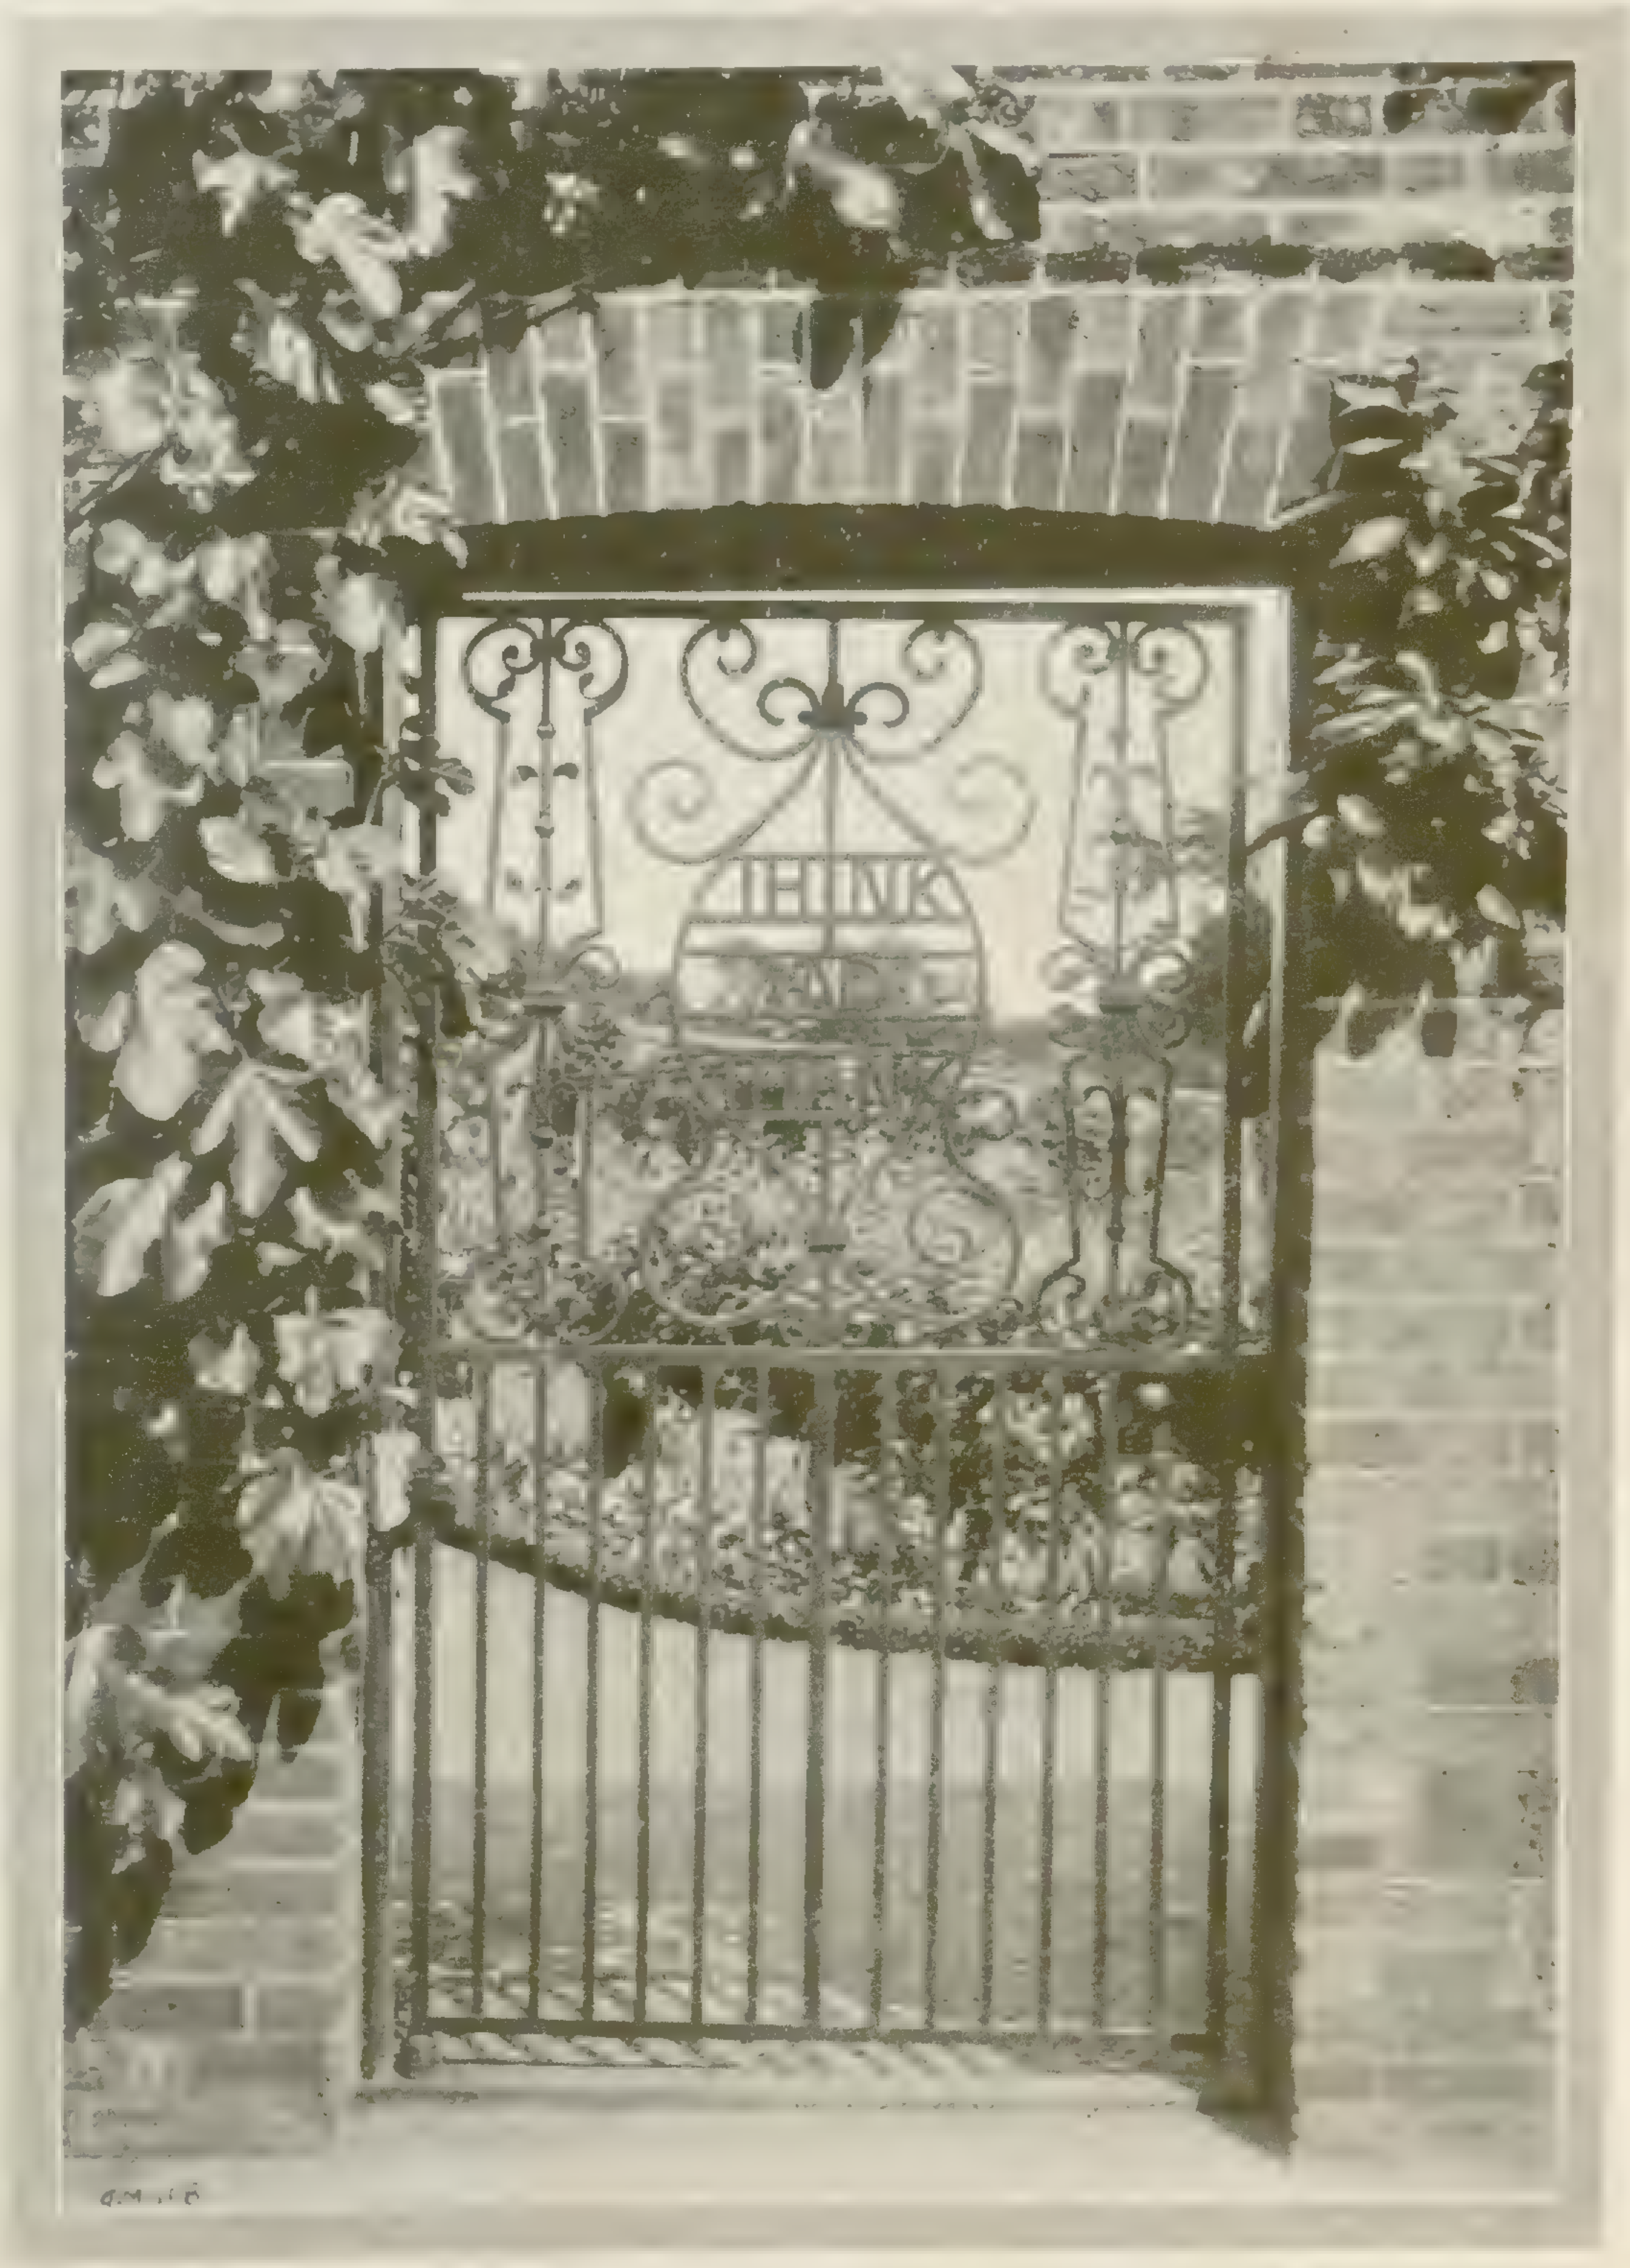
A little homily is this. Perchance it may find a place in the Gardeners' Magazine, and touch responsive chords in the hearts of some readers. It has been suggested by one of the many fine gates, all of distinct character and suggestiveness, at Lord Burnham's home at Hall Barn. This is the "Think and Thank Gate," opening into the kitchen garden.

C. B.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

WINTER - FLOWERING CYPRIPEDIUMS.—This section may now be characterised as the most popular of all orchids, not so much perhaps because of their being among the most tractable of orchids to cultivate, and for their great utility and the lasting qualities of the flowers. What a boon these plants are where there is a great demand for flowers during the months of November and December, and they are becoming equally as valued in private establishments for this purpose as are the more choice and rare varieties in prominent orchid collections. In the neighbourhood of Manchester and other large towns, where the atmospheric conditions are so unfavourable to plant life in general, we find these cypripediums most extensively cultivated, and thriving under the adverse conditions. The numerous varieties and hybrids that have been introduced lately will prove a great acquisition, and as the plants are easily propagated from divisions, they should, in the near future, become generally distributed.



[Photo: H. N. King.

"THINK AND THANK" GATE AT HALL BARN.

AFTER FLOWERING any repotting necessary may be attended to. It is not necessary to annually repot such species as C. insigne, C. Charlesworthi, and C. Spicerianum, or the hybrids, such as C. Leeanum, C. nitens, C. Actæus, etc. I consider they give a far better return of flowers, and blooms of a better quality, when not disturbed too frequently. The pots used should be well and cleanly drained, for the plants especially require an abundance of water during the growing season. The potting compost we use is about equal portions of fibrous peat and turfy loam, with a little chopped sphagnum moss added, and sufficient sand and broken crocks to render the compost porous.

INCREASING THE STOCK.—This is best done by dividing the rhizomes between the growths, and then carefully disentangling the roots, and potting up the portions separately. All back growtns, i.e., those without young leading growths, should be placed in small pots, with plenty of drainage; a stick should be placed in each so as to support the leaves of the old growths, and, to some extent, prevent injury, as soon as the new growth makes an appearance roots usually start from their base, and they may then be again repotted into pots that will afford them ample root room. When dividing plants of this kind I find it a good plan to place all back growths that have been potted up in a warm, moist position, and when the conditions are favourable they may be sprayed overhead. Where placed in a warm house care must be observed to keep them free from insect pests. Thrips especially will be almost sure to find any young growths of this kind, and they prove most difficult to dislodge.—H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

POINSETTIAS.—These are among the brightest subjects we have for decoration at the present time. The only drawback is, they will not stand exposure to the cold, more especially when used as pot plants. This fault may be remedied to some extent by gradually reducing the temperature; they will then stand well if the thermometer does not fall much below 40 degrees. When cut I find they last much better if the ends are dipped in hot water as soon as cut, this preventing bleeding, and sending the sap up to the bracts. I have had them last in good condition under this treatment for several weeks, while, on the other hand, I have seen them droop the same day as cut when the sap has been allowed to run down and sufficient care has not been taken in regard to preparing them for the change.

EPIPHYLLUMS.—I often wonder why these beautiful plants are not more grown. The amount of bloom produced by a healthy plant is remarkable, and the plants are very elegant, though quaint looking when out of flower. It is usual to graft the epiphyllum on the pereskia at various heights, but I consider they are far prettier when grown entirely on their own roots, and allowed to droop naturally about the pots in which they are grown. The idea that all the cactus family live and thrive best on the poorest and most sterile of soils, and with hardly any water, is a mistake, for if healthy plants and healthy roots are there they will stand a fairly liberal supply of moisture, and a compost consisting of good fibrous loam and peat, with plenty of broken charcoal or sandstone to keep it well open. During the period of rest, of course, much less moisture is necessary, and only sufficient should be given to prevent shrivelling.

SOLOMON'S SEAL.—Of all hardy plants this is, I consider, the easiest to force into flower. It responds very quickly indeed if forced in a brisk heat, which, however, has certain drawbacks, inasmuch as the stems then become unduly long. If grown simply for cutting this is not of any great moment, but if wanted for arranging with other plants they should be forced more slowly. The plants will then not only be more dwarf and sturdy, but the flowers will open more slowly, last longer, and give off a very delicate perfume. The latter, which much resembles that of the hawthorn, is much appreciated by many people.

ADIANTUMS IN WINTER.—Those required to give cut fronds, and those to be used for decoration will now need careful management to keep up a regular supply. It is easy enough to keep up a good supply until Christmas, but it is during the first two months of the year that the supply often falls short. To provide against this, some plants should be kept in cool frames during the summer, and then taken into warmth early in the autumn. The plants will then make a fresh start, and make good fronds, which will mature and keep fresh until those that make their spring growth are ready for use. Many of the adiantums will continue, under favourable conditions, to make growth throughout the winter, but most of the cuneatum type are better for a rest. Plants that are likely to be wanted late in spring should be kept cool and moderately dry just now, they will then start away freely if given a little more warmth early in the year. Where the pots are well filled with roots a little liquid manure, or a slight sprinkling of any of the artificial fertilisers, will be beneficial to them at this period.

CHRYSANTHEMUM CUTTINGS.—Rooting cuttings for another year will soon be in full swing. I very much question the mode of procedure pretty generally adopted, I mean putting the cuttings singly into small pots, and afterwards placing them in frames within the greenhouse. This plan has been the cause of a number of failures, especially among amateurs, inasmuch as the little attentions, such as removing damp from the glass regularly, have been neglected, and decay of the cuttings has resulted. At best it is a coddling practice, and often the little plants receive a check when taken from a closed box to inure them to air. A good plan is to prepare a shallow bed of light sandy soil, in a frame or heated pit, where warmth may be obtained if necessary, and dibble the cuttings in about three inches apart. Failures are rare with this treatment, and air may be given to produce short sturdy growth. Sorts late in giving cuttings, or slow rooting ones, may be placed in a warm house, and if removed before the leaves become drawn, will make satisfactory progress afterwards.—T. B. Field, Ashwellthorpe Gardens.

THE FLOWER GARDEN.

GENERAL REMARKS.—The exceptionally open season we have had up to the time of writing has somewhat negatived what would generally be suitable calendarial instructions, once more proving it unwise to strictly adhere to set dates for certain work, and showing the necessity for close observation and a readiness to act according to seasons and circumstances. The exceptional conditions have, however, enabled outside work to be pushed on in a more than usually satisfactory way. Where ground alterations are being done, the temptation may be to complete them too hurriedly lest the weather should change; this must be guarded against or future disappointment will more than outweigh any immediate gain. If flower beds are prepared, then endeavour to obtain two feet or more of good soil; study the texture or formation of the subsoil, and if it be in the least heavy or retentive of water, insure a sufficient number of land drains being put in; these may be from six to nine yards apart, at from two to three feet deep. Drain pipes should be covered with a few inches of furnace clinkers, or other rough porous material, and lightly rammed down before soil is placed on. The herring-bone system of draining is better than drains laid straight longitudinally, the former being more likely to intercept the water. See that proper levels are taken, and adhered to, in all operations, whether for drains or surface levels.

EDGINGS to walks and beds may still be attended to, filling in any vacancies or regulating them where too big or thick; these may consist of box, hypericums, veronicas, euonymous, saxifragas, thrift, scrub oak, beech, etc. Straggling or untidy edging greatly detracts from the good appearance of the grounds. Any leaf raking not yet completed should be finished as soon as possible.

PERGOLAS must be attended to; carefully inspect them, and where timber has been used for construction any that is decaying and unsafe for another season should be removed. Peeled oak is much better than larch. Repairs can be done better now, while the climbers are dormant, than when growth is starting. Where at all possible the supports, below ground at least, should be non-perishable, either of stone or brick; indeed, the whole pier is best of these materials; the initial outlay is more, but the future saving more than compensates for it, and there is not the frequent damage to climbers through repairs or decaying supports. If wooden supports are used they should be dowelled into stone or brick above the ground level, and if a piece of sheet lead is used between the wood and stone it will prevent moisture getting into the stone, which, in frosty weather, might cause cracks. It is pitiable to see the number of pergolas recently built of timber that at the longest can only last a few years, when the whole structure will have to be rebuilt, and probably a large number of its occupants killed, or at the least very badly damaged. The autumn seeding of some of the clematis has been very pleasing, and the autumn tints of foliage were good in favourable localities, though it is one of the pleasures denied us here, as most of the vitis are rather too vigorous and rampant growers for pergolas (except the largest-built ones), and are best given a space to themselves on some building or trellis work with plenty of room to spread. If viewed across a sheet of water when in their autumn glory the effect is specially pleasing.

CARNATION BEDS.—Watch these to see whether slugs or birds are injuring the plants. Guard against trampling on the beds more than necessary, but see that none of the plants are loose in the ground. Where carnations are in pots in frames, preparatory for planting in spring, keep them as cool as possible, admitting an abundance of air whenever the weather is at all suitable, and guard against a too liberal application of water.—E. F. Hazelton, Knowsley Gardens, Prescot.

FRUITS UNDER GLASS.

LATE VINERIES.—Any vines that look sickly, and have not given good returns, should be well examined at the roots, where generally the cause of trouble may be found. It is difficult to overhaul the roots of a particular vine in the centre of a house, and if very unsatisfactory it should be removed altogether, and a young rod run up from the nearest vine to fill the place. Late Muscats do not require much root room, and should have their roots inside; neither should the border be too deep. The bottom should be concrete, and then good drainage, with a depth of from two to three feet of soil, consisting of good turfy loam and plenty of lime or mortar rubble, horn shavings, and half-inch bones; manures can always be added when the vines need it.

MADRESFIELD COURT should also have its roots inside. The house should command plenty of fire heat and ample ventilation. This grape is best trained on the extension system, as it generally grows strongly, and the extra wood allowed keeps the berries, in some degree, from cracking; stopping should be carefully done, and a few laterals be left to grow on the growth on which the bunch is formed, as these keep the sap flowing. Watering is another important matter; when the berries start to colour, water, as a rule, is withheld; certainly the vines do not require so much after this stage, but they should not be allowed to get too dry, as when the next watering is given a rush of sap takes place, and crack go the berries. A little artificial manure given at intervals is better than a lot of farmyard liquid manure for this variety, as it tends to make a lot of gross wood. Plants are best removed from the house when colouring commences, as they continue to throw off a certain amount of damp during the day. Air should be left on always to get the skins as tough as possible, and on a bright morning, if the berries are liable to crack, the house should not be damped down.

GROS COLMAR very often fails to colour. This generally gets planted in an out-of-the-way corner, and is not given a proper chance, and yet it is one of the best grapes at Christmas, and after. When the berries start to colour the leaves should be tied back to allow all the sun and light possible to reach the bunch. Lady Hutt does well on the extension system, being a gross grower; this variety likes plenty of fire heat, and free ventilation without draughts, or else it becomes spotted. The berries require plenty of room to develop, and should be thinned freely. Appley Towers is a good late grape, and, being a strong grower, requires plenty of room; it colours and keeps well.

CUCUMBERS.—A few seeds may be sown in small pots for early plants. In a brisk heat they will soon germinate, and should be then placed up to the light, but away from draughts.

LATE PEACH HOUSES.—By the end of the month these trees should all be pruned, cleaned, and tied, and the borders top-dressed ready for starting. If left until later the work is often unsatisfactorily done, especially the cleaning part. Any fresh planting to be done should be taken in hand and finished at once, as the buds soon commence to swell in the new year; the newly-planted trees should be allowed to settle before they are tied in.—A. B. Wadds, Paddockhurst Gardens.

NEW JAPANESE CHRYSANTHEMUMS.

Continuing my list published in the Gardeners' Magazine of November 14, the following are noteworthy additions in the Japanese section:

Helena Williams (Williams), is a true sport from Madame Oberthur, and therefore identical in form. The colour is most pleasing, pure yellow, with a central suffusion of chrome, which passes away with age and development; quite a charming variety.

Miss Maud Jefferies, although not quite new, is worthy of attention, as we have not too many varieties of this type and colour. It has incurving florets, white with a flush of pink; an Australian variety.

Melchet Beauty has been seen several times in good condition during the present season. The flower is well built up in the centre, and the broad florets are semi-drooping. Colour, yellow, richly overlaid with crimson.

Rose Pockett has narrow, slightly twisted florets, cream coloured at the base, with a suffusion of rose and amber. As might be expected from its name, it is an Australian variety.

Lady E. Letchworth, yellow, with drooping florets that curl slightly at the tip.

Splendour was one of Mr. Silsbury's last year's novelties, and is quite one of the best of incurving Japanese varieties we have, especially for those who approve of the type, yet do not desire them too tightly incurved. The florets are broad, with an amber-bronze reverse. The inside colour is dull red, but little of this is seen in good blooms.

Mary Donellan, although not quite new, is deserving of mention for the information of those who prefer the incurving type of flower. The broad florets are rich orange-yellow.

W. Mease was raised by Mr. Pockett in Australia; in the form of its petal it reminds one of Etoile de Lyon, but it is more refined than that variety. It is a fully-built flower of much substance. Colour, rose-lilac. I do not think it is really worthy of the name it bears.

C. H. Totty is red-chestnut in colour, very effective as a decorative variety, but not large enough for present-day exhibitors.

John Peed has taken a long time to come to the front, but this season many really good blooms have been seen. In colour it is attractive, white, lined and edged with purple. The florets are perhaps a trifle short, but they are numerous, making up a full bloom.

Mdlle. J. de la Crouee is a pretty shade of salmon-pink, and for those who prefer narrow florets it is desirable.

Mary Mason is distinct, terra-cotta, with a shading of rose; some may describe it as rosy-red. The petals fall as in J. H. Silsbury, with the tip curling upwards.

Mrs. A. S. Bott has loosely incurving, broad, amber-coloured florets.

Swanmore Park. E. Molyneux.

Prohibition of Importation of Gooseberry Bushes.—The Board of Agriculture and Fisheries have made an Order entitled the American Gooseberry Mildew (Prohibition of Importation of Bushes) Amendment Order of 1908, which provides that the provisions of the American Gooseberry Mildew (Prohibition of Importation of Bushes) Order of 1907 shall not extend or apply to bushes brought to Great Britain from the Channel Islands. The Order came into operation on November 16, 1908.

NEW BOOKS.

◆

THE HEREDITY OF ACQUIRED CHARACTERS IN PLANTS.

By Rev. G. Henslow, M.A., F.L.S. (John Murray, Albemarle Street, W.) Price 6s.

The object, we are told, of this book is to prove that evolution, so far as plants are concerned, depends upon the inheritance of acquired characters. This was Darwin's contention; but Dr. Weismann and his followers assert that no such characters can ever be hereditary unless the influence of the environment can reach and affect the reproductive organs or his hypothetical substance germ-plasm. Mr. Henslow contends, on the other hand, that, as all the characters of the vegetative system which are regarded as specific are acquired long before any vegetative cell has begun to assume a reproductive character, Dr. Weismann's proviso is inapplicable to plants. Ecologists of the present day, who study plants growing under natural conditions, agree in accepting the fact that evolution in plants is the result, not only of a natural response to the direct action of changed conditions of life by means of which they evolve new structures in adaptation to their new environments, but that the acquired characters can become hereditary.

It does not seem to be generally known, as the author points out, that Darwin supplemented his theory of the "Origin of Species by means of Natural Selection" by another interpretation of the methods of evolution. The first indication of the alternative is found in the preface to the first edition of the last-named work. Therein he expresses the opinion that "Natural selection is the main, but not exclusive, means of modification," and in an early part of the same book he observes "Some slight amount of change may be attributed to the direct action of the conditions of life." Subsequently, Darwin wrote, "The direct action of changed conditions leads to definite or indefinite results," and he proceeds, "by the term definite action I mean an action of such a nature that when many individuals of the same variety are exposed during several generations to any change in their physical conditions of life, all, or nearly all, the individuals are modified in the same manner. A new sub-variety would then be produced without the aid of selection."

In the first chapter of the book now before us, the author discloses the singular fact that present day Darwinians contradict Darwin in several ways. They assert that varieties are spontaneous and congenital, appearing in the seedlings of plants and young of animals, then by means of natural selection the "unfit" are supposed to be eliminated, and the "fittest" to survive. That, in fact, the influence of the environment may affect the vegetative organs of plants, but that anything so acquired cannot affect the reproductive germ cells, and therefore cannot be hereditary. "Darwin himself," states the author, "maintained that such variations, on the contrary, are hereditary"; and proceeding, he submits that, although no germ or sperm cells are in existence in plants when the environment acts upon their stems, roots, or leaves, the effects are hereditary. Mr. Henslow has long been engaged in studying plants with a view to determine how far observation would support Darwinism, but he states that he has not succeeded in finding a case in Nature in support of it. Individual differences or variations were found everywhere, but he soon saw that these were not the materials of evolution. On the other hand, proofs accumulated on every side of Darwin's definite variations, now called adaptations. These proofs have been freely used by Mr. Henslow in support of his views on the "true" as opposed to the "new" Darwinism, and his views, it may be added, are now held by the leading plant ecologists, or botanists, who study plants growing wild under various physical conditions, throughout Europe.

Appreciating the importance of it being very clearly understood what Darwin's views really were with regard to the heredity of acquired characters in plants, and how far they are supported by investigations, carefully conducted on well-defined lines, we strongly recommend this book to those who are interested in this important question. It is well known that Mr. Henslow has but few equals in his powers of observation, his interpretation of facts, and in recording the results of his observations, and we need not refer to them. But it is necessary we should say that, in the preparation of this important work, he has surpassed himself, and presented so clear a view of the "True Darwinism" as to render the book essential to all who are interested in the subject with which it deals.

IN MY LADY'S GARDEN.

By Mrs. Richmond. (T. Fisher Unwin, Adelphi Terrace, London, W.C.) Price, 12s. 6d. net.

For some years Mrs. Richmond occupied the position of garden editor of the "Queen," and during that period contributed a large number of highly interesting essays on gardens and garden management. From these she has made a selection of forty-eight of the most important, and has so arranged them as to form a connected history of the garden and its work for the year. Arranged in proper sequence, they serve as reminders as the procession of weeks pass, and while giving much information relating to the flowering of the various plants, to their distinctive characteristics, and the several places in the garden for which they are best suited, are of much value as a guide to the details requiring attention during the twelve months. Mrs. Richmond gives in her book, as, indeed, she had done in the pages of the "Queen," unquestionable evidence of a thorough acquaintance with a wide range of plants, and with the conditions under which they can be grown to the highest degree of perfection. She also again reminds us of the faculty she possesses in so marked a degree of presenting technicalities to her readers in a pleasant and interesting manner. The book will consequently be most acceptable to those who prefer in their search for information on gardening matters, brightly written essays to technical treatises, provided, of course, they are, as in this case, based on practical knowledge.

The book is admirably produced, and contains two charming illustrations in colour from drawings by Miss Beatrice Parsons, and forty-eight page illustrations in black and white.

COLOUR IN THE FLOWER GARDEN.

By Gertrude Jekyll. ("Country Life," Lim., 20, Tavistock Street, Covent Garden, W.C.) Price, 12s. 6d.

Miss Jekyll has written many good books on gardening and other matters, and if, in expressing our appreciation of the merits of the work now before us, we refrain from saying that it is the best of the series, we shall be compelled to say that it should have a high position among the best of her literary efforts. The scope and object of the book are admirably stated in the introduction, and in the opening thereto Miss Jekyll submits the proposition that, to plant and maintain a flower border with a good scheme for colour is by no means the easy thing that is commonly supposed; and then expresses her belief that the only way in which it can be made successful is to devote certain borders to certain times of the year; each border or garden region to be bright from one to three months. Nothing, the authoress states, seems to her more unsatisfactory than the border that in spring shows a few patches of flowering bulbs in ground otherwise looking empty, or with tufts of herbaceous plants coming through. Then, she observes, the bulbs die down, and the space they have occupied is wanted for something that comes into bloom later. Either the border will then show bare patches, or the positions of the bulbs will be forgotten, and the bulbs be probably injured by trowel or fork when the spaces are planted.

For some years Miss Jekyll has been working at these problems, and, having arrived at certain conclusions, she states them at some length, and in her usual and pleasant manner. She tells us that she is strongly of the opinion that the possession of a quantity of plants, however good they may be in themselves, and however ample their number, does not make a garden. Having obtained the plants, they should be arranged with care, and on well-defined lines. The object should be to so use the plants that they will form beautiful pictures, and that, while charming the eye, they stimulate those responsible for the garden to still further endeavour. With reference to the manner in which the plants should be arranged to produce a series of tasteful effects, Miss Jekyll says, "It is just the way in which it is done that makes the whole of the difference between commonplace gardening and gardening that may rightly claim to rank as a fine art. Given the same space of ground and the same material, they may either be fashioned into a dream of beauty, a place of perfect rest and refreshment of mind and body—a series of soul-satisfying pictures—a treasure of well-set jewels; or they may be so misused that everything is jarring and displeasing. To learn how to perceive the difference and how to do right is to apprehend gardening as a fine art. In practice it is to place every plant or group of plants with such thoughtful care and definite intention that they shall form a harmonious whole, and that successive portions, or in some cases even single details, shall show a series of pictures." With these views, all who have devoted much attention to flower arrangements in the garden will readily agree.

Having read and enjoyed the introduction, it would be of much interest to pass under review the seventeen chapters into which the work is divided, and make reference to the strong and the weak points in each. The space available will not admit of this being done, and we must, perforce, be content in stating that in them Miss Jekyll shows how colour effects of the most delightful character may be had in succession from quite early in the spring until the autumn is well advanced, and that much may be done by judicious planting in imparting a glow of colour to the garden during the winter months. The book is illustrated by considerably over 100 photographic illustrations, and they are of so high an order of merit as to add materially to its value.

LITTLE GARDENS.

By H. H. Thomas. (Cassell and Co., Lim., London, E.C.) Price, 1s. 6d.

"Little Gardens" is at once concise, clear, and instructive, and those amateurs, for whom, by the way, it is specially written, who take it for their guide in forming and managing their gardens, and act upon the advice given in its pages, will have good cause for satisfaction. The making of the garden has two chapters devoted to it, and the selection and cultivation of the plants, fruits, and vegetables adapted to gardens of limited dimensions are described with sufficient fullness to enable one to readily understand the admirable advice given.

ELEMENTARY BOTANY.

By M. A. Liversidge. (Blackie and Son, Lim., 50, Old Bailey, E.C.) Price, 1s. 6d.

This book has been written with special reference to the requirements of the middle and lower forms of secondary schools, and it possesses the advantage of being inexpensive and having its subject matter presented in as simple a manner as possible. The book is divided into four parts, and in the first the seed and its germination and the general morphology of the plant are dealt with; the simple structure of the plant occupies the second; the physiology of the plant taken experimentally the third, and the fourth part is devoted to the classification, and a brief description of some of the more important natural orders. Miss Liversidge has done her work remarkably well, and the text is elucidated with excellent illustrations.

TWO LEGS AND OTHER STORIES.

By Carl Ewald. (Methuen and Co., 36, Essex Street, W.C.)

A series of charming stories translated from the Danish that will strongly appeal to young people, and especially to those who take an interest in the various aspects of natural history. Not a few of those who are of mature years will find much to interest and amuse them in this delightful book, and be glad to turn to its pages now that the garden does not make such strong claims upon them.

APPLE SALES.

I can assure our worthy friend "E. M." that I never set out, on page 793, to enumerate all the causes why apples sell badly, because I do not profess to be acquainted with them all, and even if I had so much knowledge a whole issue of the GARDENERS' MAGAZINE would be needed to set them forth. I simply mentioned a few of the causes why apples sell badly, and I do not see anything in "E. M.'s" criticism on page 935 which proves me to be in the wrong. Your correspondent states that the real cause of low prices at the end of September is due to overstocked markets, and in the next sentence he goes on to make excuses for the people who sell late-keeping apples, like Bramley's Seedling, at the above season. Could anything be more inconsistent? If markets are really overstocked at the end of September surely the selling of late varieties at that period contributes to the overstocking, and the whole thing proves that when a man plants late apples for market it is part of the business to provide some means of storage.

I have been talking to a man to-day, December 16, who informed me that within the last week he has sold his Bramleys at 18s. a cwt. Would he have done anything like so well if he had rushed them into the market at the end of September? I may say that the apples referred to were sold by auction in a fruit market. Does "E. M." contend that there are more apples produced in this country at the end of September than can be consumed, and markets are consequently overstocked? If so, then planting had better stop, but I am disposed to think that it is the system, or perhaps want of system, in distribution that is at fault, because at the time when the Kentish grower referred to by "E. M." was selling his Worcester Pearmains in first-class order at 3s. 6d. the man in the street who was attracted by the appearance of this bright-looking apple, and was tempted to invest in a few pounds of them, paid a price for the fruit that would have recompensed the grower, and allowed a good profit for the middleman, had a fair proportion of the money gone into the pocket of the producer. H.

Home-grown Perennials for Forcing.—A cheap floral display can easily be secured in the greenhouse during spring by potting up home-grown roots and clumps of herbaceous, and, in some instances, shrubby perennials. Dielytra spectabilis, Solomon's seal, herbaceous spiræas and astilbes, and, among shrubs, azaleas, spiræas, deutzias, philadelphus, prunus, etc., may be cited as examples. Unlike plants which have been grown for a season in pots, and consequently well established, these will only stand a low temperature; to attempt "forcing," as generally understood, is simply to court failure. Given a gentle bottom heat to stimulate activity in the roots first, and then every hope may be entertained of the flower buds or flowering growths following in due course.—THOMAS SMITH, Walmsgate Gardens.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

Royal Horticultural Society.

There was a comparatively small show on Tuesday, December 22, but orchids, fruits, and shrubs were all well shown. The attendance was moderate.

FLORAL COMMITTEE.

Messrs. Jas. Veitch and Sons, Chelsea, showed largely and well on this occasion, putting up a large bank of their brilliant and useful winter-flowering begonias, together with batches of Crowea latifolia major, the yellow Calliopsis Granti, the curious marbled-leaved Acanthus montanus (F.C.C.), and Javanico-jasminiflorum rhododendron hybrids, but the begonias were the great feature of this exhibit. All along the side of the hall the Chelsea firm arranged a wonderfully fine display of evergreen hardy trees and shrubs, putting up euonymus, oleas, yuccas, laurels, hollies in great variety, ivies in variety, privets, euryas, laurestinus, ligustrums, aucubas, Berberis Knighti, arbutus, magnolias, Skimmia japonica rosea, Cotoneaster humifera, veronicas, cratægus, viburnums, etc., etc., the whole making up a vastly interesting collection, and one of great educational value. A hardy evergreen named Sarcococca ruscifolia gained an A.M.

A very brilliant display was made by Messrs. H. Cannell and Sons, Swanley, with zonal pelargoniums, shown as only this firm can show them, and a grand lot of well-grown Begonia Gloire de Lorraine, B. Mrs. Leopold de Rothschild, B. The King, B. Agatha compacta, and B. Turnford Hall. Messrs. Hugh Low and Co. brought up a display of perpetual-flowering carnations, the flowers being large and bright; and a collection of acacias, heaths, epacrises, and daphnes.

Messrs. H. B. May and Sons, Edmonton, showed a group of the newer ferns, the various plumose nephrolepises figuring largely; there were also examples of an excellent strain of Primula obconica. Messrs. W. Cutbush and Son, Highgate, set up a handsome lot of the beautiful perpetual-flowering carnations, the flowers being very bright and attractive, and giving quite a summer-like appearance to the show; Lady Miller, a pink cross between a Malmaison and a perpetual variety, appears to be a good new thing. The Highgate firm also sent a very big lot of Otaheite oranges, full of fruits, and very effective, as well as batches of daphnes, skimmias, pernettyas, etc. Messrs. Paul and Son, Cheshunt, exhibited a few plants of the white starry-flowered Montanoa bipinnatifida, and some standards of Calceolaria Burbidgei.

Mr. W. Pingo Horton, Cravenhurst Lodge, Seaford, Sussex, exhibited a miscellaneous collection of begonias, cypripediums, primulas, etc., but the quality of the plants was distinctly poor.

ORCHID COMMITTEE.

Messrs. Hugh Low and Co., Bush Hill Park, Enfield, submitted a small group of cypripediums, the best being C. Minos Youngi and C. Helen II. Messrs. Jas. Veitch and Sons, Chelsea, showed Cypripedium Thalia splendens, and the fine C. Elatior (A.M.), the latter a striking and beautiful hybrid from C. Leeanum and C. Baron Schroder. Mr. H. T. Pitt, Rosslyn, Stamford Hill, showed the large-bloomed C. Felicity. The very beautiful white Cœlogyne Mooreana, with two spikes and fifteen charming flowers, was shown by Mr. H. G. Alexander, orchid grower to Lieut.-Colonel Holford, Westonbirt, Tetbury, Gloucester, who also brought up Cypripedium Antinous (F.C.C.), a handsome cross between C. J. Howes and C. Actæus; and Oncidium Forbesi Westonbirt var. Messrs. Armstrong and Brown, Tunbridge Wells, showed a fine Cypripedium Minos Youngi and C. Helen II. Armstrongæ.

Some beautiful calanthes, notably C. Bryan with three beautiful spikes, C. Angela (F.C.C.) with vivid ruby crimson flowers (C. Burfordiense x C. Chapmani), C. Gildeni with rose blooms, and C. Norman (A.M.), a bright, large flowered rosy crimson variety of great beauty; and a grand plant of Cypripedium Leeanum Clinkaberryanum, with fifteen splendid blooms. Messrs. J. Cypher and Sons, Cheltenham, exhibited a group of cypripediums that included Leeanum and insigne varieties of great beauty, and half a dozen plants of the beautiful Cattleya Maggie Raphael alba. Messrs. Sander and Sons, St. Albans, contributed a bright group of orchids, and among the many good things in it we made note of Cypripedium Leeanum Clinkaberryanum, C. Olga Bagshawe, C. Eurvades, Lælia autumnalis alba, L. anceps Schroderæ, and an exquisitely beautiful odontoglossum of fine form and rich red brown markings, named O. Magali Sander (F.C.C.).

Messrs. Charlesworth and Co., Haywards Heath, Sussex, contributed a delightful group of orchids, giving evidence of the variety available at this season of the year. They had Lælio-cattleya Charlesworthi, L.-c. Charlesworthi princeps, Vanda Watsoni, V. lamellata Boxalli, Lælia autumnalis, and L. anceps, Phaio-calanthe Colmani, Miltonia Bleuana, the rare Phaius amboinense, Trichopilea suavis, Gongora quinquinervis, Odontoglossum Phœbe magnificum, O. crispum xanthotes Snow Queen, O. Harryano-crispum, and O. Harryano-triumphans, etc. Messrs. J. and A. McBean, Cooksbridge, Sussex, had a beautiful lot of varieties of Odontoglossum crispum, Lælia anceps, and L. autumnalis, and a great variety of cypripediums of the Leeanum and insigne varieties. Mr. T. Menteith Ogilvie, The Shrubbery, Oxford, showed a large number of varieties of the useful Lycaste Skinneri, and a plant of L. Balliæ, together with several forms of Cypripedium insigne. Mr. Mertens, Mont St. Amand, Ghent, showed a few very beautiful hybrid odontoglossums.

FRUIT AND VEGETABLE COMMITTEE.

Messrs. Jas. Veitch and Sons, Chelsea, contributed a hundred and fifty distinct varieties of apples, all in a fine state of preservation, and showing how, with reasonable facilities, fruit can be kept to Christmas time. A few of the finer varieties were White Calville, Cox's Orange Pippin, Barnack Beauty, The Queen, Belle de Pontoise, Bismarck, Lane's Prince Albert, Blenheim Pippin, Newton Wonder, Bramley's Seedling, Bow Hill Pippin, Reinette du Canada, Sandringham, Alfriston, Lord Derby, King of Tomkins County, Beauty of Kent, and Twenty Ounce.

Messrs. H. Cannell and Sons, Swanley, exhibited a collection of one hundred and fifty varieties of apples, grown at their Eynsford Nursery; there were excellent dishes of New Hawthornden, Beauty of Kent, Emperor Alexander, Cox's Orange Pippin, Sanspareil, Norfolk Beauty, Gloria Mundi, and Smart's Prince Arthur. Messrs. Hugh Low and Co. staged a small collection of well-preserved apples. Mr. Chas. Ross, Welford Park Gardens, showed his fine new apple named Encore.

CERTIFICATES AND AWARDS.

First-class Certificate.—To Acanthus montanus, from Messrs. Jas. Veitch and Sons, Chelsea; Cypripedium Antinous, from Mr. H. G. Alexander, orchid grower to Lieut.-Colonel Holford, Westonbirt; Odontoglossum Majali Sander, from Messrs. Sander and Sons, St. Albans; Calanthe Angela, from Mr. H. J. Chapman, gardener to Norman C. Cookson, Esq., Oakwood, Wylam-on-Tyne.

Award of Merit.—To Sarcococca ruscifolia, from Messrs. Jas. Veitch and Sons, Chelsea; Calanthe Norman, from N. C. Cookson, Esq.; Cypripedium Elatior, from Messrs. Jas. Veitch and Sons, Chelsea.

MEDALS.

Gold.—Messrs. Jas. Veitch and Sons, Chelsea, one for fruit and one for shrubs.

Silver-gilt Flora.—Messrs. W. Cutbush and Son, Highgate.

Silver-gilt Banksian. Messrs. H. Cannell and Sons, Swanley.

Silver Flora.—Mr. F. M. Ogilvie, Oxford; Messrs. Charlesworth and Co., Haywards Heath; Messrs. J. and A. McBean, Cooksbridge; Messrs. Sander and Sons, St. Albans.

Silver Knightian.—Messrs. H. Cannell and Sons.

Silver Banksian.—Messrs. J. Cypher and Sons, Cheltenham; Messrs. H. B. May and Sons, Edmonton; Messrs. H. Low and Co., for fruits.

Bronze Banksian.—Messrs. Hugh Low and Co., Bush Hill Park, Enfield.

Birmingham Gardeners' Association.

The ever-welcome "Question Night" was held on December 10, with Mr. A. D. Christie, Rockingham House Gardens, Edgbaston, presiding, and the members present were kept interested by the variety of questions found in the question box by the chairman. The artificial fertilisation of the flowers of the grape vine gave rise to an animated discussion, as also did the degree of temperature necessary for that of Muscat of Alexandria, especially during the night-time. One expert recommended from 60 to 65 degrees, while another had proved 55 degrees sufficient, and hence economising fuel, also had secured a most successful setting of the Black Hamburgh and other black varieties without any artificial heat whatever. The perfect development of the foliage and fruit was also obtained under the same cool treatment for several years in succession; neither red spider, thrips, mealy bug, or mildew had ever infested the vines, consequently there had been no need to resort to the annual doctoring so generally recognised by growers.

Among the other numerous questions asked was that regarding the paving of inside vine borders with bricks or large stones, to lessen evaporation of moisture, and to induce the production of root action towards the surface of the border. The culture of Trachelium cæruleum, Calanthe vestita, Begonia Gloire de Lorraine, the comparative merits of polypodium and osmunda rhizomatous fibre for the drainage of orchids. The comparatively new and elegant Polygonum Baldschuanicum was pronounced to be one of the most beautiful hardy climbers extant, and the osmunda fibre was described as favourable to the production of fungoid growth. Several other minor questions were put, and discussed, and the meeting concluded with a nomination of officers and members of committee for 1909.

Reading and District Gardeners' Association.

The regular fortnightly meeting of the above association took place in the Abbey Hall on Monday, December 14, when, although the weather was most unfavourable, the chairman (Mr. T. Tunbridge) presided over a good attendance of members.

The lecturer for the evening was Mr. G. Stanton, Park Place, Henley-on-Thames, and he opened his subject, "Winter Reminders of Summer Beauty," by mentioning that it had for many years past been his hobby to reserve as much as possible from the beauty of summer for enjoyment in winter, when scarcity of flowers rendered dried specimens valuable, and brought back happy memories of sunshine and floral splendour.

He had experimented widely with flowers which were not usually thought to be everlasting, such as London pride and solidago, and was satisfied with the results. The best time to cut blooms for drying was before they were fully opened, choosing a warm, dry day. All foliage should be removed, and the flowers hung upside down, where they could remain until quite dry. Grasses, however, are best dried in an upright position, as they then retain their natural grace.

Mr. Stanton, to illustrate his lecture, exhibited about sixty vases containing specimen bunches of dried flowers, grasses, etc., and in the course of his remarks, when dealing with the different subjects, he showed that Statice Suworowi, ammobium, and catananche were special favourites with him. Grasses, flowers, etc., wild and cultivated, were all requisitioned, the most prominent being teasel, winter cherry, spindle berries, honesty, Silene inflata, gypsophila, and globe thistle, while among the smaller subjects the beautiful blue Eryngium planum and rhodanthe were mentioned as worthy of special note. Grasses having a softening effect were freely interspersed among the other vases, and they represented all the most graceful varieties, including feather grass, hair grass, love grass, squirrel's-tail, harestail, wood melic, cloud grass, yellow oat, and bulrush.

A good discussion followed the lecture, those taking part including Messrs. Tunbridge (chairman), Hinton, Foster, L. Castle (hon. secretary), W. Townsend, Lees, Alexander, Bailey, Burfitt, Wilson, Wynn, Pope, Carter, E. J. Dore, Herridge, Woolford, and D. Dore.

A very beautiful group of primulas, in variety, with a fine specimen of Nephrolepis exaltata, was exhibited by Mr. F. Townsend, gardener to the vice-president, L. G. Sutton, Esq., and Mr. E. S. Pigg staged a number of lettuces, Sutton's Champion Brown Cos, grown without protection, taken from a plantation from which he had lately been cutting about sixty per week.

Hearty votes of thanks to the lecturer and to the exhibitors concluded the meeting.

Royal Botanic Society.

DECEMBER 17.

Mr. Pembroke Stephens, K.C., presided over a meeting of the society held on the 17th inst., when Mr. George Gordon, V.M.H., gave a lecture on trees and shrubs remarkable for the beauty of their flowers, and specially adapted for the creation of distinct and attractive features in the gardens. The lecture was illustrated with about seventy lantern slides, chiefly from photographs taken by himself in various parts of the United Kingdom, and of special interest as representing finely developed specimens of the respective kinds, and the positions in gardens where they appear to the best advantage. A vote of thanks was accorded Mr. Gordon at the close of the lecture.

Pangbourne Gardeners' Association.

At the last fortnightly meeting there was an excellent attendance, when Mr. J. A. Hall, The Gardens, Shiplake Court, Henley-on-Thames, read a paper on "Violas and Pansies." Mr. W. Clark occupied the chair. At the commencement Mr. Hall said there was no doubt that these flowers did better under the cooler conditions prevailing in Scotland and the North of England than in the southern parts of the country; but yet he thought, by a little attention to shading and watering, they might be grown better than they sometimes are. After tracing the history of both kinds of flowers, the lecturer enumerated the best varieties of each, the various uses to which they could be put, best positions for growing them successfully, methods of propagation, etc.

A good discussion followed, in which many of the members present joined, after which a hearty vote of thanks was accorded Mr. Hall for his interesting paper. During the evening the library in connection with the association was opened.

Beckenham Horticultural Society.

The subject before the above society on Friday, the 11th inst., was a written lecture on "Gregor Johann Mendel," by the Rev. W. Wilks, M.A., secretary of the R.H.S. The Rev. G. O. F. Griffiths, vice-president, very kindly undertook the reading of the paper, and a very instructive evening resulted, and a hearty vote of thanks was accorded Mr. Griffiths.

United Horticultural Benefit and Provident Society.

The monthly committee meeting of this society was held at the Royal Horticultural Hall, Vincent Square, Westminster, on Monday evening, December 14, Mr. Charles H. Curtis in the chair. Four new members were elected, making a total of seventy-five for the year. The death of a member who joined the society only four years ago was reported. He had paid £5 to the benefit fund, and he received £31 sick pay, and the balance due to his nominee was £2 6s. 1d. The committee is doing its best to secure the election of two children of deceased members to the benefits of the Royal Gardeners' Orphan Fund. Any votes sent to Mr. W. Collins, 9, Martindale Road, Balham, would be thankfully received and acknowledged, and used for this purpose.

Hellebores (Christmas roses).—Where these are allowed to flower outside in their permanent quarters, protection should be afforded them to prevent the flowers being soiled or damaged; if the bed is large enough a cold frame may be placed over them, and ventilation carefully attended to; if they are in single clumps handlights or cloches may be used; and, failing these, if any old disused lights are procurable, a number of stakes may be driven in the ground with a narrow rail nailed on top, on which the lights may be laid. A few dry leaves around the plants will then be beneficial. If plants are to be lifted for forcing, but very very slight warmth must be given, a temperature of about 45 degrees being sufficient. — E. F. Hazelton.

Gerbera Notes.—Referring to the article by Mr. P. S. Hayward, on p. 891, it may be interesting to record that, at the recent Paris Autumn Show there was a very dainty group of Gerberas Jamesoni staged by M. Adnet, of Cap d'Antibes. This gentleman has raised a large number of hybrids, and of these, six were awarded certificates by the Floral Committee. They were M. Irwin Lynch, violet-rose; Pres. Gravereau, straw-yellow; M. S. Mottet, orange-yellow; Mlle. Ruan, pure white; Mme. Ph. de Vilmorin, salmon-rose; Mme. Bosch, orange-rose. The group occupied a corner in one of the large greenhouses, and excited no little interest on the part of several of our Parisian friends.—C. H. P.

Ready Next Week—January 2.

THE
NEW YEAR NUMBER
OF THE
GARDENERS' MAGAZINE.

The special features will include:—

GARDENS AROUND TUNBRIDGE WELLS, Illustrated and Described.
A RARE OLD FLORIST'S FLOWER.
GREENHOUSE ANNUALS.
STEWING AND BAKING PEARS.
GOLDEN-LEAVED TREES.
A FAMOUS GARDENING VILLAGE.
LATE SINGLE CHRYSANTHEMUMS.
GARDEN ROOT CROPS.
POPULARITY OF FIGS.
FROST AND DEW.

Also a Double-page
ALMANACK FOR 1909,
WITH AN ILLUSTRATION IN COLOURS OF A GOLD MEDAL ROSE.

Price TWOPENCE, by post 2½d.

¶ This Number, which will be a very attractive one, will have a large additional circulation, and will therefore be of great importance to Advertisers.

Announcements for this issue should reach the Publishers by Tuesday, December 29.

Offices: 148 and 149, Aldersgate Street, London.

ANSWERS TO CORRESPONDENTS.

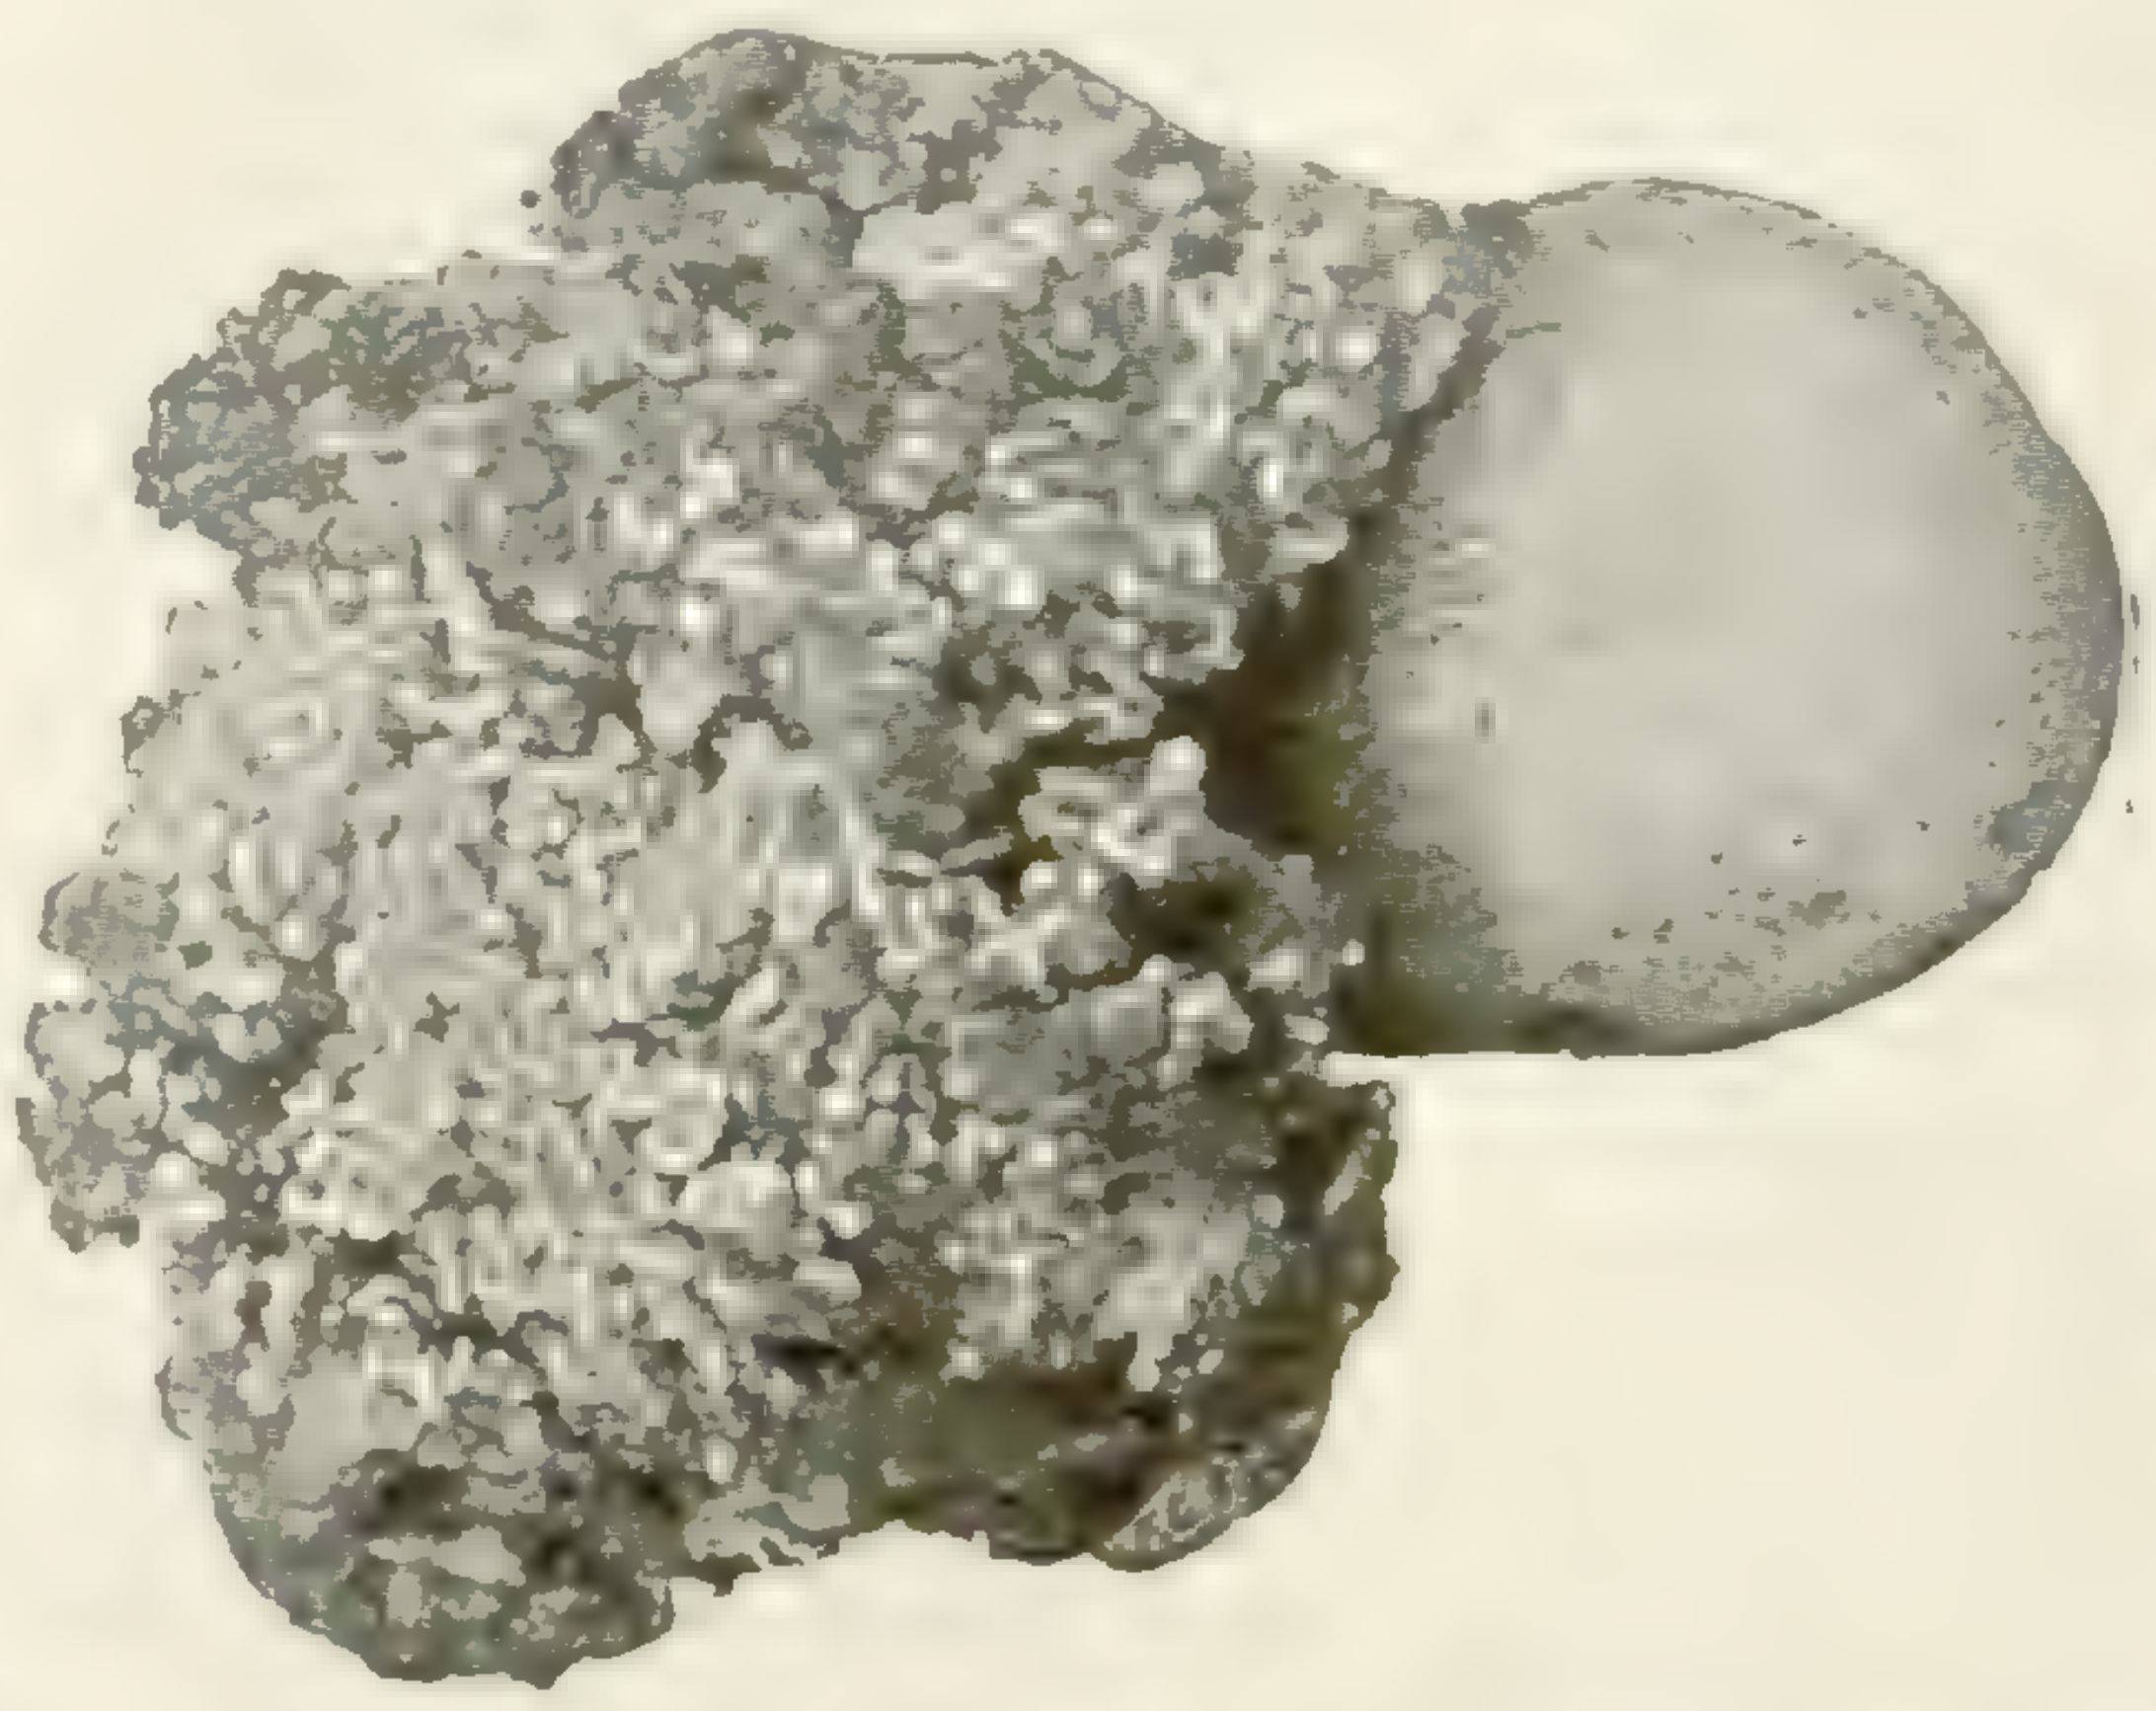
Editorial Communications should be addressed to the **Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.**

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

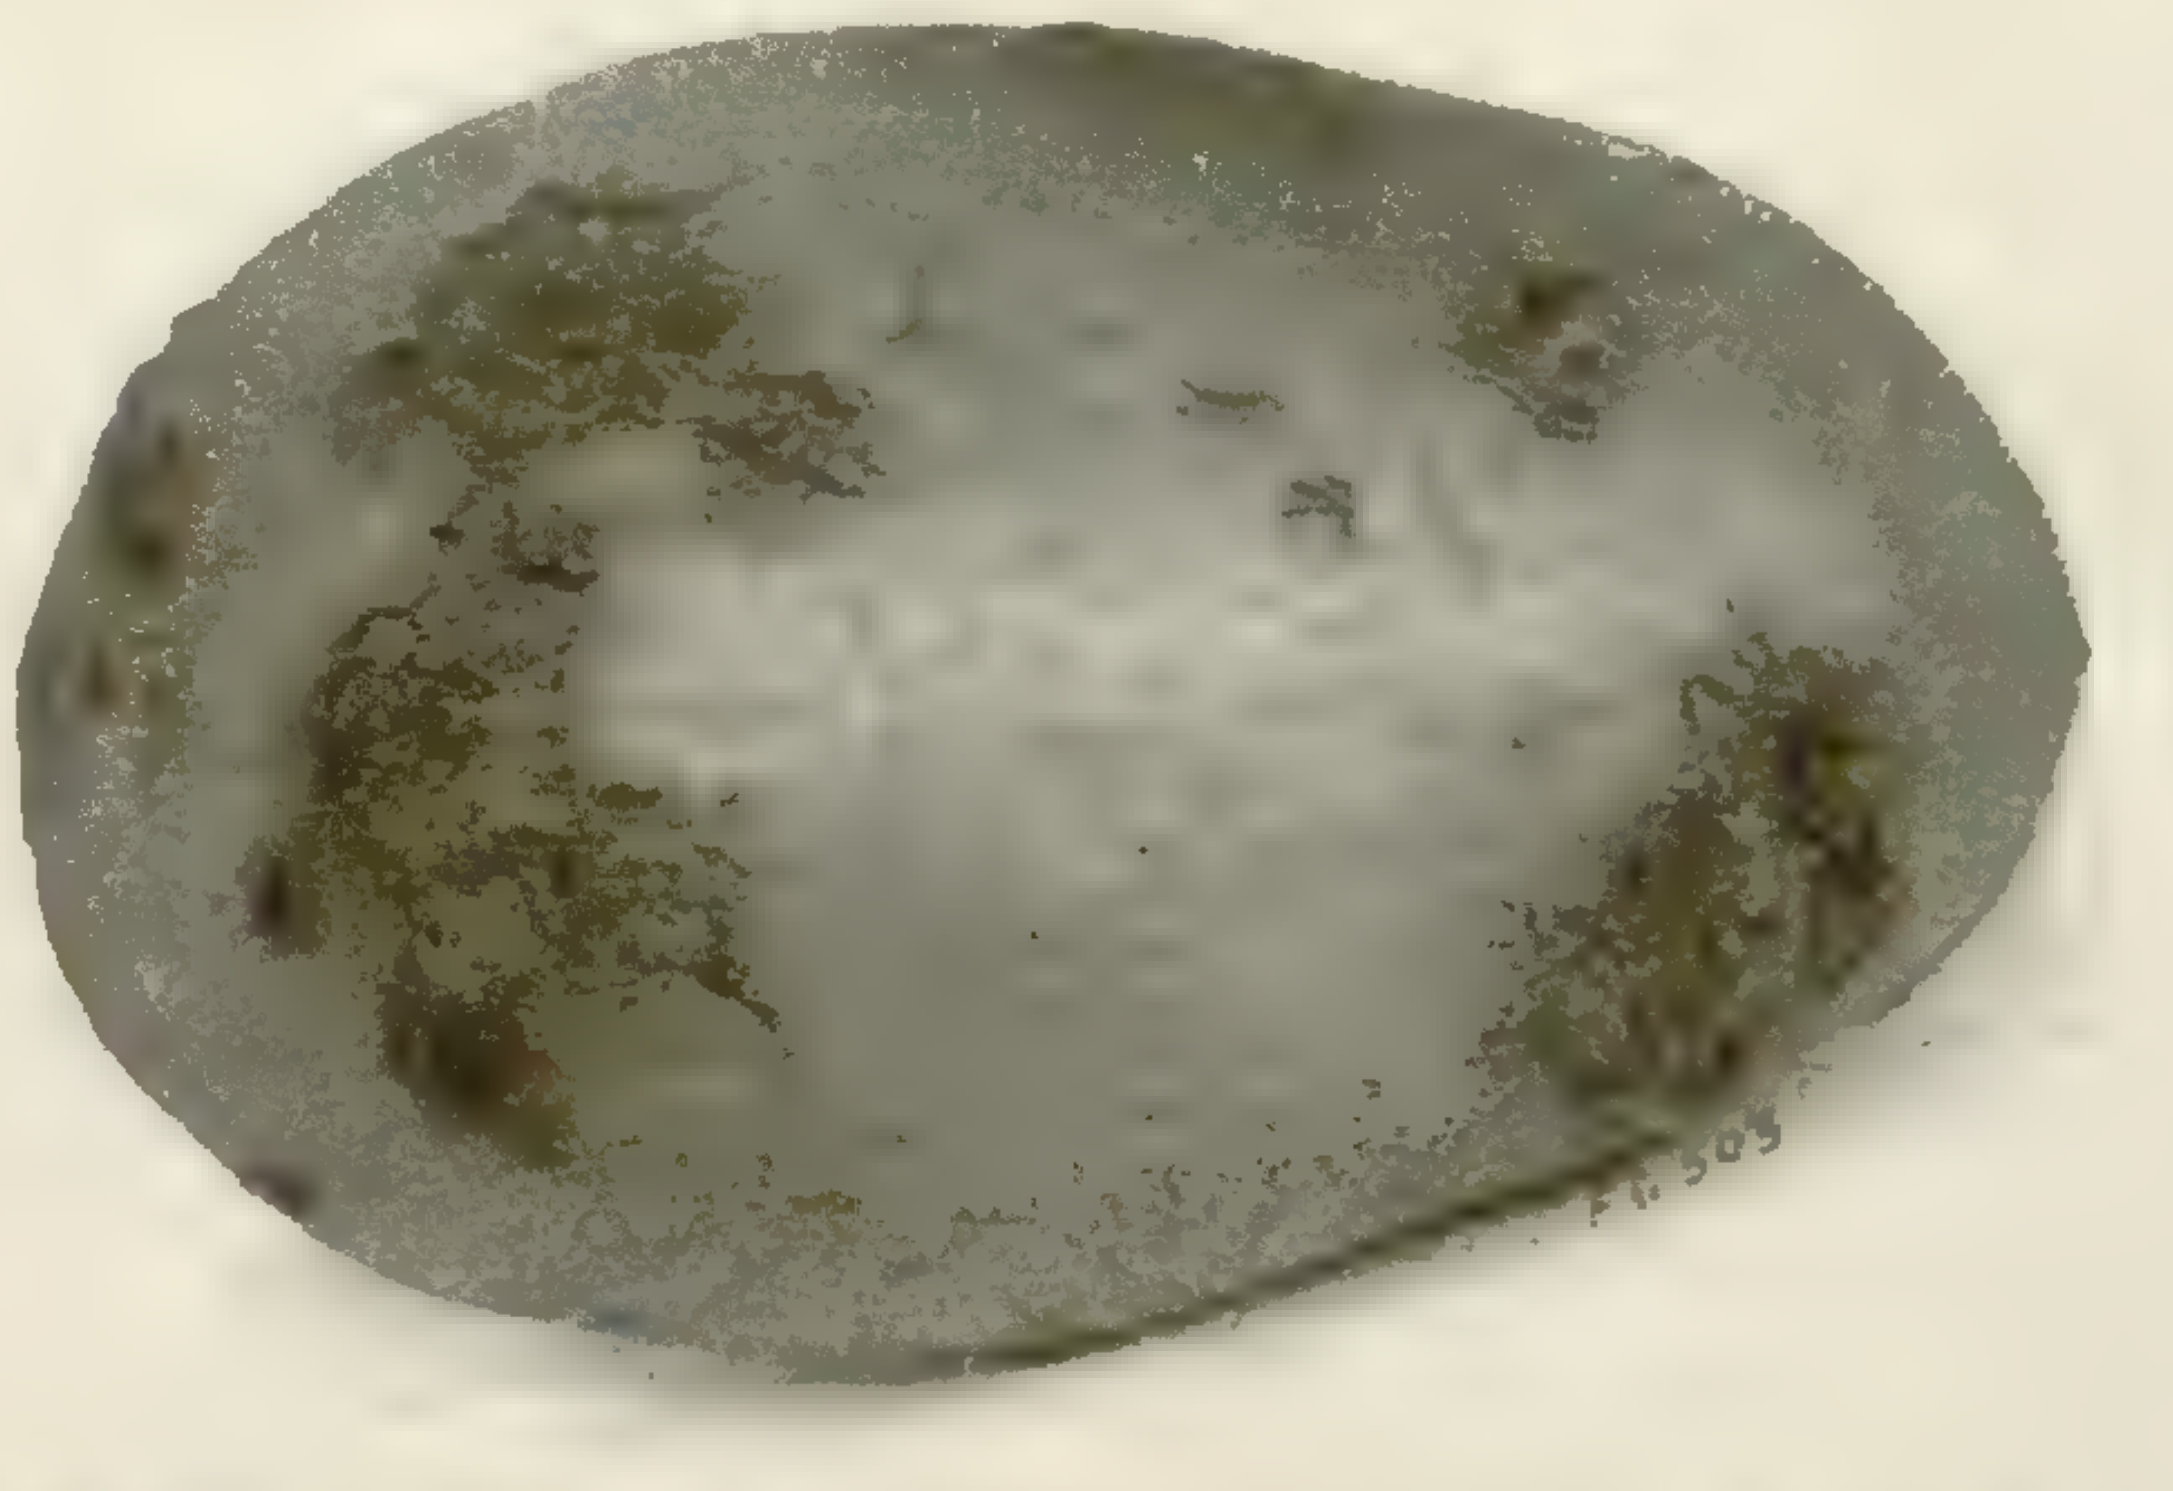
Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. **All parcels must be sufficiently prepaid.**

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the **paragraph.**

SCAB AND BLACK SCAB ON POTATOES.—W. C. H., Lincoln: We gladly accede to your request to give illustrations of these two diseases so as to show the marked difference there is in the effects produced. We take it you do not need advice concerning the methods to adopt for the prevention and cure of these diseases. We have given these particulars on several occasions, but will gladly do so again if you wish, because we are anxious to assist in the eradication of such destructive diseases. Potato Scab (Sorosporium scabies) is the commoner disease, and it has proved very troublesome in America. Black Scab (Chrysophlyctis endobiotica), first brought to public notice in these columns, is a terrible pest, and no pains should be spared to eradicate it.



POTATO TUBER AFFECTED WITH BLACK SCAB (CHRYSOPHLYCTIS ENDOBIOTICA).



POTATO INFECTED WITH SCAB (SOROSPORIUM SCABIES).

PLUMS.—H. C., Nantwich: Under garden culture you should have no difficulty in securing fine fruits of Yellow Imperatrice, Denniston's Superb, Bryanston Gage, McLaughlin's Gage, and Oullin's Golden plums towards the end of August. These are dessert varieties. Large-fruited culinary varieties useful by that date would include Goliath, Prince of Wales, Pond's Seedling, Czar (ripe about mid-August), and Belle de Louvain. We are not acquainted with a plum named Thornley's Seedling.

PASTE-BOARD AND FLUTED PAPER.—We shall be very glad if any of our readers who are acquainted with the names and addresses of wholesale makers of pasteboard flower boxes and fluted packing paper will be good enough to send us a postcard giving this information for the benefit of one of our Northern readers.

ROSES.—C. P., Brentford: It is practically impossible to say which is the best rose for a south wall at Brentford. We have seen W. A. Richardson, Gloire de Dijon, Allister Stella Gray, Dundee Rambler, and Felicité-et-Perpétue doing well in the town and neighbourhood. If you have no special liking for any particular kind of rose, we suggest you obtain Dundee Rambler. Felicité-et-Perpĕtue has the merit of being practically evergreen. A red climbing rose of great beauty and usefulness, especially in towns, is Longworth Rambler.

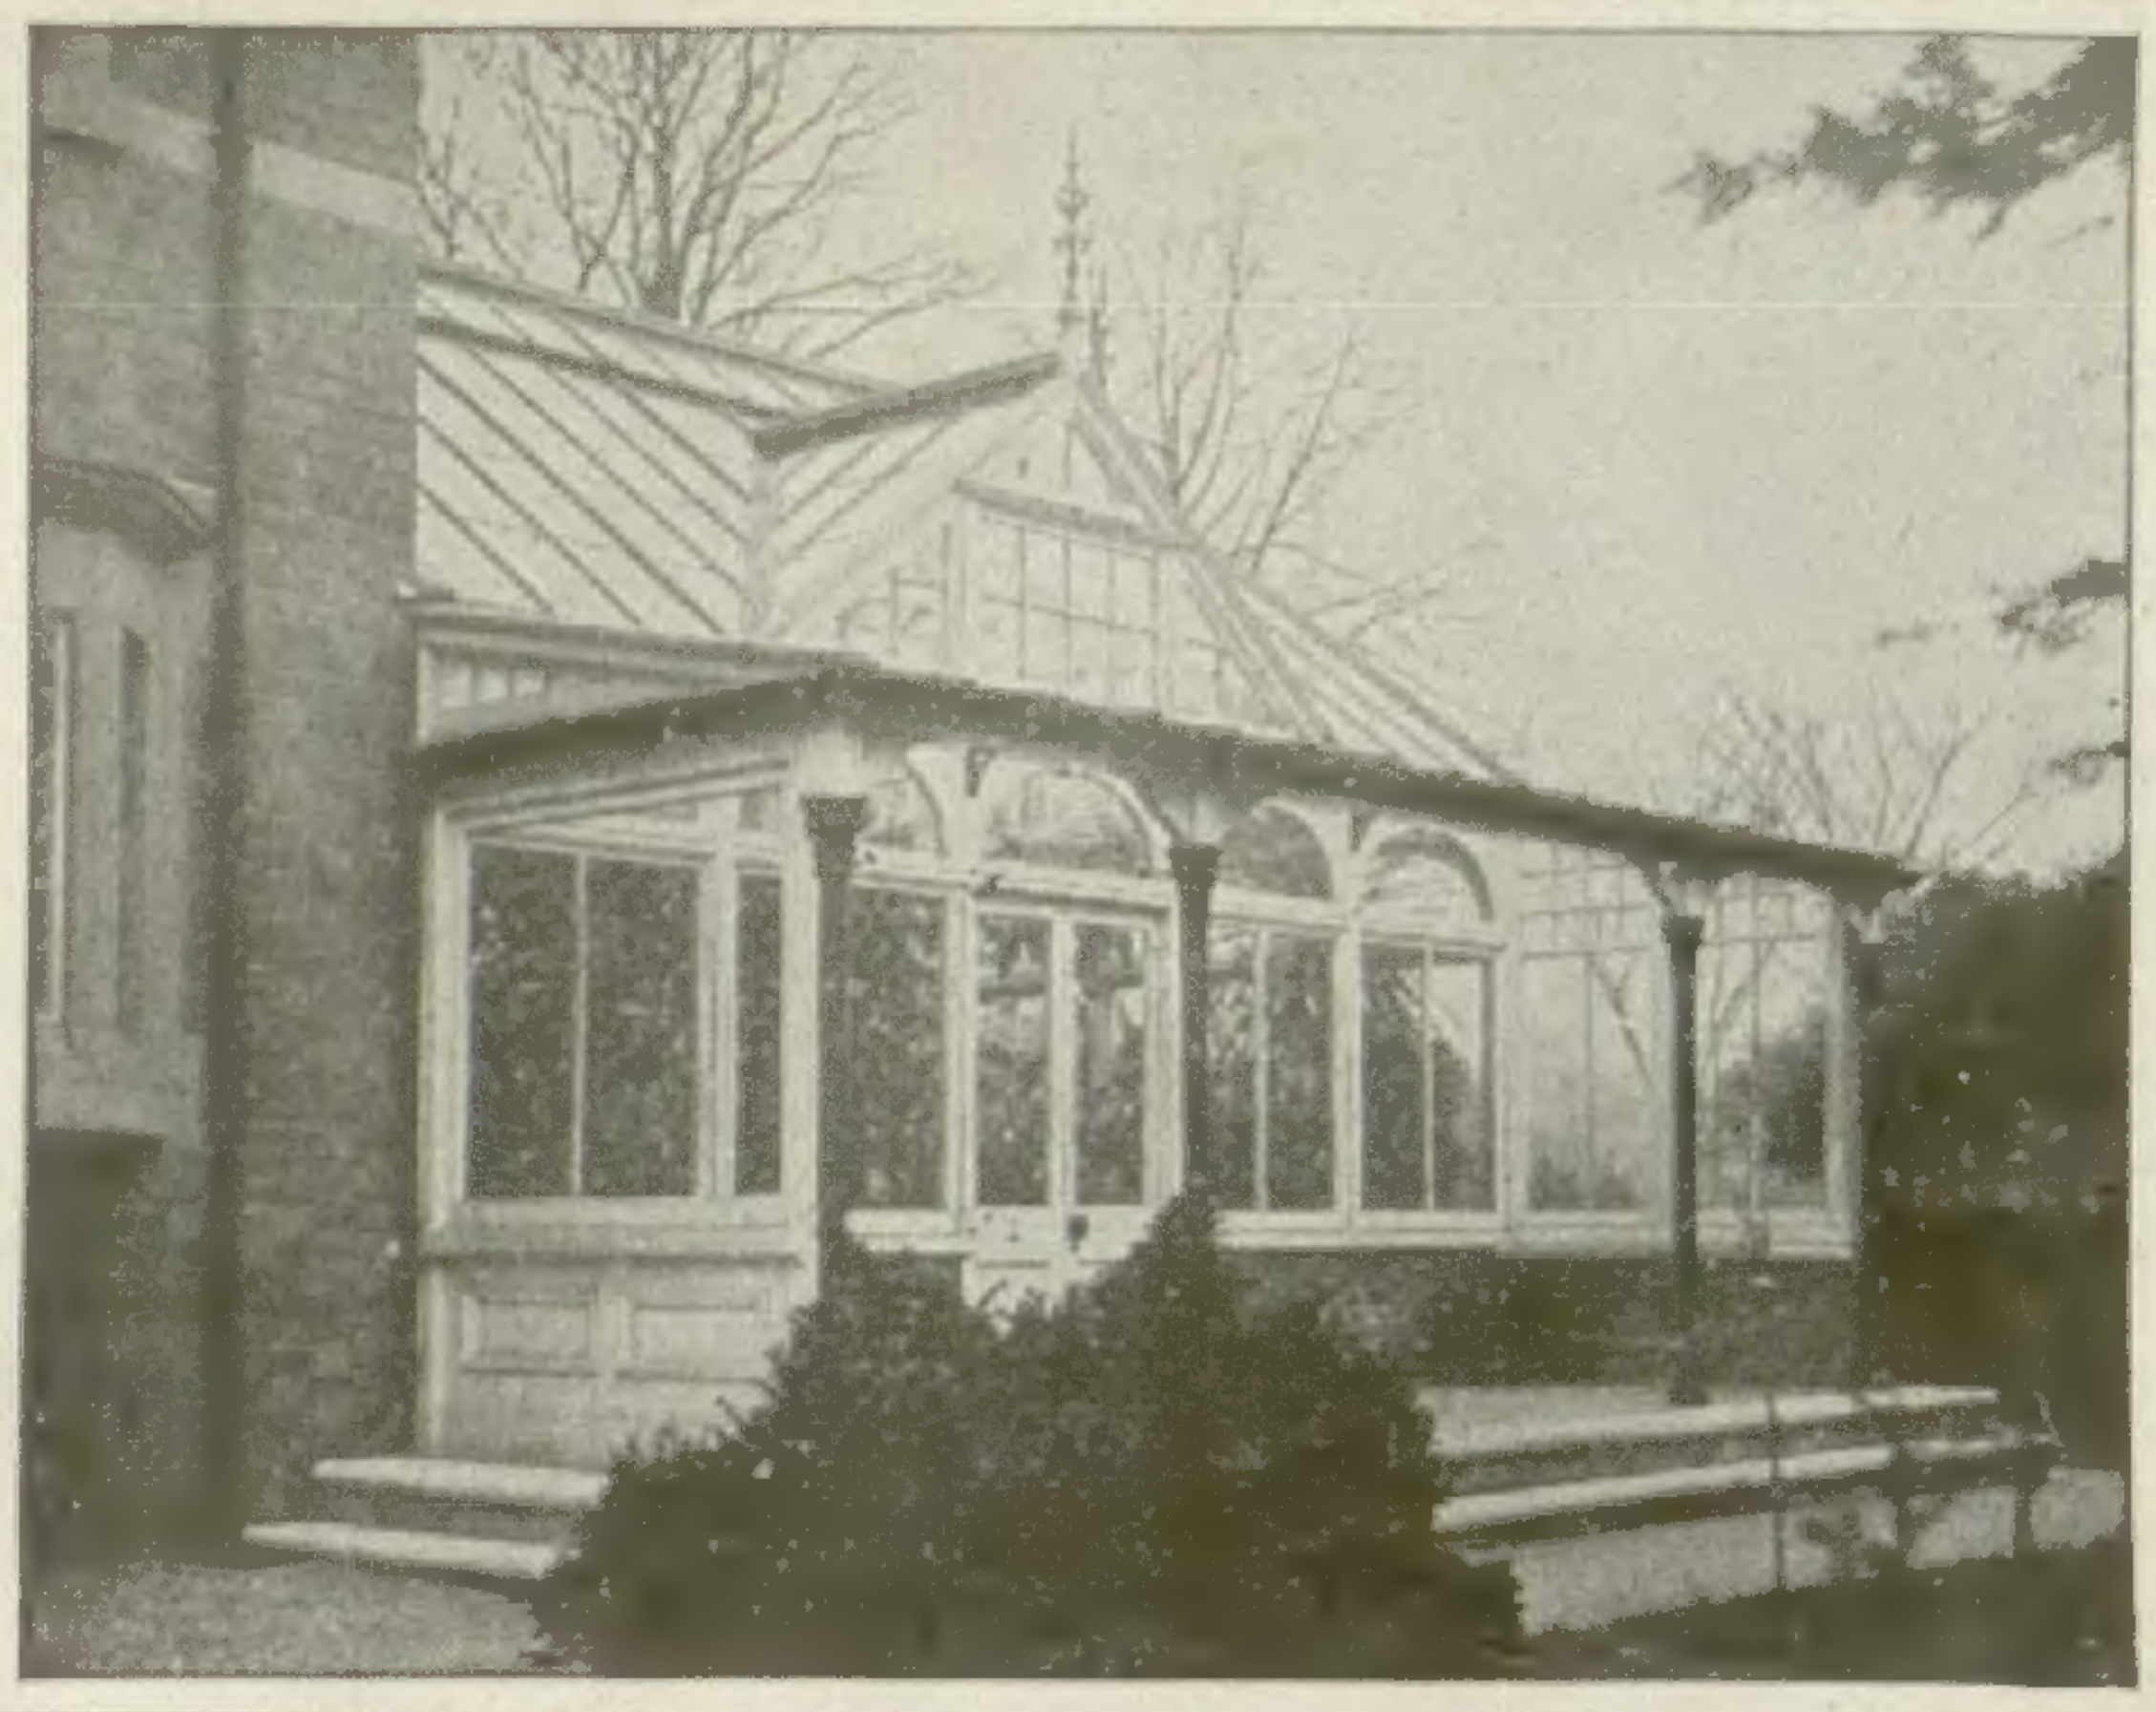
CHRYSANTHEMUMS.—Y. B.: We have already dealt with the subject of chrysanthemum propagation, and as the season advances we propose to deal with the various phases of chrysanthemum culture, keeping in view both the production of big blooms and the provision of flowers for cutting, etc.

BLACK TARTARIAN CHERRY.—S.E.C., Aylesbury: The Black Tartarian Cherry is one of the finest varieties, and you can make no mistake in planting it against a wall. It is very hardy and prolific, and ripens its large, black, richly-flavoured fruits about the beginning of July, sometimes earlier. It is on record that this cherry was introduced to cultivation in this country by Mr. Hugh Ronalds, who at one time was a well-known and successful pomologist resident in Brentford, Middlesex. He advertised the variety at 5s. per plant as far back as 1794. A Mr. John Fraser also introduced it, from Russia, where he found it grown by a German in St. Petersburg, but Fraser was two years behind Ronalds.

DEPTH AT WHICH TO PLANT.—A Beckenham correspondent writes: For thirty years I have been a constant reader of the Gardeners' Magazine, and I have not the slightest wish or reason to alter my adherence to it, but there have been times when I felt almost courageous enough to ask a contributor how he reconciled certain points raised in his article. These times have not been numerous, but one has now come, and I would like to ask "Pedestrian" (p. 914) how one is to reconcile his advice, in the one case, that "the ground must not be cultivated more than two feet deep, 1ft. 6in. for preference, in most soils," with the advice that "the roots should be spread out at a depth below the surface of 2ft. 6in. or 3ft." In conclusion he writes: "No stems must be buried," and with this I agree, but what about the 2½ft. or 3ft. deep?

[Just previous to the receipt of this letter we received a note from "Pedestrian" pointing out that "2½ft. to 3ft." should have read "2½ to 3in." The error was a clerical one on the part of our contributor, but we regret it escaped us in the proof.—Ed., "G.M."]

WEAKLY - CONSTITUTIONED CHRYSANTHEMUMS.—"G. N., Taunton," writes a very pleasant letter of thanks for the trouble and interest we have taken in questions concerning chrysanthemum cuttings. He confesses to some little surprise that Mr. Molyneux fixes no special dates for the insertion of cuttings in his article on p. 927, and adds, "I have obtained Mr. J. B. Wroe's book on chrysanthemums, and find he gives dates, such as 10th, 15th, and 20th of the present month, and this seems to put the matter on a systematic basis. But a further matter of importance is that of varieties liable to mildew, rust, and other diseases, in short, weakly-constitutioned varieties. I am quite sure, from my own observations, that some varieties are far more liable to attacks than others, and it would be a great boon if someone with large experience would enumerate a few of the strongest constitutioned varieties, suitable for amateurs and small growers, and at the same time point out varieties to avoid. I may illustrate my point by saying that F. S. Vallis, Mrs. Val-



For 50 years we have specialised in the construction of Glasshouses, and our name is now regarded all over the country as synonymous with all that is latest and best in Glasshouse construction.

Contracts are undertaken for the erection and heating of

CONSERVATORIES, WINTER-GARDENS, VINERIES,

and all kinds of Glasshouses.
The most recent improvements in Ventilation, Heating and internal fittings are introduced.
Plans and estimates will be sent free on receipt of particulars. Write for Illustrated Catalogue, post free.

Contractors to H.M. Board of Works, H.M. Admiralty, H.M. War Office, etc., etc.
Awarded Gold Medal of the Society of Architects and Six Medals of the Royal Horticultural Society.

A REALLY RELIABLE REMEDY
FOR
PEST-RIDDEN GARDENS.

No soil insect pest that preys upon plants can withstand the deadly fumes given off by

"Kilogrub"

"KILOGRUB" is sudden death to all pests of the soil. All you have to do is to distribute it well over the ground and work it into the soil, only two or three ounces being necessary for a square yard.

Thorough tests have proved "KILOGRUB'S" worth. Hundreds of experienced gardeners know its value.

Prices, cash with order, carriage paid:—

7 lbs.	2s. 0d.
½ cwt.	5s. 0d.
½ cwt.	7s. 0d.
1 cwt.	11s. 6d.

lis, General Hutton, Mrs. W. Knox, and Mrs. A. T. Miller are all excellent growers, while Henry Perkins, and Chrys. Montigny need very skilful culture, and even then appear to be uncertain."

NAMES OF PLANTS.

Under this heading we can only undertake to name species and well marked varieties of plants, and not florists' flowers. Specimens should be packed in stout boxes with damp (not wet) moss, or some leaves, as packing material, to ensure their reaching us in a fresh state. It is essential that flowers must accompany specimens of flowering plants, that fern fronds be fertile, and that numbers be firmly attached to the specimens so that they can be seen without any untying. We cannot promise to name more than six specimens at one time from any one correspondent.

G. C. G., Trowbridge.—Iris stylosa.

J. H., Huddersfield.—Probably Xanthosoma Lindeni.

S. H. M., Llandudno.—1, Opuntia microdasys; 2, Daphne indica rubra; 3, Exacum affine.

J. C. B., Gourock.—Not recognised from the specimen sent; kindly send another when more fully developed.

F. G. W., Godalming.—1, Leonotus Leonurus; 2, Calceolaria Burbidgei; 3, Euphorbia splendens; 4, Calanthe Veitchi; 5, Exacum affine; 6, Acrostichum crinitum.

NAMES OF FRUITS.

M. W. B., Warwick.—1, Blenheim Pippin; 2, Bramley's Seedling; 3, Beauty of Waltham.

T. H. C., Barnstaple.—1, Lane's Prince Albert; 2, probably Cellini, very much shrivelled.

L. L., Cambridge.—1, Ribston Pippin; 2, Golden Russet; 3, Mère de Ménage; 4, Court Pendu Plat.

A. S., Guildford.—We do not know an apple named Beauty of Wilts, and the name does not appear in Dr. Hogg's "Fruit Manual." We will endeavour to identify the variety.

The Time to Plant.—Success cannot reasonably be expected when operations are neglected in their proper season. Perennials to flower in the early spring months should be completed before the end of the year, and examples—doronicum, aquilegia, anchusa, German iris. Perennials that take two years to establish should be planted in well-prepared and deeply-worked soil, notably ligularia, pæonies, Anemone japonica, and delphiniums. Perennials that succeed in sun-baked positions can be planted at almost any time, such as hieraciums, euphorbias and Iris stylosa. Perennials that only succeed in wet ground are best planted early in autumn or late in spring, and examples are primulas, cypripediums, Iris aurea and gigantea, liliums, trollius, etc.—Thomas Smith, Walmsgate Gardens.

MARKETS.

COVENT GARDEN.

Flowers.

Lack of sunshine has had some effect upon production, but there were ample fine flowers to meet the generous demand. The ready disposal of high-grade material was again most marked.
